ESP32-P4

Technical Reference Manual Pre-release v0.7

PRELIMINARY

ESPRESSIF

About This Document

The **ESP32-P4 Technical Reference Manual** is targeted at developers working on low level software projects that use the ESP32-P4 SoC. It describes the hardware modules listed below for the ESP32-P4 SoC and other products in ESP32-P4 series. The modules detailed in this document provide an overview, list of features, hardware architecture details, any necessary programming procedures, as well as register descriptions.

Navigation in This Document

Here are some tips on navigation through this extensive document:

- Release Status at a Glance on the very next page is a minimal list of all chapters from where you can directly jump to a specific chapter.
- Use the **Bookmarks** on the side bar to jump to any specific chapters or sections from anywhere in the document. Note this PDF document is configured to automatically display **Bookmarks** when open, which is necessary for an extensive document like this one. However, some PDF viewers or browsers ignore this setting, so if you don't see the **Bookmarks** by default, try one or more of the following methods:
  - Install a PDF Reader Extension for your browser;
  - Download this document, and view it with your local PDF viewer;
  - Set your PDF viewer to always automatically display the **Bookmarks** on the left side bar when open.
- Use the native **Navigation** function of your PDF viewer to navigate through the documents. Most PDF viewers support to go **Up**, **Down**, **Previous**, **Next**, **Back**, **Forward** and **Page** with buttons, menu, or hot keys.
- You can also use the built-in **GoBack** button on the upper right corner on each and every page to go back to the previous place before you click a link within the document. Note this feature may only work with some Acrobat-specific PDF viewers (for example, Acrobat Reader and Adobe DC) and browsers with built-in Acrobat-specific PDF viewers or extensions (for example, Firefox).

Release Status at a Glance

Note that this manual in still work in progress. See our release progress below:

No.	Chapter	Progress
	Part I. Microprocessor and Master	
1	Bus Architecture	Published
2	High-Performance CPU	Published
3	RISC-V Trace Encoder (TRACE)	Published
4	Processor Instruction Extensions (PIE)	Published
5	Low-Power CPU	Published
	Part II. System DMA	
6	GDMA Controller (GDMA-AHB, GDMA-AXI)	Published
7	VDMA Controller (VDMA)	Published
8	2D-DMA Controller (2D-DMA)	Published
	Part III. Memory Organization	
9	System and Memory	Published
10	eFuse Controller (EFUSE)	Published
	Part IV. System Component	
11	GPIO Matrix and IO MUX	Published
12	Reset and Clock	Published
13	Chip Boot Control	Published
14	Interrupt Matrix	Published
15	Event Task Matrix (ETM)	Published
16	Low-Power Management	Published
17	System Timer	Published
18	Timer Group (TIMG)	Published
19	Watchdog Timers (WDT)	Published
20	RTC Timer	Published
21	Permission Control (PMS)	Published
22	System Registers (SYSREG)	Published
23	Debug Assistant	Published
24	AXI Performance Monitor	Published
25	LP Mailbox	Published
26	Brown-out Detector	Published
27	Power Supply Detector (PSDET)	Published
	Part V. Cryptography/Security Component	
28	AES Accelerator (AES)	Published
29	ECC Accelerator (ECC)	Published
30	HMAC Accelerator (HMAC)	Published
31	RSA Accelerator (RSA)	Published
32	SHA Accelerator (SHA)	Published
33	RSA Digital Signature Peripheral (RSA_DS)	Published
34	ECDSA Digital Signature Peripheral (ECDSA_DS)	Published
35	External Memory Encryption and Decryption (XTS_AES)	Published

No.	Chapter	Progress
36	Random Number Generator (RNG)	Published
37	Key Manager	Published
	Part VI. Image and Voice Processing	
38	JPEG Codec	Published
39	Image Signal Processor (ISP)	Published
40	Pixel-Processing Accelerator (PPA)	Published
41	LCD and Camera Controller (LCD_CAM)	Published
42	H264 Encoder	Published
43	MIPI CSI	Published
44	MIPI DSI	Published
45	Voice Activity Detection (VAD)	Published
	Part VII. Connectivity Interface	
46	UART Controller (UART)	Published
47	SPI Controller (SPI)	Published
48	I2C Controller (I2C)	Published
49	Analog I2C Controller	Published
50	I3C Controller [to be added later]	86%
51	I2S Controller (I2S)	Published
52	LP I2S Controller	Published
53	Pulse Count Controller (PCNT)	Published
54	USB 2.0 High-Speed OTG	Published
55	USB 2.0 Full-Speed OTG	Published
56	USB Serial/JTAG Controller (USB_SERIAL_JTAG)	Published
57	Ethernet Media Access Controller (EMAC)	Published
58	Two-Wire Automotive Interface (TWAI)	Published
59	SD/MMC Host Controller (SDHOST)	Published
60	LED PWM Controller (LEDC)	Published
61	Motor Control PWM (MCPWM)	Published
62	Remote Control Peripheral (RMT)	Published
63	Parallel IO Controller (PARLIO)	Published
64	BitScrambler	Published
	Part VIII. Analog Signal Processing	
65	Touch Sensor (TOUCH)	Published
66	Temperature Sensor (TSENS)	Published
67	ADC Controller (ADC)	Published
68	Analog Voltage Comparator	Published

I Microprocessor and Master 64

1 Bus Architecture 65

2 High-Performance CPU 68
2.1 Overview 68
2.2 Features 69
2.3 Terminology 70
2.4 Address Map 70
2.5 Configuration and Status Registers (CSRs) 71
2.5.1 Register Summary 71
2.5.2 Register Description 75
2.6 RISC-V Standard ISA Extensions Support 111
2.6.1 M Extension 111
2.6.1.1 Overview 111
2.6.1.2 Functional Description 111
2.6.2 C Extension 111
2.6.2.1 Overview 111
2.6.2.2 Functional Description 111
2.6.3 F Extension 112
2.6.3.1 Overview 112
2.6.3.2 Functional Description 112
2.6.3.3 Initialization 112
2.6.4 Zc (Z) Extension 113
2.6.4.1 Overview 113
2.6.4.2 Functional Description 113
2.6.4.3 Zc Instructions 114
2.6.4.4 Limitations 115
2.6.5 Bit Manipulation (Zb) Extension 116
2.6.5.1 Overview 116
2.6.5.2 Functional Description 116
2.6.6 A Extension 117
2.6.6.1 Overview 117
2.6.6.2 Functional Description 117
2.6.6.3 Load-Reserve (LR.W) Instruction 117
2.6.6.4 Store-Conditional (SC.W) Instruction 117
2.6.6.5 AMO Instructions 118
2.7 Custom Instruction Extensions 119
2.7.1 Hardware Loop 119
2.7.1.1 Overview 119
2.7.1.2 Features 119
2.7.1.3 Functional Description 119

2.7.1.4 Instructions/Operations/Modes Supported in HWLP 119
2.7.1.5 HWLP Constraints 120
2.7.1.6 Register Summary 120
2.7.1.7 Register Description 120
2.7.1.8 HWLP Instructions 126
2.7.2 Processor Instruction Extension 127
2.7.2.1 Overview 127
2.7.2.2 Functional Description 127
2.7.2.3 Initialization, Context Switching, and Exceptions 127
2.8 Memory-Mapped Registers 129
2.8.1 Overview 129
2.8.2 Features 129
2.8.3 Functional Description 129
2.9 Interrupt Controller 130
2.9.1 Overview 130
2.9.2 CLIC 130
2.9.2.1 Overview 130
2.9.2.2 CLIC CSRs 130
2.9.2.3 Interrupt Mapping 131
2.9.2.4 CLIC Parameters 131
2.9.2.5 Interrupt Level and Priority Encoding 131
2.9.2.6 CLIC Memory-Mapped Register Summary 132
2.9.2.7 CLIC Memory-Mapped Register Description 134
2.9.3 Core-Local Interrupts (CLINT) 137
2.9.3.1 Overview 137
2.9.3.2 Features 137
2.9.3.3 Software Interrupt 137
2.9.3.4 Timer Counter and Interrupt 137
2.9.3.5 Register Summary 137
2.9.3.6 Register Description 138
2.10 Memory Protection Unit 142
2.10.1 Standard Physical Memory Protection 142
2.10.1.1 Overview 142
2.10.1.2 Features 142
2.10.1.3 Functional Description 142
2.10.1.4 Register Summary 143
2.10.1.5 Register Description 143
2.10.2 Custom Physical Memory Attribute (PMA) Checker 147
2.10.2.1 Overview 147
2.10.2.2 Features 147
2.10.2.3 Functional Description 147
2.10.2.4 Register Summary 149
2.10.2.5 Register Description 150
2.11 Debug and Trace Support 152
2.11.1 Debug 152
2.11.1.1 Overview 152

2.11.1.2 Features 153
2.11.1.3 Functional Description 153
2.11.1.4 JTAG Control 153
2.11.1.5 Register Summary 154
2.11.1.6 Register Description 155
2.11.2 Debug Halt Groups 159
2.11.2.1 Overview 159
2.11.2.2 Features 159
2.11.2.3 Functional Description 159
2.11.2.4 Register Summary 160
2.11.2.5 Register Description 160
2.11.3 Hardware Trigger 161
2.11.3.1 Overview 161
2.11.3.2 Features 161
2.11.3.3 Functional Description 161
2.11.3.4 Trigger Execution Flow 162
2.11.3.5 Register Summary 162
2.11.3.6 Register Description 163
2.11.4 Trace 168
2.11.4.1 Overview 168
2.11.4.2 Features 168
2.11.4.3 Functional Description 168
2.12 Performance 169
2.12.1 Branch Prediction 169
2.12.1.1 Overview 169
2.12.1.2 Features 169
2.12.1.3 Functional Description 169
2.12.2 RAS 170
2.12.2.1 Overview 170
2.12.2.2 Features 170
2.12.2.3 Functional Description 171
2.12.3 Control Status Register for Performance Configuration 171
2.13 Custom Features 172
2.13.1 Bus Error Response 172
2.13.1.1 Overview 172
2.13.1.2 Functional Description 172
2.13.1.3 Control Status Registers 173
2.13.2 Dedicated IO 174
2.13.2.1 Overview 174
2.13.2.2 Features 174
2.13.2.3 Functional Description 174
2.13.2.4 Register Summary 175
2.13.2.5 Register Description 175
2.13.3 RunStall Support 177
2.13.3.1 Overview 177
2.13.3.2 Functional Description 177

2.13.3.3 Register Summary 177
2.13.4 Debug Assist Information 178
2.13.5 Core Lock-up 178
2.13.5.1 Overview 178
2.13.5.2 Functional Description 178
2.13.5.3 Register Summary 178
2.13.5.4 Register Description 178
2.13.6 External Wakeup 178
2.13.6.1 Overview 178
2.13.6.2 Functional Description 179

3 RISC-V Trace Encoder (TRACE) 180
3.1 Terminology 180
3.2 Introduction 181
3.3 Features 182
3.4 Architectural Overview 183
3.5 Functional Description 183
3.5.1 Synchronization 183
3.5.2 Address Mode 184
3.5.3 Optional Sideband Signals 184
3.5.4 Filtering 185
3.5.5 Anchor Tag 185
3.5.6 Memory Writing Mode 186
3.5.7 Automatic Restart 186
3.6 Encoder Output Packets 186
3.6.1 Header 186
3.6.2 Index 187
3.6.3 Payload 187
3.6.3.1 Format 3 Packets 187
3.6.3.2 Format 2 Packets 189
3.6.3.3 Format 1 Packets 190
3.7 Interrupt 191
3.8 Programming Procedures 192
3.8.1 Encoder Option Configuration 192
3.8.2 Filter Configuration 193
3.8.3 Enable Encoder 194
3.8.4 Disable Encoder 195
3.8.5 Notify 195
3.8.6 Decode Data Packets 196
3.8.7 AHB Configuration 196
3.8.8 Software Retention 197
3.9 Register Summary 198
3.10 Registers 199

4 Processor Instruction Extensions (PIE) 210
4.1 Overview 210

4.2 Features 210
4.3 Structure Overview 210
4.3.1 Internal Structure Diagram 210
4.3.2 Vector Register Bank 211
4.3.3 Arithmetic Logic Unit (ALU) 211
4.3.4 Multiply-and-Accumulate (MAC) Unit 212
4.3.4.1 QACC Accumulator Register 212
4.3.4.2 XACC Accumulator Register 212
4.3.5 Address Unit 212
4.4 Components of Extended Instruction Set 212
4.4.1 Registers 212
4.4.1.1 General-Purpose Registers 213
4.4.1.1.1 AR 213
4.4.1.2 Vector Registers 213
4.4.1.2.1 QR 213
4.4.1.3 Special Registers 213
4.4.1.3.1 SAR 214
4.4.1.3.2 SAR_BYTE 214
4.4.1.3.3 FFT_BIT_WIDTH 214
4.4.1.3.4 UA_STATE 214
4.4.1.3.5 Core Configuration and Status Register 215
4.4.2 Data Format and Alignment 215
4.4.3 Misaligned Access Handling 216
4.4.3.1 Force-alignment mode 216
4.4.3.2 Hardware misaligned mode 216
4.4.4 Data Overflow and Saturation 216
4.4.5 Data Rounding 217
4.5 Extended Instruction List 217
4.5.1 Read Instructions 220
4.5.2 Write Instructions 221
4.5.3 Data Exchange Instructions 222
4.5.4 Arithmetic Instructions 223
4.5.4.1 Vector Addition Instructions 223
4.5.4.2 Vector Multiplication Instructions 224
4.5.4.3 Vector Complex Multiplication Instructions 224
4.5.4.4 Vector Multiplication Accumulation Instructions 225
4.5.4.5 Vector and Scalar Multiplication Accumulation Instructions 226
4.5.4.6 Other Instructions 226
4.5.5 Comparison Instructions 227
4.5.6 Bitwise Logical Instructions 228
4.5.7 Shift Instructions 228
4.5.8 Fast Fourier Transform (FFT) Instructions 229
4.5.8.1 Butterfly Computation Instructions 229
4.5.8.2 Bit Reverse Instruction 229
4.5.8.3 Real FFT Instructions 229
4.6 Instruction Performance 230

4.6.1 Data Hazard 230
4.6.2 Hardware Resource Hazard 231
4.6.3 Control Hazard 232
4.7 Extended Instruction Functional Description 233
4.7.1 Instruction Symbols and Field Definitions 233
4.7.2 List of Instructions 234

5 Low-Power CPU 633
5.1 Overview 633
5.2 Features 633
5.3 Configuration and Status Registers (CSRs) 634
5.3.1 Register Summary 634
5.3.2 Registers 635
5.4 Interrupts and Exceptions 644
5.4.1 Interrupts 644
5.4.2 Interrupt Handling 645
5.4.3 Exceptions 645
5.5 Debugging 646
5.5.1 Features 646
5.5.2 Functional Description 646
5.5.3 Register Summary 647
5.5.4 Registers 647
5.6 Hardware Trigger 649
5.6.1 Features 649
5.6.2 Functional Description 649
5.6.3 Trigger Execution Flow 650
5.6.4 Register Summary 650
5.6.5 Registers 650
5.7 Performance Counter 653
5.8 System Access 654
5.8.1 Memory Access 654
5.8.2 Peripheral Access 654
5.9 Event Task Matrix Feature 655
5.10 Sleep and Wake-Up Process 655
5.10.1 Features 655
5.10.2 Process 655
5.10.3 Wake-Up Sources 657
5.10.4 Sleep Rejection 657

II System DMA 658

6 GDMA Controller (GDMA-AHB, GDMA-AXI) 659
6.1 Overview 659
6.2 Features 660
6.3 Architecture 661
6.4 Functional Description 662

6.4.1 Linked List 662
6.4.2 Peripheral-to-Memory and Memory-to-Peripheral Data Transfer 663
6.4.3 Memory-to-Memory Data Transfer 664
6.4.4 Enabling GDMA 664
6.4.5 Linked List Reading Process 665
6.4.6 Interrupt Response Mechanism for GDMA-AXI Linked List Switching 666
6.4.7 EOF 666
6.4.8 Accessing Memory 667
6.4.9 Arbitration 667
6.4.10 Bus Error Response Information Logging 668
6.4.11 Automatic Clock Gating 668
6.4.12 CRC Calculation 669
6.5 Event Task Matrix Feature 670
6.6 Interrupts 671
6.7 Programming Procedures 673
6.7.1 Programming Procedures for GDMA's Transmit Channel 673
6.7.2 Programming Procedures for GDMA's Receive Channel 673
6.7.3 Programming Procedures for Memory-to-Memory Transfer 673
6.7.4 Programming Procedures for Channel Priority and Weight 674
6.7.5 Programming Procedures for CRC Calculation 674
6.8 Register Summary 675
6.8.1 GDMA-AHB Register Summary 675
6.8.2 GDMA-AXI Register Summary 683
6.9 Registers 691
6.9.1 GDMA-AHB Registers 691
6.9.2 GDMA-AXI Registers 730

7 VDMA Controller (VDMA) 774
7.1 Overview 774
7.2 Terminology 774
7.3 Features 775
7.4 Architectural Overview 775
7.5 Functional Description 777
7.5.1 Transfer Hierarchy 777
7.5.2 Arbitration Scheme 779
7.5.2.1 Read Arbiter 779
7.5.2.2 Write Arbiter 780
7.5.3 Handshaking Interface 780
7.5.4 Transfer Control 781
7.5.4.1 Single-Block Transfer 781
7.5.4.2 Multi-Block Transfer 781
7.5.5 Flow Controller 786
7.5.6 Channel Suspend and Resume 786
7.5.7 Channel Disable 787
7.5.7.1 Disabling a Suspended Channel Before Transfer Completion 787
7.5.7.2 Disabling a Non-suspended Channel Before Transfer Completion 787

7.5.8 Low-Power Technique 788
7.5.8.1 Low-Power Technique for DMA Channels 788
7.5.8.2 Low-Power Technique for Slave Bus Interface 788
7.5.8.3 Low-Power Technique for AXI Master Interface Channels 789
7.5.8.4 Global Low-Power Technique 789
7.6 Interrupts 789
7.7 Programming Procedures 790
7.7.1 Common Programming Procedures 790
7.7.2 Programming Procedures for Shadow-Register-Based Multi-Block Transfer 790
7.7.3 Programming Procedures for Linked-List-Based Multi-Block Transfer 792
7.7.4 Programming Procedures for Single-Block Transfer 793
7.8 Register Summary 794
7.9 Registers 798

8 2D-DMA Controller (2D-DMA) 828
8.1 Overview 828
8.2 Features 828
8.3 Architecture 828
8.4 Functional Description 829
8.4.1 Transfer Mode 829
8.4.2 Linked List 830
8.4.3 Padding in 2D-MOD1 Mode and DSCR-PORT Mode 833
8.4.4 Peripheral-to-Memory and Memory-to-Peripheral Data Transfer 834
8.4.5 Memory-to-Memory Data Transfer 835
8.4.6 Macroblock Reordering 835
8.4.6.1 Macroblock Reordering in TX Direction 835
8.4.6.2 Macroblock Reordering in RX Direction 836
8.4.7 Color Space Conversion 837
8.4.8 Enabling 2D-DMA 840
8.4.9 Linked List Reading Process 841
8.4.10 EOF 841
8.4.11 Accessing Memory 842
8.4.12 Arbitration 842
8.5 Event Task Matrix Feature 843
8.6 Interrupts 844
8.7 Programming Procedures 846
8.7.1 General Configurations for 2D-DMA 846
8.7.2 Mode-Specific Configurations for 2D-DMA 846
8.7.3 Configurations for 2D-DMA's Transmit Channel 846
8.7.4 Configurations for 2D-DMA's Receive Channel 847
8.7.5 Configurations for Memory-to-Memory Transfer 847
8.7.6 Configurations for Channel Priority and Weight 847
8.7.7 Resetting 2D-DMA While it Runs 848
8.8 Register Summary 849
8.9 Registers 856

III Memory Organization 900

9 System and Memory 901
9.1 Overview 901
9.2 Features 901
9.3 Functional Description 902
9.3.1 Address Mapping 902
9.3.2 Internal Memory 905
9.3.3 External Memory 909
9.3.3.1 External Memory Address Mapping 909
9.3.3.2 Cache 909
9.3.3.3 Cache Operations 910
9.3.4 DMA Address Space 911
9.3.5 Modules/Peripherals Address Mapping 912
9.4 eFuse Controller (EFUSE) 916
9.4.1 Overview 916
9.4.2 Features 916
9.4.3 Functional Description 916
9.4.3.1 Structure 916
9.4.3.1.1 EFUSE_WR_DIS 926
9.4.3.1.2 EFUSE_RD_DIS 926
9.4.3.1.3 Data Storage 926
9.4.3.2 Programming of Parameters 928
9.4.3.3 Reading of Parameters by Users 929
9.4.3.4 eFuse VDDQ Timing 931
9.4.3.5 Parameters Used by Hardware Modules 931
9.4.4 Interrupts 931
9.4.5 Register Summary 933
9.4.6 Registers 940

IV System Component 980

10 GPIO Matrix and IO MUX 981
10.1 Overview 981
10.2 Features 981
10.2.1 HP GPIO Matrix and HP IO MUX 981
10.2.2 LP GPIO Matrix and LP IO MUX 982
10.3 Architectural Overview 982
10.4 Peripheral Input via GPIO Matrix 985
10.4.1 Overview 985
10.4.2 Signal Synchronization 985
10.4.3 GPIO Filter 986
10.4.4 Glitch Filter 986
10.4.5 Simple GPIO Input 987
10.4.6 GPIO Wakeup 987
10.4.6.1 HP GPIO Wakeup 987

10.4.6.2 LP GPIO Wakeup 987
10.4.7 Programming Procedure 988
10.4.7.1 HP GPIO Matrix 988
10.4.7.2 LP GPIO Matrix 989
10.5 Peripheral Output via GPIO Matrix 990
10.5.1 Overview 990
10.5.2 Simple GPIO Output 990
10.5.3 Sigma Delta Modulated Output (SDM) 991
10.5.3.1 Functional Description 991
10.5.3.2 SDM Configuration 991
10.5.4 Programming Procedure 992
10.5.4.1 HP GPIO Matrix 992
10.5.4.2 LP GPIO Matrix 993
10.6 Direct Input and Output via IO MUX 993
10.6.1 Overview 993
10.6.2 Functional Description 993
10.6.2.1 HP IO MUX 993
10.6.2.2 LP IO MUX 994
10.7 Analog Functions 994
10.7.1 Overview 994
10.7.2 Analog Functions 994
10.8 Pin Functions in Light-sleep 995
10.9 Pin Hold Feature 995
10.10 Hysteresis Characteristics of GPIO Pins 997

11 Reset and Clock 1081
11.1 Reset 1081
11.1.1 Overview 1081
11.1.2 Architectural Overview 1081
11.1.3 Features 1081
11.1.4 Functional Description 1082
11.1.5 Peripheral Reset 1084
11.2 Clock 1084
11.2.1 Overview 1084
11.2.2 Architectural Overview 1085
11.2.3 Features 1085
11.2.4 Functional Description 1086
11.2.4.1 HP System Clock 1086
11.2.4.2 LP System Clock 1087
11.2.4.3 Peripheral Clocks 1088
11.3 Programming Procedures 1092
11.3.1 HP System Clock Configuration 1092
11.3.2 LP System Clock Configuration 1093
11.3.3 Peripheral Clock Reset and Configuration 1093
11.4 Register Summary 1095
11.4.1 Reset and Clock (HP_SYS_CLKRST) Register Summary 1095
11.4.2 LP Always on Clock and Reset (LP_CLKRST) Register Summary 1097
11.4.3 LP Peripheral Clock and Reset (LPPERI) Register Summary 1097
11.5 Registers 1099
11.5.1 Reset and Clock (HP_SYS_CLKRST) Registers 1099
11.5.2 LP Always on Clock and Reset (LP_CLKRST) Registers 1189
11.5.3 LP Peripheral Clock and Reset (LPPERI) Registers 1209

12 Chip Boot Control 1219
12.1 Overview 1219
12.2 Functional Description 1219
12.2.1 Default Configuration 1219
12.2.2 Boot Mode Control 1220
12.2.3 ROM Messages Printing Control 1222
12.2.4 JTAG Signal Source Control 1223

13 Interrupt Matrix 1224
13.1 Overview 1224
13.2 Interrupt Terminology in ESP32-P4 1224
13.2.1 Interrupt 1224
13.2.2 Interrupt Signal/Interrupt Source 1224
13.2.3 Interrupt Flow in ESP32-P4 1225
13.3 Features 1225
13.4 Functional Description 1226
13.4.1 Peripheral Interrupt Sources 1226
13.4.2 Assign Peripheral Interrupt Source to HP CPU Interrupt 1233

13.4.2.1 Assign One Peripheral Interrupt Source (*SOURCE*) to HP CPU*x* 1233
13.4.2.2 Assign Multiple Peripheral Interrupt Sources (*SOURCE*) to HP CPU*x* 1233
13.4.2.3 Disable HP CPU*x* Peripheral Interrupt Source (*SOURCE*) 1233
13.4.3 Query Current Interrupt Status of HP CPU*x* Peripheral Interrupt Source 1233
13.4.4 Interrupt Remapping 1233
13.5 Register Summary 1235
13.5.1 HP CPU0 Interrupt Matrix Register Summary 1235
13.5.2 HP CPU1 Interrupt Matrix Register Summary 1240
13.6 Registers 1247
13.6.1 HP CPU0 Interrupt Matrix Registers 1247
13.6.2 HP CPU1 Interrupt Matrix Registers 1257

14 Event Task Matrix (ETM) 1268
14.1 Overview 1268
14.2 Features 1268
14.3 Functional Description 1268
14.3.1 Architecture 1268
14.3.2 Events 1269
14.3.3 Tasks 1274
14.3.4 Event and Task Status 1279
14.3.5 Timing Considerations 1279
14.3.6 Channel Control 1281
14.4 Register Summary 1282
14.5 Registers 1286

15 Low-Power Management 1425
15.1 Overview 1425
15.2 Terminology 1425
15.3 Features 1425
15.4 Functional Description 1426
15.4.1 Power Scheme 1426
15.4.1.1 Regulators 1427
15.4.1.2 Digital Power Domains 1428
15.4.1.3 Analog Power Domains 1428
15.4.1.4 Battery Power Domain 1428
15.4.2 PMU 1429
15.4.2.1 PMU Main State Machine 1430
15.4.2.2 Sleep/Wake-up Controller 1431
15.4.2.3 Analog Power Controller 1432
15.4.2.4 Digital Power Controller 1433
15.4.2.5 Clock Controller 1435
15.4.2.6 Backup Controller 1436
15.4.2.7 System Controller 1437
15.4.2.8 Battery Power Controller 1437
15.4.2.9 Output Regulator Control 1438
15.4.2.9.1 Regulator Features 1438

15.4.2.9.2 Regulator Configuration Examples 1440
15.4.2.9.3 Software Configuration Steps 1440
15.5 Power Modes 1441
15.6 Event Task Matrix Feature 1441
15.7 Interrupts 1442
15.8 Register Summary 1444
15.9 Registers 1447

16 System Timer 1507
16.1 Overview 1507
16.2 Features 1507
16.3 System Timer Structure 1508
16.4 Clock Source Selection 1508
16.5 Functional Description 1509
16.5.1 Counter 1509
16.5.2 Comparator and Alarm 1510
16.5.3 Event Task Matrix 1511
16.5.4 Synchronization Operation 1511
16.6 Interrupts 1512
16.7 Programming Procedure 1512
16.7.1 Read Current Count Value 1512
16.7.2 Configure a One-Time Alarm in Target Mode 1513
16.7.3 Configure Periodic Alarms in Period Mode 1513
16.7.4 Update After Light-sleep 1513
16.8 Register Summary 1515
16.9 Registers 1517

17 Timer Group (TIMG) 1532
17.1 Overview 1532
17.2 Features 1532
17.3 Functional Description 1533
17.3.1 16-bit Prescaler and Clock Selection 1533
17.3.2 54-bit Time-base Counter 1534
17.3.3 Alarm Generation 1534
17.3.4 Timer Reload 1535
17.3.5 Event Task Matrix Feature 1536
17.3.6 RTC_SLOW_CLK Frequency Calculation 1537
17.3.7 Interrupts 1537
17.4 Configuration and Usage 1538
17.4.1 Timer as a Simple Clock 1538
17.4.2 Timer as One-shot Alarm 1538
17.4.3 Timer as Periodic Alarm by APB 1538
17.4.4 Timer as Periodic Alarm by ETM 1539
17.4.5 RTC_SLOW_CLK Frequency Calculation 1540
17.5 Register Summary 1541
17.6 Registers 1543

18 Watchdog Timers (WDT) 1557
18.1 Overview 1557
18.2 Digital Watchdog Timers 1558
18.2.1 Features 1558
18.2.2 Functional Description 1559
18.2.2.1 Clock Source and 32-Bit Counter 1559
18.2.2.2 Stages and Timeout Actions 1560
18.2.2.3 Write Protection 1560
18.2.2.4 Flash Boot Protection 1561
18.3 Super Watchdog 1561
18.3.1 Features 1561
18.3.2 Super Watchdog Controller 1561
18.3.2.1 Structure 1562
18.3.2.2 Workflow 1562
18.4 Interrupts 1562
18.5 Register Summary 1563
18.6 Registers 1563

19 RTC Timer 1572
19.1 Introduction 1572
19.2 Feature List 1572
19.3 Functional Description 1572
19.4 Event Task Matrix Feature 1574
19.5 Interrupts 1574
19.6 Register Summary 1576
19.7 Registers 1577

20 Permission Control (PMS) 1586
20.1 Overview 1586
20.2 Features 1588
20.3 Functional Description 1588
20.3.1 Architecture 1588
20.3.2 Address Ranges and Permissions Management 1589
20.3.2.1 Address Ranges Managed by HP APM and LP APM 1589
20.3.2.2 Address Ranges Managed by DMA APM 1590
20.4 Programming Procedure 1590
20.4.1 Configuring Access Permissions for HP CPU0/1 1591
20.4.2 Configuring Access Permissions for LP CPU 1591
20.4.3 Configuring Access Permission for DMA Masters 1592
20.5 Illegal Access and Interrupts 1592
20.6 Register Summary 1593
20.6.1 HP_DMA_PMS_REG 1593
20.6.2 HP_PERI_PMS_REG 1599
20.6.3 LP2HP_PERI_PMS_REG 1600
20.6.4 LP_PERI_PMS_REG 1600
20.6.5 HP2LP_PERI_PMS_REG 1602

20.7 Registers 1603
20.7.1 HP_DMA_PMS_REG 1603
20.7.2 HP_PERI_PMS_REG 1630
20.7.3 LP2HP_PERI_PMS_REG 1655
20.7.4 LP_PERI_PMS_REG 1668
20.7.5 HP2LP_PERI_PMS_REG 1677

21 System Registers (SYSREG) 1687
21.1 Overview 1687
21.2 Function Description 1687
21.2.1 HP System Registers 1687
21.2.1.1 External Memory Encryption/Decryption Configuration 1687
21.2.1.2 HP Peripherals Clock Configuration and Power Control 1687
21.2.1.3 HP Cache Clock and Reset Configuration 1687
21.2.1.4 HP SPM and HP L2MEM Clock Configuration 1688
21.2.1.5 HP SPM Parity Check Configuration 1688
21.2.1.6 HP L2MEM ECC Check Configuration 1689
21.2.1.7 BitScrambler Configuration 1689
21.2.1.8 Ethernet MAC Control 1689
21.2.1.9 USB 2.0 High-Speed OTG Control 1690
21.2.1.10 CPU Control and Record 1690
21.2.1.11 HP to LP Interrupt and Wakeup Control 1690
21.2.1.12 HP GPIO Hold Control 1690
21.2.1.13 HP GPIO Output Control 1690
21.2.1.14 Illegal Access and Unauthorized Access 1691
21.2.1.15 HP CPU Bus Timeout Protection 1691
21.2.1.16 AXI Matrix 1692
21.2.1.17 Post Write 1693
21.2.2 LP System Registers 1694
21.2.2.1 LP Timer Stall Control 1694
21.2.2.2 Focused Ion Beam (FIB) Control 1694
21.2.2.3 Boot Mode 1694
21.2.2.4 LP CPU Control 1694
21.2.2.5 Reset Control 1695
21.2.2.6 Wakeup Control 1696
21.2.2.7 Pad Hold Control 1696
21.2.2.8 Power Discharge Control 1696
21.2.2.9 LPROM and LP SPM Clock Control 1697
21.2.2.10 Analog Voltage Comparator 1697
21.2.2.11 Illegal Access and Unauthorized Access 1697
21.2.2.12 LP Bus Timeout Protection 1697
21.2.2.13 RNG Control 1698
21.3 Interrupt 1698
21.4 Register Summary 1700
21.4.1 HP Register Summary 1700
21.4.2 ICM Register Summary 1702

21.4.3 LP Register Summary 1703
21.5 Registers 1705
21.5.1 HP Registers 1705
21.5.2 ICM Register 1758
21.5.3 LP Registers 1768

22 Debug Assistant 1793
22.1 Overview 1793
22.2 Features 1793
22.3 Functional Description 1793
22.3.1 Region Read/Write Monitoring 1793
22.3.2 SP Monitoring 1794
22.3.3 PC Logging 1794
22.3.4 CPU/DMA Bus Access Logging 1794
22.4 Interrupts 1794
22.5 Recommended Operation 1795
22.5.1 Region Monitoring and SP Monitoring Configuration 1795
22.5.2 PC Logging Configuration 1798
22.5.3 CPU/DMA Bus Access Logging Configuration 1798
22.5.3.1 HP CPU0/1 Bus Access Logging Configuration 1798
22.5.3.2 DMA Bus Access Logging Configuration 1801
22.6 Register Summary 1805
22.6.1 HP CPU Bus Logging Configuration Register Summary 1805
22.6.2 DMA Bus Logging Configuration Register Summary 1805
22.6.3 Summary of Other Registers 1806
22.7 Registers 1810
22.7.1 HP CPU Bus Logging Configuration Registers 1810
22.7.2 DMA Bus Logging Configuration Registers 1817
22.7.3 Other Registers 1824

23 AXI Performance Monitor 1853
23.1 Overview 1853
23.2 Terminology 1853
23.3 Feature List 1854
23.4 Architectural Overview 1855
23.5 Functional Description 1855
23.5.1 Clock 1855
23.5.2 Reset 1856
23.5.3 Transaction ID Filtering 1856
23.5.4 Monitoring Metrics 1856
23.5.4.1 Maximum Outstanding Count for Read/Write Address Channel Transactions 1858
23.5.4.2 Read/Write Address Channel Latency 1858
23.5.4.3 Read/Write Data Channel Latency 1859
23.5.4.4 Write Data Channel WVALID Idle Cycles 1859
23.5.4.5 Read/Write Transaction Transfer Latency 1859
23.5.4.6 Average Bandwidth Measurement 1860

23.5.4.7 Instantaneous Bandwidth Measurement 1860
23.6 Interrupts 1862
23.7 Programming Procedures 1862
23.7.1 Using AXI Perf Mon to Measure Outstanding Transactions 1862
23.7.2 Using AXI Perf Mon to Measure Read Average Bandwidth 1863
23.7.3 Using AXI Perf Mon to Measure Read Instantaneous Bandwidth 1863
23.8 Register Summary 1865
23.9 Registers 1872

24 LP Mailbox 1894
24.1 Overview 1894
24.2 Features 1894
24.3 Functional Description 1895
24.3.1 Message Registers 1895
24.3.2 Interrupts 1895
24.3.3 Inter-Core Communication 1896
24.4 Register Summary 1897
24.5 Registers 1897

25 Brown-out Detector 1911
25.1 Introduction 1911
25.2 Feature List 1911
25.3 Architectural Overview 1912
25.4 Functional Description 1912
25.5 Interrupts 1915
25.6 Programming Procedures 1915

26.1 Overview 1926
26.2 Features 1926
26.3 Functional Description 1926

V Cryptography/Security Component 1927

27 AES Accelerator (AES) 1928
27.1 Introduction 1928
27.2 Features 1928
27.3 Clock and Reset 1928
27.4 AES Working Modes 1929
27.5 Typical AES Working Mode 1930
27.5.1 Key, Plaintext, and Ciphertext 1930
27.5.2 Endianness 1930
27.5.3 Operation Process 1933
27.6 DMA-AES Working Mode 1934

27.6.1 Key, Plaintext, and Ciphertext 1934
27.6.2 Endianness 1935
27.6.3 Standard Incrementing Function 1936
27.6.4 Block Number 1936
27.6.5 Initialization Vector 1936
27.6.6 Block Operation Process 1936
27.6.7 GCM Operation Process 1937
27.7 GCM Algorithm 1938
27.7.1 Hash Subkey 1939
27.7.2 J_0 1939
27.7.3 Authentication Tag 1939
27.7.4 AAD Block Number 1940
27.7.5 Number of Effective Bits of Incomplete Blocks 1940
27.8 Pseudo-Round Anti-DPA Function 1940
27.9 Interrupts 1941
27.10 Memory Summary 1941
27.11 Register Summary 1942
27.12 Registers 1943

28 ECC Accelerator (ECC) 1950
28.1 Overview 1950
28.2 Feature List 1950
28.3 ECC Basics 1950
28.3.1 Elliptic Curve and Points on the Curves 1950
28.3.2 Affine Coordinates and Jacobian Coordinates 1951
28.3.3 Memory Blocks 1951
28.3.4 Data and Data Block 1951
28.3.5 Writing Data 1952
28.3.6 Reading Data 1952
28.3.7 Standard Calculation and Jacobian Calculation 1952
28.4 Function Description 1952
28.4.1 Curve Mode 1952
28.4.2 Working Modes 1953
28.4.2.1 Affine Point Multiplication (Affine Point Multi) 1953
28.4.2.2 Affine Point Verification (Affine Point Verif) 1954
28.4.2.3 Affine Point Verification + Affine Point Multiplication (Affine Point Verif + Multi) 1954
28.4.2.4 Jacobian Point Multiplication (Jacobian Point Multi) 1954
28.4.2.5 Point Addition (Point Add) 1955
28.4.2.6 Jacobian Point Verification (Jacobian Point Verif) 1955
28.4.2.7 Affine Point Verification + Jacobian Point Multiplication (Affine Point Verif + Jacobian Point Multi) 1955
28.4.2.8 Mod Addition (Mod Add) 1956
28.4.2.9 Mod Subtraction (Mod Sub) 1956
28.4.2.10 Mod Multiplication (Mod Multi) 1956
28.4.2.11 Mod Division (Mod Div) 1957
28.4.3 Enhancing Anti-Attack Performance 1957

28.5 Clock and Reset 1957
28.6 Interrupts 1957
28.7 Programming Procedures 1958
28.8 Register Summary 1959
28.9 Registers 1960

29 HMAC Accelerator (HMAC) 1964
29.1 Main Features 1964
29.2 Functional Description 1964
29.2.1 Upstream Mode 1964
29.2.2 Downstream Mode - JTAG Enable Feature 1965
29.2.3 Downstream Mode - RSA_DS Key Derivation Feature 1965
29.2.4 HMAC eFuse Configuration 1966
29.2.5 HMAC Process (Detailed) 1967
29.2.5.1 Enable HMAC Module 1967
29.2.5.2 Configure HMAC Keys and Key Purposes 1967
29.2.5.3 Downstream Mode Process 1967
29.2.5.4 Upstream Mode Process 1968
29.3 HMAC Algorithm Details 1969
29.3.1 Padding Bits 1969
29.3.2 HMAC Algorithm Structure 1970
29.4 Register Summary 1972
29.5 Registers 1974

30 RSA Accelerator (RSA) 1981
30.1 Introduction 1981
30.2 Features 1981
30.3 Functional Description 1981
30.3.1 Definitions and Representations 1982
30.3.2 Large-Number Modular Exponentiation 1982
30.3.3 Large-Number Modular Multiplication 1983
30.3.4 Large-Number Multiplication 1984
30.3.5 Options for Additional Acceleration 1984
30.4 Interrupts 1986
30.5 Memory Summary 1987
30.6 Register Summary 1987
30.7 Registers 1988

31 SHA Accelerator (SHA) 1992
31.1 Introduction 1992
31.2 Features 1992
31.3 Working Modes 1992
31.4 Function Description 1993
31.4.1 Preprocessing 1993
31.4.1.1 Padding the Message 1994
31.4.1.2 Parsing the Message 1994

31.4.1.3 Setting the Initial Hash Value 1995
31.4.2 Hash Operation 1996
31.4.2.1 Typical SHA Mode Process 1996
31.4.2.2 DMA-SHA Mode Process 1998
31.4.3 Message Digest 1999
31.5 Interrupt 2000
31.6 Register Summary 2002
31.7 Registers 2004

32 RSA Digital Signature Peripheral (RSA_DS) 2008
32.1 Overview 2008
32.2 Features 2008
32.3 Functional Description 2008
32.3.1 Overview 2008
32.3.2 Private Key Operands 2009
32.3.3 Software Prerequisites 2009
32.3.4 RSA_DS Operation at the Hardware Level 2011
32.3.5 RSA_DS Operation at the Software Level 2011
32.4 Memory Summary 2014
32.5 Register Summary 2015
32.6 Registers 2016

33 ECDSA Digital Signature Peripheral (ECDSA_DS) 2019
33.1 Introduction 2019
33.2 Features 2019
33.3 ECDSA Basics 2019
33.3.1 Domain Parameters 2019
33.3.2 Key Generation 2020
33.3.3 Signature Generation 2020
33.3.4 Signature Verification 2021
33.4 Functional Description 2021
33.4.1 ECDSA_DS Working Modes 2021
33.4.2 Data and Data Block 2022
33.4.2.1 Writing Data 2023
33.4.2.2 Reading Data 2023
33.4.2.3 Padding the Message 2023
33.4.2.4 Parsing the Message 2024
33.4.3 Security Features 2024
33.4.3.1 High Anti-Attack Performance 2024
33.4.3.2 State-Dependent Register Access Control 2024
33.4.3.3 Hardware Occupation 2024
33.5 Programming Procedures 2025
33.5.1 ECDSA_DS Process 2025
33.5.1.1 IDLE Stage 2026
33.5.1.2 PREP Stage 2026
33.5.1.3 LOAD Stage 2026

33.5.1.4 PROC Stage 2026
33.5.1.5 POST Stage 2026
33.5.1.6 ECDSA_DS SHA Interface 2027
33.5.2 Clocks and Resets 2027
33.5.3 Interrupts 2028
33.6 Memory Blocks 2029
33.7 Register Summary 2030
33.8 Registers 2031

34 External Memory Encryption and Decryption (XTS_AES) 2038
34.1 Overview 2038
34.2 Features 2038
34.3 Module Structure 2038
34.4 Functional Description 2039
34.4.1 XTS Algorithm 2040
34.4.2 Key 2040
34.4.3 Target Memory Space 2041
34.4.4 Data Writing 2041
34.4.5 Manual Encryption Block 2042
34.4.6 Auto Encryption Block 2042
34.4.7 Auto Decryption Block 2043
34.5 Software Process 2043
34.6 Anti-DPA 2044
34.7 Register Summary 2046
34.8 Registers 2047

35 Random Number Generator (RNG) 2052
35.1 Introduction 2052
35.2 Feature List 2052
35.3 Functional Description 2052
35.4 Programming Procedure 2053
35.5 Register Summary 2054
35.6 Registers 2055

36 Key Manager 2056
36.1 Overview 2056
36.2 Background Knowledge 2056
36.3 Glossary 2057
36.4 Features 2058
36.5 Architectural Overview 2059
36.6 Functional Description 2060
36.6.1 HUK Generator 2060
36.6.1.1 HUK Generation Process 2060
36.6.1.2 HUK Status Check 2061
36.6.2 Key Manager 2061
36.6.2.1 Random Deploy Mode 2062

36.6.2.2 AES Deploy Mode 2062
36.6.2.3 ECDH0 Deploy Mode 2064
36.6.2.4 ECDH1 Deploy Mode 2065
36.6.2.5 Private Key Recovery Mode 2067
36.6.2.6 key_info Export Mode 2068
36.7 Programming Procedures 2068
36.7.1 HUK Generator 2068
36.7.1.1 IDLE Phase 2069
36.7.1.2 PREP Phase 2069
36.7.1.3 LOAD Phase 2069
36.7.1.4 PROC Phase 2069
36.7.1.5 GAIN Phase 2069
36.7.1.6 POST Phase 2070
36.7.2 Key Manager 2070
36.7.2.1 IDLE Phase 2070
36.7.2.2 PREP Phase 2074
36.7.2.3 LOAD Phase 2074
36.7.2.4 PROC Phase 2074
36.7.2.5 GAIN Phase 2075
36.7.2.6 POST Phase 2075
36.8 Programming Examples 2075
36.8.1 Software Process in Chip Private Key Deploy Phase 2076
36.8.2 Software Process in Chip Normal Startup Phase 2076
36.9 Interrupts 2077
36.10 Memory Blocks 2077
36.11 Register Summary 2079
36.11.1 HUK Register Summary 2079
36.11.2 Key Manager Register Summary 2079
36.12 Registers 2081
36.12.1 HUK Registers 2081
36.12.2 Key Manager Registers 2085

VI Image and Voice Processing 2094

37 JPEG Codec 2095
37.1 Terminology 2095
37.2 Introduction 2096
37.3 Features 2097
37.4 Architectural Overview 2098
37.5 Functional Description 2099
37.5.1 JPEG Encoder 2100
37.5.1.1 Pause 2100
37.5.1.2 Color Space Conversion 2100
37.5.1.3 Configurable Quantization Coefficient Table 2101
37.5.1.4 Stuffed Zero Byte 2103
37.5.1.5 EOI Marker 2103

37.5.2 JPEG Decoder 2103
37.5.2.1 Multiple Chrominance Components 2103
37.5.2.2 Parsing RST Marker 2104
37.5.2.3 Configurable Quantization Coefficient Table 2105
37.5.2.4 Configurable Huffman Table 2105
37.5.2.5 Timeout Detection 2107
37.6 Interrupts 2107
37.7 Programming Procedures 2109
37.7.1 JPEG Encoder 2109
37.7.2 JPEG Decoder 2112
37.7.3 Reset 2115
37.8 Register Summary 2117
37.9 Registers 2118

38 Image Signal Processor (ISP) 2140
38.1 Introduction 2140
38.2 Terminology 2141
38.3 Feature List 2141
38.4 Architectural Overview 2142
38.5 Functional Description 2142
38.5.1 ISP_Header 2142
38.5.2 ISP_Pipeline 2143
38.5.2.1 Black Level Correction (BLC) 2143
38.5.2.2 Defective Pixel Correction (DPC) 2143
38.5.2.3 Bayer Filter (BF) 2144
38.5.2.4 Lens Shading Correction (LSC) 2144
38.5.2.5 Demosaic 2146
38.5.2.6 White Balance Gain (WBG) 2146
38.5.2.7 Color Correction Matrix (CCM) 2146
38.5.2.8 Gamma Correction 2146
38.5.2.9 RGB2YUV 2147
38.5.2.10 Sharpen 2147
38.5.2.11 Contrast/Hue/Saturation/Luminance Adjustment (COLOR) 2147
38.5.2.12 YUV_Limit and YUV2RGB 2148
38.5.2.13 Cropping (CROP) 2148
38.5.2.14 Automatic Exposure Statistics (AE) 2148
38.5.2.15 Automatic Focus Statistics (AF) 2149
38.5.2.16 Automatic White Balance Statistics (AWB) 2149
38.5.2.17 Histogram Statistics (HIST) 2150
38.5.3 ISP_Tail 2150
38.5.4 Sequence Control 2151
38.5.5 Shadow Registers 2151
38.5.6 CSI_CM 2151
38.5.7 CSI_Bridge 2152
38.5.8 Color Mode and Byte Order 2152
38.5.8.1 Output Pixel Layout Format 2152

38.5.8.2 Byte Order 2153
38.6 Interrupts 2153
38.7 Programming Procedures 2155
38.7.1 ISP Clock Reset Configuration 2155
38.7.2 CSI_Bridge Configuration 2156
38.7.3 VDMA Configuration 2156
38.7.4 ISP General Configuration 2157
38.7.5 Enabling ISP for Image Capture from MIPI-CSI 2157
38.7.6 Enabling ISP for Image Capture from DVP 2157
38.7.7 Enabling ISP for Image Capture from VDMA 2158
38.7.8 LSC LUT Configuration 2158
38.7.9 AE Configuration 2158
38.7.10 AF Configuration 2159
38.7.11 AWB Configuration 2160
38.7.12 HIST Configuration 2161
38.7.13 ISP_Pipeline Module Update Configuration 2162
38.8 Register Summary 2163
38.8.1 ISP Register Summary 2163
38.8.2 MIPI CSI_Bridge Register Summary 2167
38.9 Registers 2169
38.9.1 ISP Registers 2169
38.9.2 MIPI CSI_Bridge Registers 2243

39 Pixel-Processing Accelerator (PPA) 2255
39.1 Overview 2255
39.2 Terminology 2255
39.3 Features 2255
39.4 Architectural Overview 2256
39.5 Functional Description 2257
39.5.1 PPA Color Space 2257
39.5.1.1 SRM Color Space 2258
39.5.1.2 BLEND Color Space 2260
39.5.2 PPA 2D-DMA Linked List Configuration 2261
39.5.2.1 SRM Special Configuration 2262
39.5.3 Scaling - Rotation - Mirroring (SRM) 2263
39.5.3.1 Basic Functionality 2263
39.5.3.2 Pixel Block Rearrangement 2264
39.5.4 Layer Blending (BLEND) 2265
39.5.4.1 Basic Functionality 2265
39.5.4.2 Filled Image Output 2266
39.6 Interrupts 2266
39.7 Programming Procedures 2267
39.7.1 PPA Clock Reset Configuration 2267
39.7.2 SRM Configuration 2267
39.7.3 BLEND CLUT Configuration 2268
39.7.4 BLEND Configuration 2269

39.7.5 BLEND Image Filling Configuration 2269
39.7.6 Error Handling 2270
39.8 Register Summary 2271
39.9 Registers 2273

40 LCD and Camera Controller (LCD_CAM) 2300
40.1 Overview 2300
40.2 Features 2300
40.3 Functional Description 2301
40.3.1 Block Diagram 2301
40.3.2 Signal Description 2301
40.3.3 LCD_CAM Module Clocks 2302
40.3.3.1 LCD Clock 2302
40.3.3.2 Camera Clock 2304
40.3.4 LCD_CAM Reset 2305
40.3.5 LCD_CAM Data Format Control 2305
40.3.5.1 LCD Data Format Control 2305
40.3.5.2 Camera Data Format Control 2308
40.3.6 YUV-RGB Data Format Conversion 2309
40.3.6.1 YUV Formats 2309
40.3.6.2 Format Conversion Configuration 2310
40.3.7 LCD_CAM Timing 2312
40.3.7.1 LCD Timing (RGB Format) 2312
40.3.7.2 LCD Timing (I8080/MOTO6800 Format) 2313
40.4 Interrupts 2313
40.5 Software Configuration Process 2314
40.5.1 Configure LCD (RGB Format) as TX Mode 2314
40.5.2 Configure LCD (I8080/MOTO6800 Format) as TX Mode 2314
40.5.3 Configure Camera as RX Mode 2316
40.6 Register Summary 2317
40.7 Registers 2318

41 H264 Encoder 2336
41.1 Overview 2336
41.2 Terminology 2336
41.3 Features 2336
41.4 Architecture 2337
41.5 Functional Description 2339
41.5.1 Encoder Algorithm Core (ENC_CORE) 2339
41.5.1.1 Architecture 2339
41.5.1.2 Original Video Color Space Convert 2340
41.5.1.3 Quantization Result Decimation 2341
41.5.1.4 Motion Vector (MV) Merging 2342
41.5.1.5 MB Level Rate Control 2342
41.5.1.6 Region of Interest (ROI) 2344
41.5.1.7 Data Replace For Debug Function 2345

41.5.2 H264 Dedicated DMA 2346
41.5.2.1 Architecture 2346
41.5.2.2 Linked List Descriptor 2347
41.5.2.3 Transfer Initialization 2349
41.5.2.4 Transfer Reset 2350
41.5.2.5 Data Replace For Debug Function 2350
41.5.2.6 Channel Configuration 2351
41.6 Interrupts 2352
41.7 Programming Procedures 2354
41.7.1 GOP Mode 2355
41.7.2 Dual Stream Mode 2358
41.7.3 Soft Reset 2361
41.8 Register Summary 2363
41.8.1 H264 Encoder Register Summary 2363
41.8.2 H264 DMA Register Summary 2366
41.9 Registers 2374
41.9.1 H264 Encoder Registers 2374
41.9.2 H264 DMA Registers 2414

42 MIPI CSI 2592
42.1 Introduction 2592
42.2 Terminology 2592
42.3 Feature List 2593
42.4 Architectural Overview 2594
42.5 Functional Description 2595
42.5.1 Data Lane State 2595
42.5.2 MIPI RX D-PHY Operation 2596
42.5.2.1 No-Power State 2597
42.5.2.2 Shut-Down State 2597
42.5.2.3 AFE Initialization 2599
42.5.2.4 Control Mode 2599
42.5.2.5 High-Speed Data Reception Mode 2599
42.5.2.6 Escape Mode 2600
42.5.3 MIPI RX D-PHY Configuration 2601
42.5.3.1 MIPI RX D-PHY Programming Interface 2601
42.5.3.2 MIPI RX D-PHY Test Code 2603
42.5.4 Descrambler 2603
42.5.5 Error Management 2604
42.6 Interrupts 2605
42.7 Programming Procedures 2607
42.7.1 Start High-Speed Data Reception 2607
42.7.1.1 Clock and Reset 2607
42.7.1.2 MIPI RX D-PHY and MIPI Host Initialization 2608
42.7.2 Stop High-Speed Data Reception 2608
42.8 Register Summary 2609
42.9 Registers 2611

43 MIPI DSI 2633

43.1 Introduction 2633

43.2 Feature List 2633

43.3 Architectural Overview 2634

43.4 Functional Description 2635

43.4.1 DSI Bridge 2635

43.4.2 DSI Host 2636

43.4.2.1 Video Transmission 2637

43.4.2.2 Command Transmission 2637

43.4.2.2.1 Command Transmission in LP mode 2638

43.4.2.2.2 Command Transmission in HS mode 2640

43.4.2.3 Video Pattern Generator 2640

43.4.2.3.1 Color Bar Pattern 2640

43.4.2.3.2 BER Testing Pattern 2641

43.4.2.4 Errors 2642

43.4.3 D-PHY 2642

43.4.3.1 D-PHY Operating Modes 2642

43.4.3.1.1 No Power State 2643

43.4.3.1.2 Shutdown State 2643

43.4.3.1.3 PLL-Locking and AFE Initialization 2645

43.4.3.1.4 Control Mode 2645

43.4.3.1.5 High-Speed Data Transfer 2645

43.4.3.1.6 Escape Mode 2646

43.4.3.1.7 Turnaround 2646

43.4.3.2 PLL Parameters 2646

43.4.3.3 Test Codes 2648

43.4.3.3.1 Normal Operation 2648

43.4.3.3.2 PLL Bias Current Selector / Filter Capacitance Control / VCO Control 2648

43.4.3.3.3 PLL CP Control / PLL Lock Bypass for Initialization and for ULP 2649

43.4.3.3.4 PLL LPF and CP control 2650

43.4.3.3.5 PLL Input Divider Ratio 2651

43.4.3.3.6 PLL Loop Divider Ratio 2651

43.4.3.3.7 PLL Input and Loop Divider Ratios Control 2652

43.4.3.3.8 AFE/BIAS/Bandgap Analog Programmability 2653

43.4.3.3.9 HS RX Control of Lane 0 2654

43.4.4 Clocks and Display Resolution 2655

43.5 Interrupts 2658

43.6 Programming Procedures 2661

43.6.1 DSI Bridge Configuration 2661

43.6.2 D-PHY configuration 2662

43.6.3 MIPI DSI common configuration 2662

43.6.4 System memory data output flow configuration 2662

43.6.5 Video pattern output flow configuration 2662

43.6.6 Using DCS command to operate Display register 2662

43.7 Register Summary 2664

43.7.1 MIPI DSI Bridge Register Summary 2664

43.7.2 MIPI DSI Host Register Summary 2665
43.8 Registers 2668
43.8.1 MIPI DSI Bridge Register 2668
43.8.2 MIPI DSI Host Register 2687

44 Voice Activity Detection (VAD) 2723
44.1 Introduction 2723
44.2 Feature List 2723
44.3 Architectural Overview 2723
44.4 Functional Description 2724
44.4.1 Algorithm Parameter Configuration 2724
44.4.2 Wake-up Source Configuration 2726
44.5 Interrupts 2726
44.6 Programming Procedure 2727
44.6.1 Automatic Operation Mode 2727
44.6.2 Manual Operation Mode 2727
44.7 Register Summary 2728
44.8 Registers 2729

VII Connectivity Interface 2732

45 UART Controller (UART) 2733
45.1 Overview 2733
45.2 Features 2733
45.3 UART Structure 2734
45.4 Functional Description 2735
45.4.1 Clock and Reset 2735
45.4.2 UART FIFO 2736
45.4.3 Baud Rate Generation and Detection 2736
45.4.3.1 Baud Rate Generation 2736
45.4.3.2 Baud Rate Detection 2737
45.4.4 UART Data Frame 2738
45.4.5 AT_CMD Character Structure 2739
45.4.6 RS485 2739
45.4.6.1 Driver Control 2739
45.4.6.2 Turnaround Delay 2740
45.4.6.3 Bus Snooping 2740
45.4.7 IrDA 2740
45.4.8 Wakeup 2741
45.4.9 Flow Control 2742
45.4.9.1 Hardware Flow Control 2743
45.4.9.2 Software Flow Control 2744
45.4.10 GDMA Mode 2745
45.4.11 Interrupts 2746
45.5 Programming Procedures 2747
45.5.1 Register Type 2747

45.5.2 Detailed Steps 2748
45.5.2.1 Initializing UART*n* 2748
45.5.2.2 Configuring UART*n* Communication 2748
45.5.2.3 Enabling UART*n* 2749
45.6 Register Summary 2750
45.6.1 UART Register Summary 2750
45.6.2 LP UART Register Summary 2751
45.6.3 UHCI Register Summary 2752
45.7 Registers 2754
45.7.1 UART Registers 2754
45.7.2 LP UART Registers 2777
45.7.3 UHCI Registers 2797

46 SPI Controller (SPI) 2819
46.1 Overview 2819
46.2 Glossary 2819
46.3 Features 2821
46.4 Architectural Overview 2823
46.5 Functional Description 2824
46.5.1 Data Modes 2824
46.5.2 Introduction to Bus Signals 2824
46.5.3 Bit Read/Write Order Control 2827
46.5.4 Unaligned Byte Transfer 2829
46.5.5 Transfer Types 2829
46.5.6 CPU-Controlled Data Transfer 2829
46.5.6.1 CPU-Controlled Master Transfer 2830
46.5.6.2 CPU-Controlled Slave Transfer 2832
46.5.7 DMA-Controlled Data Transfer 2833
46.5.7.1 DMA Configuration 2833
46.5.7.2 DMA TX/RX Buffer Length Control 2834
46.5.8 Data Flow Control (Take GP-SPI as an Example) 2835
46.5.8.1 GP-SPI Functional Blocks 2835
46.5.8.2 Data Flow Control as Master 2836
46.5.8.3 Data Flow Control as Slave 2837
46.5.9 GP-SPI as a Master 2838
46.5.9.1 State Machine 2838
46.5.9.2 Register Configuration for State and Bit Mode Control 2840
46.5.9.3 Full-Duplex Communication (1-bit Mode Only) 2844
46.5.9.4 Half-Duplex Communication (1/2/4/(8)-bit Mode) 2845
46.5.9.5 DMA-Controlled Configurable Segmented Transfer 2847
46.5.10 GP-SPI Works as a Slave 2851
46.5.10.1 Configurable Communication Formats 2851
46.5.10.2 CMD Values Supported in Half-Duplex Communication 2852
46.5.10.3 Slave Single Transfer and Slave Segmented Transfer 2855
46.5.10.4 Configuration of Slave Single Transfer 2855
46.5.10.5 Configuration of Slave Segmented Transfer in Half-Duplex 2856

46.5.10.6 Configuration of Slave Segmented Transfer in Full-Duplex 2856
46.6 CS Setup Time and Hold Time Control 2857
46.7 Clock Control 2858
46.7.1 GP-SPI Clock Control 2858
46.7.2 LP-SPI Clock Control 2859
46.7.3 Clock Phase and Polarity 2859
46.7.4 Clock Control as Master 2860
46.7.5 Clock Control as Slave 2861
46.8 GP-SPI Timing Compensation 2861
46.9 LP-SPI Wake-Up 2863
46.10 Differences Among LP-SPI, GP-SPI2, and GP-SPI3 2864
46.10.1 Feature Differences 2864
46.10.2 Register Differences 2865
46.10.3 Interrupt Differences 2868
46.11 Interrupt 2869
46.11.1 Interrupt Description 2869
46.11.2 Interrupts Used in Master and in Slave (Take GP-SPI as an Example) 2871
46.12 Register Summary 2872
46.12.1 GP-SPI2 Register Summary 2872
46.12.2 GP-SPI3 Register Summary 2874
46.12.3 LP-SPI Register Summary 2875
46.13 Register 2876
46.13.1 GP-SPI2 Register 2876
46.13.2 GP-SPI3 Register 2918
46.13.3 LP-SPI Register 2952

47 I2C Controller (I2C) 2979
47.1 Overview 2979
47.2 Features 2979
47.3 I2C Architecture 2980
47.4 Functional Description 2982
47.4.1 Clock Configuration 2982
47.4.2 SCL and SDA Noise Filtering 2983
47.4.3 SCL Clock Stretching 2983
47.4.4 Generating SCL Pulses in Idle State 2984
47.4.5 Synchronization 2984
47.4.6 Open-Drain Output 2985
47.4.7 Timing Parameter Configuration 2986
47.4.8 Timeout Control 2988
47.4.9 Command Configuration 2988
47.4.10 TX/RX RAM Data Storage 2989
47.4.11 Data Conversion 2990
47.4.12 Addressing Mode 2990
47.4.13 $R/\overline{W}$ Bit Check in 10-bit Addressing Mode 2991
47.4.14 To Start the I2C Controller 2991
47.5 Functional Differences Between LP_I2C and I2C 2992

47.6 Programming Example 2992
47.6.1 $I2C_{master}$ Writes to $I2C_{slave}$ with a 7-bit Address in One Command Sequence 2992
47.6.1.1 Introduction 2993
47.6.1.2 Configuration Example 2993
47.6.2 $I2C_{master}$ Writes to $I2C_{slave}$ with a 10-bit Address in One Command Sequence 2994
47.6.2.1 Introduction 2995
47.6.2.2 Configuration Example 2995
47.6.3 $I2C_{master}$ Writes to $I2C_{slave}$ with Two 7-bit Addresses in One Command Sequence 2996
47.6.3.1 Introduction 2996
47.6.3.2 Configuration Example 2997
47.6.4 $I2C_{master}$ Writes to $I2C_{slave}$ with a 7-bit Address in Multiple Command Sequences 2998
47.6.4.1 Introduction 2998
47.6.4.2 Configuration Example 2999
47.6.5 $I2C_{master}$ Reads $I2C_{slave}$ with a 7-bit Address in One Command Sequence 3000
47.6.5.1 Introduction 3000
47.6.5.2 Configuration Example 3001
47.6.6 $I2C_{master}$ Reads $I2C_{slave}$ with a 10-bit Address in One Command Sequence 3002
47.6.6.1 Introduction 3003
47.6.6.2 Configuration Example 3003
47.6.7 $I2C_{master}$ Reads $I2C_{slave}$ with Two 7-bit Addresses in One Command Sequence 3005
47.6.7.1 Introduction 3005
47.6.7.2 Configuration Example 3006
47.6.8 $I2C_{master}$ Reads $I2C_{slave}$ with a 7-bit Address in Multiple Command Sequences 3007
47.6.8.1 Introduction 3008
47.6.8.2 Configuration Example 3009
47.7 Interrupts 3011

64.8 Register Summary 3639
64.9 Registers 3640

65 ADC Controller (ADC) 3646
65.1 Overview 3646
65.2 Terminology 3647
65.3 Features 3647
65.4 Architecture 3648
65.5 Functional Description 3649
65.5.1 SAR ADC Power Up 3649
65.5.2 SAR ADC Channels 3649
65.5.3 SAR ADC Clock 3650
65.5.4 SAR ADC Conversion and Attenuation 3650
65.5.5 HP ADC FSM 3651
65.5.6 HP ADC Pattern Table 3652
65.5.7 HP ADC Pattern Configuration Example for Multi-channel Sampling 3653
65.5.8 Dual HP ADC Sampling Control 3654

65.5.9 HP ADC Filters 3654
65.5.10 HP ADC Threshold Monitors 3654
65.5.11 HP ADC GDMA Support 3655
65.5.12 LP ADC Wake-Up Modes for Automatic Monitoring 3655
65.6 Event Task Matrix Feature 3655
65.7 Interrupts 3656
65.8 Programming Procedure 3657
65.8.1 HP ADC Multi-Channel Sampling Mode 3657
65.8.2 LP ADC One-shot Sampling Mode 3657
65.8.3 LP ADC Automatic Monitoring 3657
65.9 Register Summary 3659
65.9.1 HP ADC Register Summary 3659
65.9.2 LP ADC Register Summary 3659
65.10 Registers 3661
65.10.1 HP ADC Registers 3661
65.10.2 LP ADC Registers 3671

66 Analog Voltage Comparator 3688
66.1 Introduction 3688
66.2 Feature List 3688
66.3 Architectural Overview 3688
66.4 Functional Description 3689
66.5 Event Task Matrix Feature 3690
66.6 Interrupts 3690
66.7 Programming Procedures 3691

IX Appendix 3692

Interrupt Configuration Registers 3699

Revision History 3700

List of Tables

2.4-1 CPU Address Map 71
2.7-2 HWLP Instructions 126
2.8-1 Address Decoding for Memory-Mapped Register Access 129
2.8-2 Internal Memory Address Map 129
2.9-1 CLIC Interrupt Mapping 131
2.9-2 CLIC Level and Priority Encoding with CLICINTCTLBITS=3 132
2.9-4 Core-Local Interrupt Sources 137
2.11-1 JTAG Control 154
2.11-3 Virtual address in DPC upon Debug Mode Entry 157
2.11-5 NAPOT encoding for maddress 162

3.3-1 Trace Encoder Parameters 182
3.5-1 Optional sideband signals 184
3.6-1 Header Format 187
3.6-2 Index Format 187
3.6-3 Packet format 3 subformat 0 187
3.6-4 Packet format 3 subformat 1 188
3.6-5 Packet format 3 subformat 3 188
3.6-6 Packet format 2 189
3.6-7 Packet format 1 with address 190
3.6-8 Packet format 1 without address 191
3.7-1 CORE*n*_TRACE's Internal Interrupt Sources 192
3.8-1 Debug module trigger support (the action field of the mcontrol register) 193
3.8-2 Trace Status 195

4.4-1 Register List of ESP32-P4 Extended Instruction Set 212
4.4-2 Data Format and Alignment 215
4.4-3 Rounding Mode Configuration 217
4.4-4 Rounding Operation Results 217
4.5-1 Extended Instruction List 218
4.5-2 Read Instructions 221
4.5-3 Write Instructions 222
4.5-4 Data Exchange Instructions 222
4.5-5 Vector Addition Instructions 223
4.5-6 Vector Multiplication Instructions 224
4.5-7 Vector Complex Multiplication Instructions 225
4.5-8 Vector Multiplication Accumulation Instructions 225
4.5-9 Vector and Scalar Multiplication Accumulation Instructions 226
4.5-10 Other Instructions 227
4.5-11 Comparison Instructions 227
4.5-12 Bitwise Logical Instructions 228
4.5-13 Shift Instructions 228
4.5-14 Butterfly Computation Instructions 229
4.5-15 Bit Reverse Instruction 229

4.5-16 Real Number FFT Instructions 230
4.6-1 Five-Stage Pipeline of the ESP32-P4 Processor 230
4.7-1 Instruction Field Names and Descriptions 233

5.4-1 LP CPU Interrupt Mapping 644
5.4-2 LP CPU Exception Causes 645
5.7-1 Performance Counter 653
5.10-1 Wake Sources 657

6.4-1 GDMA-AHB Selecting Peripherals via Register Configuration 663
6.4-2 GDMA-AXI Selecting Peripherals via Register Configuration 664

7.4-1 Hardware Handshaking Interface and Peripherals Mapping Table 776
7.5-1 Register Update Methods for Multi-Block Transfer 782

8.4-1 Descriptor Field Description 831
8.4-2 Selecting Peripherals via Register Configuration in TX Direction 835
8.4-3 Selecting Peripherals via Register Configuration in RX Direction 835
8.4-4 Recommended Configurations for Macroblock Reordering in TX Direction 836
8.4-5 Recommended Configuration Table for Macroblock Reordering in 2D-DMA Receive Direction (Without Color Format Conversion) 836
8.4-6 Parameter Configuration for Color Space Conversion in TX Direction 838
8.4-7 Parameter Configuration for Color Space Conversion in RX Direction 839
8.4-8 RGBB888 Storage Format 840
8.4-9 YUV444 Storage Format 840
8.4-10 YUV422 Storage Format 840

9.3-1 Memory Address Mapping 904
9.3-2 Module/Peripheral Address Mapping 912
9.4-1 Parameters in eFuse BLOCK0 918
9.4-2 Secure Key Purpose Values 924
9.4-3 Parameters in BLOCK1 to BLOCK10 925
9.4-4 User Read Registers and Programming Registers 930
9.4-5 Configuration of Default VDDQ Timing Parameters 931
9.4-6 eFuse's Internal Interrupt Sources 932

10.4-1 HP GPIO Wakeup Signal Trigger and Clear Conditions 987
10.4-2 LP GPIO Wakeup Signal Trigger and Clear Conditions 988
10.8-1 Bit Used to Control IO MUX Functions in Light-sleep Mode 995
10.12-1 Peripheral Signals via HP GPIO Matrix 999
10.13-1 Peripheral Signals via LP GPIO Matrix 1010
10.14-1 HP IO MUX Pin Functions 1011
10.15-1 LP IO MUX Pin Functions 1014
10.16-1 GPIO Pin Analog Functions 1015
10.18-1 HP IO MUX and HP GPIO Matrix's Internal Interrupt Sources 1017
10.18-2 LP IO MUX and LP GPIO Matrix's Internal Interrupt Sources 1018

11.1-1 HP CPU Reset Source 1082

11.1-2 LP CPU Reset Source 1083
11.2-1 ROOT_CLK Clock Source 1086
11.2-2 LP_SLOW_CLK Clock Source Selection 1087
11.2-3 LP_FAST_CLK Clock Source Selection 1088
11.2-4 Derived HP Clock sources 1089
11.2-5 HP Peripheral Clocks 1089
11.2-6 Derived LP Clock Sources 1090
11.2-7 LP Peripheral Clocks 1091

12.2-1 Default Configuration of Strapping Pins 1220
12.2-2 Boot Mode Control 1220
12.2-3 ROM Message Printing Control 1222
12.2-4 JTAG Signal Source Control 1223

13.4-1 CPU Peripheral Interrupt Source Mapping/Status Registers and Peripheral Interrupt Sources 1228

14.3-1 Selectable Events for ETM Channel*n* 1269
14.3-2 Mappable Tasks for ETM Channel*n* 1275

15.4-1 Wake-up Sources 1432
15.4-2 HP System Peripherals' Function Clocks 1435
15.4-3 VO2/3/4 Registers 1439
15.4-4 Regulator Power Control 1439
15.4-5 Over-Current Protection Control 1440
15.4-6 Regulator Waiting Counter 1440
15.5-1 Preset Power Modes 1441

16.5-1 UNIT*n* Configuration Bits 1509
16.5-2 Trigger Point 1511
16.5-3 Synchronization Operation for Configuration Registers 1511
16.6-1 System Timer's Internal Interrupt Sources 1512

17.3-1 Alarm Generation When Up-Down Counter Increments 1535
17.3-2 Alarm Generation When Up-Down Counter Decrements 1535
17.3-3 TIMG*n*'s Internal Interrupt Sources 1537

18.2-1 Timeout Actions 1560

19.3-1 Configure RTC Timer to Log the Occurrence Time of Specific Events 1573
19.3-2 Target times Configuration 1573
19.5-1 RTC Timer's Internal Interrupt Sources 1574

20.1-1 Management Areas by PMP and APM 1586
20.5-1 APM Internal Interrupt Sources 1592

21.3-1 System Registers Interrupt Sources 1698

22.5-1 HP CPU0/1 Packet Format 1800
22.5-2 HP CPU LOST Packet Format 1800
22.5-3 DMA_2 Packet Format 1803

22.5-4 DMA_3 Packet Format 1803
22.5-5 DMA LOST Packet Format 1803

23.5-1 Setting of Measurement Metrics in Metric Select Registers 1857
23.5-2 Correspondence between Metric Select Registers and Range Statistics Metrics 1857
23.5-3 Correspondence between Agent Select Register Configuration Values and Actual Agents 1858
23.6-1 AXI PERF MON Internal Interrupt Sources 1862

24.3-1 LP Mailbox's Internal Interrupt Sources 1896

27.4-1 AES Accelerator Working Mode 1929
27.4-2 Key Length and Encryption/Decryption 1929
27.5-1 Working Status under Typical AES Working Mode 1930
27.5-2 Text Endianness Type for Typical AES 1930
27.5-2 Text Endianness Type for Typical AES 1931
27.5-3 Key Endianness Type for AES-128 Encryption and Decryption 1932
27.5-4 Key Endianness Type for AES-256 Encryption and Decryption 1932
27.6-1 Block Cipher Mode 1934
27.6-2 Working Status under DMA-AES Working mode 1934
27.6-3 TEXT-PADDING 1935
27.6-4 Text Endianness for DMA-AES 1935
27.9-1 AES's Internal Interrupt Sources 1941

28.3-1 ECC Accelerator Memory Blocks 1951
28.4-1 ECC Accelerator Curve Mode Selection 1953
28.4-2 Working Modes of ECC Accelerator 1953

29.2-1 HMAC Purposes and Configuration Value 1966

30.3-1 Acceleration Performance 1986
30.4-1 RSA's Internal Interrupt Source 1986
30.5-1 RSA Accelerator Memory Blocks 1987

31.3-1 SHA Accelerator Working Mode 1993
31.3-2 SHA Hash Algorithm Selection 1993
31.4-4 The Storage and Length of Message Digest from Different Algorithms 2000
31.5-1 SHA's Internal Interrupt Sources 2000

33.4-1 ECDSA_DS Elliptic Curve Selection 2022
33.4-2 ECDSA_DS SHA Algorithm 2022
33.4-3 ECDSA_DS Working State 2022
33.6-1 ECDSA_DS Memory Blocks 2029

34.4-1 Key generated based on Key_A, Key_B, and Key_C 2040
34.4-2 Mapping Between Offsets and Registers 2042

36.6-1 HUK Generator Working Mode 2060
36.9-1 Key Manager and HUK Generator's Internal Interrupt Sources 2077
36.10-1 Key Manager Memory Blocks 2078

36.10-2 HUK Generator Memory Blocks 2078

37.1-2 Marker Code Assignments 2096
37.2-1 The Number of Data Units in the MCU of Different Image Format 2096
37.5-1 Supported Image Formats for Color Space Conversion 2101
37.5-2 Position Number of Coefficients in a Quantization Coefficient Table (Example) 2101
37.5-3 Recommended 8-bit Precision Quantization Coefficient Table for the Luminance Component 2102
37.5-4 Recommended 8-bit Precision Quantization Coefficient Table for the Chrominance Component 2102
37.5-5 Sampling Factor and Image Format 2104
37.7-1 JPEG Encoder hb and vb Configuration 2110
37.7-2 DMA2D_OUT_MACRO_BLOCK_SIZE_CH*n* Configuration 2111
37.7-3 JPEG Decoder JPEG_HA and JPEG_VA Configuration 2112
37.7-4 JPEG Decoder hb and vb Configuration 2113
37.7-5 DMA2D_IN_MACRO_BLOCK_SIZE_CH*n* Configuration 2114
37.7-6 2D DMA Color Space Conversion Configuration 2114

38.5-1 Gain Storage Sequence in LSC LUTs 2145
38.5-2 ISP Output Pixel Layout Format 2152
38.6-1 ISP's Internal Interrupt Sources 2153

39.5-1 Pixel Storage Order 2257
39.5-2 PPA SRM Alpha Configuration 2259
39.5-3 BLEND CLUT Address 2261
39.5-4 PPA Linked List Configuration 2262
39.5-5 Automatic Padding Block Size Configuration 2263
39.5-6 Number of Pixel Block Rearrangements in SRM Output 2264
39.6-1 SRM Parameter Error Types 2266
39.6-2 BLEND Parameter Error Types 2267

40.3-1 LCD_CAM Input and Output Signal Descriptions 2302
40.3-2 LCD Data Format Control – Stage One 2307
40.3-3 LCD Output Data Reordering 2308
40.3-4 Camera Data Format Control 2309
40.3-5 Conversion Mode Control in 24-bit Mode 2311
40.3-6 Conversion Mode Control in Other Modes 2311

42.5-1 Lane State Descriptions 2596
42.5-2 Frequency Ranges Supported by MIPI RX D-PHY 2598
42.5-3 Test Data in HS RX Control of Lane 0 2603
42.5-4 Test Dout in HS RX Control of Lane 0 2603
42.5-5 Scrambler PRBS Initial Seed Values for Lane 1 and Lane 2 2604
42.5-6 Detectable Errors by MIPI CSI-2 Host 2604

43.4-1 input pixel arrangement 2635
43.4-2 DPI bit arrangement 2636
43.4-3 Color Bar Coding 2641
43.4-4 Frequency Ranges Supported by MIPI BD D-PHY 2644
43.4-5 M and N ratios 2647

43.4-6 VCO ranges 2647
43.4-7 PLL CP and LPF Control Bits 2647
43.4-8 Test Data of 0x10 2648
43.4-9 Test Dout of 0x10 2649
43.4-10 Test Data of 0x11 2649
43.4-11 Test Dout of 0x11 2650
43.4-12 Test Data of 0x12 2650
43.4-13 Test Dout of 0x12 2651
43.4-14 Test Data of 0x17 2651
43.4-15 Test Dout of 0x17 2651
43.4-16 Test Data of 0x18 2651
43.4-17 Test Dout of 0x18 2652
43.4-18 Test Dout of 0x18 2652
43.4-19 Test Data of 0x19 2652
43.4-20 Test Dout of 0x19 2653
43.4-21 Test Data of 0x22 2653
43.4-22 Test Dout of 0x22 2654
43.4-23 Test Dout of 0x22 2654
43.4-24 Test Data of 0x44 2655
43.4-25 Test Dout of 0x44 2655
43.5-1 DSI Bridge interrupts 2658
43.5-2 DSI Host Interrupts 2658

45.2-1 UART and LP UART Feature Comparison 2733
45.4-1 UART_CHAR_WAKEUP Mode Configuration 2742

46.5-1 Data Modes Supported by GP-SPI and LP-SPI 2824
46.5-2 Functional Description of SPI2/SPI3 and LP_SPI Bus Signals 2824
46.5-3 SPI2 Bus Signals Used in Various SPI Modes 2825
46.5-4 SPI3 Bus Signals Used in Various SPI Modes 2826
46.5-5 LP-SPI Bus Signals Used in Various SPI Modes 2827
46.5-6 Bit Order Control in GP-SPI (Take GP-SPI2 as an Example) 2828
46.5-7 Bit Order Control in LP-SPI 2828
46.5-8 Supported Transfer Types as Master or Slave 2829
46.5-9 Interrupt Trigger Condition on GP-SPI Data Transfer as Slave 2834
46.5-10 Registers Used for State Control in 1/2/4/8-bit Modes 2841
46.5-11 Sending Sequence of Command Value 2843
46.5-12 Sending Sequence of Address Value 2843
46.5-13 BM Table for CONF State 2849
46.5-14 An Example of CONF buffer*i* in Segment *i* 2850
46.5-15 BM Bit Value and Register to Be Updated in This Example 2850
46.5-16 CMD Values Supported in SPI Mode 2853
46.5-16 CMD Values Supported in SPI Mode 2854
46.5-17 CMD Values Supported in QPI Mode 2854
46.7-1 Clock Phase and Polarity Configuration as Master 2860
46.7-2 Clock Phase and Polarity Configuration as Slave 2861
46.9-1 LP-SPI Wake-Up Configuration When Working as a Slave 2864

46.10-1 Feature Differences Among GP-SPI2, GP-SPI3, and LP-SPI 2864
46.10-2 Register Differences 2865
46.10-3 Interrupt Differences 2868
46.10-3 Interrupt Differences 2869
46.11-1 Internal Interrupt Sources of LP-SPI and GP-SPI 2869
46.11-2 GP-SPI Master Mode Interrupts 2871
46.11-3 GP-SPI Slave Mode Interrupts 2872

47.3-1 I2C Timing Parameters (Cited from Table 5 in The I2C-bus specification Version 2.1) 2982
47.4-1 I2C Synchronous Registers 2985

49.4-1 I2S*n* Signal Description 3074
49.9-1 Bit Width of Channel Valid Data 3081
49.9-2 Endian of Channel Valid Data 3081
49.9-3 Data-Fetching Control in PDM Mode 3084
49.9-4 I2S*n* Channel Control for Raw PDM Data 3085
49.9-5 I2S*0* PCM-to-PDM Data Output 3085
49.10-1 PDM-to-PCM Data Input 3089
49.10-2 Channel Storage Data Width 3090
49.10-3 Channel Storage Data Endian 3090

50.3-1 LP I2S Signal Description 3118
50.8-1 PDM-to-PCM Data Input 3124
50.8-2 Channel Storage Data Endian 3125

51.4-1 Counter Mode. Rising edge of Input Pulse Signal. Control Signal in Low State 3144
51.4-2 Counter Mode. Rising edge of Input Pulse Signal. Control Signal in High State 3144
51.4-3 Counter Mode. Falling Edge of Input Pulse Signal. Control Signal in Low State 3144
51.4-4 Counter Mode. Falling Edge of Input Pulse Signal. Control Signal in High State 3145
51.5-1 PCNT's Internal Interrupt Sources 3146

52.4-1 IN and OUT Transactions in Slave Mode 3167

53.4-1 IN and OUT Transactions in Slave Mode 3179
53.5-1 UTMI+ OTG Interface 3181

54.3-1 Standard CDC-ACM Control Requests 3189
54.3-2 CDC-ACM Settings with RTS and DTR 3190
54.3-3 Commands of a Nibble 3192
54.3-4 USB-to-JTAG Control Requests 3193
54.3-5 JTAG Capability Descriptors 3194
54.4-1 Reset SoC into Download Mode 3195
54.4-2 Reset SoC into Booting from flash 3195

55.4-1 Transmit Descriptor 0 (TDES0) 3229
55.4-2 Transmit Descriptor 1 (TDES1) 3233
55.4-3 Transmit Descriptor 2 (TDES2) 3233
55.4-4 Transmit Descriptor 3 (TDES3) 3233
55.4-5 Transmit Descriptor 6 (TDES6) 3234

55.4-6 Transmit Descriptor 7 (TDES7) 3234
55.4-7 Receive Descriptor 0 (RDES0) 3234
55.4-8 Receive Descriptor 1 (RDES1) 3237
55.4-9 Receive Descriptor 2 (RDES2) 3238
55.4-10 Receive Descriptor 3 (RDES3) 3238
55.4-11 Receive Descriptor 4 (RDES4) 3238
55.4-12 Receive Descriptor 6 (RDES6) 3240
55.4-13 Receive Descriptor 7 (RDES7) 3240
55.4-14 Destination Address Filtering 3246
55.4-15 Source Address Filtering 3247

56.2-1 Data Frames and Remote Frames in SFF and EFF 3307
56.2-2 Error Frame 3309
56.2-3 Overload Frame 3309
56.2-4 Interframe Space 3310
56.2-5 Segments of a Nominal Bit Time 3313
56.4-1 Bit Information of TWAI_BUS_TIMING_0_REG (0x18) 3317
56.4-2 Bit Information of TWAI_BUS_TIMING_1_REG (0x1c) 3318
56.4-3 Buffer Layout for Standard Frame Format and Extended Frame Format 3318
56.4-4 TX/RX Frame Information (SFF/EFF); TWAI Address 0x40 3319
56.4-5 TX/RX Identifier 1 (SFF); TWAI Address 0x44 3319
56.4-6 TX/RX Identifier 2 (SFF); TWAI Address 0x48 3319
56.4-7 TX/RX Identifier 1 (EFF); TWAI Address 0x44 3320
56.4-8 TX/RX Identifier 2 (EFF); TWAI Address 0x48 3320
56.4-9 TX/RX Identifier 3 (EFF); TWAI Address 0x4c 3320
56.4-10 TX/RX Identifier 4 (EFF); TWAI Address 0x50 3320
56.4-11 Bit Information of TWAI_ERR_CODE_CAP_REG (0x30) 3326
56.4-12 Bit Information of Bits SEG.4 - SEG.0 3326
56.4-13 Bit Information of TWAI_ARB_LOST_CAP_REG (0x2c) 3327
56.5-1 TWAI's Internal Interrupt Sources 3329

57.3-1 SD/MMC Signal Description 3353
57.8-1 DES0 Descriptor Field 3359
57.8-2 DES1 Descriptor Field 3360
57.8-3 DES2 Descriptor Field 3361
57.8-4 DES3 Descriptor Field 3361

58.4-1 Commonly-used Frequencies and Resolutions 3401
58.7-1 LEDC Memory Blocks 3408

59.3-1 Functions of Each Submodule in the Operator Module 3427
59.3-2 Timing Events Used in PWM Generator 3437
59.3-3 Timing Events Priority When PWM Timer Increments 3437
59.3-4 Timing Events Priority when PWM Timer Decrements 3438
59.3-5 Dead Time Generator Switches Control Fields 3449
59.3-6 Typical Dead Time Generator Operating Modes 3449
59.3-7 MCPWM-Related ETM Events 3457

59.3-8 ETM Related Tasks 3458

60.3-1 Configuration Update 3518

61.5-1 Operations to Reset AXI Clock Domain with Clock Restrictions 3542
61.5-2 Requirements for TX Unit Operating as Slave with Clock Restrictions 3543
61.5-3 Requirements for RX Unit Operating as Slave with Clock Restrictions 3544
61.6-1 PARLIO's Internal Interrupt Sources 3548

62.4-1 Instruction Structure 3570
62.4-2 Effective CTL_MUX_SEL_n values when CTL_MUX_REL is 1 3571
62.4-3 CTL_MUX_SEL Values 3572
62.4-4 Instruction Opcode 3573
62.4-5 LOOP Opcode 3573
62.4-6 ADD Opcode 3574
62.4-7 IF Opcode 3574
62.4-8 IFN Opcode 3574
62.4-9 LDCTD Opcode 3575
62.4-10 LDCTI Opcode 3575
62.4-11 Settings for EOF modes 3577

63.3-1 ESP32-P4 Capacitive Touch Pins 3595
63.3-2 Capacitive Touch Sensor Output Signal 3596
63.4-1 touch_smooth_data Calculation 3603

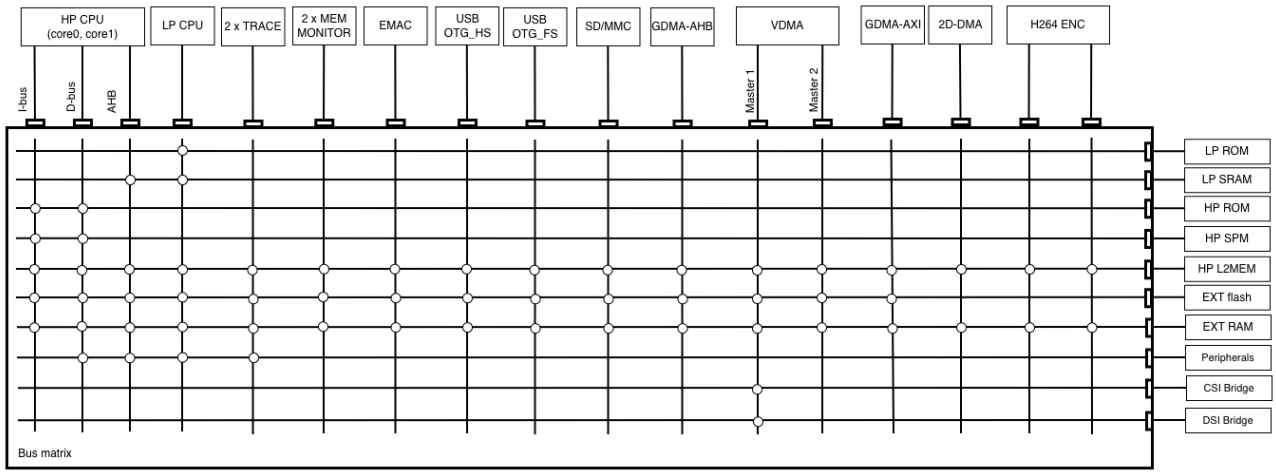
Part I

Microprocessor and Master

This part covers the essential processing elements of the system, diving into the microprocessor architecture with both high-performance and low-power CPUs. Details include CPU instruction extensions and trace encoding for debugging purposes.

Chapter 1

Bus Architecture



The ESP32-P4 SoC uses a multi-layer bus matrix as the core of its communication architecture, connecting multiple masters and slaves efficiently. This architecture supports concurrent access, effectively mitigating conflicts so that the high-performance and low-power RISC-V cores, DMA controllers, debug interfaces, and various peripherals can operate simultaneously with minimal contention. By optimizing data flow and system performance, the bus matrix ensures efficient system operation even when multiple high-speed peripherals are running at the same time.

The main system of the ESP32-P4 SoC consists of:

- Masters:
  - I-bus, D-bus and AHB bus of the high-performance (HP) 32-bit RISC-V processor 0
  - I-bus, D-bus and AHB bus of the high-performance (HP) 32-bit RISC-V processor 1
  - Low-power (LP) 32-bit RISC-V processor
  - TRACE0 (Trace Interface 0)
  - TRACE1 (Trace Interface 1)
  - HP L2MEM MONITOR (HP L2 Memory Monitor)
  - HP SPM MONITOR (HP Scratchpad Memory Monitor)
  - EMAC
  - USB OTG_HS (USB 2.0 High-Speed OTG)
  - USB OTG_FS (USB 2.0 Full-Speed OTG)
  - SD/MMC
  - GDMA-AHB
  - VDMA
  - GDMA-AXI
  - 2D-DMA
  - H264 ENC
- Slaves:
  - LP ROM
  - LP SRAM
  - HP ROM
  - HP SPM

- HP L2MEM
- External flash
- External RAM
- Peripherals (LP, HP and HP CPU peripherals)
- CSI Bridge
- DSI Bridge

The bus architecture of the SoC is shown below.

Note:

1. Circles at intersections indicate that the bus (column) can access the corresponding slave device (row).
2. Peripherals in the diagram include LP, HP, and HP CPU peripherals.
3. CPU in the diagram represents both high-performance RISC-V processor 0 and processor 1, with each core having independent I-bus, D-bus, and AHB bus interfaces.
4. The 2x MEM MONITOR in the diagram refers to HP L2MEM MONITOR and HP SPM MONITOR.

Figure 1.0-1. ESP32-P4 Bus Architecture

Below is the description of each bus shown in Figure 1.0-1 *ESP32-P4 Bus Architecture*:

- **HP CPU I-bus**: Connects the instruction bus of the high-performance (HP) 32-bit RISC-V processor to the bus matrix for instruction fetch. It can directly access the HP SPM or indirectly access other code-containing memories through the cache, including HP ROM, HP L2MEM, as well as external flash and external RAM. In most cases, the cache is transparent to users.
- **HP CPU D-bus**: Connects the data bus of the high-performance (HP) 32-bit RISC-V processor to the bus matrix for literal loading and debug access. It can directly access the HP SPM or access other code- or data-containing memories (such as HP ROM, external flash, and external RAM) through the cache. It can also directly access peripheral registers, but only for HP CPU peripherals. In most cases, the cache is transparent to users.
- **HP CPU AHB bus**: Connects the AHB bus of the high-performance (HP) 32-bit RISC-V processor to the bus matrix for accessing data in peripherals or memory. Through the AHB interface, both LP and HP peripherals can be accessed, and direct access to HP L2MEM, HP ROM, LP SRAM, and external flash

and external RAM can be configured via address mapping (refer to Chapter 9 *System and Memory* for detailed configuration of address mapping).

- **LP CPU bus**: Connects the low-power (LP) 32-bit RISC-V processor to the bus matrix, allowing the LP CPU to access peripherals or memory. Accessible targets include LP SRAM, LP ROM, HP L2MEM, HP ROM, external flash, external RAM, as well as LP, HP, and HP CPU peripherals.
- **TRACE bus**: Connects TRACE0 and TRACE1 modules to the bus matrix for debugging operations. Accessible targets include HP L2MEM and external RAM.
- **MEM MONITOR bus**: Connects HP L2MEM MONITOR and HP SPM MONITOR to the bus matrix for writing monitoring data from their respective monitored memory regions to memory. The two MEM MONITOR interfaces have the same access path. Accessible targets include HP L2MEM and external RAM.
- **EMAC bus**: Connects the Ethernet MAC controller to the bus matrix for high-speed network data transfer. Accessible targets include HP L2MEM and external RAM.
- **USB OTG_HS bus**: Connects the USB 2.0 High-Speed OTG controller to the bus matrix for USB 2.0 High-Speed data transfer. Accessible targets include HP L2MEM and external RAM.
- **USB OTG_FS bus**: Connects the USB 2.0 Full-Speed OTG controller to the bus matrix for USB 2.0 Full-Speed data transfer. Accessible targets include HP L2MEM and external RAM.
- **SD/MMC bus**: Connects the SD/MMC controller to the bus matrix for SD/MMC card data read and write operations. Accessible targets include HP L2MEM and external RAM, supporting high-speed data transfer through DMA.
- **GDMA bus**: The chip contains two types of GDMA controllers and one VDMA controller for high-speed data transfer.
  - **GDMA-AHB**: DMA controller based on AHB bus protocol
  - **GDMA-AXI**: DMA controller based on the AXI bus protocol
  - **VDMA**: Video DMA controller based on the AXI bus protocol

  Each DMA provides one connection to the bus matrix and one connection to external memory. GDMAs perform high-speed data transfers through these buses, including peripheral-to-memory, memory-to-peripheral, peripheral-to-peripheral, and memory-to-memory transfers. Accessible targets include HP L2MEM, and external flash and external RAM. For DMA accesses to external memory, it is recommended to configure longer burst lengths whenever possible to ensure optimal data throughput.
- **2D-DMA bus**: Connects the DMA2D graphics accelerator to the bus matrix for 2D graphics data transfer and processing. Accessible targets include HP L2MEM and external RAM.
- **H264 ENC bus**: Connects the H.264 video encoder to the bus matrix, containing two AXI interfaces with the same access path. Used for data access during video encoding. Accessible targets include HP L2MEM and external RAM.

Chapter 2

High-Performance CPU

2.1 Overview

ESP32-P4 is powered by Espressif's second-generation 32-bit CPU core complex based upon RISC-V Instruction Set Architecture (ISA). The CPU Core complex consists of dual RISC-V CPU cores with a dedicated core-local interrupt controller (CLIC), a debug block, and a core-local interrupt (CLINT) timer. Figure 2.1 shows the block diagram of the CPU core complex.

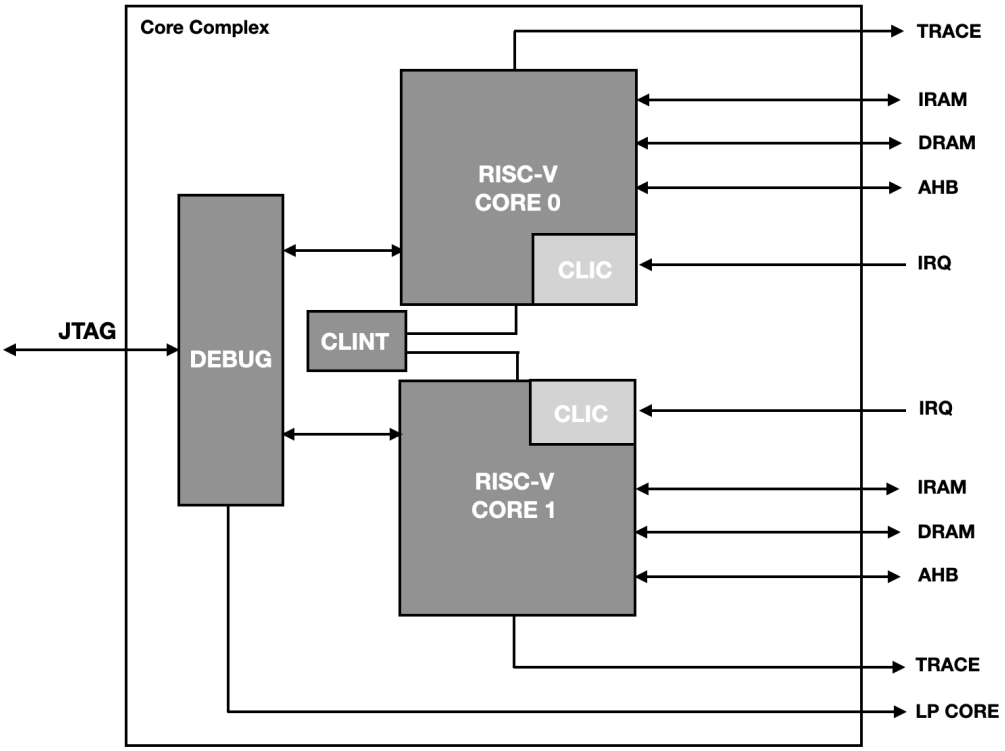


Figure 2.1-1. CPU Core Complex Block Diagram

Each RISC-V core in CPU core complex uses a 5-stage, in-order, scalar pipeline architecture optimized for area, power, and performance. Each RISC-V core has a built-in dedicated core-local interrupt controller (CLIC) and system bus (SYS BUS) interfaces for memory and peripheral access. The CLINT timer is shared between two cores. The DEBUG block provides a connection between the JTAG interface and the dual cores. It also supports LP core debug. Each core also provides an instruction trace interface for offline debugging.

2.2 Features

Each RISC-V CPU core in the CPU core complex implements the following standard RISC-V extensions:

- Mandatory base integer (I)
- Multiplication/Division (M)
- Atomic (A)
- Floating (F)
- Compressed (C)
- Code size reduction (Zc)
- Bit Manipulation (Zb)

In addition to the above standard extensions, each RISC-V CPU core also implements custom instructions (X) which can be broadly classified in the following two categories:

- Custom instructions to accelerate AI algorithms performance
- Custom hardware loop instructions to further improve performance and reduce code size for iterative AI algorithms execution

Apart from the above RISC-V instruction extensions support, each CPU core supports the features below:

- RISC-V RV32IMAFCX ISA with a five-stage pipeline that supports an operating clock frequency up to 360 MHz
- Compatible with RISC-V Instruction Set Manual, Volume I: RISC-V User-Level ISA, Version 2.2
- Compatible with RISC-V Instruction Set Manual, Volume II: RISC-V Privileged Architecture, Version 1.10
- Compatible with Core-Local Interrupt Controller (CLIC) RISC-V Privileged Architecture Extensions (10/10/2023)
- Compatible with RISC-V External Debug Support Version 0.13.2
- Zero wait cycle access to on-chip SRAM and cache for program and data access over IRAM/DRAM interface
- 32-bit AHB system bus for peripheral access
- Core-local interrupts (CLINT) dedicated for each privilege mode
- User (U) privilege mode execution
- Interrupt delegation to user mode
- Bus error response
- Standard physical memory protection (PMP) configurable up to 32 regions and custom attributes (PMA) configurable up to 16 regions for security
- Branch target buffer (BTB) with BHT and RAS for performance improvement
- Debug module (DM) compliant with the specification RISC-V External Debug Support Version 0.13.2 with external debugger support over an industry-standard JTAG/USB port

- Debugger with a direct system bus access (SBA) to memory and peripherals via Core 0 data bus
- Support for instruction trace for offline debug
- Hardware trigger compliant with the specification RISC-V External Debug Support Version 0.13.2 with up to 3 breakpoints/watchpoints
- Fast GPIO support (up to 8)
- Configurable events for core performance metrics

2.3 Terminology

To better illustrate the functionality of the High-Performance CPU, the following terms are used in this chapter.

ABI	Application binary interface
branch	An instruction that conditionally changes the execution flow
CLIC	Core-local interrupt controller
CLINT	Core-local interrupt
CSR	Control and status register
delta	A change in the program counter that is other than the difference between two instructions placed consecutively in memory
DTM	Debug transport module
FPR	Floating-point register
GPIO	General-purpose input/output
GPR	General-purpose register
HWLP	Hardware loop
hart	RISC-V hardware thread
LSB	Least significant bit
LR	Load reserved
MSB	Most significant bit
PMP	Physical memory protection
retire	The final stage of executing an instruction, when the machine state is updated
RO	Read-only field
R/W	Readable and writable field
SC	Store conditional
SoC	System on chip
WO	Write-only field
WARL	Write any read legal
W1	Write One

2.4 Address Map

The table below shows the address map of various regions accessible by CPU for instruction, data, and system bus peripherals.

Table 2.4-1. CPU Address Map

Region	Description	Start Address	End Address	Access Type
CPU	CLIC/CLINT registers	0x2000_0000	0x2FFF_FFFF	R/W
IRAM/DRAM	Instruction/Data region	0x3000_0000	0x3FEF_FFFF	R/W
CPU peripherals		0x3FF0_0000	0x3FF1_FFFF	R/W
IRAM/DRAM	Instruction/Data region	0x3FF2_0000	0x4FFF_FFFF	R/W
CPU peripherals	HP APB peripherals	0x5000_0000	0x500F_FFFF	R/W
LP RAM/ROM		0x5010_0000	0x5010_FFFF	R/W
LP APB peripherals		0x5011_0000	0x5012_FFFF	R/W
AHB	AHB peripheral region	*Default	*Default	R/W

***Default:** Addresses not matching any of the specified ranges above are accessed through AHB bus by a CPU core.

2.5 Configuration and Status Registers (CSRs)

2.5.1 Register Summary

Below is a list of CSRs implemented for each HP CPU core. All the implemented CSRs follow the standard mapping of bit fields as described in the RISC-V Instruction Set Manual, Volume II: Privileged Architecture, Version 1.10. It must be noted that even among the standard CSRs, not all bit fields have been implemented, limited by the subset of features implemented in the CPU. Refer to the next section for detailed description of the subset of fields implemented under each of these CSRs.

Name	Description	Address	Access
Machine Information CSRs			
mvendorid	Machine vendor ID	0xF11	RO
marchid	Machine architecture ID	0xF12	RO
mimpid	Machine implementation ID	0xF13	RO
mhartid	Machine hart ID	0xF14	RO
Machine Trap Setup CSRs			
mstatus	Machine mode status	0x300	R/W
misa [1]	Machine ISA	0x301	R/W
mideleg	Machine interrupt delegation register (INACTIVE IN CLIC MODE)	0x303	RO
mie	Machine interrupt enable register (INACTIVE IN CLIC MODE)	0x304	RO
mtvec [2]	Machine trap vector	0x305	R/W
mcounteren	Machine counter enable	0x306	R/W
mtvt	Machine vector interrupt base address (Refer to CLIC specifications)	0x307	R/W

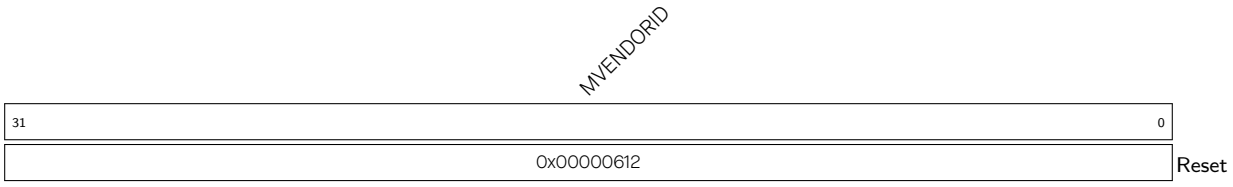
[1] Although misa is specified as having both read and write access (R/W), its fields are hardwired and thus write has no effect. This is what would be termed WARL (Write Any Read Legal) in RISC-V terminology

[2] mtvec Holds trap vector configuration consisting of vector base address and a vector mode

Name	Description	Address	Access
Machine Trap Handling CSRs			
mscratch	Machine scratch	0x340	R/W
mepc	Machine trap program counter	0x341	R/W
mcause [3]	Machine trap cause	0x342	R/W
mtval	Machine trap value	0x343	R/W
mip	Machine interrupt pending (INACTIVE IN CLIC MODE)	0x344	RO
mnxti	Interrupt handler address and enable modifier (Refer to CLIC specifications)	0x345	R/W
mintstatus	Current interrupt levels (Refer to CLIC specifications)	0xFB1	RO
mintthresh	Interrupt threshold (Refer to CLIC specifications)	0x347	R/W
mscratchcsw	Conditional scratch swap on priv mode change (Refer to CLIC specifications)	0x348	R/W
mscratchcswl	Conditional scratch swap on level change (Refer to CLIC specifications)	0x349	R/W
mclicbase	Machine mode interrupt controller base address register (CUSTOM) (Refer to CLIC specifications)	0x350	RO
User Trap Setup CSRs			
ustatus	User mode status	0x000	R/W
utvec [4]	User trap vector	0x005	R/W
utvt	User vector interrupt base address (Refer to CLIC specifications)	0x007	R/W
User Trap Handling CSRs			
uscratch	User scratch	0x040	R/W
uepc	User trap program counter	0x041	R/W
ucause [5]	User trap cause	0x042	R/W
unxti	Interrupt handler address and enable modifier (Refer to CLIC specifications)	0x045	R/W
uintthresh	Interrupt threshold (Refer to CLIC specifications)	0x047	R/W
uclicbase	User mode interrupt controller base address (CUSTOM) (Refer to CLIC specifications)	0x050	RO
uintstatus	Current interrupt levels (Refer to CLIC specifications)	0xCB1	RO
Physical Memory Protection (PMP) CSRs			
pmpcfg0	Physical memory protection configuration	0x3A0	R/W
pmpcfg1	Physical memory protection configuration	0x3A1	R/W
pmpcfg2	Physical memory protection configuration	0x3A2	R/W
pmpcfg3	Physical memory protection configuration	0x3A3	R/W
pmpcfg4	Physical memory protection configuration	0x3A4	R/W
pmpcfg5	Physical memory protection configuration	0x3A5	R/W
pmpcfg6	Physical memory protection configuration	0x3A6	R/W
pmpcfg7	Physical memory protection configuration	0x3A7	R/W

[3] External interrupt IDs reflected in mcause include even those IDs which have been reserved by RISC-V standard for core internal sources.
[4] utvec holds trap vector configurations, including the vector base address and the vector mode
[5] External interrupt IDs reflected in mcause include even those IDs that have been reserved by the RISC-V standard for core internal sources.

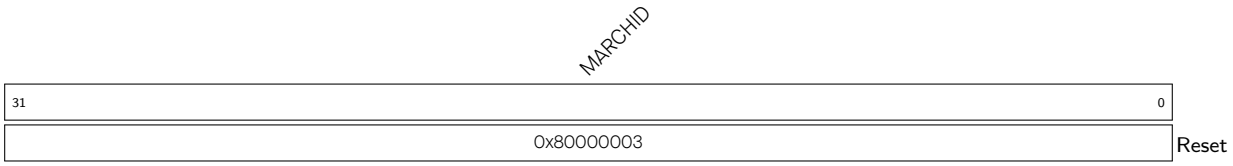
Name	Description	Address	Access
pmpaddr*n* (*n*: 0-31)	Physical memory protection address register	0x3B0+0x1**n*	R/W
Trigger Module CSRs (shared with Debug Mode)			
tselect	Trigger select register	0x7A0	R/W
tdata1	Trigger abstract data 1	0x7A1	R/W
tdata2	Trigger abstract data 2	0x7A2	R/W
tdata3	Trigger abstract data 3	0x7A3	R/W
tinfo	Trigger information	0x7A4	R/W
tcontrol	Global trigger control	0x7A5	R/W
mcontext	Machine mode context register	0x7A8	R/W
Debug Mode CSRs (Accessible only in Debug Mode)			
dcsr	Debug control and status	0x7B0	R/W
dpc	Debug PC	0x7B1	R/W
dscratch0	Debug scratch register 0	0x7B2	R/W
dscratch1	Debug scratch register 1	0x7B3	R/W
dmcs2	Debug mode control status register 2	0x32	R/W
Machine Counter Setup			
mcountinhibit	Machine counter inhibit register	0x320	R/W
mhpmevent8	Machine performance-monitoring event selector	0x308	R/W
mhpmevent9	Machine performance-monitoring event selector	0x329	R/W
mhpmevent13	Machine performance-monitoring event selector	0x32D	R/W
Machine Counter/Timers			
mcycle	Machine cycle counter	0xB00	R/W
minstret	Machine instructions-retired counter	0xB02	R/W
mhpmcounter8	Machine performance-monitoring counter	0xB08	R/W
mhpmcounter9	Machine performance-monitoring counter	0xB09	R/W
mhpmcounter13	Machine performance-monitoring counter	0xB0D	R/W
mcycleh	Upper 32 bits of mcycle	0xB80	R/W
minstreth	Upper 32 bits of minstret	0xB82	R/W
mhpmcounter8h	Upper 32 bits of mhpmcounter8	0xB88	R/W
mhpmcounter9h	Upper 32 bits of mhpmcounter9	0xB89	R/W
mhpmcounter13h	Upper 32 bits of mhpmcounter13	0xB8D	R/W
Unprivileged/User Mode Floating-Point CSRs			
fflags	Floating-point accrued exceptions	0x001	R/W
frm	Floating-point dynamic rounding mode	0x002	R/W
fcsr	Floating-point control and status register (frm + fflags)	0x003	R/W
Unprivileged/User Mode Counter/Timers			
cycle	Cycle Counter for RDCYCLE instruction	0xC00	RO
time	Timer for RDTIME instruction	0xC01	RO
instret	Instructions-retired counter for RDINSTRET instruction	0xC02	RO
hpmcounter8	Performance-monitoring counter	0xC08	RO
hpmcounter9	Performance-monitoring counter	0xC09	RO
hpmcounter13	Performance-monitoring counter	0xC0D	RO
cycleh	Upper 32 bits of cycle	0xC80	RO



Name	Description	Address	Access
instreth	Upper 32 bits of instret	0xC82	RO
hpmcounter8h	Upper 32 bits of hpmcounter8	0xC88	RO
hpmcounter9h	Upper 32 bits of hpmcounter9	0xC89	RO
hpmcounter13h	Upper 32 bits of hpmcounter13	0xC8D	RO
Custom System CSRs (Custom)			
Floating-Point User Mode CSR (Custom)			
fxcr	Floating-point extended control register	0x800	R/W
GPIO Access CSRs (Custom)			
cpu_gpio_oen	GPIO output enable	0x803	R/W
cpu_gpio_in	GPIO input value	0x804	RO
cpu_gpio_out	GPIO output value	0x805	R/W
Extension Control and Status CSRs (Custom)			
mext_ill_reg	Machine extension illegal register	0x7F0	R/W
mhwloop_state_reg	Machine mode HWLP extension state register	0x7F1	R/W
mext_pie_status	Machine mode PIE extension status register	0x7F2	R/W
Zc Extension CSRs			
jvt	Machine table jump base vector and control register	0x017	R/W
Machine Extension Status CSRs (Custom)			
mexstatus	Machine extension control and status register	0x7E1	R/W
mhint	Machine implicit operation register	0x7C5	R/W
Physical Memory Attributes Checker (PMAC) CSRs (Custom)			
pma_cfg*n* (*n*: 0-15)	Physical memory attribute configuration register	0xBC0+0x1**n*	R/W
pma_addr*n* (*n*: 0-15)	Physical memory attribute address register	0xBD0+0x1**n*	R/W
Machine Hardware Loop CSRs (Custom)			
mhloop0_start_addr	32-bit start address for loop 0	0x7C6	R/W
mhloop0_end_addr	32-bit start address for loop 0	0x7C7	R/W
mhloop0_count	Iteration count for hardware loop 0	0x7C8	R/W
mhloop1_start_addr	32-bit start address for loop 1	0x7C9	R/W
mhloop1_end_addr	32-bit end address for loop 1	0x7CA	R/W
mhloop1_count	Iteration count for hardware loop 1	0x7CB	R/W
User Hardware Loop CSRs (Custom)			
uhloop0_start_addr	32-bit start address for loop 0	0x8C0	R/W
uhloop0_end_addr	32-bit end address for loop 0	0x8C1	R/W
uhloop0_count	Iteration count for hardware loop 0	0x8C2	R/W
uhloop1_start_addr	32-bit start address for loop 1	0x8C3	R/W
uhloop1_end_addr	32-bit end address for loop 1	0x8C4	R/W
uhloop1_count	Iteration count for hardware loop 1	0x8C5	R/W
uhwloop_state_reg	User HWLP state register	0x8C6	R/W
Bus Error Exception Context CSRs (Custom)			
ldpc0	Load bus error PC register 0	0xBE0	R/W
ldpc1	Load bus error PC register 1	0xBE1	R/W
ldtval0	Load bus error access address register 0	0xBE8	R/W
ldtval1	Load bus error access address register 1	0xBE9	R/W

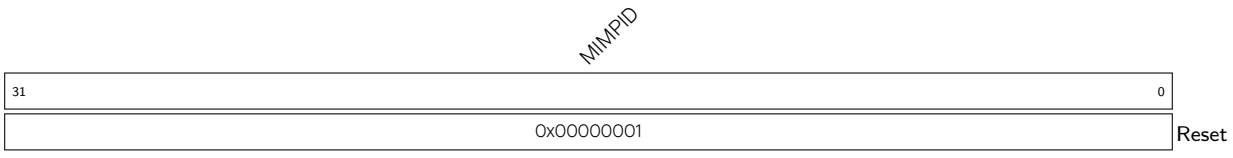
Name	Description	Address	Access
stpc0	Store bus error PC register 0	0xBF0	R/W
stpc1	Store bus error PC register 1	0xBF1	R/W
stpc2	Store bus error PC register 2	0xBF2	R/W
sttval0	Store bus error access address register 0	0xBF8	R/W
sttval1	Store bus error access address register 1	0xBF9	R/W
sttval2	Store bus error access address register 2	0xBFA	R/W

Note that if write/set/clear operation is attempted on any of the CSRs which are read-only (RO), as indicated in the above table, the CPU will generate an illegal instruction exception.



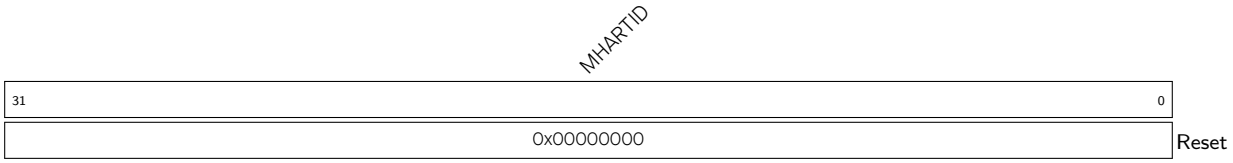
2.5.2 Register Description

Register 2.1. mvendorid (0xF11)



MVENDORID Represents Vendor ID. (RO)

Register 2.2. marchid (0xF12)

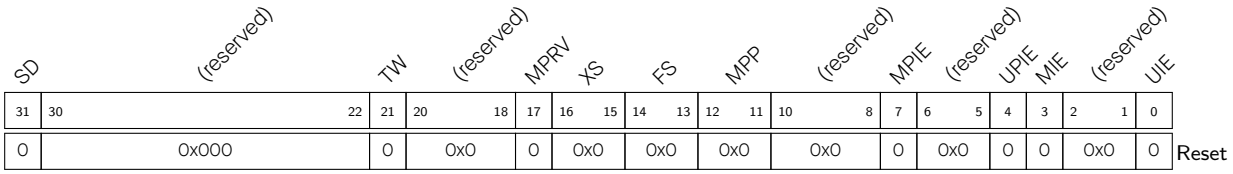


MARCHID Represents Architecture ID. (RO)

Register 2.3. mimpid (0xF13)

MIMPID Represents Implementation ID. (RO)

Register 2.4. mhartid (0xF14)



MHARTID Represents Hart ID.

0: Hart 0

1: Hart 1

(RO)

Register 2.5. mstatus (0x300)

SD Automatically set when either the FS or XS fields signal the presence of some dirty state that will require saving extension context to memory. (RO)

TW Configures whether the WFI (wait for interrupt) instruction can execute in less privileged modes.
0: WFI can execute in lower privilege modes.
1: WFI can only be executed in machine mode, and if executed in a less privileged mode, it will trigger an illegal instruction exception.
(R/W)

MPRV Configures whether to apply mstatus.MPP as the effective privilege mode, in which loads and stores execute, instead of the actual privilege mode in which the CPU is executing.
0: Not apply
1: Apply
Note that instruction protection is unaffected by this bit.
(R/W)

XS Represents the combined status of the custom extension states, including the HWLP and the PIE extensions.
0x0: All extension are Off
0x1: None dirty or clean, some on
0x2: None dirty, some clean
0x3: Some dirty
Note that in order to modify the state of either of these extensions, the corresponding CSRs mext_hwlp_status and mext_pie_status must be used.
(RO)

FS Represents the status of the floating-point unit, including the floating-point registers f0–f31 and the CSRs fcsr, frm, and fflags.
0x0: Off
0x1: Initial
0x2: Clean
0x3: Dirty
(R/W)

MPP Configures machine previous privilege mode (before trap).
0x0: User mode
0x3: Machine mode
Note: Only the lower bit is writable. Any write to the higher bit is ignored as it is directly tied to the lower bit.
(R/W)

Continued on the next page...

Register 2.5. mstatus (0x300)

Continued from the previous page...

MPIE Configures whether to enable the machine previous interrupt (before trap).

0: Disable

1: Enable

(R/W)

UPIE Configures whether to enable the user previous interrupt (before trap).

0: Disable

1: Enable

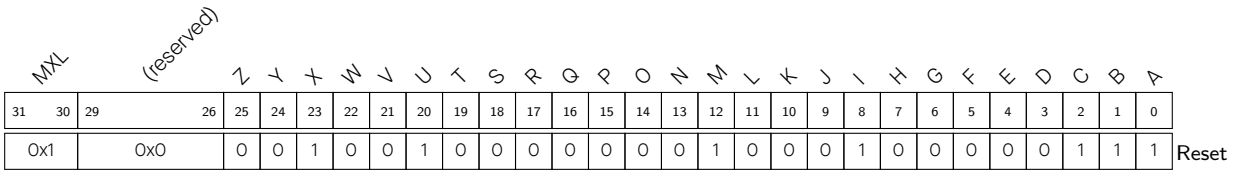
(R/W)

MIE Configures whether to enable the global machine interrupt.

0: Disable

1: Enable

(R/W)



UIE Configures whether to enable the global user interrupt.

0: Disable

1: Enable

(R/W)

Register 2.6. misa (0x301)

MXL Machine XLEN = 1 (32-bit). (RO)

Z Reserved = 0. (RO)

Y Reserved = 0. (RO)

X Non-standard extensions present = 1. (RO)

W Reserved = 0. (RO)

V Reserved = 0. (RO)

U User mode implemented = 1. (RO)

T Reserved = 0. (RO)

S Supervisor mode implemented = 0. (RO)

R Reserved = 0. (RO)

Q Quad-precision floating-point extension = 0. (RO)

P Reserved = 0. (RO)

O Reserved = 0. (RO)

N User-level interrupts supported = 0. (RO)

M Integer Multiply/Divide extension = 1. (RO)

L Reserved = 0. (RO)

K Reserved = 0. (RO)

J Reserved = 0. (RO)

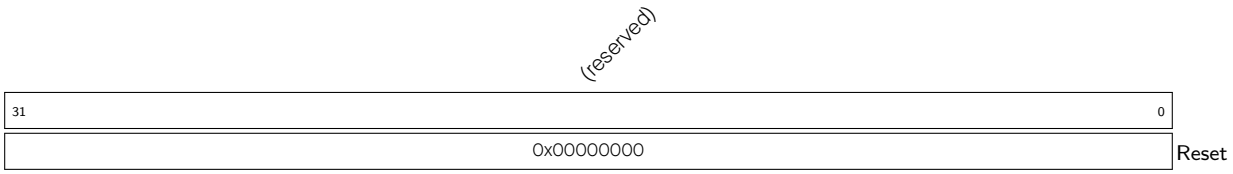
I RV32I base ISA = 1. (RO)

H Hypervisor extension = 0. (RO)

G Additional standard extensions present = 0. (RO)

F Single-precision floating-point extension = 0. (RO)

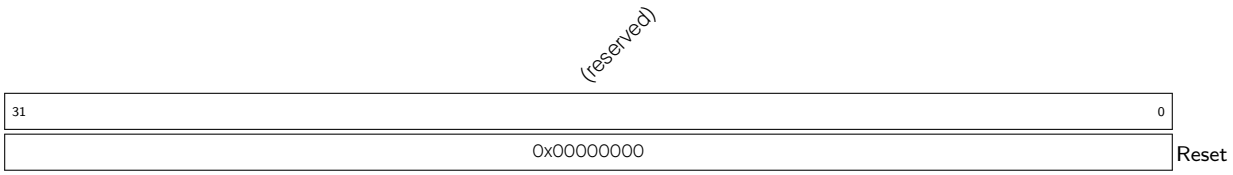
E RV32E base ISA = 0. (RO)



D Double-precision floating-point extension = 0. (RO)

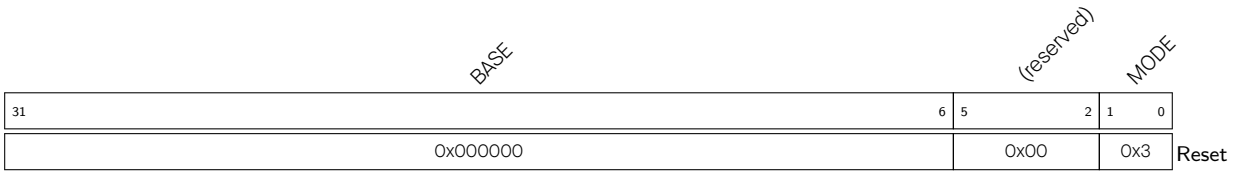
C Compressed Extension = 1. (RO)

B Bit Manipulation = 1. (RO)



A Atomic Extension = 1. (RO)

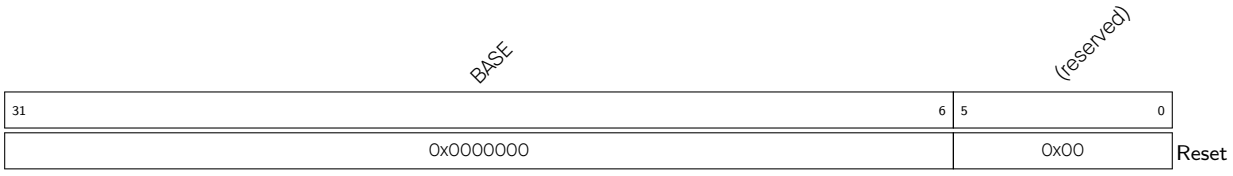
Register 2.7. mideleg (0x303)



mideleg All bits are hardwired to 0 since only CLIC mode is available. (RO)

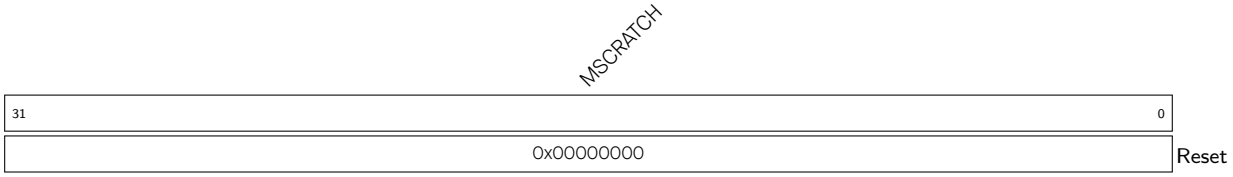
Register 2.8. mie (0x304)

mie All bits are hardwired to 0 since only CLIC mode is available. (RO)



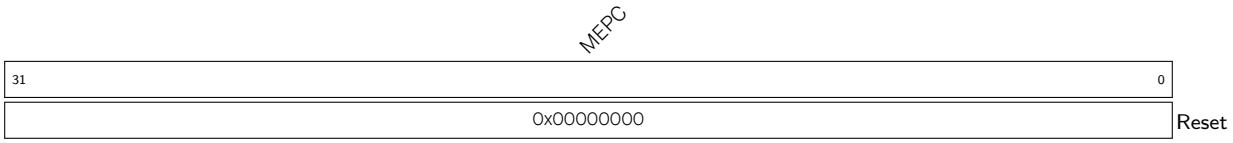
Register 2.9. mtvec (0x305)

BASE Configures the higher 26 bits of exception and non-vectored machine mode interrupt base address aligned to 64 bytes. (R/W)



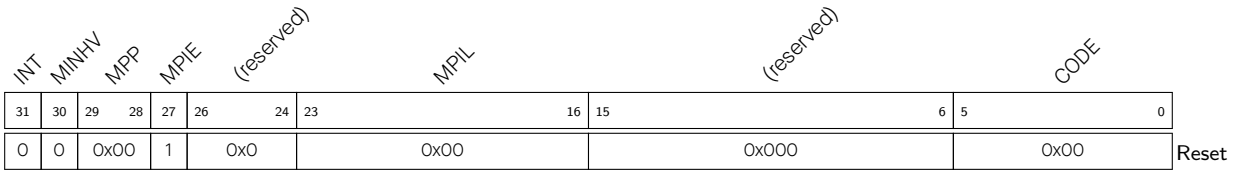
MODE Represents whether machine mode interrupts are operating in CLIC mode or vectored/non-vectored CLINT mode. Only CLIC mode **0x3** is available. (RO)

Register 2.10. mtvt (0x307)



BASE Configures the higher 26 bits of CLIC machine mode interrupt vector base address aligned to 64 bytes. (R/W)

Register 2.11. mscratch (0x340)



MSCRATCH Configures machine scratch information for custom use. (R/W)

Register 2.12. mepc (0x341)

MEPC Configures the machine trap/exception program counter. This is automatically updated with address of the instruction which was about to be executed while CPU encountered the most recent trap. (R/W)

Register 2.13. mcause (0x342)

INT Represents whether the CPU entered a trap due to interrupts.

0: The trap occurred due to an exception.

1: The trap occurred due to an interrupt.

(R/W)

MINHV Represents whether mepc is an address of an instruction or an address of a vector table entry.

1: Address of a table entry

0: Address of an instruction

(R/W)

MPP Represents the previous privilege mode, same as mstatus.MPP. (R/W)

MPIE Represents the previous interrupt enable, same as mstatus.MPIE. (R/W)

MPIL Represents the previous 8-bit interrupt level. (R/W)

CODE Represents the unique ID of the most recent exception or interrupt due to which CPU entered trap. Possible exception IDs are:

0x01: Instruction access fault

0x02: Illegal instruction

0x03: Hardware breakpoint/watchpoint or EBREAK

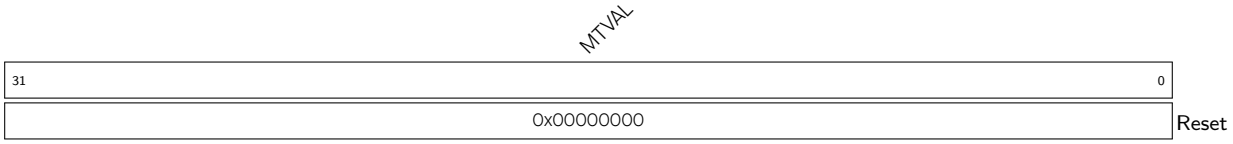
0x05: PMP load access fault

0x06: Misaligned store address or AMO address

0x07: Store access or AMO access fault

0x08: ECALL from U mode

0x0b: ECALL from M mode



0x1f: Illegal PIE instruction

Other exception IDs are reserved.

Note: Exception ID 0x0 (instruction access misaligned) is not present because CPU always masks the lowest bit of the address during instruction fetch.

(R/W)

Register 2.14. mtval (0x343)

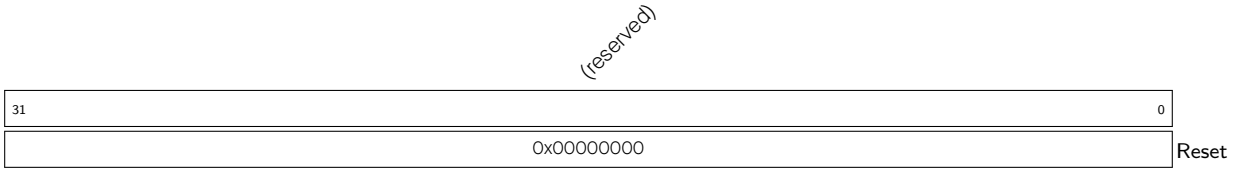
MTVAL Represents the machine trap value. This is automatically updated with an exception dependent data which may be useful for handling that exception.

Data is to be interpreted depending upon exception IDs:

0x01: Faulting virtual address of instruction

0x02: Faulting instruction opcode

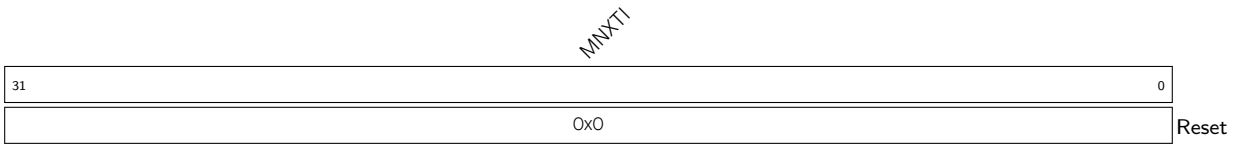
0x05: Faulting data address of load operation



0x07: Faulting data address of store operation

0x1F: Faulting instruction opcode related to illegal PIE instruction

Note: The value of this register is not valid for other exception IDs and interrupts.



(R/W)

Register 2.15. mip (0x344)

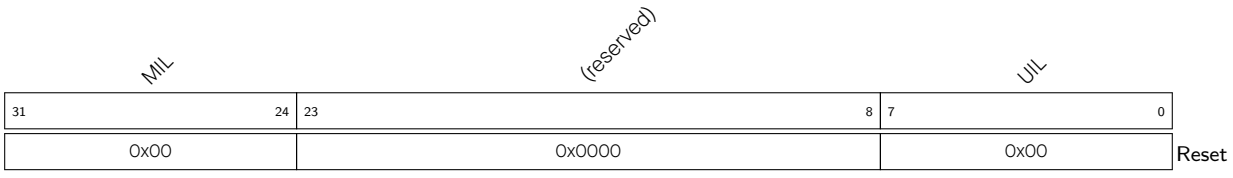
All bits are hardwired to 0 since only CLIC mode is available. (RO)

Register 2.16. mnxti (0x345)

MNXTI Represents the next machine mode interrupt entry address and configures the interrupt enable status.

This CSR can be used by software to service the next horizontal interrupt for the same privilege mode when it has greater level than the saved interrupt context (held in mcause.MPIL) and greater level than the interrupt threshold of the corresponding privilege mode, without incurring the full cost of an interrupt pipeline flush and context save/restore.

This CSR is designed to be accessed using CSRRSI/CSRRCI instructions, where the value read is a pointer to an entry in the trap handler table and the write back updates the interrupt-enable status. In addition, writes to the mnxti have side-effects that update the interrupt context state. A read of the mnxti CSR using CSRR returns either zero, indicating there is no suitable interrupt to service or that the system is not in a CLIC mode, or returns a non-zero address of the entry in the trap handler table for software trap vectoring.

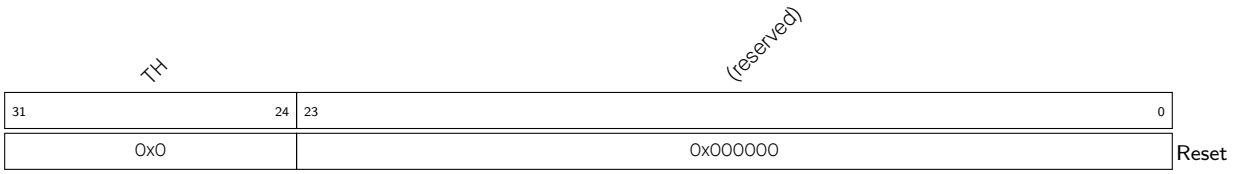


If the CSR instruction that accesses mnxti includes a write, the mstatus CSR is the one used for the read-modify-write portion of the operation, while the mcause register's exccode field and the mintstatus.MIL field can also be updated with the new interrupt id and level. If the interrupt is edge-triggered, then the pending bit is also zeroed.

The mnxti CSR is intended to be used inside an interrupt handler after an initial interrupt has been taken and mcause and mepc registers updated with the interrupted context and the ID of the interrupt.

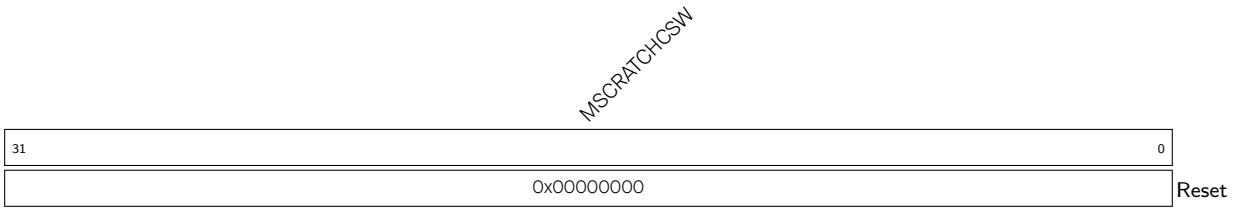
If the pending interrupt is edge-triggered, hardware will automatically clear the corresponding pending bit when the CSR instruction that accesses mnxti includes a write. However, if the CSR instruction does not include write side effects, then no state update on any CSR occurs and thus the interrupt pending bit is not zeroed. This behavior allows software to optimize the selection and execution of interrupts using mnxti.

(R/W)



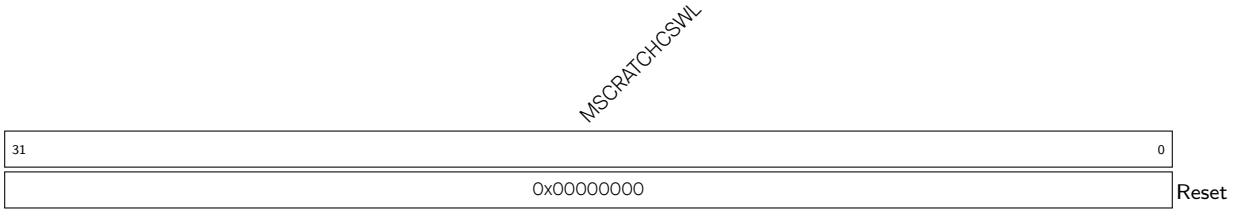
Register 2.17. mintstatus (0xFB1)

MIL Represents the active 8-bit interrupt level for current machine mode interrupt. (RO)



UIL Hardwired to 0x0 as user mode interrupts are not supported. (RO)

Register 2.18. mintthresh (0x347)



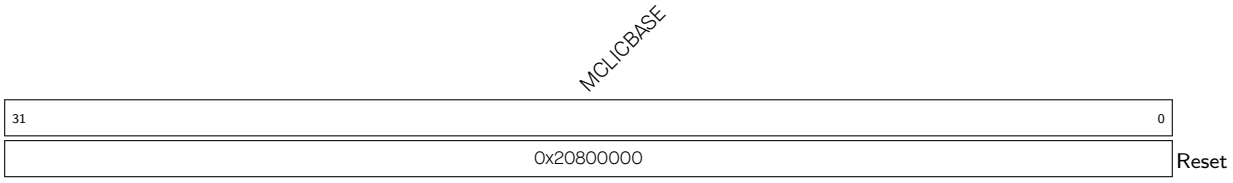
TH Configures the 8-bit level threshold of machine mode interrupts.
Note that the effective threshold level for machine mode interrupts is the maximum of mintthresh.TH and mintstatus.MIL. All machine mode pending interrupts with levels less than or equal to the effective threshold level are not allowed to preempt the execution.
(R/W)

Register 2.19. mscratchcsw (0x348)

MSCRATCHCSW Configures the MSCRATCH value by conditionally swapping its value with RS1, based on the current privilege mode and the previous privilege mode in MPP.
This is the conditional scratch swap CSR, which allows performing a scratch value swap conditionally, based on privilege mode change, in a single instruction.
When using CSRRW instruction to access this CSR, the value written into RD is either that of MSCRATCH, if MPP is different than the current privilege mode, or RS1 if MPP is the same as the current privilege mode. The MSCRATCH CSR value is updated with the original value of RS1 only if there is a privilege mode difference.
(R/W)

Register 2.20. mscratchcswl (0x349)

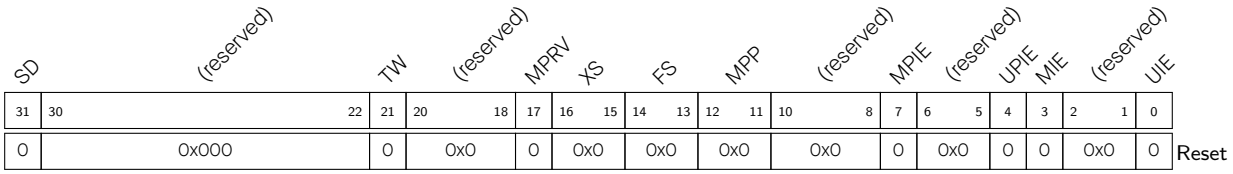
MSCRATCHCSWL Configures the MSCRATCH value by conditionally swapping its value with RS1, based on the current interrupt level in mintstatus.MIL and the previous interrupt level in mcause.MPIL.



This is the conditional scratch swap CSR, which allows performing a scratch value swap conditionally, based on interrupt level change, in a single instruction.

When using CSRRW instruction to access this CSR, the value written into RD is either that of MSCRATCH, if only one of mcause.MPIL and mintstatus.MIL is equal to zero, or RS1 for all other cases.

The value of MSCRATCH is updated with the initial value of RS1 only if one of mcause.MPIL and mintstatus.MIL is equal to zero.



(R/W)

Register 2.21. mclicbase (0x350)

MCLICBASE Represents the base address of the CLIC memory-mapped registers for machine mode. (RO)

Register 2.22. ustatus (0x000)

SD Automatically set when either the FS or XS fields signal the presence of some dirty state that will require saving extension context to memory. (RO)

TW Represents whether the WFI (wait for interrupt) instruction can execute in less privileged modes.
0: WFI can execute in lower privilege modes.
1: WFI can only be executed in machine mode, and if executed in a less privileged mode, it will trigger an illegal instruction exception.
(RO)

MPRV Represents whether to apply ustatus.MPP as the effective privilege mode, in which loads and stores execute, instead of the actual privilege mode in which the CPU is executing.
0: Not apply
1: Apply
Note that instruction protection is unaffected by this bit.
(RO)

XS Represents the combined status of the custom extension states, including the HWLP and the PIE extensions.
0x0: All extension are Off
0x1: None dirty or clean, some on
0x2: None dirty, some clean
0x3: Some dirty
Note that in order to modify the state of either of these extensions, the corresponding CSRs mext_hwlp_status and mext_pie_status must be used.
(RO)

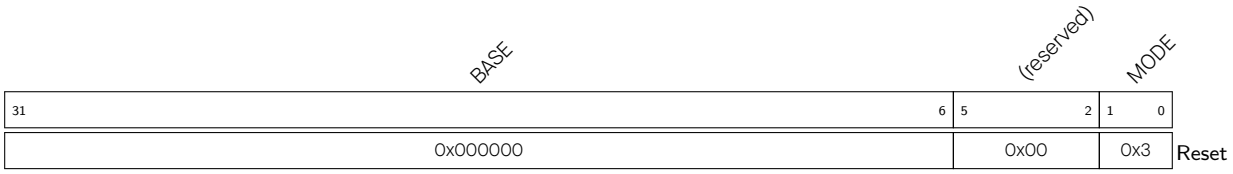
FS Configures the status of the floating-point unit, including the floating-point registers f0–f31 and the CSRs fcsr, frm, and fflags.
0x0: Off
0x1: Initial
0x2: Clean
0x3: Dirty
(R/W)

MPP Represents machine previous privilege mode (before trap).
0x0: User mode
0x3: Machine mode
Note: Only the lower bit is writable. Any write to the higher bit is ignored as it is directly tied to the lower bit.
(RO)

Continued on the next page...

Register 2.22. ustatus (0x000)

Continued from the previous page...

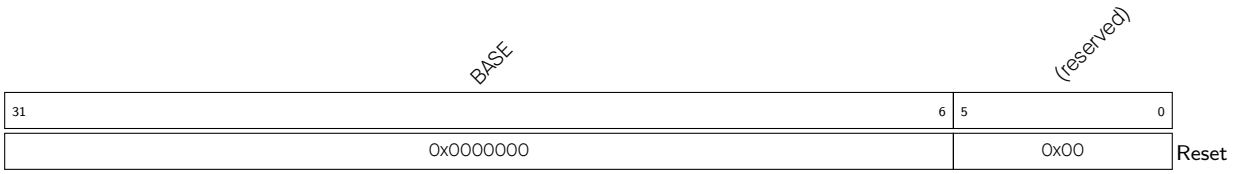


MPIE Represents machine previous interrupt enable status (before trap).
0: Disabled
1: Enabled
(RO)

UPIE Represents user previous interrupt enable status (before trap).
0: Disabled
1: Enabled
(RO)

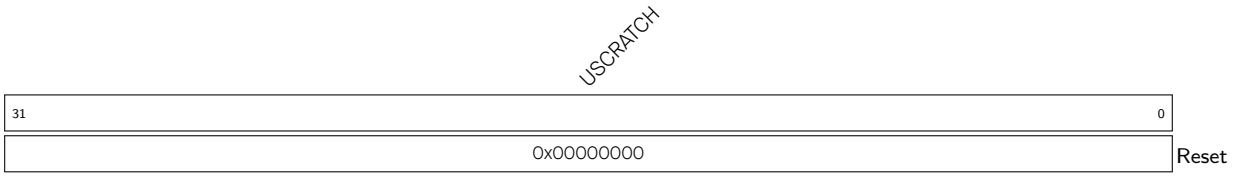
MIE Represents global machine interrupt enable status.
0: Disabled
1: Enabled
(RO)

UIE Represents global user mode interrupt enable status.
0: Disabled
1: Enabled
(RO)



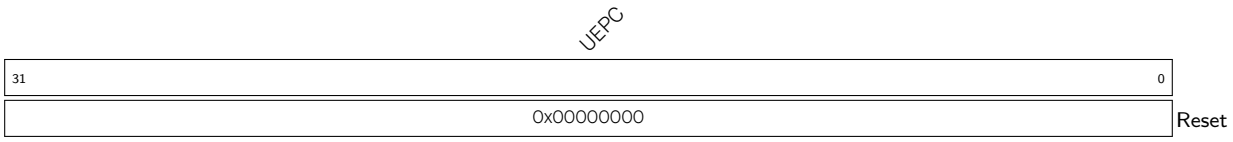
Register 2.23. utvec (0x005)

BASE Configures the higher 26 bits of exception and non-vectored user mode interrupt base address aligned to 64 bytes. (R/W)



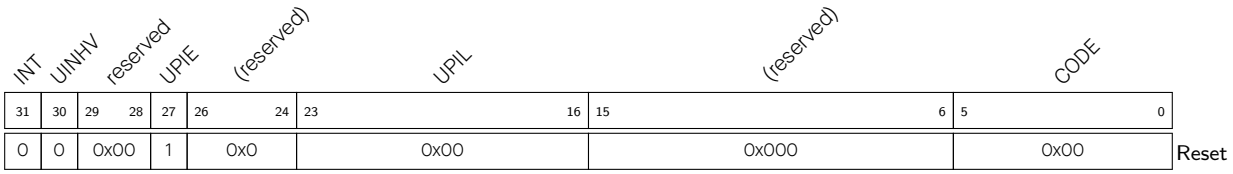
MODE Represents whether user mode interrupts are operating in CLIC mode or vectored/non-vectored CLINT mode. Only CLIC mode **0x3** is available. (RO)

Register 2.24. utvt (0x007)



BASE Configures the higher 26 bits of CLIC user mode interrupt vector base address aligned to 64 bytes. (R/W)

Register 2.25. uscratch (0x040)



USCRATCH Configures user scratch information for custom use. (R/W)

Register 2.26. uepc (0x041)

UEPC Configures the user trap/exception program counter. This is automatically updated with address of the instruction which was about to be executed while CPU encountered the most recent trap. (R/W)

Register 2.27. ucause (0x042)

INT Represents whether the CPU entered a trap due to interrupts.

0: The trap occurred due to an exception.

1: The trap occurred due to an interrupt.

(R/W)

UINHV Represents whether uepc is an address of an instruction or an address of a vector table entry.

1: Address of a table entry

0: Address of an instruction

(R/W)

UPIE Represents the previous interrupt enable, same as ustatus.UPIE. (R/W)

UPIL Represents the previous 8-bit interrupt level. (R/W)

CODE Represents the unique ID of the most recent exception or interrupt due to which CPU entered trap. Possible exception IDs are:

0x01: Instruction access fault

0x02: Illegal instruction

0x03: Hardware breakpoint/watchpoint or EBREAK

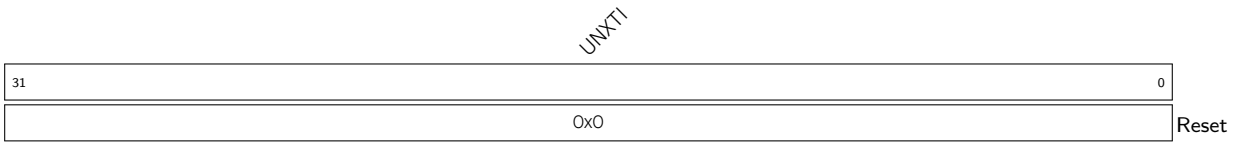
0x05: PMP load access fault

0x06: Misaligned store address or AMO address

0x07: Store access or AMO access fault

0x08: ECALL from U mode

0x0b: ECALL from M mode



0x1f: Illegal PIE instruction

Other exception IDs are reserved.

Note: Exception ID 0x0 (instruction access misaligned) is not present because CPU always masks the lowest bit of the address during instruction fetch.

(R/W)

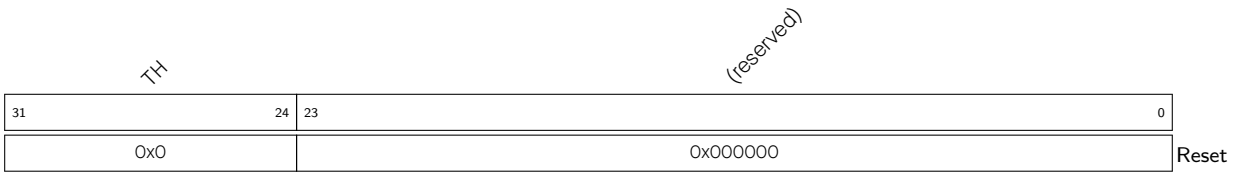
Register 2.28. unxti (0x045)

UNXTI Represents the next user mode interrupt entry address and configures the interrupt enable status.

This CSR can be used by software to service the next horizontal interrupt for the same privilege mode when it has greater level than the saved interrupt context (held in ucause.UPIL) and greater level than the interrupt threshold of the corresponding privilege mode, without incurring the full cost of an interrupt pipeline flush and context save/restore.

This CSR is designed to be accessed using CSRRSI/CSRRCI instructions, where the value read is a pointer to an entry in the trap handler table and the write back updates the interrupt-enable status. In addition, writes to the unxti have side-effects that update the interrupt context state.

A read of the unxti CSR using CSRR returns either zero, indicating there is no suitable interrupt to service or that the system is not in a CLIC mode, or returns a non-zero address of the entry in the trap handler table for software trap vectoring.



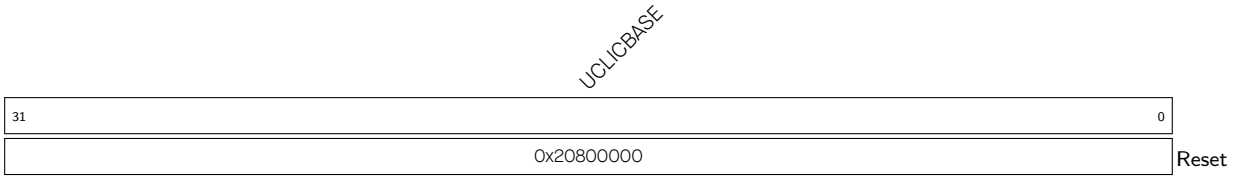
If the CSR instruction that accesses unxti includes a write, the ustatus CSR is the one used for the read-modify-write portion of the operation, while the ucause register's exccode field and the uintstatus.UIL field can also be updated with the new interrupt id and level. If the interrupt is edge-triggered, then the pending bit is also zeroed.

The unxti CSR is intended to be used inside an interrupt handler after an initial interrupt has been taken and ucause and uepc registers updated with the interrupted context and the ID of the interrupt.

If the pending interrupt is edge-triggered, hardware will automatically clear the corresponding pending bit when the CSR instruction that accesses unxti includes a write. However, if the CSR instruction does not include write side effects, then no state update on any CSR occurs and thus the interrupt pending bit is not zeroed. This behavior allows software to optimize the selection and execution of interrupts using unxti.

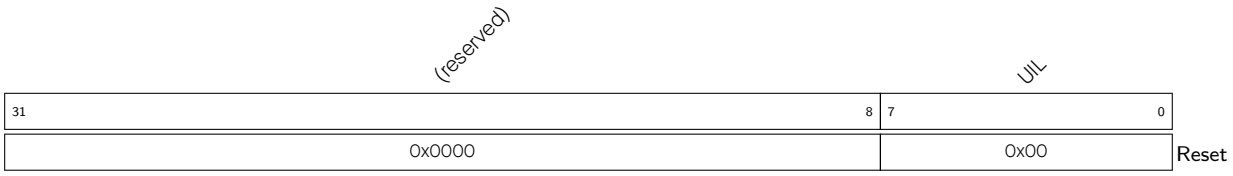
(R/W)

Register 2.29. uintthresh (0x047)



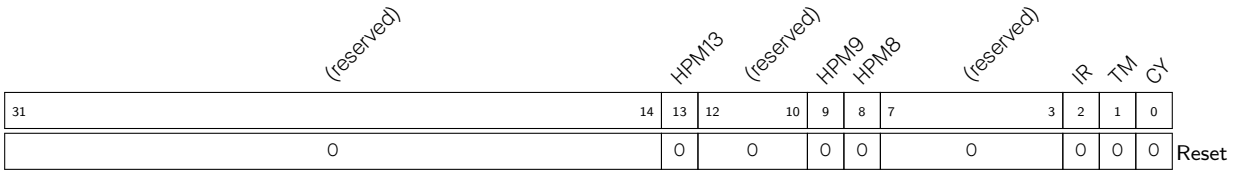
TH Configures the 8-bit level threshold of user mode interrupts.

Note that the effective threshold level for user mode interrupts is the maximum of uintthresh.TH and uintstatus.UIL. All user mode pending interrupts with levels less than or equal to the effective threshold level are not allowed to preempt the execution.



(R/W)

Register 2.30. uclicbase (0x050)



UCLICBASE Represents the base address of the CLIC memory-mapped registers for user mode. (RO)

Register 2.31. uintstatus (0xCB1)

UIL Represents the active 8-bit interrupt level for the current user mode interrupt. (RO)

Register 2.32. mcounteren (0x306)

HPM13 Configures inline]Configures users counters instead of machine counters access from user mode. Bhanu: Updated hpmcounter13 access from user mode.

0: Accessing hpmcounter13 CSR in user mode will generate illegal instruction exception.

1: Accessing hpmcounter13 CSR in user mode is valid.

(R/W)

HPM9 Configures hpmcounter9 access from user mode.

0: Accessing hpmcounter9 CSR in user mode will generate illegal instruction exception.

1: Accessing hpmcounter9 CSR in user mode is valid.

(R/W)

HPM8 Configures hpmcounter8 access from user mode.

0: Accessing hpmcounter8 CSR in user mode will generate illegal instruction exception.

1: Accessing hpmcounter8 CSR in user mode is valid.

(R/W)

CY Configures access of cycle counter from user mode.

0: Accessing cycle CSR in user mode will generate illegal instruction exception.

1: Accessing cycle CSR in user mode is valid.

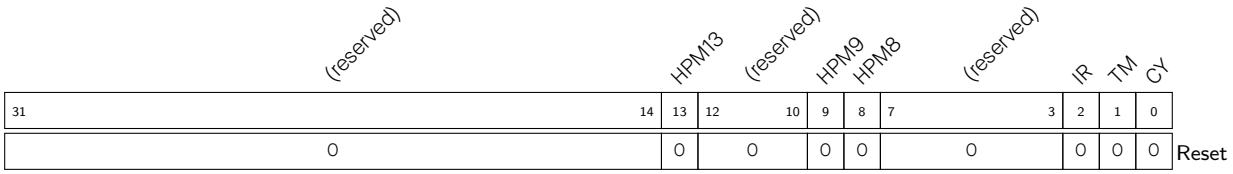
(R/W)

TM Configures access of time counter from user mode.

0: Accessing time CSR in user mode will generate illegal instruction exception.

1: Accessing time CSR in user mode is valid.

(R/W)



IR Configures access of instret counter from user mode.

0: Accessing instret CSR in user mode will generate illegal instruction exception.

1: Accessing instret CSR in user mode is valid.

(R/W)

Register 2.33. mcountinhibit (0x320)

HPM13 Configures the incrementing of mhpmcounter13.

0: Continue incrementing the mhpmcounter13 counter.

1: Stop incrementing the mhpmcounter13 counter.

(R/W)

HPM9 Configures the incrementing of mhpmcounter9.

0: Continue incrementing the mhpmcounter9 counter.

1: Stop incrementing the mhpmcounter9 counter.

(R/W)

HPM8 Configures the incrementing of mhpmcounter8.

0: Continue incrementing the mhpmcounter8 counter.

1: Stop incrementing the mhpmcounter8 counter.

(R/W)

IR Configures the incrementing of the instret counter.

0: Continue incrementing the instret counter.

1: Stop incrementing the instret counter.

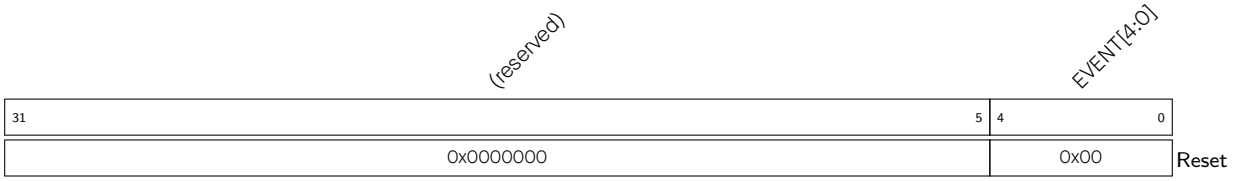
(R/W)

TM Configures the incrementing of the time counter.

0: Continue incrementing the time counter.

1: Stop incrementing the time counter.

(R/W)



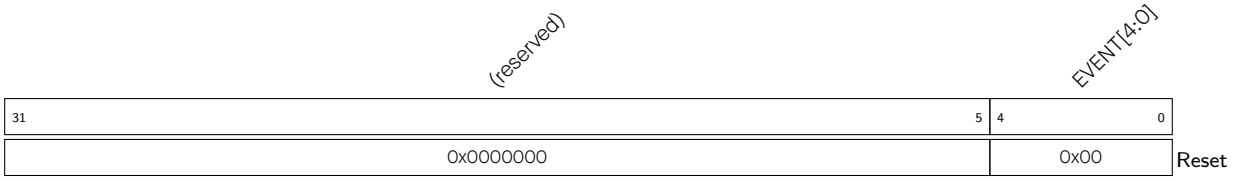
CY Configures the incrementing of the cycle counter.

0: Continue incrementing the cycle counter.

1: Stop incrementing the cycle counter.

(R/W)

Register 2.34. mhpmevent8 (0x328)

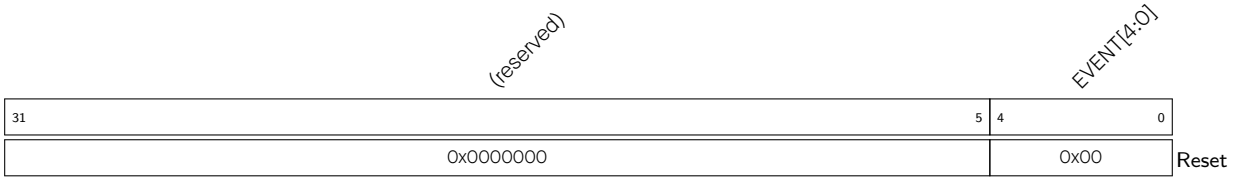


EVENT[4:0] Event selector for mhpmcounter8.

The only valid event value for this counter is 0x6, for conditional branch mispredictions.

(R/W)

Register 2.35. mhpmevent9 (0x329)

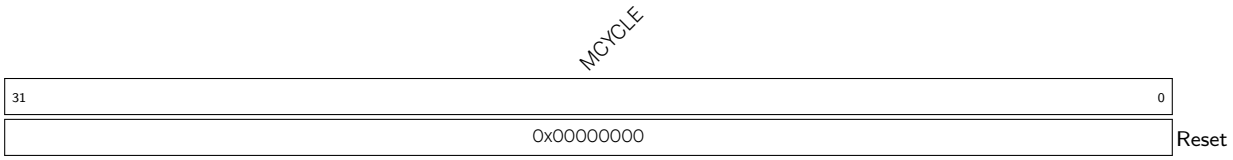


EVENT[4:0] Event selector for mhpmcounter9.

The only valid event value for this counter is 0x7, for conditional branch instructions.

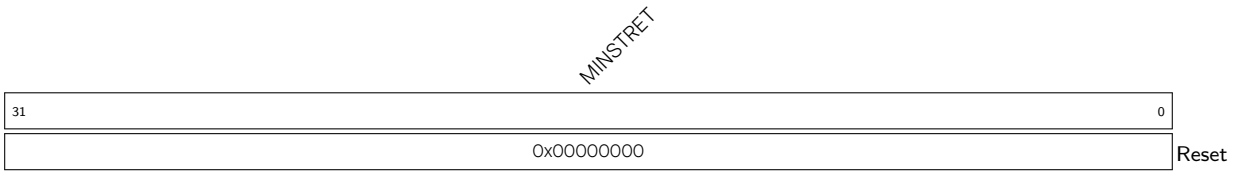
(R/W)

Register 2.36. mhpmevent13 (0x32D)



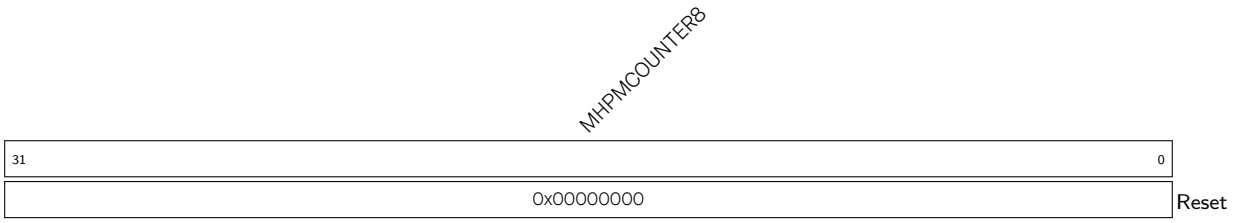
EVENT[4:0] Event selector for mhpmcounter13.

The only valid event value for this counter is 0xB, for store instructions.



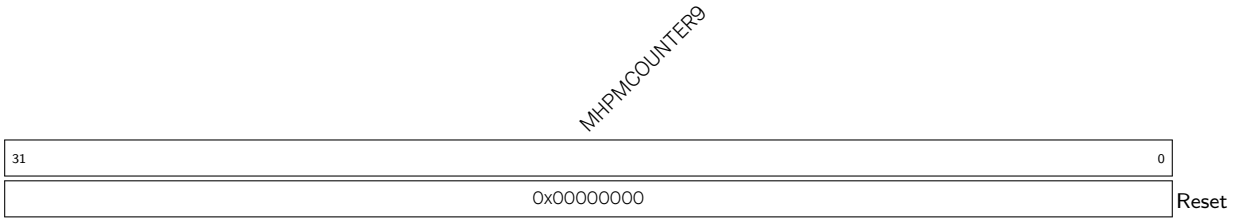
(R/W)

Register 2.37. mcycle (0xB00)



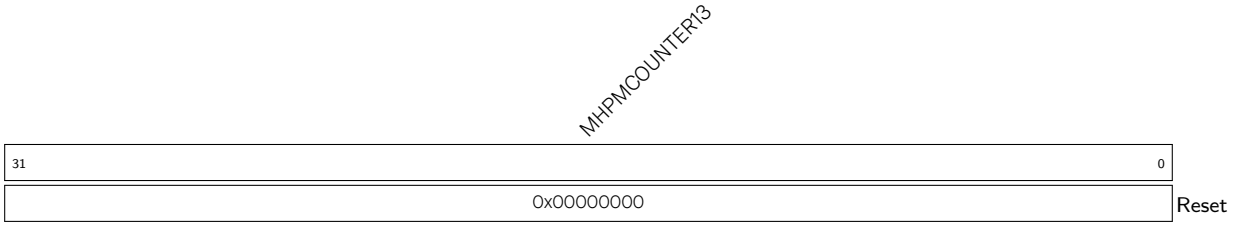
MCYCLE Represents the lower 32 bits of the machine mode cycle counter. (R/W)

Register 2.38. minstret (0xB02)



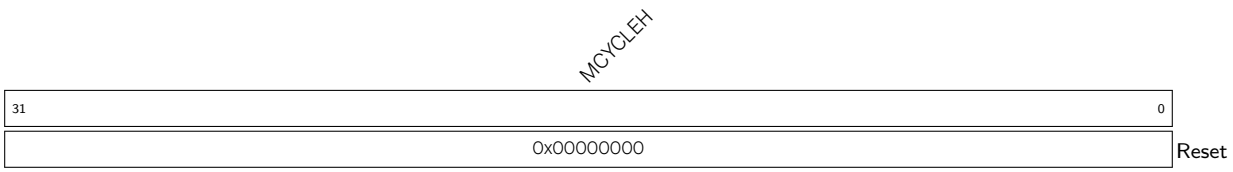
MINSTRET Represents the lower 32 bits of the machine instructions retired counter. (R/W)

Register 2.39. mhpmcounter8 (0xB08)



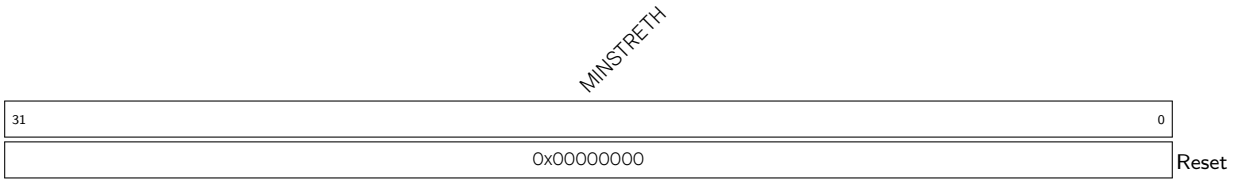
MHPMCOUNTER8 Represents the lower 32 bits of the machine performance-monitoring counter8. (R/W)

Register 2.40. mhpmcounter9 (0xB09)



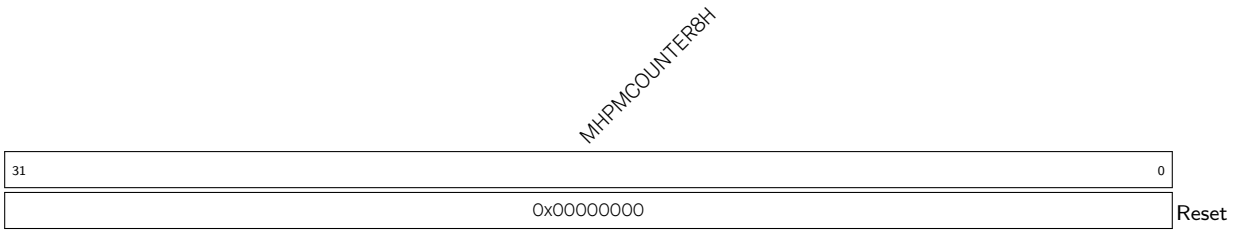
MHPMCOUNTER9 Represents the lower 32 bits of the machine performance-monitoring counter9. (R/W)

Register 2.41. mhpmcounter13 (0xB0D)



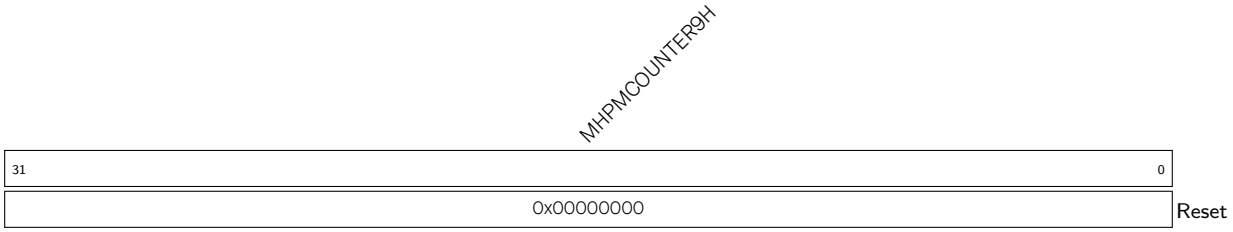
MHPMCOUNTER13 Represents the lower 32 bits of the machine performance-monitoring counter13. (R/W)

Register 2.42. mcycleh (0xB80)



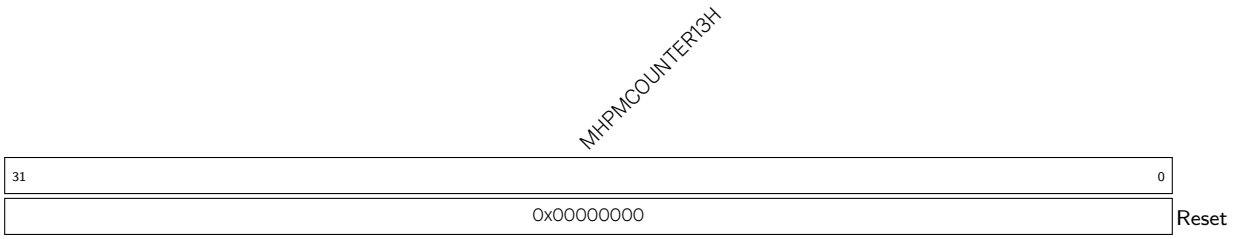
MCYCLEH Represents the upper 32 bits of mcycle counter. (R/W)

Register 2.43. minstreth (0xB82)



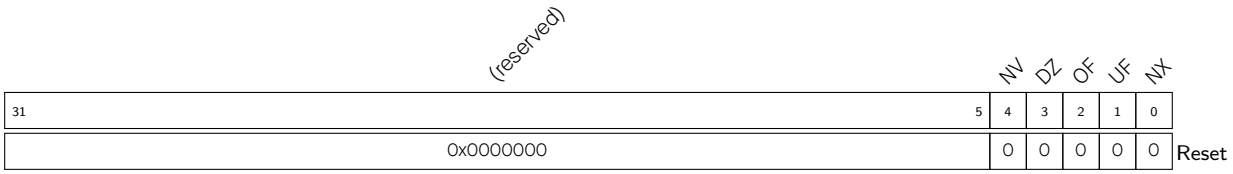
MINSTRETH Represents the upper 32 bits of minstret counter. (R/W)

Register 2.44. mhpmcounter8h (0xB88)



MHPMCOUNTER8H Represents the upper 32 bits of mhpmcounter8 counter. (R/W)

Register 2.45. mhpmcounter9h (0xB89)



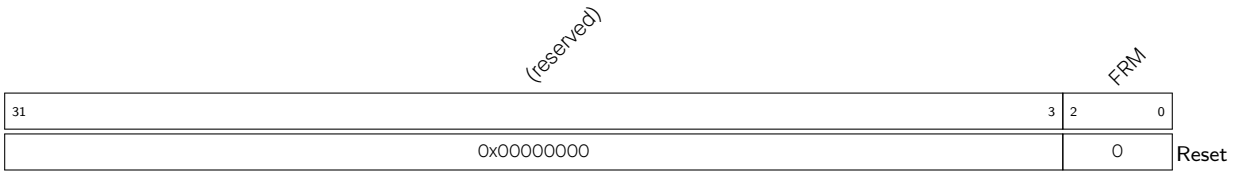
MHPMCOUNTER9H Represents the upper 32 bits of mhpmcounter9 counter. (R/W)

Register 2.46. mhpmcounter13h (0xB8D)

MHPMCOUNTER13H Represents the upper 32 bits of mhpmcounter13 counter. (R/W)

Register 2.47. fflags (0x001)

NV Represents the floating-point invalid operation flag. (R/W)



DZ Represents the floating-point divide-by-zero flag. (R/W)

OF Represents the floating-point overflow flag. (R/W)

UF Represents the floating-point underflow flag. (R/W)

NX Represents the floating-point inexact flag. (R/W)

Register 2.48. frm (0x002)

FRM Configures the floating-point rounding mode.

Valid rounding mode values:

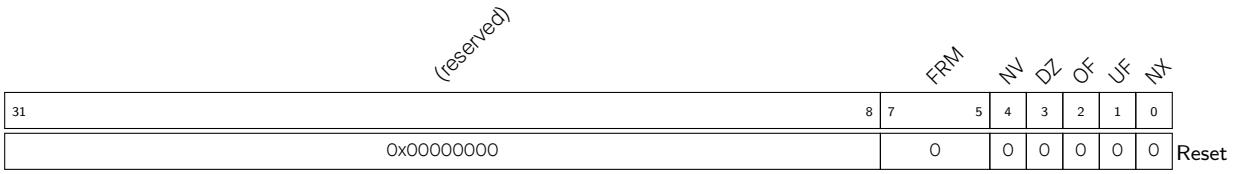
0x0: RNE (Round to nearest, ties to even)

0x1: RTZ (Round towards zero)

0x2: RDN (Round down towards negative infinity)

0x3: RUP (Round up towards positive infinity)

0x4: RMM (Round to nearest, ties to maximum magnitude)



0x5: Reserved (Invalid. Reserved to future use)

0x6: Reserved (Invalid. Reserved to future use)

0x7: DYN (In Instruction's rm field, it selects dynamic rounding mode. In the rounding mode register, it is invalid)

(R/W)

Register 2.49. fcsr (0x003)

FRM Configures the floating-point rounding mode.

Valid rounding mode values:

0x0: RNE (Round to nearest, ties to even)

0x1: RTZ (Round towards zero)

0x2: RDN (Round down towards negative infinity)

0x3: RUP (Round up towards positive infinity)

0x4: RMM (Round to nearest, ties to maximum magnitude)

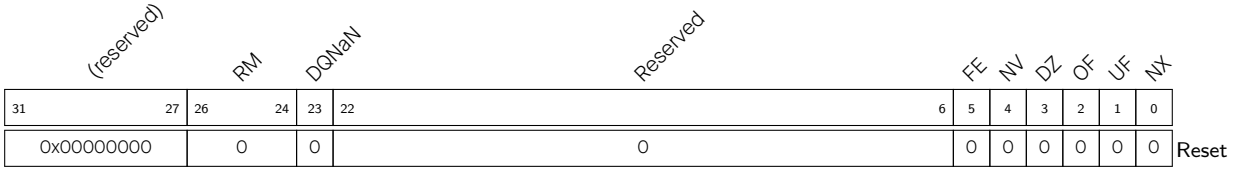
0x5: Reserved (Invalid. Reserved to future use)

0x6: Reserved (Invalid. Reserved to future use)

0x7: DYN (In Instruction's rm field, it selects dynamic rounding mode. In the rounding mode register, it is invalid)

(R/W)

NV Represents the floating-point invalid operation flag. (R/W)



DZ Represents the floating-point divide-by-zero flag. (R/W)

OF Represents the floating-point overflow flag. (R/W)

UF Represents the floating-point underflow flag. (R/W)

NX Represents the floating-point inexact flag. (R/W)

Register 2.50. fxsr (0x800)

RM Mapped to frm bits. Write operation to this field will be reflected on fcsr register at the same time. (R/W)

DQNaN Configures the calculated value of QNaN output.

0: The calculated value of QNaN output is the fixed value specified in RISC-V, i.e., 0x7FC00000.

1: The calculated QNaN value is consistent with the IEEE 754 standard.

(R/W)

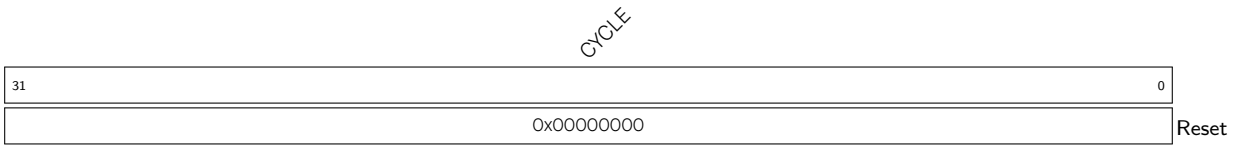
FE Floating-point exception accumulation bit. Mapped to FE bits. Write operation to this field will be reflected on fcsr register at the same time.

0: No floating-point exception occurred

1: Floating-point exception occurred

(R/W)

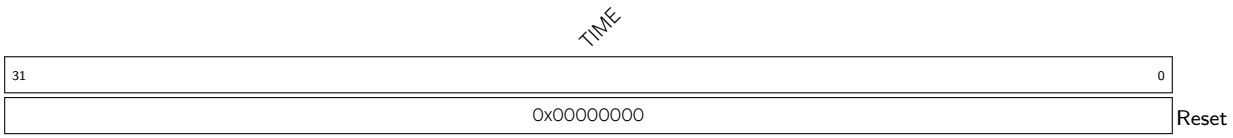
NV Represents the invalid operand exception flag. Mapped to NV bits. Write operation to this field will be reflected on fcsr register at the same time. (R/W)



DZ Represents the divide-by-zero exception flag. Mapped to DZ bits. Write operation to this field will be reflected on fcsr register at the same time. (R/W)

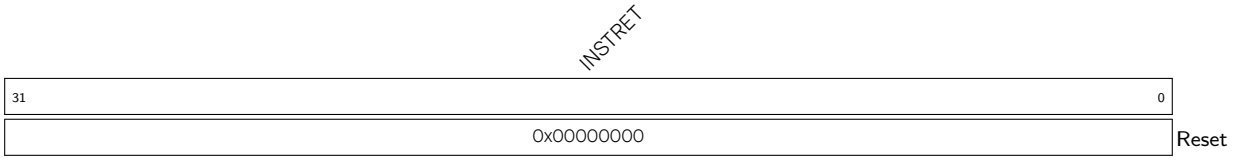
OF Represents the overflow exception flag. Mapped to OF bits. Write operation to this field will be reflected on fcsr register at the same time. (R/W)

UF Represents the underflag. Mapped to UF bits. Write operation to this field will be reflected on fcsr register at the same time. (R/W)



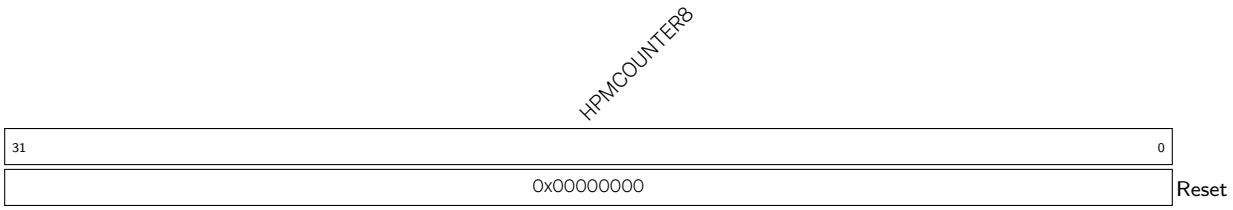
NX Represents the inexact flag. Mapped to NX bits. Write operation to this field will be reflected on fcsr register at the same time. (R/W)

Register 2.51. cycle (0xC00)



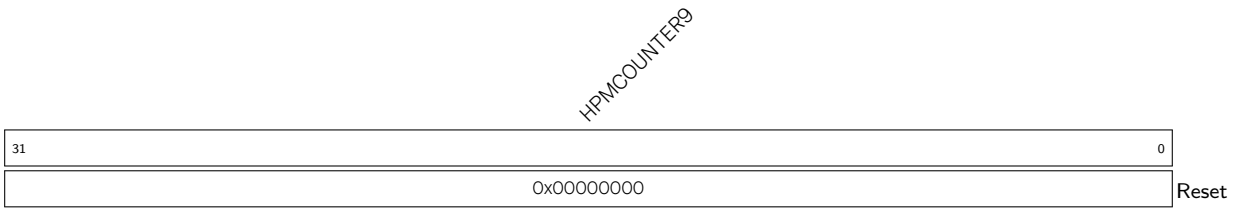
CYCLE Read-only mirror of mcycle. (RO)

Register 2.52. time (0xC01)



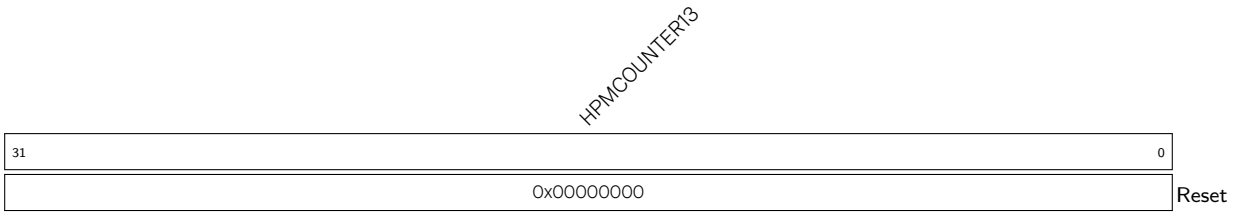
TIME Represents the timer value for RDTIME instruction. (RO)

Register 2.53. instret (0xC02)



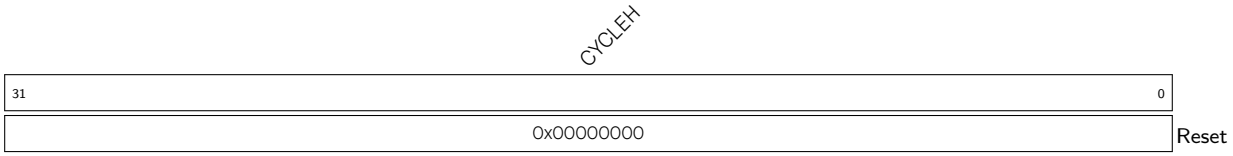
INSTRET Read-only mirror of minstret. (RO)

Register 2.54. hpmcounter8 (0xC08)



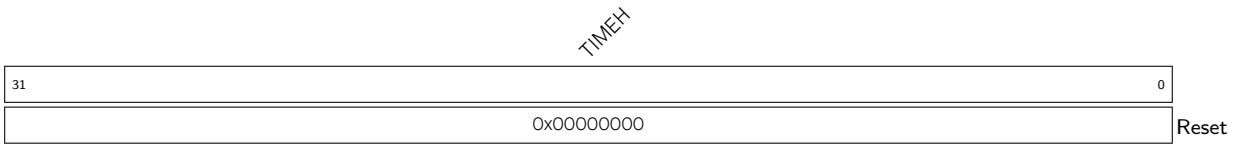
HPMCOUNTER8 Read-only mirror of mhpmcounter8. (RO)

Register 2.55. hpmcounter9 (0xC09)



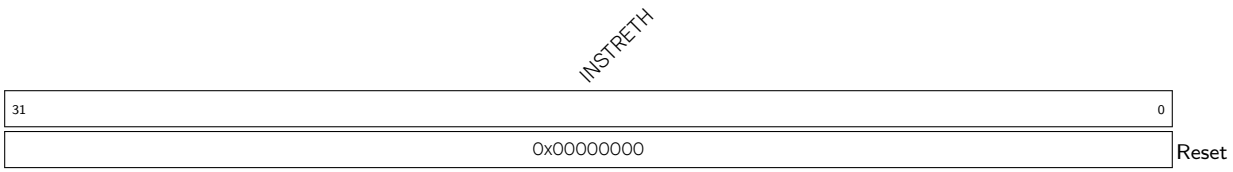
HPMCOUNTER9 Read-only mirror of mhpmcounter9. (RO)

Register 2.56. hpmcounter13 (0xC0D)



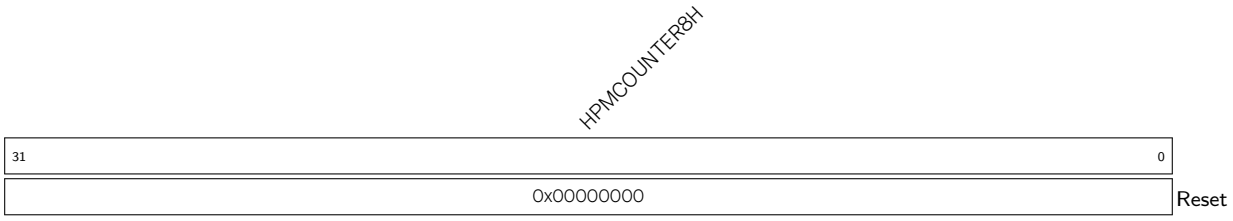
HPMCOUNTER13 Read-only mirror of mhpmcounter13. (RO)

Register 2.57. cycleh (0xC80)



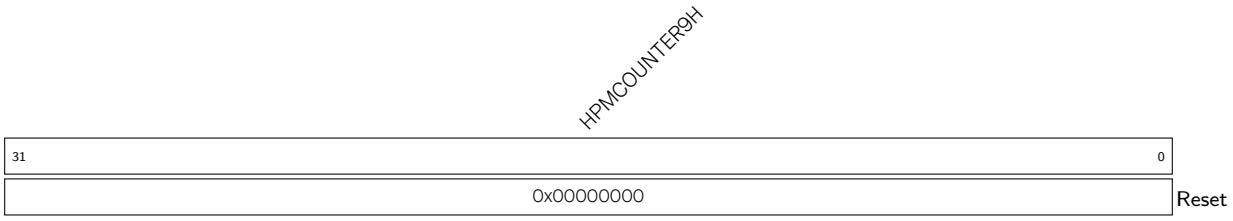
CYCLEH Read-only mirror of mcycleh. (RO)

Register 2.58. timeh (0xC81)



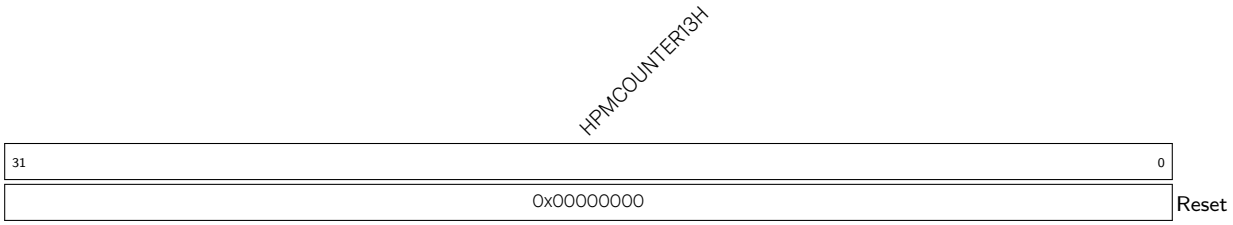
TIMEH Represents the upper 32 bits of the timer for RDTIME instruction. (RO)

Register 2.59. instreth (0xC82)



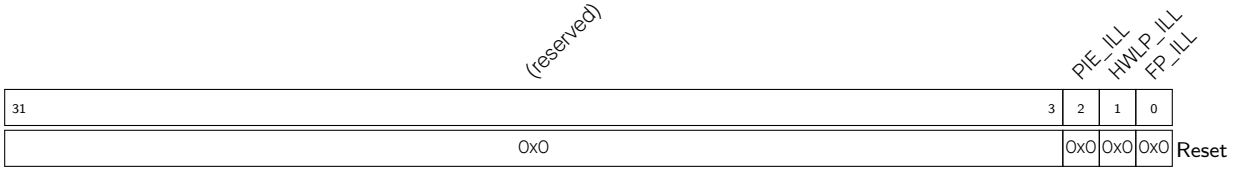
INSTRETH Read-only mirror of minstreth. (RO)

Register 2.60. hpmcounter8h (0xC88)



HPMCOUNTER8H Read-only mirror of mhpmcounter8h. (RO)

Register 2.61. hpmcounter9h (0xC89)

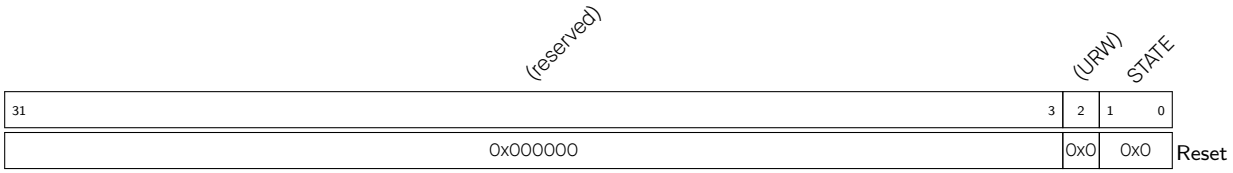


HPMCOUNTER9H Read-only mirror of mhpmcounter9h. (RO)

Register 2.62. hpmcounter13h (0xC8D)

HPMCOUNTER13H Read-only mirror of mhpmcounter13h. (RO)

Register 2.63. mext_ill (0x7F0)



PIE_ILL Represents whether an illegal instruction exception occurred due to the CPU attempting to execute instructions belonging to the disabled PIE extension. (R/W)

HWLP_ILL Represents whether an illegal instruction exception occurred due to CPU attempting to execute instructions belonging to the disabled HWLP extension. (R/W)

FP_ILL Represents whether an illegal instruction exception occurred due to the CPU attempting to execute instructions belonging to the disabled RV32F extension, i.e. mstatus.FS=0x0. (R/W)

Register 2.64. mext_hwlp_status (0x7F1)

URW Represents whether to enable user-mode access for user-mode hardware loop CSRs.

0: Access is disabled

1: Access is enabled

(R/W)

STATE Configures state of the HWLP extension:

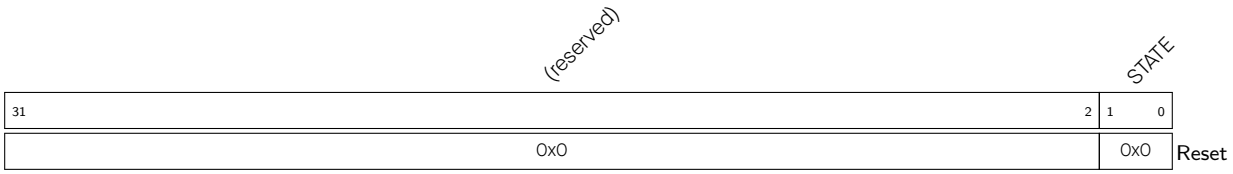
0x0: OFF (Accessing HWLP instructions/CSRs will trigger an illegal instruction exception)

0x1: INITIAL

0x2: CLEAN

0x3: DIRTY

Assuming state is not OFF, whenever HWLP CSRs are modified or HWLP instructions are executed the state will be updated to DIRTY. SW can set the state as INITIAL or CLEAN depending on the context. As specified in RISCV standard: When an extension's status is set to OFF, any instruction that attempts to read or write the corresponding state will cause an illegal instruction exception.



When the status is INITIAL, the corresponding state should have an initial constant value.

When the status is CLEAN, the corresponding state is potentially different from the initial value, but matches the last value stored on a context swap.

When the first iteration of HWLP is complete, the state changes to DIRTY. When the status is DIRTY, the corresponding state has potentially been modified since the last context save.

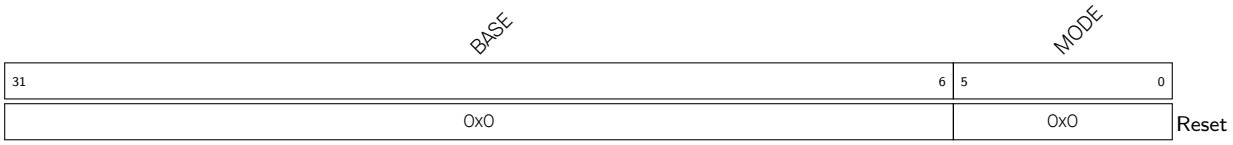
(R/W)

Register 2.65. mext_pie_status (0x7F2)

STATE Configures the state of the PIE extension:

0x0: OFF (Executing PIE instructions will trigger illegal instruction exception)

0x1: INITIAL



0x2: CLEAN

0x3: DIRTY

This is the extension state bits for the PIE extension, with similar functionality as the mstatus.FS bits of RV32F. Please refer to the "RISC-V Volume II - Privileged Architecture" for the standard interpretation of the STATE values.

(R/W)

Register 2.66. jvt (0x017)

BASE Represents jump table base address. (R/W)

MODE Represents configurable modes. This field is reserved to define the usage of this register. Currently, only one usage is defined, i.e., jump table. Other usages are reserved for future use).

0x0: The JTV_BASE is used as jump table

Others: reserved for future standard use

(R/W)

Register 2.67. mexstatus (0x7E1)

EXPT_VLD This bit is automatically set upon entering a trap handler.

This bit is only writable from debug mode.

(RO)

LOCKUP This bit is automatically set when double exceptions occur.

Upon lockup, the core will stall and wait for the debugger to resolve the lockup.

This bit is only writable from debug mode.

(RO)

BUS_ERR This bit is automatically set upon entering a load/store fault trap due to a bus error exception.

Upon entering the trap handler, this bit must be read to find if the load/store fault is due to a bus error.

When mexstatus.NMFT is enabled, this bit gets cleared automatically on executing MRET instruction.

When mexstatus.NMFT is disabled and mexstatus.PBEXE, this bit must be cleared manually before resuming execution, else it may re-trigger a pending bus error exception.

(R/W)

PBEXE Configures whether to enable the pending bus-error exception.

0: Disable

1: Enable

When mexstatus.PBEXE is enabled and mexstatus.NMFT is disabled, a synchronous exception is generated when mexstatus.BUS_ERR is set.

If mexstatus.NMFT is enabled, mexstatus.PBEXE has no effect.

Upon entering a trap the value of mexstatus.PBEXE is pushed into mexstatus.PPBEXE and mexstatus.PBEXE is set to 0, automatically.

Upon exiting a trap via MRET, the value of mexstatus.PPBEXE is popped back into mexstatus.PBEXE.

(R/W)

PPBEXE Configures whether to enable the previous pending bus-error exception.

0: Disable

1: Enable

Upon entering a trap, the value of mexstatus.PBEXE is pushed into mexstatus.PPBEXE.

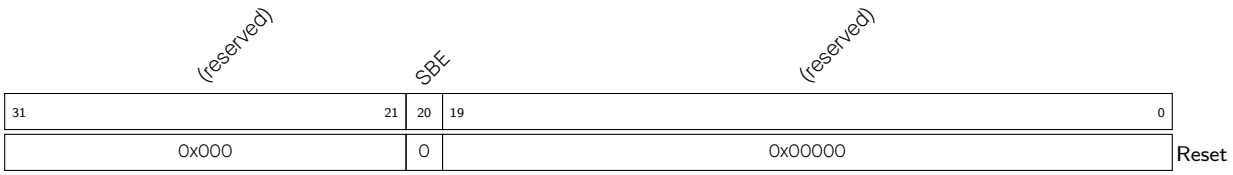
Upon exiting a trap via MRET, the value of mexstatus.PPBEXE is popped back into mexstatus.PBEXE and mexstatus.PPBEXE is set to 1, automatically.

(R/W)

Continued on the next page...

Register 2.67. mexstatus (0x7E1)

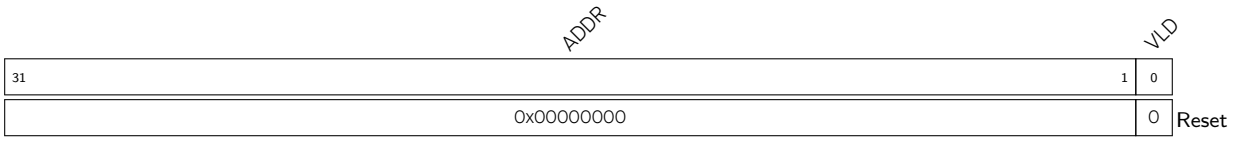
Continued from the previous page...



PMP_ERR This bit is automatically set upon entering load/store fault trap due to a PMP/PMA exception.
Upon entering the trap handler, this bit must be read to find if the load/store fault is due to PMP/PMA error.
This bit is cleared automatically upon MRET.
(R/W)

FETCH_ERR This bit is automatically set upon entering the fetch fault trap due to a bus-error exception.
Upon entering the trap handler, this bit must be read to find if the fetch fault is due to bus error.
This bit is cleared automatically upon MRET.
(R/W)

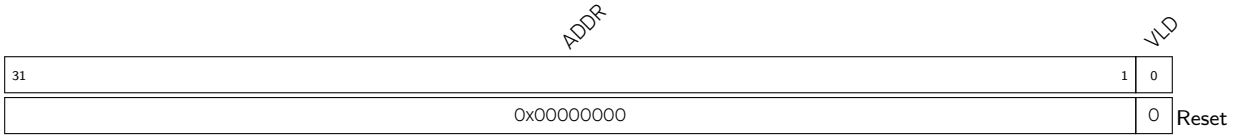
NMFT Configures whether to disable the memory fence on trap.
1: CPU will enter the trap handler upon exceptions/interrupts without waiting for pending memory load/store operations to finish (Default).
0: CPU will wait for pending memory load/store operations to finish before entering the trap handler.
(R/W)



CLIC_INHV Configures whether to enable resuming faulting vector table fetch.
0: Disable
1: Enable (default). When it is set, mcause.minhv is used to decide if mepc holds an instruction address or a vector table address.
(R/W)

Register 2.68. mhint (0x7C5)

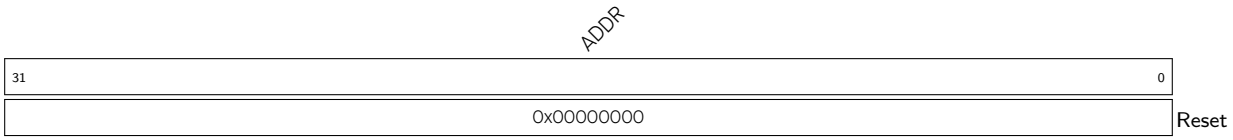
SBE Configures whether to enable the synchronous load/store bus-error exception.
0: Disable
1: Enable
(R/W)



Register 2.69. ldpc0 (0xBE0)

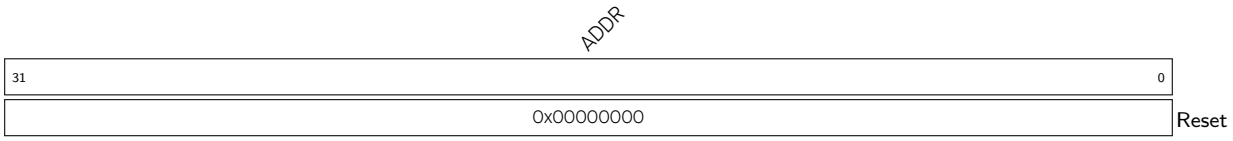
VLD Configures whether the program-counter address value in this CSR is valid for a recent load bus-error exception.
0: Not valid
1: Valid
(R/W)

ADDR Configures the higher 31 bits of the half-word-aligned program counter corresponding to the same load bus-error exception. (R/W)



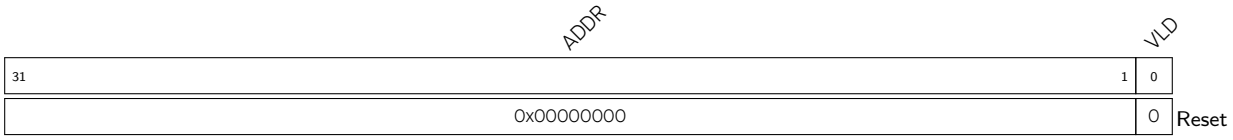
Register 2.70. ldpc1 (0xBE1)

VLD Configures whether the program-counter address value in this CSR is valid for a recent load bus-error exception.
0: Not valid
1: Valid
(R/W)



ADDR Configures the higher 31 bits of the half-word-aligned program counter corresponding to the same load bus-error exception. (R/W)

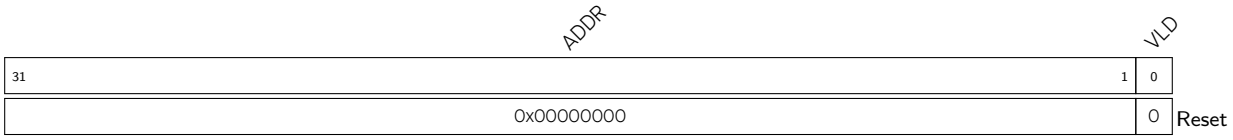
Register 2.71. ldtval0 (0xBE8)



ADDR Configures the access address corresponding to the load bus-error exception recorded in ldpc0. (R/W)

Register 2.72. ldtval1 (0xBE9)

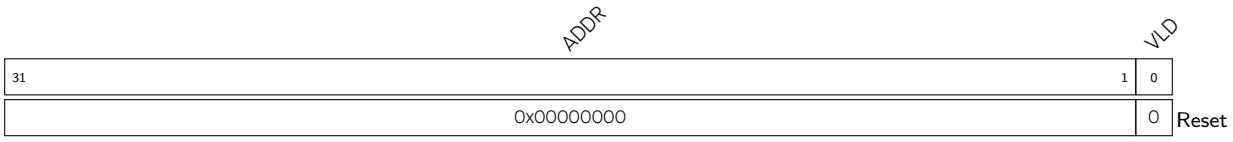
ADDR Configures the access address corresponding to the load bus-error exception recorded in ldpc1. (R/W)



Register 2.73. stpc0 (0xBF0)

VLD Configures whether the program-counter address value in this CSR is valid for a recent store bus-error exception.
0: Not valid
1: Valid
(R/W)

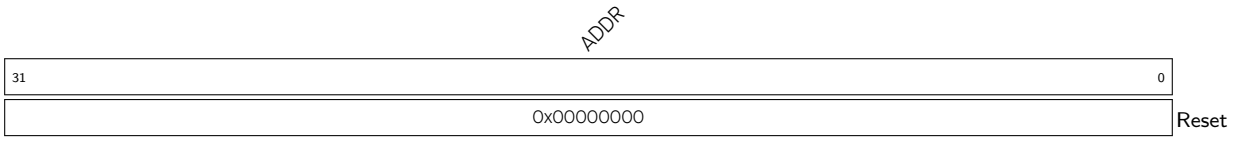
ADDR Configures the higher 31 bits of the half-word-aligned program counter corresponding to the same store bus-error exception. (R/W)



Register 2.74. stpc1 (0xBF1)

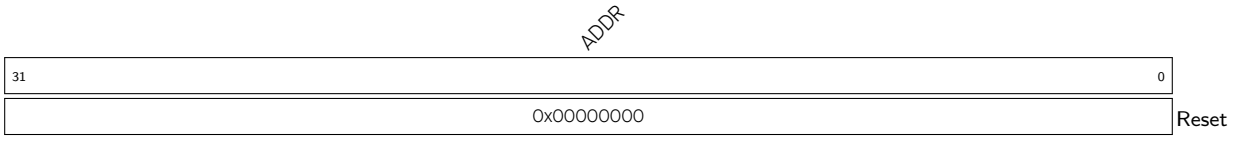
VLD Configures whether the program-counter address value in this CSR is valid for a recent store bus-error exception.
0: Not valid
1: Valid
(R/W)

ADDR Configures the higher 31 bits of the half-word-aligned program counter corresponding to the same store bus-error exception. (R/W)



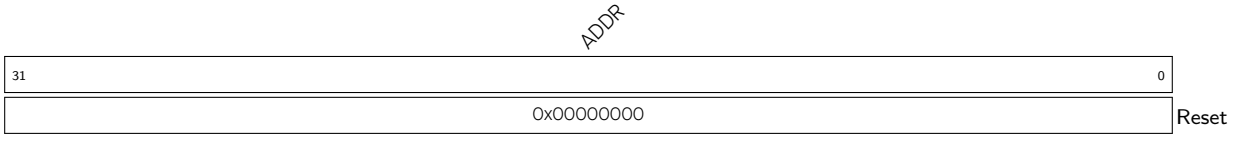
Register 2.75. stpc2 (0xBF2)

VLD Configures whether the program-counter address value in this CSR is valid for a recent store bus-error exception.
0: Not valid
1: Valid
(R/W)



ADDR Configures the higher 31 bits of the half-word-aligned program counter corresponding to the same store bus-error exception. (R/W)

Register 2.76. sttval0 (0xBF8)



ADDR Configures the access address corresponding to the store bus-error exception recorded in stpc0. (R/W)

Register 2.77. sttval1 (0xBF9)

ADDR Configures the access address corresponding to the store bus-error exception recorded in stpc1. (R/W)

Register 2.78. sttval2 (0xBFA)

ADDR Configures the access address corresponding to the store bus-error exception recorded in stpc2. (R/W)

2.6 RISC-V Standard ISA Extensions Support

Each HP core implements mandatory base integer ISA and is compliant with version 2.0 of RV32I base integer instruction set specified in RISC-V Instruction Set Manual, Volume I: RISC-V User-Level ISA, Version 2.2.

2.6.1 M Extension

2.6.1.1 Overview

In addition to base RV32I instruction set, each HP core also implements standard integer multiplication and division extension and is fully compliant with version 2.0 of standard extension "M" specified RISC-V Instruction Set Manual, Volume I: RISC-V User-Level ISA, Version 2.2.

2.6.1.2 Functional Description

Instructions specified in "M" extension perform multiply and divide operations on the values held in two integer registers. Below are CPU cycle details taken by multiply and divide instructions in the absence of any data hazard in the pipeline.

- MUL operation takes 2 cycles
- DIV operation takes 1-19 cycles depending on operands

2.6.2 C Extension

2.6.2.1 Overview

Each HP core also implements RISC-V standard compressed instruction set extension named "C" and is fully compliant with version 2.0 of standard extension "C" specified in RISC-V Instruction Set Manual, Volume I: RISC-V User-Level ISA, Version 2.2. RVC is generic term used to specify C extension support. RVC reduces static and dynamic code size by adding short 16-bit instruction encoding for common operations. Typically, 50-60% of the RISC-V instructions in a program can be replaced with RVC instructions, resulting in a 25-35% code-size reduction.

2.6.2.2 Functional Description

RVC uses a simple compression scheme that offers a shorter 16-bit version of 32-bit RISC-V instructions for any of the below scenarios:

1. Immediate and address offset is small
2. One of the registers is a zero register (x0), the ABI lint register (x1), or the ABI stack pointer (x2)
3. Destination register and the first source register are identical, or
4. The registers used are the 8 most popular ones i.e. x8-x15.

2.6.3 F Extension

2.6.3.1 Overview

Each HP core implements the RISC-V standard single-precision floating-point instruction set extension, "RV32F" extension in short. The RV32F extension also provides its own register file and various CSRs for configuration and flag checking. Please refer to the RISC-V Instruction Set Manual, Volume I: RISC-V User-Level ISA, Version 2.2, F Standard Extension Version 2.0" for complete information.

2.6.3.2 Functional Description

- Various instructions to perform floating-point arithmetic operations, conversion/move operations to/from integer format, comparison operations, classification operations, and memory load/store operations.
- Single-precision 32-bit floating-point operations compliant with IEEE 754-2008 standard.
- Separate 32-bit wide floating-point register file with 32 registers.
- Configurable rounding modes.
- Flags for checking inexact, overflow, underflow, invalid and divide by zero outcomes.
- Subnormal and NaN (not a number) arithmetic
- Status bits to control the availability of the extension and track its usage in the context of a program execution.

2.6.3.3 Initialization

The RV32F extension is disabled by default and must be manually enabled using the mstatus.FS bits. Otherwise, an illegal instruction exception will be generated upon executing any of the instructions, or accessing any of the CSRs, which are part of the RV32F extension.

Please refer to the RISC-V Instruction Set Manual, Volume II: Privileged Architecture, Version 1.10, Extension Context Status in mstatus Register for complete information.

2.6.4 Zc (Z) Extension

2.6.4.1 Overview

Zc extension is useful for code size reduction. Each HP core implements this extension compatible with Zc-specification v1.0.4-3. The Zc-specification has multiple subset extensions, and the ESP32-P4HP CPU has implemented Zcb, Zcmp, and Zcmt extensions.

2.6.4.2 Functional Description

Zcb Extension

The Zcb extension depends on the C extension and provides more compressed instructions for the following scenarios:

- Immediate and address offset is small.
- Destination register and the first source register are identical.
- The registers used are the 8 most popular ones (x8-x15).

Zcmp Extension

The Zcmp extension is a set of instructions which may be executed as a series of existing 32-bit RISC-V instructions.

- PUSH, POP, POPRET operations used to reduce the size of function prologues and epilogues
  - The PUSH operation
    - adjusts the stack pointer to create the stack frame
    - pushes (stores) the registers specified in the register list to the stack frame
  - The POP operation
    - pops (loads) the registers in the register list from the stack frame
    - adjusts the stack pointer to destroy the stack frame
  - The POPRET operation
    - pops (loads) the register in the register list from the stack frame
    - cm.popretz also moves zero into a0 as the return value
    - adjusts the stack pointer to destroy the stack frame
    - executes a ret instruction to return from the function
- Move two a0-a1 into two registers of s0-s7
- Move two s0-s7 into a0-a1

Zcmt Extension

The Zcmt extension is also referred to as table jump. It reads the jump target address from the jump table and then jumps to it.

Table jump uses a 256-entry 32-bit wide table in instruction memory to contain function address. The table must be a minimum of 64-byte aligned. It is used as a form of dictionary compression to reduce the code size of jal, auipc+jalr, jr, auipc+jr instructions.

Table jump allows the linker to replace the following instruction sequences with a cm.jalt encoding, and an entry in the table:

- 32-bit j calls
- 32-bit jal ra calls

2.6.4.3 Zc Instructions

Instruction	Mnemonic	Description
Zcb extension		
c.lbu	c.lbu rd', uimm(rs1')	Loads a byte from the memory address formed by adding rs1' to the zero-extended immediate uimm. The resulting byte is zero-extended to 32 bits and is written to rd'
c.lhu	c.lhu rd', uimm(rs1')	Loads a halfword from the memory address formed by adding rs1' to the zero-extended immediate uimm. The resulting byte is zero-extended to 32 bits and is written to rd'
c.lh	c.lh rd', uimm(rs1')	Loads a halfword from the memory address formed by adding rs1' to the zero-extended immediate uimm. The resulting byte is sign-extended to 32 bits and is written to rd'
c.sb	c.sb rs2', uimm(rs1')	Stores the least significant byte of rs2' to the memory address formed by adding rs1' to the zero-extended immediate uimm
c.sh	c.sh rs2', uimm(rs1')	Stores the least significant halfword of rs2' to the memory address formed by adding rs1' to the zero-extended immediate uimm
c.zext.b	c.zext.b rsd'	Zero-extends the least significant byte of the operand to 32 bits by inserting zeros into all of the bits more significant than 7
c.sext.b	c.sext.b rsd'	Sign-extends the least significant byte of the operand to 32 bits by copying the most significant bit in the byte to all the more significant bits
c.zext.h	c.zext.h rsd'	Zero-extends the least significant halfword of the operand to 32 bits by inserting zeros into all of the bits more significant than 15
c.sext.h	c.sext.h rsd'	Sign-extends the least significant halfword of the operand to 32 bits by copying the most significant bit in the halfword to all the more significant bits
c.not	c.not rsd'	Takes the one's complement of rd'/rs1' and writes the result to the same register
c.mul	c.mul rsd'	Multiplies 32 bits of the source operands from rsd' and rs2' and writes the lowest 32 bits to the result to rsd'
Zcmp extension		
cm.push	cm.push {reg_list}, -stack_adj	Stores the registers in reg_list to the memory below the stack pointer, and then creates the stack frame by decrementing the stack pointer by stack_adj, including any additional stack space requested by the value of spimm

Instruction	Mnemonic	Description
cm.pop	cm.pop {reg_list}, stack_adj	Loads the registers in reg_list from stack memory, and then adjusts the stack pointer by stack_adj
cm.popret	cm.popret {reg_list}, stack_adj	Loads the registers in reg_list from stack memory, adjusts the stack pointer by stack_adj, then return to ra
cm.popretz	cm.popretz {reg_list}, stack_adj	Loads the registers in reg_list from stack memory, adjusts the stack pointer by stack_adj, moves zero to a0 and then return to ra
cm.mva01s	cm.mva01s rs1', rs2'	Moves r1s' into a0 and r2s' into a1
cm.mva01	cm.mva01 r1s', r2s'	Moves a0 into r1s' and a1 into r2s'
Zcmt extension		
cm.jt	cm.jt index	Reads an entry from the jump vector table in memory and jumps to the address that was read
cm.jalt	cm.jalt index	Reads an entry from the jump vector table in memory and jumps to the address that was read, linking to ra

For more details about the instructions please refer to Zc-specification v1.0.4-3.

2.6.4.4 Limitations

jvt adds architecture state to the context. Therefore, it must be saved and restored on context switches.

2.6.5 Bit Manipulation (Zb) Extension

2.6.5.1 Overview

The bit-manipulation (bitmanip) extension, also known as the Zb extension set, consists of several component extensions to the base RISC-V architecture. These extensions aim to improve code density, performance, and energy efficiency. The HP core fully supports the Zb extension. For Zb extension specifications, please refer to Zb-specification v1.0.0.

2.6.5.2 Functional Description

Although the bitmanip instructions are designed for general-purpose use, certain instructions are more applicable to specific domains. Hence, the bitmanip extension set is divided into several smaller extensions instead of a single large one. Each extension has its own Zb*-extension name, and comprises instructions that share related functionality, use cases, and often the same implementation logic. Some instructions are available in only one extension, while others are available in several. The instructions have mnemonics and encodings that are independent of the extensions in which they appear. Thus, when implementing extensions with overlapping instructions, there is no redundancy in logic or encoding.

2.6.6 A Extension

2.6.6.1 Overview

Support for atomic (A) extension is available in compliance with RISC-V Instruction Set Manual, Volume I: RISC-V User-Level ISA, Version 2.2, with an emphasis to guarantee forward progress, i.e. any situation that may cause data memory lock for an indefinite amount of time is prevented by their very functionality.

2.6.6.2 Functional Description

Atomic (A) Extension contains instructions that atomically read-modify-write memory to support synchronization between multiple RISC-V harts running in the same memory space. The two forms of atomic instruction provided are load-reserved/store-conditional instructions and atomic fetch-and-op memory instructions. The atomic instructions currently ignore the aq (acquire) and rl (release) bits as they are irrelevant to the current architecture, in which memory ordering is always guaranteed.

2.6.6.3 Load-Reserve (LR.W) Instruction

The LR.W instruction simply locks a 32-bit aligned memory address to which the load access is being performed. Once a 4-byte memory region is locked, it will remain locked, i.e. other harts won't be able to access this same memory location, until any of the following scenarios is encountered during execution:

- any load operation
- any store operation
- any interrupts/exceptions
- backward jump/taken backward branch
- JALR
- ECALL/EBREAK/MRET/URET
- FENCE/FENCE.I
- debug mode
- critical section exceeding 64 bytes
- data address in SC.W instruction not matching that in LR.W instruction

If any of the above happens, except SC.W, the memory lock will be released immediately. If an SC instruction is encountered instead, the lock will be released eventually (not immediately) in the manner described in Section 2.6.6.4.

If a misaligned address is encountered, it will cause an exception with mcause = 6.

2.6.6.4 Store-Conditional (SC.W) Instruction

The SC.W instruction first checks if the memory lock is still valid, and the address is the same as specified during the last LR.W instruction. If so, only then will it perform the store to memory, and later release the lock as soon as it gets an acknowledgement of operation completion from the memory.

On the other hand, if the lock is found to have been invalidated (due to any of the situations as described in Section 2.6.6.3), it will set a fail code (currently always 1) in the destination register rd.

If a misaligned address is encountered, it will cause an exception with mcause = 6.

2.6.6.5 AMO Instructions

An AMO instruction executes in three steps:

1. Read data from memory address given by rs1, and save it to destination register rd.
2. Combine the data in rd and rs2 according to the operation type and keep the result for Step 3 below.
3. Write the result obtained in Step 2 above to memory address given by rs1.

There are nine different AMO operations: SWAP, ADD, AND, OR, XOR, MAX, MIN, MAXU, and MINU.

During this whole process, the memory address is kept locked from being accessed by other harts. If a misaligned address is encountered, it will cause an exception with mcause = 6.

For AMO operations both load and store access faults (PMP/PMA) are checked in the 1st step itself. For such cases mcause = 7.

2.7 Custom Instruction Extensions

2.7.1 Hardware Loop

2.7.1.1 Overview

HWLP (hardware loop) is the implementation of "For" loop in hardware. A loop is configured with a start and an end address and the number of iterations before its execution. When instruction execution encounters the start address, the loop execution starts. When the end address is executed, it is considered as one loop count and the start address is fetched again. This procedure is repeated until the loop count is equal to the number of iterations configured.

2.7.1.2 Features

HWLP has the following features:

- Execution with no extra penalty compared to conditional branch instructions
- Support for two nested HWLPs
- Configurable using a single instruction (lp.setupi) in case of end address within 1 KB from the configuration instruction

2.7.1.3 Functional Description

The configuration of HWLP is done either through CSRs or through custom instructions of HWLP, which will be described in detail in subsequent sections. Any HWLP needs to be configured with a start, an end address, and an iteration count.

When a single loop is to be set up, either Loop0 or Loop1 CSRs can be configured. Before setting up a HWLP, configure STATE bits in mhwloop_state_reg CSR to any value other than 0 (OFF, default state). Otherwise, accessing HWLP configuration CSRs will cause an illegal instruction exception. To set up and execute HWLP in user mode, URW bit in mhwloop_state_reg CSR should be set to 1.

The core supports a maximum of two HWLPs, which can be executed in nested fashion. Each loop is configured separately in this case. Note that, the inner loop has higher priority than the outer loop in case the end instruction of both loops is common. Hardware Loop0 has to be considered as the inner loop and Loop1 as the outer loop while configuring nested loops, as Loop0 has a higher priority than Loop1 in hardware implementation.

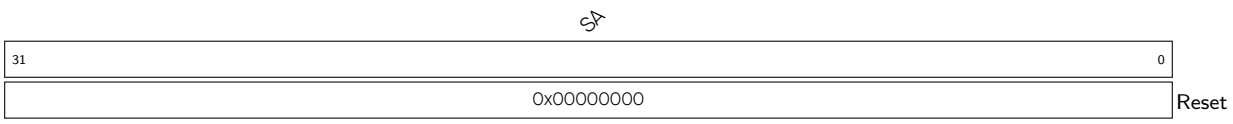
The advantage of a HWLP over a conditional branch instruction is that it has zero penalty for its execution. Branch/JUMP instructions use prediction logic for evaluating branch condition and branch/jump address. If a miss-prediction happens, the core pipeline will be flushed and the correct address will be fetched, and thus a few cycles have already been wasted in fetch of the incorrect instructions before flush. As the HWLP does not need prediction of result or target address of conditional branch, it has no penalty, and thus has a higher throughput.

2.7.1.4 Instructions/Operations/Modes Supported in HWLP

- Load type instructions
- Store type instructions

- Arithmetic, logical, AIA instructions
- Zc-extension instructions
- Any interrupts/exceptions within the HWLP
- ECALL/EBREAK
- FENCE/FENCE.I/CSRx instructions
- Atomic instructions
- Debug mode
- Data address in SC.W instruction not matching that in LR.W instruction

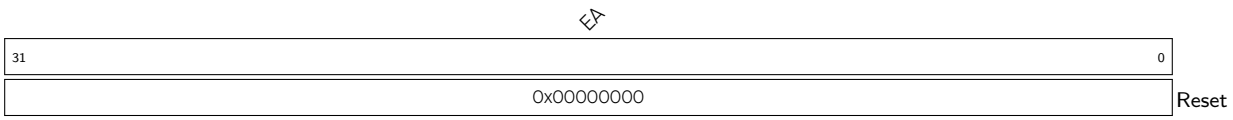
2.7.1.5 HWLP Constraints



Please note that branch or jump instructions at the end of HWLP may cause unexpected behavior.

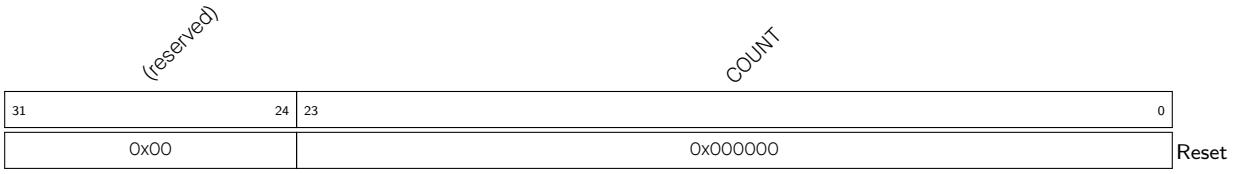
2.7.1.6 Register Summary

Name	Description	Address	Access
mhwloop0_start_addr	Machine Loop0 start address	0x7C6	R/W
mhwloop0_end_addr	Machine Loop0 end address	0x7C7	R/W
mhwloop0_count	Machine Loop0 count	0x7C8	R/W
mhwloop1_start_addr	Machine Loop1 start address	0x7C9	R/W
mhwloop1_end_addr	Machine Loop1 end address	0x7CA	R/W
mhwloop1_count	Machine Loop1 count	0x7CB	R/W
mext_ill_reg	Machine extension illegal register	0x7F0	R/W
mhwloop_state_reg	Machine HWLP state register	0x7F1	R/W
uhwloop0_start_addr	User Loop0 start address	0x8C0	R/W
uhwloop0_end_addr	User Loop0 end address	0x8C1	R/W
uhwloop0_count	User Loop0 count	0x8C2	R/W
uhwloop1_start_addr	User Loop1 start address	0x8C3	R/W
uhwloop1_end_addr	User Loop1 end address	0x8C4	R/W
uhwloop1_count	User Loop1 count	0x8C5	R/W
uhwloop_state_reg	User HWLP state register	0x8C6	R/W



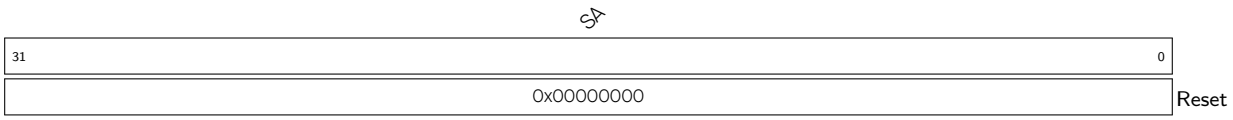
2.7.1.7 Register Description

Register 2.79. mhwloop0_start_addr (0x7C6)



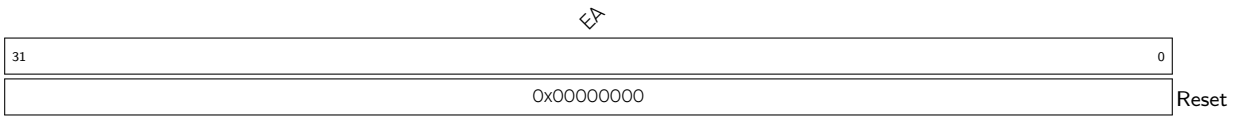
SA Configures the 32-bit address of the first instruction of HW Loop0. Valid when mhwloop_state_reg.STATE is not 0x0, that is, not OFF. (R/W)

Register 2.80. mhwloop0_end_addr (0x7C7)



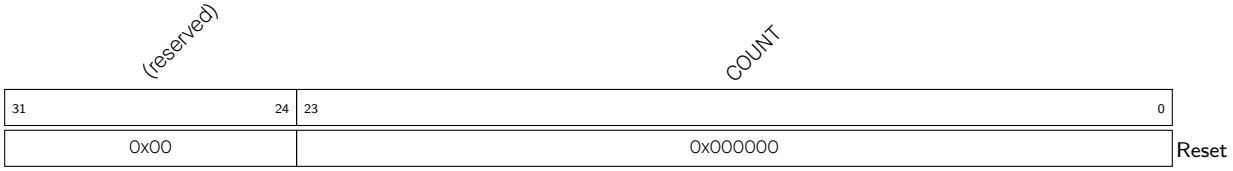
EA Configures the 32-bit address of the last instruction of HW Loop0. Valid when mhwloop_state_reg.STATE is not 0x0, that is, not OFF. (R/W)

Register 2.81. mhwloop0_count (0x7C8)



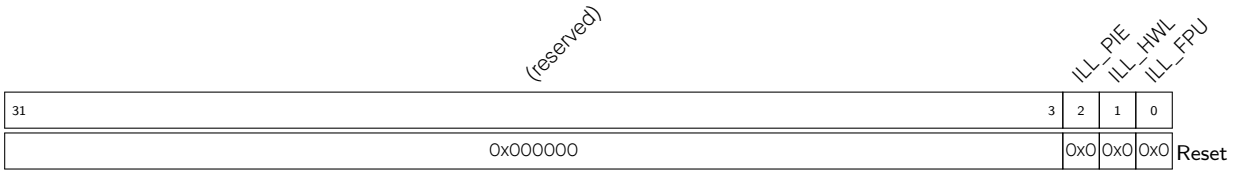
COUNT Configures the number of iterations of HW Loop0. Valid when mhwloop_state_reg.STATE is not 0x0, that is, not OFF. (R/W)

Register 2.82. mhwloop1_start_addr (0x7C9)



SA Configures the 32-bit address of the first instruction of HW Loop1. Valid when mhwloop_state_reg.STATE is not 0x0, that is, not OFF. (R/W)

Register 2.83. mhwloop1_end_addr (0x7CA)



EA Configures the 32-bit address of the last instruction of HW Loop1. Valid when mhwloop_state_reg.STATE is not 0x0, that is, not OFF. (R/W)

Register 2.84. mhwloop1_count (0x7CB)

COUNT Configures the number of iterations of HW Loop1. Valid when mhwloop_state_reg.STATE is not 0x0, that is, not OFF. (R/W)

Register 2.85. mext_ill_reg (0x7F0)

ILL_FPU Represents whether an illegal instruction is triggered due to the disabled F extension.

0: Not triggered

1: Triggered

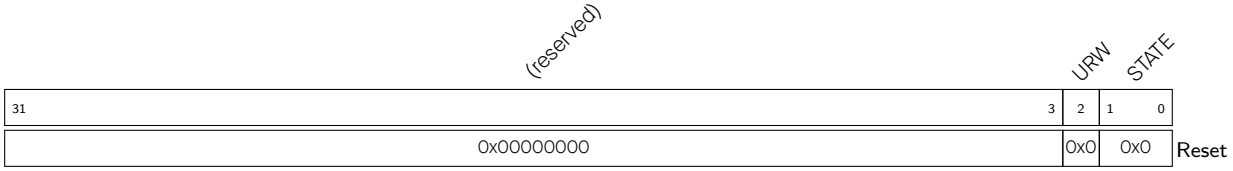
(RO)

ILL_HWL Represents whether the illegal instruction is triggered due to the disabled HWLP extension.

0: Not triggered

1: Triggered

(RO)



ILL_PIE Represents whether the illegal instruction is triggered due to the disabled PIE extension.

0: Not triggered

1: Triggered

(RO)

Register 2.86. mhwloop_state_reg (0x7F1)

STATE Configures the state of the HWLP extension.

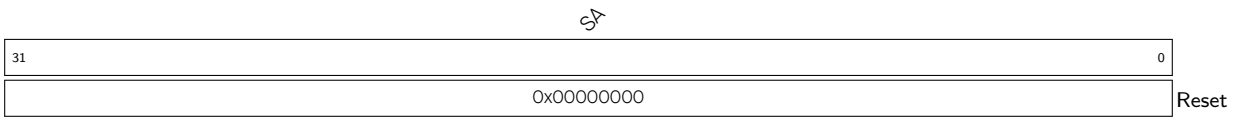
0x0: OFF (Accessing HWLP instructions and CSRs will trigger an illegal instruction exception)

0x1: INITIAL

0x2: CLEAN

0x3: DIRTY

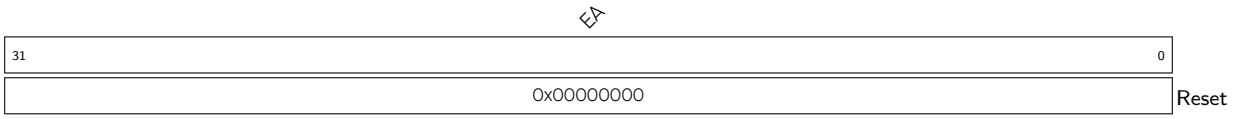
(R/W)



URW Configures user-mode access for user-mode HWLOOP CSRs.

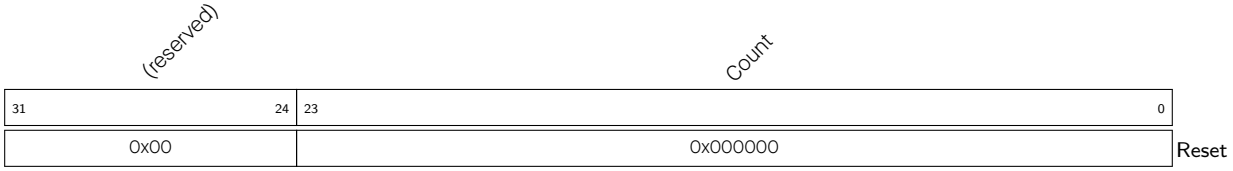
0: User-mode access is disabled

1: User-mode access is enabled



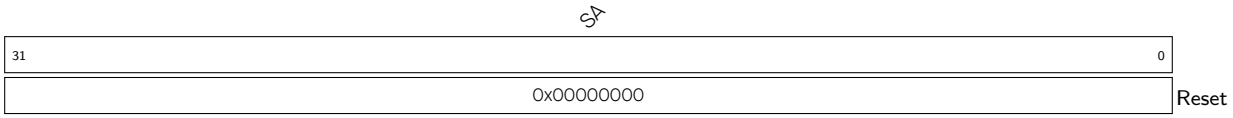
(R/W)

Register 2.87. uhwloop0_start_addr (0x8C0)



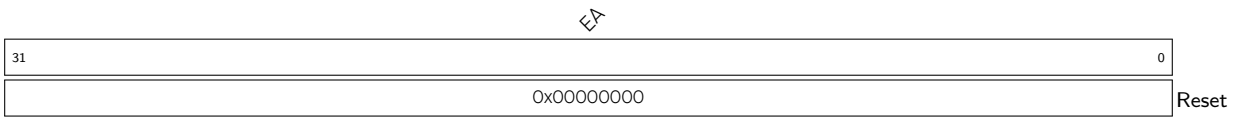
SA Configures the 32-bit address of the first instruction of HW Loop0 in user mode. Valid when mhwloop_state_reg.STATE is not 0x0, that is, not OFF. It is read-writable only when mhwloop_state_reg.URW is 1. (R/W)

Register 2.88. uhwloop0_end_addr (0x8C1)



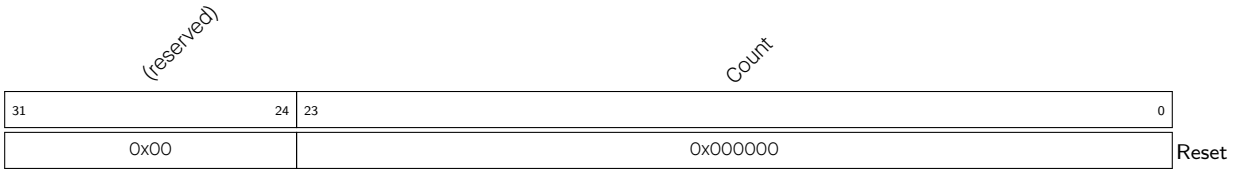
EA Configures the 32-bit address of the last instruction of HW Loop0 in user mode. Valid when mhwloop_state_reg.STATE is not 0x0, that is, not OFF. It is read-writable only when mhwloop_state_reg.URW is 1. (R/W)

Register 2.89. uhwloop0_count (0x8C2)



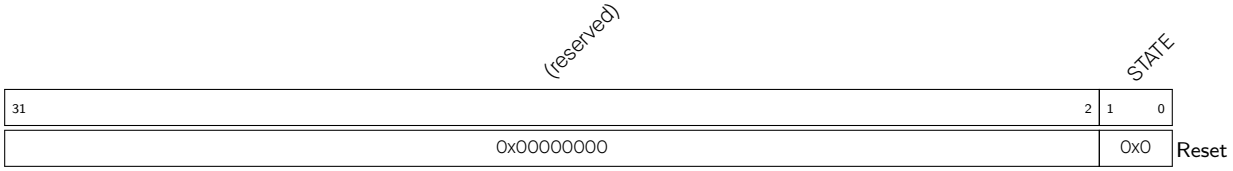
Count Configures the number of iterations of HW Loop0 in user mode. Valid when mhwloop_state_reg.STATE is not 0x0, that is, not OFF. It is read-writable only when mhwloop_state_reg.URW is 1. (R/W)

Register 2.90. uhwloop1_start_addr (0x8C3)



SA Configures the 32-bit address of the first instruction of HW Loop1 in user mode. Valid when mhwloop_state_reg.STATE is not 0x0, that is, not OFF. It is read-writable only when mhwloop_state_reg.URW is 1. (R/W)

Register 2.91. uhwloop1_end_addr (0x8C4)



EA Configures the 32-bit address of the last instruction of HW Loop1 in user mode. Valid when mhwloop_state_reg.STATE is not 0x0, that is, not OFF. It is read-writable only when mhwloop_state_reg.URW is 1. (R/W)

Register 2.92. uhwloop1_count (0x8C5)

Count Configures the number of iterations of HW Loop1 in user mode. Valid when mhwloop_state_reg.STATE is not 0x0, that is, not OFF. It is read-writable only when mhwloop_state_reg.URW is 1. (R/W)

Register 2.93. uhwloop_state_reg (0x8C6)

STATE Configures the state of the HWLP extension in user mode.

0x0: OFF (Accessing HWLP instructions and CSRs will trigger an illegal instruction exception)

0x1: INITIAL

0x2: CLEAN

0x3: DIRTY

Bits are physically the same as mhwloop_state_reg. Ensure the permission is enabled in mhwloop_state_reg.URW field.

Assuming state is not OFF, whenever HWLP CSRs are modified, or HWLP instructions are executed, the state will be updated to DIRTY.

(R/W)

2.7.1.8 HWLP Instructions

The table below contains the HWLP instruction set.

Table 2.7-2. HWLP Instructions

SN	Instruction Mnemonic	Description	31:20	19:15	14:12	11:8	7	6:0
1	lp.setupi L, uimm_Count, uimm_EndOffset	StartAddr = PC+4 EndAddr = PC+uimm_EndOffset Count = uimm_Count	uimm_Count [11:0]	uimm_EndOffset [5:1]	101	uimm_EndOffset [9:6]	L (index)	0101011
2	lp.setup L, rs1, uimm_EndOffset	StartAddr = PC+4 EndAddr = PC+uimm_EndOffset Count = GPR[rs1]	uimm_EndOffset [12:1]	rs1 [4:0] (count)	100	X	L (index)	0101011
3	lp.setup.beqz L, rs1, EndInstrSize, uimm_EndOffset	StartAddr = PC+4 EndAddr = PC+uimm_EndOffset Count = GPR[rs1] Size of HWLP end instruction = 32 bits if EndInstrSize is 1, 16 bits if EndInstrSize is 0	uimm_EndOffset [12:1]	rs1 [4:0] (count)	100	Size of end instruction (0000 for 16-bit instruction and 0010 for 32-bit instruction)	L (index)	0101011
4	lp.starti L, uimm_StartOffset	StartAddr = PC+uimm_StartOffset	uimm_StartOffset [12:1]	X	000	X	L (index)	0101011
5	lp.endi L, uimm_EndOffset	EndAddr = PC+uimm_EndOffset	uimm_EndOffset [12:1]	X	001	X	L (index)	0101011
6	lp.count L, rs1	Count = GPR[rs1]	X	rs1 [4:0] (count)	010	X	L (index)	0101011
7	lp.counti L, uimm_Count	Count = uimm_Count	uimm_Count [11:0]	X	011	X	L (index)	0101011

GoBack

2.7.2 Processor Instruction Extension

2.7.2.1 Overview

The Processor Instruction Extension (PIE) ISA entails various custom 128-bit wide SIMD (Single Instruction Multiple Data) and complex instructions for accelerating edge inference and digital signal processing applications. These instructions are fully integrated into the CPU pipeline for seamless use with the standard RV32IMAFC ISA with which the HP core is compliant. PIE Extension support is compliant to Espressif's PIE V2.2.0 version.

2.7.2.2 Functional Description

- 8 x 128-bit wide integer vector register files
- Each 128-bit wide vector register can be used as 16 x 8-bit elements, 8 x 16-bit elements, or 4 x 32-bit elements for SIMD operations
- Up to 128-bit wide memory load/store operations directly to/from the vector registers
- Fused instructions for parallel execution of arithmetic and memory operations
- Vector and scalar MAC units capable of operating on 16 x 8-bit elements or 8 x 16-bit elements per cycle
- 512-bit wide vector register for accumulating results of 8/16-bit vector MAC operations
- 40-bit wide scalar register for accumulating results of 8/16-bit scalar MAC operations
- Instructions for parallel 16-bit FFT/complex math operations
- Final results are generated after rounding and saturation
- Configurable rounding modes and scaling (arithmetic right shift) parameter

For a complete description of all the available instructions and configurations, please refer to Chapter 4 *Processor Instruction Extensions (PIE)*.

2.7.2.3 Initialization, Context Switching, and Exceptions

The PIE extension is disabled by default and must be manually enabled using the mext_pie_status.STATE field. Otherwise, an illegal instruction exception will be generated upon executing any of the instructions that are part of the PIE extension.

To indicate that an illegal instruction exception, i.e. exception with mcause = 0x2, has occurred due to disabled PIE extension, the HP core will set the mext_ill.PIE_ILL bit.

When the PIE extension is enabled, i.e. mext_pie_status.STATE bits are non-zero, the execution of any PIE instructions would always cause the mext_pie_status.STATE bits to change to DIRTY (11).

To enable the PIE extension, follow the steps below:

1. Set the mext_pie_status.STATE bits to the INITIAL (01) state.
2. Use the PIE instructions to initialize the PIE register file and accumulator registers to zero, which will cause the mext_pie_status.STATE bits to change to DIRTY (11) automatically.
3. Since the value of the PIE registers is known at this point, set the mext_pie_status.STATE bits to CLEAN (10).

4. Execute the application program.
5. During execution of the application code, if any PIE instruction is encountered, the mext_pie_status.STATE bits will automatically change to DIRTY (11).

During context switching, whether to save/restore the PIE extension registers can be decided based on the value of the mext_pie_status.STATE bits. If the value is DIRTY, the state of the PIE register must be saved to the stack. After that, the state would be updated to CLEAN or OFF, depending on whether the next context (thread) has the PIE extension enabled or not.

Some PIE instructions have constraints on the register fields or immediate fields. e.g. for fused instructions which are performing load and arithmetic, with the same destination register for the two parallel operations, it will be considered ambiguous and thus cause a PIE illegal exception with mcause = 0x1f.

2.8 Memory-Mapped Registers

2.8.1 Overview

The tightly-coupled memory-mapped registers below are present within the core complex:

- CLIC registers for each HP core
- Shared CLINT registers

2.8.2 Features

Each HP CPU core supports:

- Access to the other HP core's CLIC registers
- Bus-error exception generation on invalid address access
- Access to CLINT registers. However, only Core 0 can modify CLINT timer value

2.8.3 Functional Description

The table below shows the address decoding used by each HP core to access CLIC and CLINT address range.

Table 2.8-1. Address Decoding for Memory-Mapped Register Access

Bits	Description
31:28	Fixed as 0x2, i.e. base address
27:20	Identifies the sub module: 0x0: CLINT 0x08: CLIC 0xB: CLIC user Others: Reserved
19:16	Controls access type 0x0: Access own registers 0x1: Access the other core's registers
15:0	Register offset

Table 2.8-2. Internal Memory Address Map

Block	Start Address	End Address
CLINT (Self)	0x20000000	0x2000FFFF
CLIC (Self)	0x20800000	0x2080FFFF
CLINT (Other Core)	0x20010000	0x2001FFFF
CLIC (Other Core)	0x20810000	0x2081FFFF

2.9 Interrupt Controller

2.9.1 Overview

Each HP core uses the CLIC + CLINT scheme for implementing and supporting interrupts.

CLINT stands for core-local interrupts, which are sources local to the HP core subsystem for generating timer and software interrupts for each HP core.

CLIC stands for core-local interrupt controller, which provides low-latency, vectored, pre-emptive interrupts for each HP core. Each HP core CLIC unit supports 32 external interrupts and 2 CLINT interrupts.

2.9.2 CLIC

2.9.2.1 Overview

The HP core CLIC implementation follows the official specification: Core-Local Interrupt Controller (CLIC) RISC-V Privileged Architecture Extensions (10/10/2023).

Only the CLIC mode of operation is supported by the HP core, i.e. mtvec.MODE is hardwired to 0x3. Hence, the basic RISC-V interrupt handling scheme and the associated CSRs (such as mie, mip, mideleg, uie, and uip) are unavailable.

HP core supports machine mode interrupt as well as user mode interrupt delegation.

2.9.2.2 CLIC CSRs

The following machine mode CSRs are relevant for interrupt handling in the CLIC scheme:

- mstatus
- mtvec
- mtvt
- mscratch
- mepc
- mcause
- mnxti
- mintthresh
- mintstatus
- mclicbase
- mscratchcsw
- mscratchcswl

As mentioned earlier, the CLIC mode is decided by the mtvec.MODE field. In each HP core, these bits are hardwired to 0x3, indicating that only the CLIC mode is supported.

In CLIC mode, the global interrupt enable for machine mode is still dictated by the mstatus.MIE bit.

interrupt can be either vectored or non-vectored depending on the clicintattr[i].SHV bit.

For a non-vectored interrupt, the HP core jumps to the trap handler base address as configured in mtvec.BASE field.

For a vectored interrupt, the HP core jumps to the 32-bit word address stored at the corresponding index in the vector table. For example, for the "i"th machine mode interrupt, first the 32-bit address stored at the memory location "mtvt + 4*i" will be loaded, after which the HP core will treat the loaded data as an address and jump to it. The base address of the vector table is configured in mtvt.

Upon taking an interrupt, the HP core will store the address of the instruction that was interrupted in mepc. Also, the HP core will update the value of mcause based on the interrupt's ID.

2.9.2.3 Interrupt Mapping

CLIC in each HP core supports 32 external interrupts and 2 core-local interrupts.

The IDs 16-47 are mapped to the external interrupts, while IDs 15 and below are reserved for the core-local interrupts.

Table 2.9-1. CLIC Interrupt Mapping

ID	Description
0-2	NA (Reserved)
3	CLINT M mode software interrupt
4-6	NA (Reserved)
7	CLINT M mode timer interrupt
8-15	NA (Reserved)
16	External interrupt 0
17	External interrupt 1
18	External interrupt 2
...	...
45	External interrupt 29
46	External interrupt 30
47	External interrupt 31

For detailed description of the core-local interrupt sources, please refer to Section 2.9.3.

The mapping of the 32 external interrupts to the interrupt sources in SoC is managed using the Interrupt Matrix. Please refer to Chapter 13 *Interrupt Matrix* for details on how to configure and map to SoC interrupts to CLIC interrupts for each HP core.

2.9.2.4 CLIC Parameters

The available features of a CLIC implementation can be discovered using the registers mclicbase and clicinfo:

- mclicbase is a read-only CSR which holds the base address of the CLIC memory-mapped registers for machine mode.
- clicinfo is a memory-mapped read-only register. It consists of the following fields:
  - NUM_INTERRUPTS: Represents the number of interrupts supported by the current CLIC implementation
  - CLICINTCTLBITS: Represents the number of programmable higher bits in clicintctl[i] and mintthresh.TH for encoding the level and priority of each interrupt
- Once the value of the mclicbase is known, the full address of the clicinfo can be computed by adding the corresponding address offset of 0x0004 (shown in Section 2.9.2.6) to the mclicbase value.

2.9.2.5 Interrupt Level and Priority Encoding

Table 2.9-2 shows the possible ways that level and priority can be specified for CLIC interrupts, based on the configured values of mcliccfg.MNLBITS and clicintctl[i] registers, and the fixed value of the CLICINTCTLBITS

parameter (0x3 for this CLIC implementation).

Table 2.9-2. CLIC Level and Priority Encoding with CLICINTCTLBITS=3

mnlbits[3:0]	clicintctl[i][7:0]	Interrupt Levels	Interrupt Priorities
0	`ppp.....`	255	31, 63, 95, 127, 159, 191, 223, 255
1	`lpp.....`	127, 255	31, 63, 95, 127
2	`llp.....`	63, 127, 191, 255	31, 63
3-8	`lll.....`	31, 63, 95, 127, 159, 191, 223, 255	31

mcliccfg.MNLBITS decides the number of higher bits in the clicintctl[i] registers which are to be used to encode the level (indicated as `'l'` in the above table), while the remaining lower bits are used to encode the priority (indicated as `'p'` in the above table). Since only the higher bits of clicintctl[i] are writeable as per the CLICINTCTLBITS parameter, hence the remaining lower bits are tied to 1 (indicated as '.' in the above table).

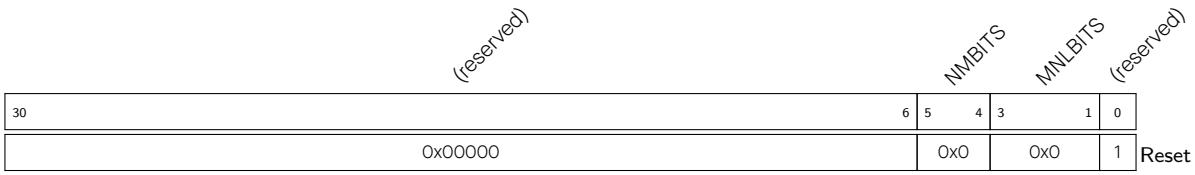
Level and priority are both used to give preference to one interrupt over the other. A higher level interrupt can preempt a lower level interrupt (assuming that mstatus.MIE is manually enabled inside an interrupt handler for allowing nesting), but in the case of two interrupts with same level and different priorities, the higher priority interrupt cannot preempt the lower priority interrupt while it is being serviced by the CPU. Thus, priority is only used as a tie-breaker to decide between two pending interrupts with the same level. Finally, if both level and priority are same for two interrupts, the one with the higher ID value is given preference.

The CPU internally uses the effective interrupt level threshold, which is defined as the maximum of mintstatus.MIL and mintthresh.TH, to decide if a new pending machine mode interrupt will be allowed to preempt the execution of an ongoing machine mode interrupt handler.

2.9.2.6 CLIC Memory-Mapped Register Summary

Listed below are all the CLIC machine mode memory-mapped registers. The address of each register is specified as an offset to the value of mclicbase, as well as the absolute address.

Note that the clicintip[i], clicintie[i], clicintattr[i] and clicintctl[i] registers are all byte sized. Still word and half-word aligned accesses to these registers will be performed atomically.



Machine Mode CLIC Registers				
Name	Description	MCLICBASE Offset	Absolute Address	Access
mcliccfg	CLIC machine mode global configuration register	0x0000	0x20800000	R/W
clicinfo	CLIC information register	0x0004	0x20800004	RO
mintthresh	CLIC machine mode interrupt threshold register	0x0008	0x20800008	R/W
clicintip[3]	Pending register for CLINT software interrupts	0x100C	0x2080100C	R/W
clicintie[3]	Enable register for CLINT software interrupts	0x100D	0x2080100D	R/W
clicintattr[3]	Attribute register for CLINT software interrupts	0x100E	0x2080100E	R/W
clicintctl[3]	Level control register for CLINT software interrupts	0x100F	0x2080100F	R/W
clicintip[7]	Pending register for CLINT timer interrupts	0x101C	0x2080101C	R/W
clicintie[7]	Enable register for CLINT timer interrupts	0x101D	0x2080101D	R/W
clicintattr[7]	Attribute register for CLINT timer interrupts	0x101E	0x2080101E	R/W

Name	Description	MCLICBASE Offset	Absolute Address	Access
clicintctl[7]	Level control register for CLINT timer interrupts	0x101F	0x2080101F	R/W
clicintip[16]	Pending register for external interrupt 0	0x1040	0x20801040	R/W
clicintie[16]	Enable register for external interrupt 0	0x1041	0x20801041	R/W
clicintattr[16]	Attribute register for external interrupt 0	0x1042	0x20801042	R/W
clicintctl[16]	Level control register for external interrupt 0	0x1043	0x20801043	R/W
clicintip[17]	Pending register for external interrupt 1	0x1044	0x20801044	R/W
clicintie[17]	Enable register for external interrupt 1	0x1045	0x20801045	R/W
clicintattr[17]	Attribute register for external interrupt 1	0x1046	0x20801046	R/W
clicintctl[17]	Level control register for external interrupt 1	0x1047	0x20801047	R/W
...	...	...	...	...
clicintip[n]	Pending register for nth external interrupt [6]	0x1040 + 4*n	0x20801040 + 4*n	R/W
clicintie[n]	Enable register for nth external interrupt [6]	0x1041 + 4*n	0x20801041 + 4*n	R/W
clicintattr[n]	Attribute register for nth external interrupt [6]	0x1042 + 4*n	0x20801042 + 4*n	R/W
clicintctl[n]	Level control register for nth external interrupt [6]	0x1043 + 4*n	0x20801043 + 4*n	R/W
....	....	....	....	....
clicintip[46]	Pending register for external interrupt 30	0x10B8	0x208010B8	R/W
clicintie[46]	Enable register for external interrupt 30	0x10B9	0x208010B9	R/W
clicintattr[46]	Attribute register for external interrupt 30	0x10BA	0x208010BA	R/W
clicintctl[46]	Level control register for external interrupt 30	0x10BB	0x208010BB	R/W
clicintip[47]	Pending register for external interrupt 31	0x10BC	0x208010BC	R/W
clicintie[47]	Enable register for external interrupt 31	0x10BD	0x208010BD	R/W
clicintattr[47]	Attribute register for external interrupt 31	0x10BE	0x208010BE	R/W
clicintctl[47]	Level control register for external interrupt 31	0x10BF	0x208010BF	R/W

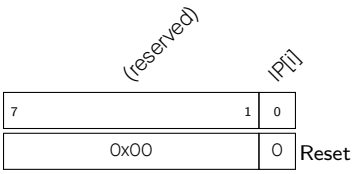
[6] It must be noted that the external interrupts are assigned to CLIC interrupt IDs 16 and onwards. Thus, the MCLICBASE offset can also be written as 0x1000 + 4*i, where "i" represents the CLIC ID, and n = i + 16. On the other hand, the descriptions of these registers use the CLIC index "i" to specify the offset instead of the external interrupt index "n", which is used here just for a matter of convenience.

2.9.2.7 CLIC Memory-Mapped Register Description

Register 2.94. mcliccfg (0x20800000)

MNLBITS Configures the number of upper bits that are used globally (for each HP core) to encode the interrupt level in all the 8-bit clicintctl[i] registers for each machine mode interrupt. The only allowed values are in the range 0-8. Any higher value will be clamped to 8. (R/W)

NMBITS Configures the number of bits in clicintattr[i].MODE to be used globally (for each HP core) to represent the mode of an interrupt. For systems with machine mode only, this is hardwired to 0. This indicates that the clicintattr[i].MODE field is hardwired to 0x3 and therefore all interrupts are in machine mode only. (RO)



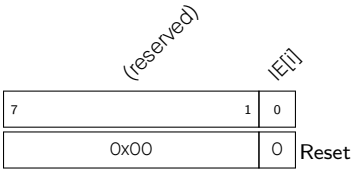
Register 2.95. clicinfo (0x20800004)

NUM_INTERRUPTS Represents the number of interrupts supported by this implementation of CLIC. Hardwired to 48. (RO)

CLICINTCTLBITS Represents the number of higher bits which are actually programmable in the 8-bit clicintctl[i] registers. Hardwired to 0x3. (RO)

Register 2.96. clicintip[i] (0x20801000 + 4*i)

IP[i] Represents the pending state for ith CLIC machine mode interrupt.



0: ith interrupt is not pending

1: ith interrupt is pending

- When the ith interrupt is configured as level type using clicintattr[i].TRIG, this bit is read-only, and to clear it the interrupt must be cleared from source.
- When the ith interrupt is configured as edge triggered using clicintattr[i].TRIG, this bit is R/W, and thus it is to be cleared by writing 0 to this register.

(R/W)

Register 2.97. clicintie[i] (0x20801001 + 4*i)

IE[i] Configures whether to enable the ith CLIC machine mode interrupt.

0: Disable

1: Enabled

(R/W)

Register 2.98. clicintattr[i] (0x20801002 + 4*i)

SHV Configures hardware vectoring for the ith CLIC machine mode interrupt.

0: ith interrupt is not hardware vectored. It means that upon taking this interrupt, the CPU will jump to the address configured in mtvec.

1: ith interrupt is hardware vectored. It means that upon taking this interrupt, the CPU will jump to the word address stored at (mtvt + 4*i) relative to the base address configured in mtvt.

(R/W)

TRIG Configures the trigger type and polarity of the ith CLIC machine mode interrupt.

0x0: interrupt is positive level-triggered

0x1: interrupt is positive edge-triggered

0x2: interrupt is negative level-triggered

0x3: interrupt is negative edge-triggered

(R/W)

MODE Configures the privilege mode of the ith CLIC interrupt.

0x0: User mode

0x3: Machine mode

Others: Reserved and not programmable

(R/W)

Register 2.99. clicintctl[i] (0x20801003 + 4*i)

CTL[i] Configures the level and priority of the ith CLIC machine mode interrupt.

- Since the CLICINTCTLBITS parameter is 3 in this implementation of CLIC, therefore the actual number of bits implemented in clicintctl[i] is the same, and thus the lower 5 bits of this register are hardwired to 1.
- The configured value of mcliccfg.MNLBITS determines the number of higher bits in clicintctl[i] which encode the level of the interrupt, while the remaining lower bits encode the priority.

(R/W)

2.9.3 Core-Local Interrupts (CLINT)

2.9.3.1 Overview

CLINT is the core-local interrupt (CLINT) block that includes software and timer interrupts and corresponding configuration registers. CLINT interrupt sources with IDs as shown below:

Table 2.9-4. Core-Local Interrupt Sources

ID	Description
3	M mode software interrupt
7	M mode timer interrupt

2.9.3.2 Features

- Two local level-type machine mode interrupt sources with programmable priorities
- Memory-mapped configuration and status registers
- 64-bit timer with interrupt functionality, overflow flags, and three sampling modes
- Software interrupt

2.9.3.3 Software Interrupt

An M mode software interrupt is controlled by setting or clearing the memory-mapped register MSIP.

The register bit clicintie[3] must be set for enabling the software interrupt at the core level.

Pending state of this interrupt can be checked by reading the corresponding bit of clicintip register of interrupt 3 in CLIC, that is clicintip[3] bit.

2.9.3.4 Timer Counter and Interrupt

The timer counter can be enabled by setting the mtime_EN bit in mtimectl.

mtimecmplo and mtimecmphi registers are set to the value for comparison with system timer with lower and higher 32 bits respectively.

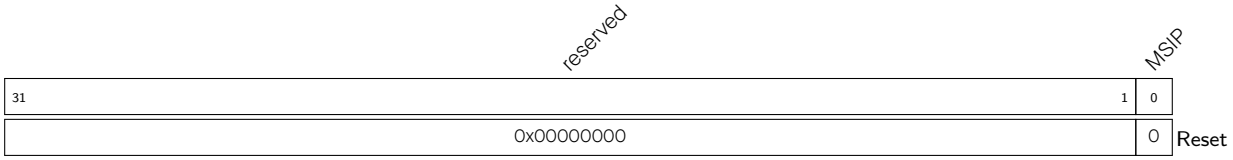
The CPU provides two local memory-mapped 32-bit wide registers mtimeloadlo and mtimeloadhi, which has both read/write access, to load the system timer with a specific value.

Interrupt for M mode is asserted when 64-bit value of system timer value exceeds the 64-bit combined value of mtimecmplo and mtimecmphi.

Pending state of timer interrupt is reflected as IP bit of clicintip register of interrupt 7 in CLIC.

For de-asserting the pending timer interrupt in M mode, either IE bit of clicintie register of interrupt 7 in CLIC has to be cleared or the value of the mtimecmplo and mtimecmphi register needs to be updated.

2.9.3.5 Register Summary



The addresses in this section are relative to CPU sub-system base address provided in Figure 9.3-1 in Chapter 9 *System and Memory*.

Name	Description	Address	Access
msip	Core-local machine software interrupt pending register	0x0000	R/W
mtimecmplo	Lower 32 bits of the core-local machine timer compare value	0x4000	R/W
mtimecmphi	Higher 32-bit core-local machine timer compare value	0x4004	R/W
mtimeloadlo	Lower 32 bits of core-local machine timer load value	0x4008	R/W
mtimeloadhi	Higher 32 bits of core-local machine timer load value	0x400C	R/W
mtimectl	Core-local machine timer interrupt control/status register	0x4010	R/W
mtimelo	Lower 32 bits of core-local timer counter value	0xBFF8	RO
mtimehi	Higher 32 bits core-local timer counter value	0xBFFC	RO

2.9.3.6 Register Description

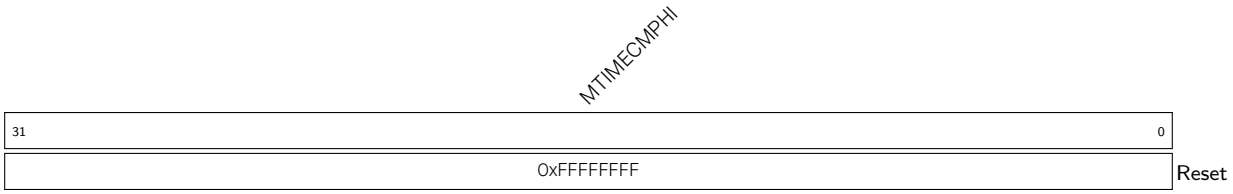
The addresses in this section are relative to CPU sub-system base address provided in Figure 9.3-1 in Chapter 9 *System and Memory*.

Register 2.100. msip (0x0000)

MSIP Configures the pending status of the machine software interrupt.

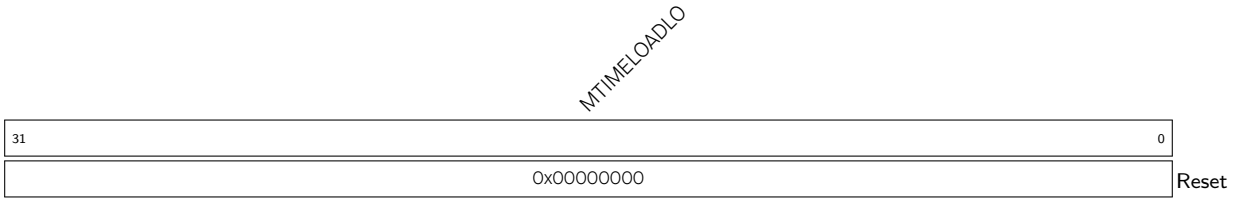
0: Not pending

1: Pending



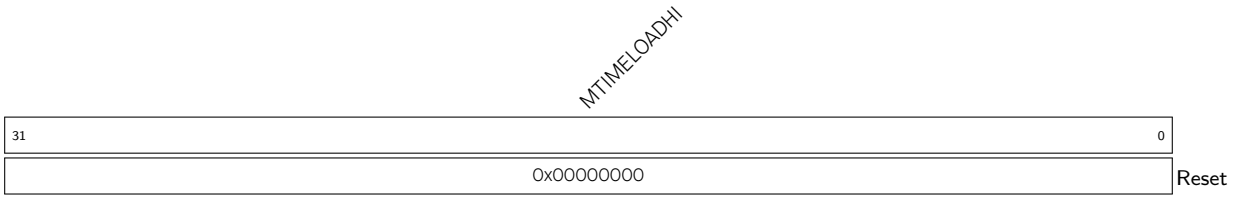
(R/W)

Register 2.101. mtimecmplo (0x4000)



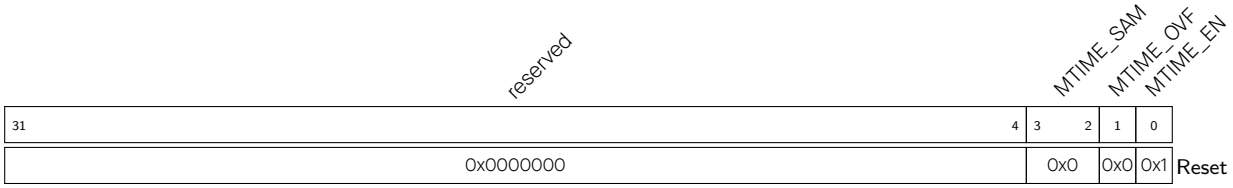
MTIMECMPLO Represents the value to compare with the lower 32 bits of the system counter. (R/W)

Register 2.102. mtimecmphi (0x4004)



MTIMECMPHI Represents the value to compare with the higher 32 bits of the system counter. (R/W)

Register 2.103. mtimeloadlo (0x4008)



MTIME_LOADLO Represents the lower 32 bits to be loaded to the system counter. (R/W)

Register 2.104. mtimeloadhi (0x400C)

MTIME_LOADHI Represents the higher 32 bits to be loaded to the system counter. (R/W)

Register 2.105. mtimectl (0x4010)

MTIME_EN Configures whether to enable the system counter.

1: Enable

0: Disable

This bit is implemented only in Core 0 MTIMERCTL register. Writing the corresponding bit of Core 1's MTIMERCTL has no effect on the system timer. Since Core 1 can access Core 0's CLINT registers, it can run or pause the timer from MTIMERCTL register of Core 0.

(R/W)

MTIME_OVF Configures the overflow bit of the system counter.

1: Represents that system counter value is maximum, that is 0xFFFFFFFFFFFFFFFF

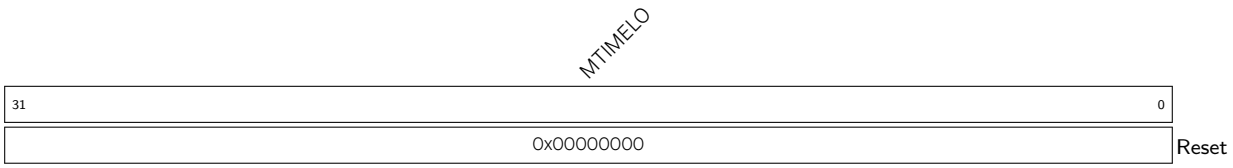
0: Otherwise

When the counter value is 0xFFFFFFFFFFFFFFFF, which is the maximum value, then this bit is set as 1 by hardware. Software can clear this bit by writing 0 to it. Writing 1 has no effect.

(R/W)

MTIME_SAM Configures the sampling mode of MTIMELO and MTIMEHI registers to allow accurate reading of the 64-bit system count. For the 64-bit system count, only one half of the read can be performed atomically. Therefore, the sampling mode allows the value of the other half to be sampled and stored in a buffer, and upon the next read of the other half, the sampled value from this buffer is retrieved instead of the actual counter.

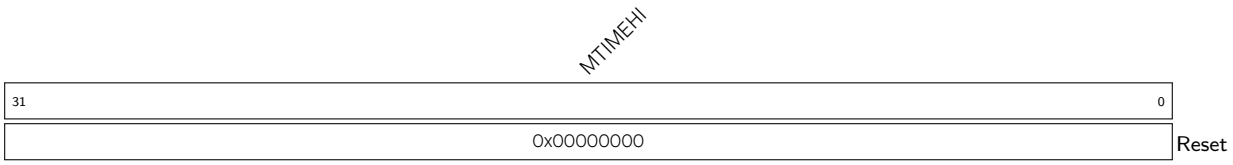
0x0: No sampling (Default)



0x1: Sample upper half of the system count on reading MTIMELO

0x2: Sample lower half of the system count on reading MTIMEHI

0x3: Sample the other half of the system count on reading MTIMELO or MTIMEHI



(R/W)

Register 2.106. mtimelo (0xBFF8)

MTIMELO Represents the current value of the lower 32 bits of the system counter. (RO)

Register 2.107. mtimehi (0xBFFC)

MTIMEHI Represents the current value of the higher 32 bits of the system counter. (RO)

2.10 Memory Protection Unit

Each HP core implements standard RISC-V physical memory protection (PMP) scheme along with custom physical memory attribute checker (PMAC) logic to prevent unauthorized memory access.

2.10.1 Standard Physical Memory Protection

2.10.1.1 Overview

The CPU core includes a physical memory protection (PMP) unit, which is fully compliant with RISC-V Instruction Set Manual, Volume II: Privileged Architecture, Version 1.10. It can be used by software to set memory access privileges (read, write and execute permissions) for required memory regions. In addition to standard PMP checks, the CPU core also implements custom physical memory attributes (PMA) checkers to provide additional permission checks based on pre-defined attributes.

2.10.1.2 Features

The PMP unit can be used to restrict access to physical memory. The main features are:

- Up to 32 PMP entries
- Minimum address granularity of 128 bytes
- Three address matching modes: OFF, TOR (Top of Range), and NAPOT (Naturally Aligned Power-of-Two). NA4 (Naturally Aligned 4-Byte Region) address matching mode is not supported
- Permission controls for read, write, and execute
- Lock function for each PMP entry
- Maximum physical space address of 4 GB

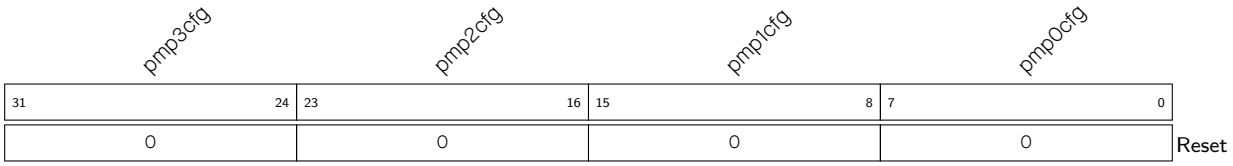
2.10.1.3 Functional Description

Software can program the PMP unit's configuration and address registers in order to contain faults and support secure execution. PMP CSRs can only be programmed in machine mode. Once the PMP unit is enabled by configuring PMP CSRs, write, read and execute permission checks are applied to all the accesses in user mode as per programmed values of the enabled 16 pmpcfgX and pmpaddrX registers (refer to Section 2.10.1.4).

By default, PMP grants permission to all accesses in machine mode and revokes permission of all access in user mode. This implies that it is mandatory to program the address range and valid permissions in pmpcfg and pmpaddr registers (refer to Section 2.10.1.4) for any valid access to pass through in user mode. However, it is not required for machine mode as PMP permits all accesses to go through by default. In cases where PMP checks are also required in machine mode, software can set the lock bit of required PMP entry to enable permission checks on it. Once the lock bit is set, it can only be cleared through CPU reset.

When any instruction is being fetched from a memory region without execute permissions, an exception is generated at processor level and exception cause is set as instruction access fault in mcause CSR. Similarly, any load/store access without valid read/write permissions will result in an exception generation with mcause updated as load access and store access fault respectively. In case of load/store access faults, violating address is captured in mtval CSR.

2.10.1.4 Register Summary



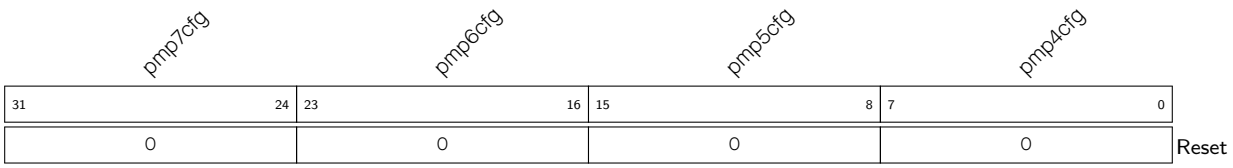
Below is a list of PMP CSRs supported by the CPU. These are only accessible from machine mode.

Name	Description	Address	Access
pmpcfg0	Physical memory protection configuration register	0x3A0	R/W
pmpcfg1	Physical memory protection configuration register	0x3A1	R/W
pmpcfg2	Physical memory protection configuration register	0x3A2	R/W
pmpcfg3	Physical memory protection configuration register	0x3A3	R/W
pmpcfg4	Physical memory protection configuration register	0x3A4	R/W
pmpcfg5	Physical memory protection configuration register	0x3A5	R/W
pmpcfg6	Physical memory protection configuration register	0x3A6	R/W
pmpcfg7	Physical memory protection configuration register	0x3A7	R/W
pmpaddr*n* (*n*: 0-31)	Physical memory protection address register	0x3B0+0x1**n*	R/W

2.10.1.5 Register Description

PMP unit implements all pmpcfg0-3 and pmpaddr0-15 CSRs as defined in RISC-V Instruction Set Manual, Volume II: Privileged Architecture, Version 1.10.

Register 2.108. pmpcfg0 (0x3A0)



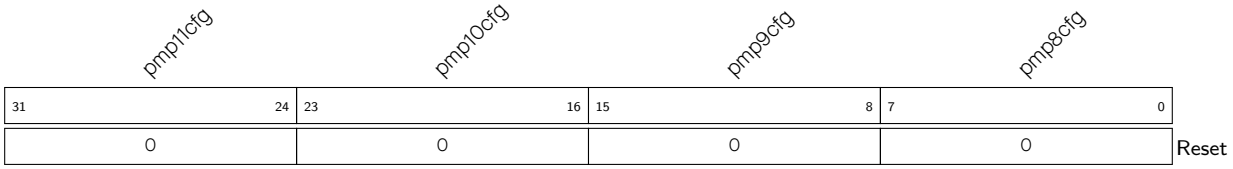
pmp3cfg Configuration register for PMP entry 3. (R/W)

pmp2cfg Configuration register for PMP entry 2. (R/W)

pmp1cfg Configuration register for PMP entry 1. (R/W)

pmp0cfg Configuration register for PMP entry 0. (R/W)

Register 2.109. pmpcfg1 (0x3A1)



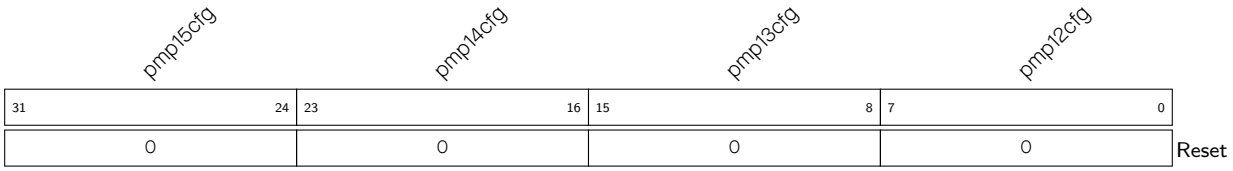
pmp7cfg Configuration register for PMP entry 7. (R/W)

pmp6cfg Configuration register for PMP entry 6. (R/W)

pmp5cfg Configuration register for PMP entry 5. (R/W)

pmp4cfg Configuration register for PMP entry 4. (R/W)

Register 2.110. pmpcfg2 (0x3A2)



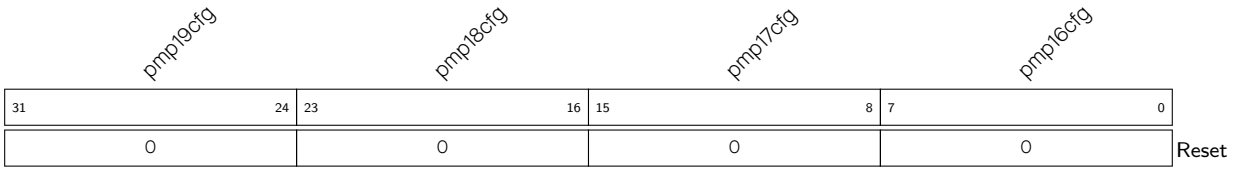
pmp11cfg Configuration register for PMP entry 11. (R/W)

pmp10cfg Configuration register for PMP entry 10. (R/W)

pmp9cfg Configuration register for PMP entry 9. (R/W)

pmp8cfg Configuration register for PMP entry 8. (R/W)

Register 2.111. pmpcfg3 (0x3A3)



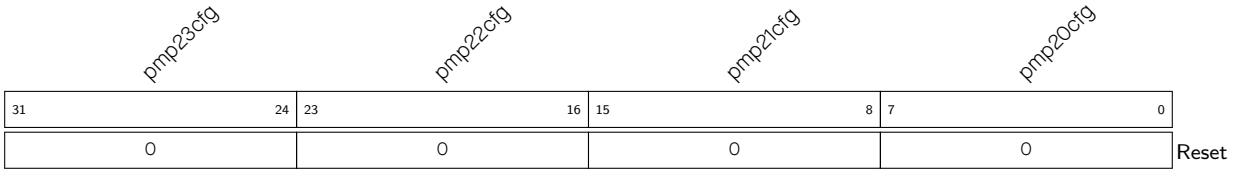
pmp15cfg Configuration register for PMP entry 15. (R/W)

pmp14cfg Configuration register for PMP entry 14. (R/W)

pmp13cfg Configuration register for PMP entry 13. (R/W)

pmp12cfg Configuration register for PMP entry 12. (R/W)

Register 2.112. pmpcfg4 (0x3A4)



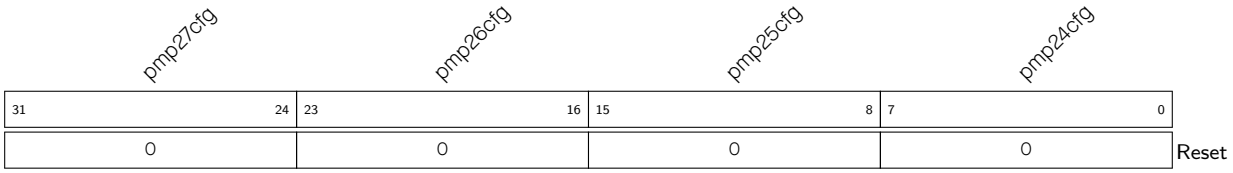
pmp19cfg Configuration register for PMP entry 19. (R/W)

pmp18cfg Configuration register for PMP entry 18. (R/W)

pmp17cfg Configuration register for PMP entry 17. (R/W)

pmp16cfg Configuration register for PMP entry 16. (R/W)

Register 2.113. pmpcfg5 (0x3A5)



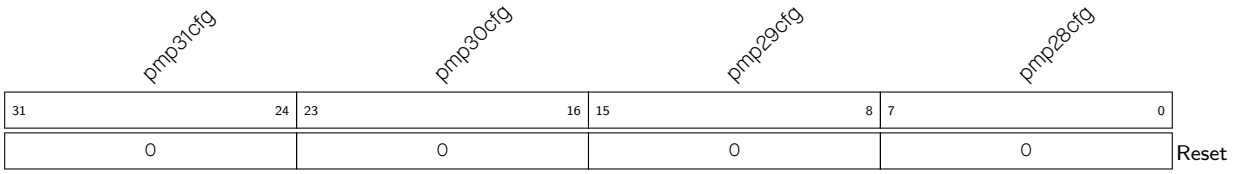
pmp23cfg Configuration register for PMP entry 23. (R/W)

pmp22cfg Configuration register for PMP entry 22. (R/W)

pmp21cfg Configuration register for PMP entry 21. (R/W)

pmp20cfg Configuration register for PMP entry 20. (R/W)

Register 2.114. pmpcfg6 (0x3A6)



pmp27cfg Configuration register for PMP entry 27. (R/W)

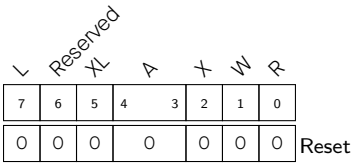
pmp26cfg Configuration register for PMP entry 26. (R/W)

pmp25cfg Configuration register for PMP entry 25. (R/W)

pmp24cfg Configuration register for PMP entry 24. (R/W)

Register 2.115. pmpcfg7 (0x3A7)

pmp31cfg Configuration register for PMP entry 31. (R/W)



pmp30cfg Configuration register for PMP entry 30. (R/W)

pmp29cfg Configuration register for PMP entry 29. (R/W)

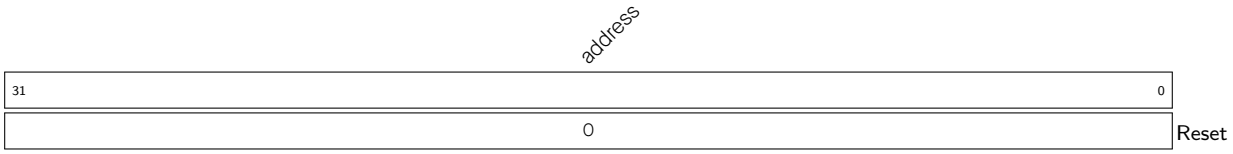
pmp28cfg Configuration register for PMP entry 28. (R/W)

The PMP configuration register format for any PMP entry is shown as follows.

Register 2.116. pmpXcfg

L Configures lock bit. Once set, it can only be cleared through a core reset. (R/W)

XL Configures custom-lock bit. Once set, it can only be cleared through a core reset.
0: PMP CSR accesses work normally
1: The corresponding pmpaddr and pmpcfg entry are locked and cannot be modified
(R/W)



A Configures address matching mode.
0: OFF
1: TOR (Top of range)
2: Not Supported
3: NAPOT (Naturally aligned power-of-two region >= 128 Bytes)
(R/W)

X Configures execute permission. When set, execution from the address range is allowed. (R/W)

W Configures write permission. When set, memory writes to the address range are allowed. (R/W)

R Configures read permission. When set, memory reads from the address range are allowed. (R/W)

Register 2.117. pmpaddr*n* (*n*: 0-31) (0x3B0+0x1**n*)

address Configures the address for pmpaddr*n*. (R/W)

2.10.2 Custom Physical Memory Attribute (PMA) Checker

2.10.2.1 Overview

CPU core also implements a custom physical memory attributes checker (PMAC) to provide additional permission checks based on pre-defined memory types configured through custom CSRs. Please note that the PMA checks are applied irrespective of the core's privilege mode, i.e., it doesn't differentiate between machine and user mode.

2.10.2.2 Features

PMAC supports below features:

- 16 PMA entries
- Configurable memory type for defined memory regions
- Minimum address granularity of 128 bytes
- Three address matching mode: OFF, TOR (Top of Range) and NAPOT (Naturally Aligned Power-of-Two). NA4 (Naturally Aligned 4-Byte Region) address matching mode is not supported
- Permission controls for read, write and execute
- Lock function for each PMA entry
- Maximum physical space address of 4 GB
- Configurable attribute for defined memory regions

2.10.2.3 Functional Description

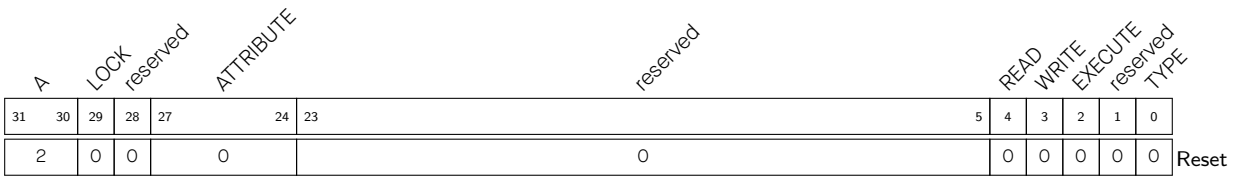
Software can program the PMAC unit's configuration and address registers in order to avoid faults due to access to invalid memory regions. PMAC CSRs can only be programmed in machine mode. Once enabled, write, read and execute permission checks are applied to all the accesses irrespective of privilege mode as per programmed values of enabled 16 pma_cfgX and pma_addrX registers (refer to Section 2.10.2.4). Access to entries marked as invalid memory types will result in fetch fault or load/store fault exception, as the case may be.

Exception generation and handling for PMAC related faults will be handled in similar way to PMP checks. When any instruction is being fetched from a memory region configured as a null or an invalid memory region, an exception is generated at the processor level and the exception cause is set as instruction access fault in mcause CSR. Similarly, any load/store access to a null or an invalid memory region will result in an exception generation with mcause updated as load access or store access fault respectively. In case of load/store access faults, violating address is captured in mtval CSR. For the PMAC entries configured as valid memory, the handling is same as for PMP checks.

A lock bit per entry is also provided in case software wants to disable programming of PMAC registers. Once the lock bit in any pma_cfgX register is set, respective pma_cfgX and pma_addrX registers can not be programmed further, unless a CPU reset cycle is applied.

A 4-bit field in PMAC CSRs is also provided to define attributes for memory regions. These bits are not used internally by the CPU core for any purpose. Based on address match, these attributes are provided on

load/store interface as side-band signals and are used by cache controller block for its internal operation.



2.10.2.4 Register Summary

Below is a list of PMA CSRs supported by the CPU. These are only accessible from machine mode.

Name	Description	Address	Access
pma_cfg*n* (*n*: 0-15)	Physical memory attribute configuration register	0xBC0+0x1**n*	R/W
pma_addr*n* (*n*: 0-15)	Physical memory attribute address register	0xBD0+0x1**n*	R/W

2.10.2.5 Register Description

Register 2.118. pma_cfg*n* (*n*: 0-15) (0xBC0+0x1**n*)

A Configures address type. The functionality is the same as pmpcfg register's A field.

0x0: OFF

0x1: TOR

0x2: NA4

0x3: NAPOT

(R/W)

LOCK Configures whether to lock the corresponding pma_cfgX and pma_addrX.

0: Not lock

1: Lock. The write permission to the corresponding pma_cfgX and pma_addrX is revoked. It can only be unlocked by core reset.

(R/W)

ATTRIBUTE Configures the values to be driven on DRAM attribute ports.

Bit 27:

0: Cacheable

1: Non-cacheable

Bit 26:

0: Write-back

1: Write-through

Bit 25:

0: Write miss allocate

1: Write miss no allocate

Bit 24:

0: Read miss allocate

1: Read miss no allocate

(R/W)

READ Configures read-permission for the corresponding region.

0: Read not allowed

1: Read allowed

(R/W)

Continued on the next page...

Register 2.118. pma_cfg*n* (*n*: 0-15) (0xBC0+0x1**n*)

Continued from the previous page...

WRITE Configures write-permission for the corresponding region.

0: Write not allowed

1: Write allowed

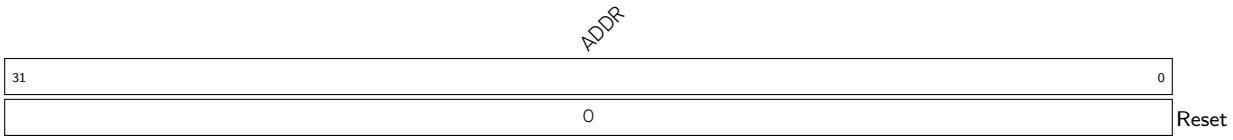
(R/W)

EXECUTE Configures execute-permission for the corresponding region.

0: Execution not allowed

1: Execution allowed

(R/W)



TYPE Configures region type.

0x0: Invalid memory region (RWX access will be treated as 0, even if programmed to 1)

0x1: Valid memory region (Programmed RWX access will be applicable)

(R/W)

Register 2.119. pma_addr*n* (*n*: 0-15) (0xBD0+0x1**n*)

ADDR Configures address. The functionality is same as pmpaddr register. (R/W)

2.11 Debug and Trace Support

2.11.1 Debug

2.11.1.1 Overview

This section describes how to debug software running on HP and LP CPU cores. Debug support is provided through standard JTAG pins and complies to the RISC-V External Debug Support Version 0.13.2 specification.

HP cores and LP core have their own dedicated JTAG DTM (debug transport module) in order to connect with respective Debug Modules. Both these JTAG DTM's are daisy-chained to provide debugger access to respective cores via a single JTAG interface. Depending on its debug requirements, Debugger can keep the unused DTM in a bypass state while debugging the required core. Both HP cores can be debugged through a single debug module (DM) connected to JTAG DTM (HP Cores), while the LP core is debugged through a separate debug module (DM) connected to JTAG DTM (LP Core).

Please note it is not possible to debug HP cores and LP core at same time as they are accessed through separate debug modules.

Figure 2.11-1 below shows the main components of External Debug Support.

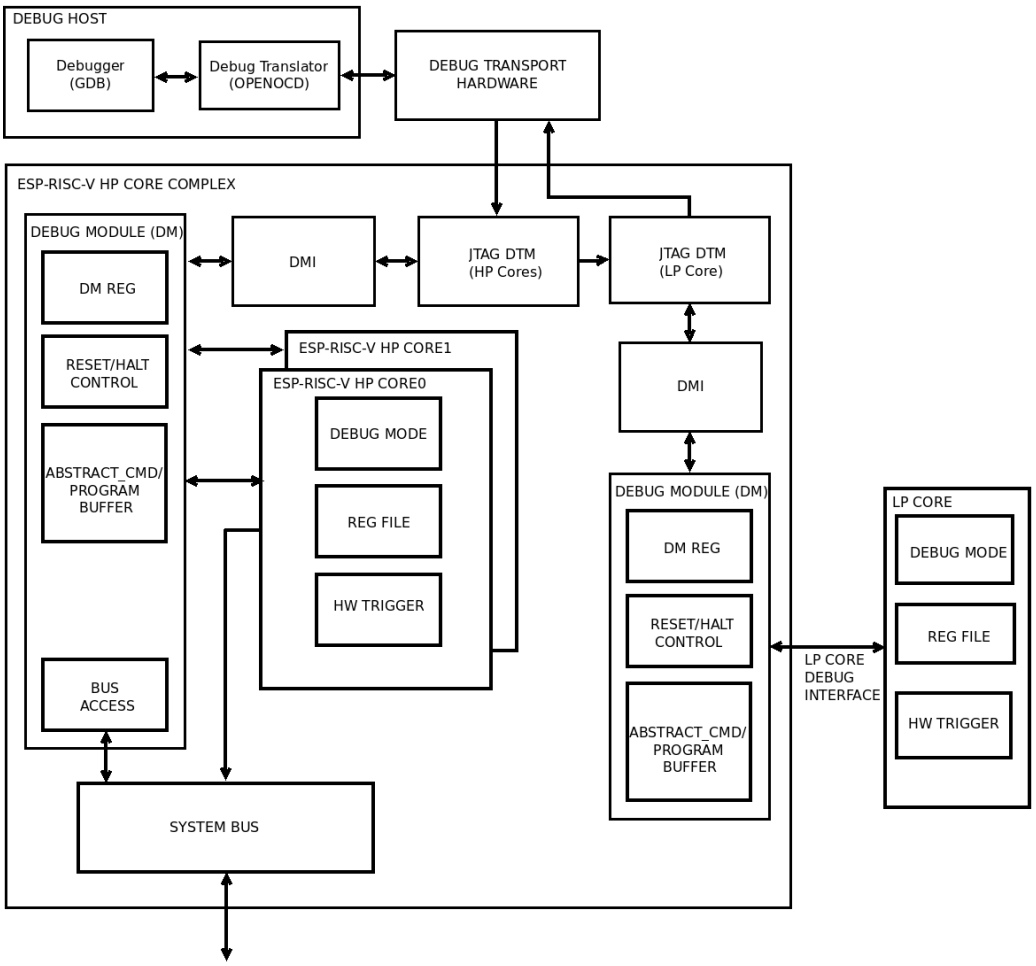


Figure 2.11-1. Debug System Overview

This section focuses on HP core debug features. For LP core debug features, please refer to Chapter 5 *Low-Power CPU*.

The user interacts with the Debug Host (e.g. laptop), which is running a debugger (e.g. GDB). The debugger communicates with a Debug Translator (e.g. OpenOCD, which may include a hardware driver) to communicate with Debug Transport Hardware (e.g. ESP-Prog adapter). The Debug Transport Hardware connects the Debug Host to the HP core's Debug Transport Module (DTM) through standard JTAG interface (bypassing LP core DTM). The DTM provides access to the Debug Module (DM) using the Debug Module Interface (DMI).

The DM allows the debugger to halt selected HP cores. Abstract commands provide access to GPRs (general-purpose registers). The Program Buffer allows the debugger to execute arbitrary code on the core, which allows access to additional CPU core state. Alternatively, additional abstract commands can provide access to additional CPU core state.

Each HP core contains Trigger Module supporting 3 triggers. When trigger conditions are met, respective core will halt spontaneously and inform the debug module that they have halted.

System bus access block allows memory and peripheral register access without affecting either HP core.

2.11.1.2 Features

The HP CPU supports the following basic debugging features for each HP core:

- Provides necessary information about the implementation to the debugger
- Allows the core to be halted and resumed
- Core registers (including CSRs) can be read/written by debugger
- Core can be debugged from the first instruction executed after reset
- Core can be reset through debugger
- Core can be halted on software breakpoint (planted breakpoint instruction)
- Hardware single-stepping
- Execute arbitrary instructions in the halted core by means of the program buffer. 2-word program buffer is supported
- System bus access is supported through word aligned address access
- Supports three Hardware Triggers (can be used as breakpoints/watchpoints) per HP core as described in Section 2.11.3
- Supports LP core debug through daisy chaining of its JTAG DTM

2.11.1.3 Functional Description

As mentioned earlier, Debug Scheme conforms to the RISC-V External Debug Support Version 0.13.2 specification. Please refer to it for functional operation details.

2.11.1.4 JTAG Control

Standard JTAG interface is the only way for DTM to access DM. The hardware provides two JTAG methods: PAD_to_JTAG and USB_to_JTAG.

- PAD_to_JTAG: The JTAG's signal source comes from IO.
- USB_to_JTAG: The JTAG's signal source comes from USB Serial/JTAG Controller.

Which JTAG method to use depends on many factors. The following table shows the configuration method.

Table 2.11-1. JTAG Control

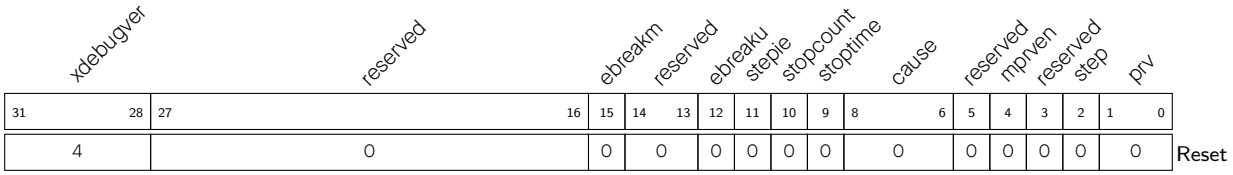
Temporary disable JTAG 3,4	EFUSE_DIS_USB_SERIAL_JTAG 4	EFUSE_DIS_USB_JTAG 4	EFUSE_DIS_PAD_JTAG 4	EFUSE_JTAG_SEL_ENABLE 4	Strapping Pin GPIO34 5	USB JTAG Status	PAD JTAG Status
0	0	0	0	0	x 2	Available 1	Unavailable 1
0	0	0	0	1	1	Available	Unavailable
0	0	0	0	1	0	Unavailable	Available
0	0	0	1	x	x	Available	Unavailable
0	0	1	0	x	x	Unavailable	Available
0	0	1	1	x	x	Unavailable	Unavailable
0	1	0	0	0	x	Unavailable	Unavailable
0	1	0	0	1	0	Unavailable	Available
0	1	0	0	1	1	Unavailable	Unavailable
0	1	0	1	x	x	Unavailable	Unavailable
0	1	1	0	x	x	Unavailable	Available
0	1	1	1	x	x	Unavailable	Unavailable
1	x	x	x	x	x	Unavailable	Unavailable

Note:

1. Available: the corresponding JTAG function is available.
   Unavailable: the corresponding JTAG function is not available.
2. x: do not care.
3. "Temporary disable JTAG" means that if there are an even number of bits "1" in EFUSE_SOFT_DIS_JTAG[2:0], the JTAG function is turned on (the corresponding value in the table is 1), otherwise it is turned off (the corresponding value in the table is 0). However, under certain special conditions of the HMAC Accelerator in ESP32-P4, the JTAG function may be turned on even if there is an odd number of bits "1" in EFUSE_SOFT_DIS_JTAG[2:0]. For information on how HMAC affects JTAG functionality, please refer to Chapter HMAC Accelerator.
4. Please refer to Chapter eFuse Controller to get more information about eFuse.
5. Please refer to Chip Boot Control to get more information about the strapping pin GPIO34.

2.11.1.5 Register Summary

Below is the list of Debug CSRs supported by HP cores:



Name	Description	Address	Access
dcsr	Debug Control and Status Register	0x7B0	R/W
dpc	Debug PC Register	0x7B1	R/W
dscratch0	Debug Scratch Register 0	0x7B2	R/W
dscratch1	Debug Scratch Register 1	0x7B3	R/W

All the debug module registers are implemented in conformance to the specification RISC-V External Debug Support Version 0.13.2. Please refer to it for more details.

2.11.1.6 Register Description

Below are the details of Debug CSRs supported by HP cores:

Register 2.120. dcsr (0x7B0)

xdebugver Represents the debug version.

4: External debug support exists

(RO)

ebreakm When 1, ebreak instructions in Machine Mode enter debug mode.

(R/W)

ebreaku When 1, ebreak instructions in User/Application Mode enter debug mode.

(R/W)

stepie Configures interrupt control in debug mode. 0: Interrupts are disabled during single-stepping

1: Interrupts are enabled during single-stepping

(R/W)

Debugger must not change the value of this bit while the hart is running.

stopcount Configures mcycle counter control in debug mode. 0: Increment counters as usual.

1: Not increment any counters while in debug mode or on ebreak instructions that cause entry into debug mode. These counters include the cycle and instret CSRs.

(R/W)

stoptime Configures timer control in debug mode.

0: Increment timers as usual.

1: Not increment any hart-local timers while in debug mode.

(R/W)

cause Explains why debug mode was entered. When there are multiple reasons to enter debug mode in a single cycle, the cause with the highest priority number is the one written.

1: An ebreak instruction was executed. (priority 3)

2: The Trigger Module caused a halt. (priority 4, highest)

3: haltreq was set. (priority 1)

4: The CPU core single-stepped because the step was set. (priority 0, lowest)

5: The hart halted directory out of reset due to resethaltreq. (priority 2)

Other values are reserved for future use.

(RO)

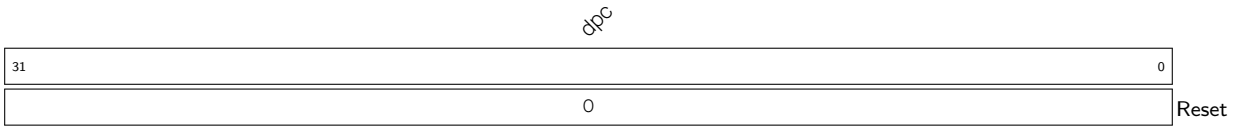
mprven Configures whether to enable the functionality of MPRV bit in mstatus CSR during debug mode.

0: Disable

1: Enable

(R/W)

Continued on the next page...



Register 2.120. dcsr (0x7B0)

Continued from the previous page...

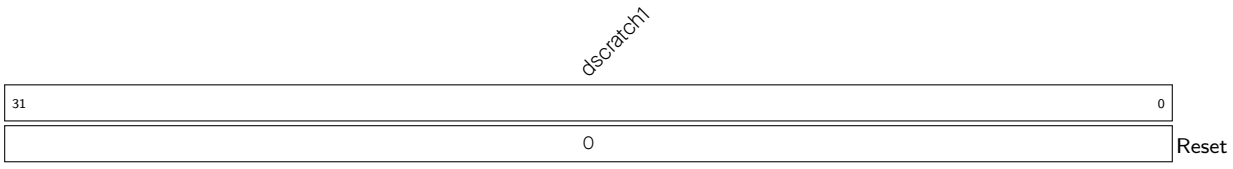
step When set and not in debug mode, the core will only execute a single instruction and then enter debug mode.
If the instruction does not complete due to an exception, the core will immediately enter debug mode before executing the trap handler, with appropriate exception registers set.
Setting this bit does not mask interrupts. This is a deviation from the RISC-V External Debug Support Specification Version 0.13.
(R/W)

prv Contains the privilege level the core was operating in when debug mode was entered. A debugger can change this value to change the core's privilege level when exiting debug mode. Only **0x3** (machine mode) and **0x0** (user mode) are supported. (R/W)

Register 2.121. dpc (0x7B1)

dpc Upon entry to debug mode, dpc is written with the virtual address of the next instruction to be executed. When resuming, the CPU core's PC is updated to the virtual address stored in dpc. A debugger may write dpc to change where the CPU resumes. (R/W)

Table 2.11-3. Virtual address in DPC upon Debug Mode Entry



Cause	Virtual Address in DPC
ebreak	Address of ebreak instruction
Single Step	Address of the instruction that would be executed next if no debugging was going on i.e. pc+4 for 32-bit instruction that don't change program flow, the destination PC on taken jumps/branches, etc.
Trigger Module	If timing is 0, the address of the instruction which caused the trigger to fire. If timing is 1, the address of next instruction to be executed at the time that debug mode was entered.
Halt Request	Address of the next instruction to be executed at the time that debug mode was entered.

Register 2.122. dscratch0 (0x7B2)

dscratch0 Used by Debug Module internally. (R/W)

Register 2.123. dscratch1 (0x7B3)

dscratch1 Used by Debug Module internally. (R/W)

2.11.2 Debug Halt Groups

2.11.2.1 Overview

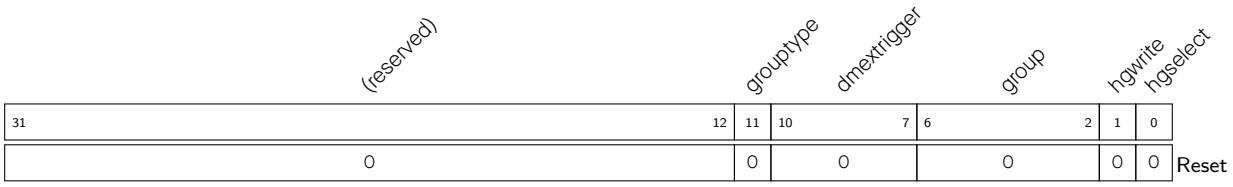
In a multi-core system, when the debugging software is running on a given core, it is useful that other cores do not change the state of the system. This requirement is addressed by synchronous halt and resume. It is important that halt/resume information is communicated as quickly as possible to other cores. So, it is better to do it based on chip infrastructure rather than commands through the debugger software running on the host.

2.11.2.2 Features

- Support cross-triggering between HP cores
- Overriding the RunStall functionality of a core

2.11.2.3 Functional Description

HP core debug module implements dmcs2 register specified in the upcoming specification, RISC-V External Debug Version 1.0-STABLE, to implement simultaneous halting/resuming based on hart groups.



2.11.2.4 Register Summary

Below is a required control register implemented inside debug module.

Name	Description	Address	Access
dmcs2	Debug module control and status register 2	0x32	R/W

2.11.2.5 Register Description

Register 2.124. dmcs2 (0x32)

grouptype Configures the group type.

0 (halt group): The remaining fields in this register configure halt groups

1 (resume group): The remaining fields in this register configure resume groups

(R/W)

dmexttrigger Configures the currently selected DM external trigger. If a non-existent trigger value is written here, the hardware will change it to a valid value or 0 if no DM external triggers exist.

(R/W)

group When hgselect is 0, this field contains the group of the hart specified by hartsel.

When hgselect is 1, this field contains the group of the DM external trigger selected by dmexttrigger.

The value written to this field is ignored unless hgwrite is also written 1.

Group numbers are contiguous starting from 0, with the highest number being implementation-dependent, and possibly different between different group types. Debuggers should read back this field after writing to confirm they are using a supported hart group. If groups are not implemented, this entire field is 0.

(R/W)

hgwrite When 1 is written and hgselect is 0, for every selected hart, the DM will change its group to the value written to group, if the hardware supports that group for that hart. Implementations may also change the group of a minimal set of unselected harts in the same way, if that is necessary due to a hardware limitation. When 1 is written and hgselect is 1, the DM will change the group of the DM external trigger selected by dmexttrigger to the value written to group, if the hardware supports that group for that trigger. Writing 0 has no effect.

(R/W)

hgselect Tied to zero.

0: Operate on HART

(RO)

2.11.3 Hardware Trigger

2.11.3.1 Overview

2.11.3.2 Features

Each HP core implements a hardware trigger block to provide breakpoint and watchpoint capability for debugging. Each trigger has the following features:

- Three independent trigger units, each of which can be configured for matching the address of the program counter or load-store accesses
- Preempting execution by causing a breakpoint exception
- Halting execution and transferring control to debuggers
- Support for NAPOT (naturally aligned power-of-two regions) address encoding

2.11.3.3 Functional Description

The Hardware Trigger module provides seven CSRs, which are listed under Section register summary. Among these, tdata1 and tdata2 are abstract CSRs, which means they are shadow registers for accessing internal registers for each of the four trigger units, one at a time.

To choose a particular trigger unit write the index (0-2) of that unit into tselect CSR. When tselect is written with a valid index, the abstract CSRs tdata1 and tdata2 are automatically mapped to reflect internal registers of that trigger unit. Each trigger unit has two internal registers, namely mcontrol and maddress, which are mapped to tdata1 and tdata2, respectively.

Writing larger than allowed indexes to tselect will clip the written value to the largest valid index, which can be read back. This property may be used for enumerating the number of available triggers during initialization or when using a debugger.

Since software or debugger may need to know the type of the selected trigger to correctly interpret tdata1 and tdata2, the 4 bits (31-28) of tdata1 encodes the type of the selected trigger. This type field is read-only and always provides a value of 0x2 for every trigger, which stands for match type trigger, hence, it is inferred that tdata1 and tdata2 are to be interpreted as mcontrol and maddress. The information regarding other possible values can be found in the specification, RISC-V External Debug Support Version 0.13.2, but this trigger module only supports type 0x2.

Once a trigger unit has been chosen by writing its index to tselect, it will become possible to configure it by setting the appropriate bits in mcontrol CSR (tdata1) and writing the target address to maddress CSR (tdata2).

Each trigger unit can be configured to either cause breakpoint exception or enter debug mode, by writing to the action field of mcontrol. This bit can only be written from debugger, thus by default a trigger, if enabled, will cause breakpoint exception.

mcontrol for each trigger unit has a hit bit which may be read, after CPU halts or enters exception, to find out if this was the trigger unit that fired. This bit is set as soon as the corresponding trigger fires, but it has to be manually cleared before resuming operation. Although, failing to clear it does not affect normal execution in any way.

Each trigger unit only supports match on address, although this address could either be that of a load/store access or the virtual address of an instruction. The address and size of a region are specified by writing to maddress (tdata2) CSR for the selected trigger unit. Larger than 1 byte region sizes are specified through NAPOT (naturally aligned power-of-two) encoding (see Table 2.11-5) and enabled by setting match bit in mcontrol. Note that for NAPOT encoded addresses, by definition, the start address is constrained to be aligned to (i.e. an integer multiple of) the region size. The maximum size supported is 128 bytes.

Table 2.11-5. NAPOT encoding for maddress

maddress(31-0)	Start Address	Size (bytes)
aaa...aaaaaaaaa0	aaa...aaaaaaaaa0	2
aaa...aaaaaaaa01	aaa...aaaaaaaa00	4
aaa...aaaaaaa011	aaa...aaaaaaa000	8
aaa...aaaaaa0111	aaa...aaaaaa0000	16
	....	
aaa...0111111111	aaa...aaa0000000	2^8

tcontrol CSR is common to all trigger units. It is used for preventing triggers from causing repeated exceptions in machine mode while execution is happening inside a trap handler. This also disables breakpoint exceptions inside ISRs by default, although, it is possible to manually enable this right before entering an ISR, for debugging purposes. This CSR is not relevant if a trigger is configured to enter debug mode.

2.11.3.4 Trigger Execution Flow

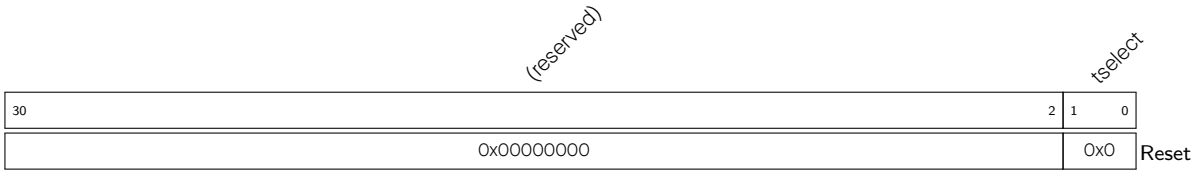
When hart is halted and enters debug mode due to the firing of a trigger (action = 1):

- dpc is set to current PC (in decode stage)
- cause field in dcsr is set to 2, which means halt due to trigger
- hit bit is set to 1, corresponding to the trigger(s) which fired

When hart goes into trap due to the firing of a trigger (action = 0) :

- mepc is set to current PC (in decode stage)
- mcause is set to 3, which means breakpoint exception
- mpte is set to the value in mte right before trap
- mte is set to 0
- hit bit is set to 1, corresponding to the trigger(s) which fired

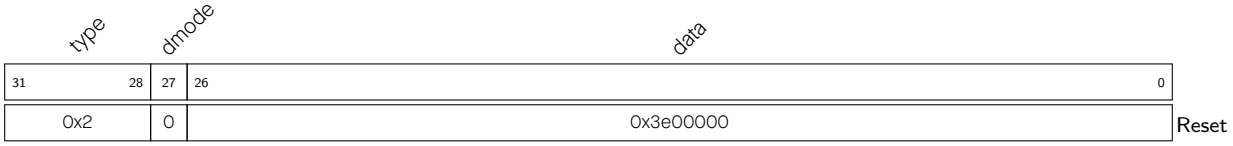
Note: If two different triggers fire at the same time, one with action = 0 and another with action = 1, then hart is halted and enters debug mode.



2.11.3.5 Register Summary

Below is a list of Trigger Module CSRs supported by the CPU. These are only accessible from machine mode.

Name	Description	Address	Access
tselect	Trigger select register	0x7A0	R/W
tdata1	Trigger abstract data 1	0x7A1	R/W
tdata2	Trigger abstract data 2	0x7A2	R/W
tdata3	Trigger abstract data 3	0x7A3	R/W
tinfo	Trigger information	0x7A4	RO
tcontrol	Global trigger control	0x7A5	R/W
mcontext	Trigger context	0x7A8	R/W

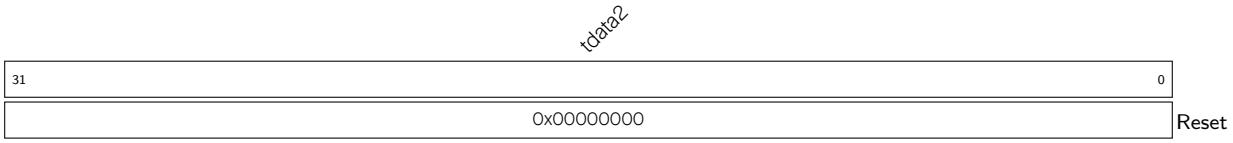


2.11.3.6 Register Description

Register 2.125. tselect (0x7A0)

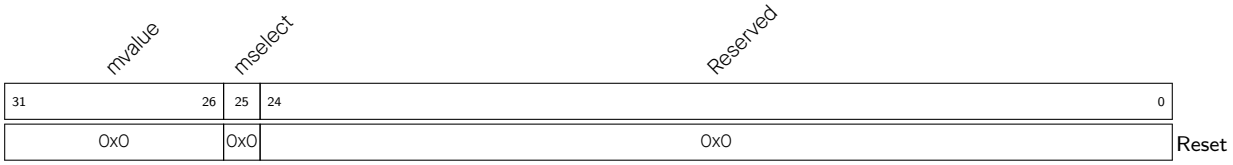
tselect Configures the index (0-3) of the selected trigger unit. (R/W)

Register 2.126. tdata1 (0x7A1)



type Represents the trigger type. This field is reserved since only match type (0x2) triggers are supported. (RO)

dmode This is set to 1 if a trigger is being used by the debugger.
0: Both Debug and M mode can write the tdata1 and tdata2 registers at the selected tselect.
1: Only Debug Mode can write the tdata1 and tdata2 registers at the selected tselect. Writes from other modes are ignored.
Note: Only writable from debug mode.
(R/W)

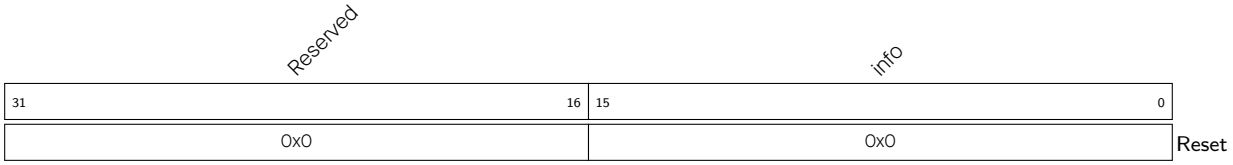


data Configures the abstract tdata1 content. This will always be interpreted as fields of mcontrol since only match type (0x2) triggers are supported. (R/W)

Register 2.127. tdata2 (0x7A2)

tdata2 Configures the abstract tdata2 content. This will always be interpreted as maddress since only match type (0x2) triggers are supported. (R/W)

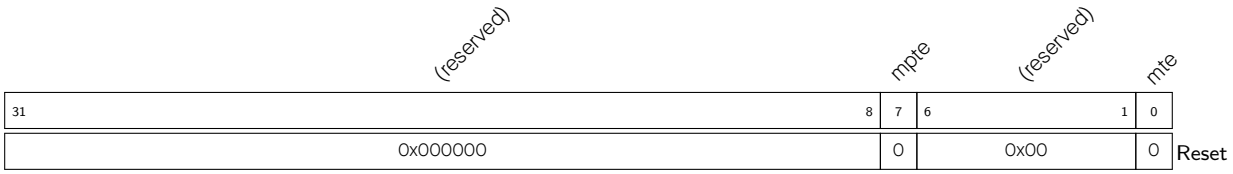
Register 2.128. tdata3 (0x7A3)



mvalue Data used together with mselect. (R/W)

mselect 0: Ignore mvalue.
1: This trigger will only match if the low bits of mcontext equal mvalue.
(R/W)

Reserved Read as 0. (RO)



Register 2.129. tinfo (0x7A4)

Reserved Read as 0. (RO)

info One bit for each possible type enumerated in tdata1. Bit N corresponds to type N. If the bit is set, then that type is supported by the currently selected trigger. If the currently selected trigger does not exist, this field contains 1. If the type is not writable, this register may be unimplemented, in which case reading it causes an illegal instruction exception. In this case, the debugger can read the only supported type from tdata1. (RO)

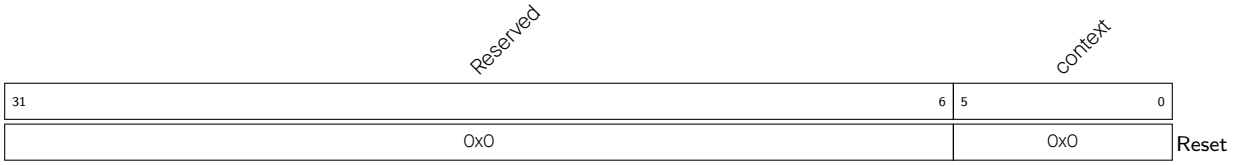
Register 2.130. tcontrol (0x7A5)

mpte Configures whether to enable the machine mode previous trigger.

When CPU is taking a machine mode trap, the value of mte is automatically pushed into this.

When CPU is executing MRET, its value is popped back into mte, so this becomes 0.

(R/W)

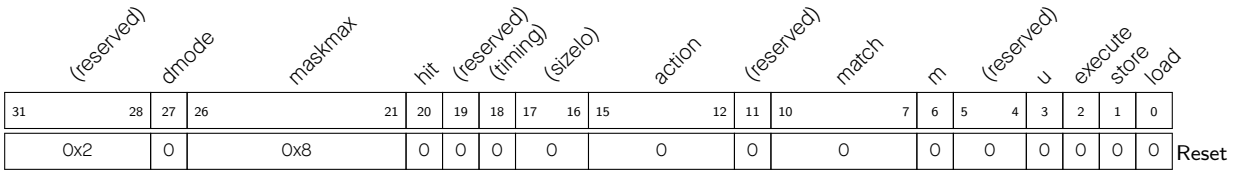


mte Configures whether to enable the machine mode trigger.

When CPU is taking a machine mode trap, its value is automatically pushed into mpte, so this becomes 0 and triggers with action=0 are disabled globally.

When CPU is executing MRET, the value of mpte is automatically popped back into this.

(R/W)



Register 2.131. MCONTEXT (0x7A8)

Reserved Read as 0. (RO)

context Writable in M mode and Debug Mode. Machine mode software can write a context number to this register, which can be used to set triggers that only fire in that specific context. (R/W)

Register 2.132. mcontrol (0x7A1)

dmode Same as dmode in tdata1. (RW*)

maskmax Represents the largest natural power-of-two (NAPOT) range supported when match is 1. It is always read as 0x8, which means only the lowest 8 bits can be masked. (RO)

hit This is found to be 1 if the selected trigger had fired previously. This bit needs to be cleared manually. (R/W)

timing Set this field to enable load/store trigger action timing.

0: Action for this trigger will be taken just before the instruction that triggered it is executed, but after all preceding instructions are committed.

1: Action for this trigger will be taken after the instruction that triggered it is executed. It should be taken before the next instruction is executed.

(R/W)

sizelo This field contains the lowest two bits of access address.

0x0: The trigger will attempt to match against an access of any size

0x1: The trigger will attempt to match against 8-bit memory accesses

0x2: The trigger will attempt to match against 16-bit memory accesses

0x3: The trigger will attempt to match against 32-bit memory accesses

(R/W)

action Configures the selected trigger to perform one of the available actions when firing. Valid options are:

0x0: cause breakpoint exception.

0x1: enter debug mode (only valid when dmode = 1)

0x2: Enable trace on trigger[0] hit

0x3: Enable trace on trigger[1] hit

0x4: Enable trace on trigger[2] hit

Note: Writing an invalid value will set this to the default value 0x0.

(R/W)

match Configures the selected trigger to perform one of the available matching operations on a data/instruction address. Valid options are:

0x0: exact byte match, i.e. address corresponding to one of the bytes in an access must match the value of maddress exactly.

0x1: NAPOT match, i.e. at least one of the bytes of an access must lie in the NAPOT region specified in maddress.

Note: Writing a larger value will clip it to the largest possible value 0x1.

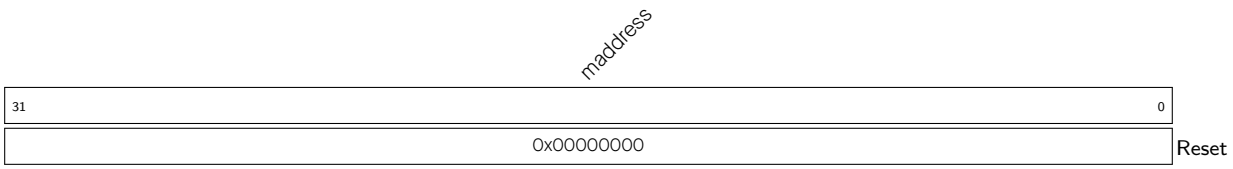
(R/W)

Continued on the next page...

Register 2.132. mcontrol (0x7A1)

Continued from the previous page...

m Set this field to enable the selected trigger to operate in machine mode. (R/W)



u Set this field to enable the selected trigger to operate in user mode. (R/W)

execute Set this field to enable the selected trigger to fire right before an instruction with the matching virtual address executed by the CPU. (R/W)

store Set this field to enable the selected trigger to fire right before a store operation with the matching data address executed by the CPU. (R/W)

load Set this field to enable the selected trigger to fire right before a load operation with the matching data address executed by the CPU. (R/W)

Register 2.133. maddress (0x7A2)

maddress Configures the address used by the selected trigger when performing a match operation. This is decoded as NAPOT when match=1 in mcontrol. (R/W)

2.11.4 Trace

2.11.4.1 Overview

In order to support non-intrusive software debug, the CPU core provides an instruction trace interface which provides relevant information for offline debug purpose. This interface provides relevant information to Trace Encoder block, which compresses the information and stores in memory allocated for it. Software decoders can read this information from trace memory without interrupting the CPU core and re-generate the actual program execution by the CPU core.

2.11.4.2 Features

The CPU core supports instruction trace feature and provides below information to Trace Encoder as mandated in RISC-V Processor Trace Version 1.0:

- Number of instructions being retired.
- Occurrence of exception and interrupt along with cause and trap values.
- Current privilege level of hart.
- Instruction type of retired instructions for jumps, branches and return.
- Instruction address for instructions retired before and after program counter changes.
- Trace enabling on trigger hit as per action bit in mcontrol.

2.11.4.3 Functional Description

Each HP core implements mandatory instruction delta tracing, also known as branch tracing. It works by tracking execution from a known start address by sending information about deltas taken by a program. Deltas are typically introduced by jump, call, return, branch type instructions and also by interrupts and exceptions. All such deltas along with additional details about cause and actual instructions/addresses are communicated over high bandwidth instruction trace interface output from the core. Trace Encoder operates on the information on this trace interface and compresses the information for storage in memory for offline debug by a decoder. More information about the encoding is available in Chapter 3 *RISC-V Trace Encoder (TRACE)*.

The core does not have any internal registers to provide control over instruction trace interface. All register controls are available in 3 *RISC-V Trace Encoder (TRACE)* block.

2.12 Performance

2.12.1 Branch Prediction

2.12.1.1 Overview

A core does branch prediction in terms of branch is taken or not taken and the target address of conditional/unconditional branch type instruction prior to its execution. Based on the prediction, the core starts fetching from the respective PC. Then, it validates the prediction on the execution of the instruction. If it is found to be miss-predicted, then the core flushes the pipeline and starts fetching from the correct PC. The prediction improves the throughput as the core continues fetching instructions based on prediction instead of waiting till the execution of branch instruction. The details about the prediction technique used by the core are described in the following section.

2.12.1.2 Features

- Prediction of both results and target address of conditional/unconditional branch type instructions
- Branch target prediction of instructions including BEQ, BNE, BLT, BLTU, BGE, BGEU, C.BEQZ, C.BNEZ, JAL, J, CJ
- Conditional branch prediction includes instructions such as: BEQ, BNE, BLT, BLTU, BGE, BGEU, C.BEQZ, C.BNEZ
- Uses 2-bit saturating counter for more accuracy
- Uses global history of conditional branches for prediction which improves performance
- Target prediction in one clock cycle for unconditional branch, that is, 0 cycle penalty when prediction or speculation is correct

2.12.1.3 Functional Description

The core uses Branch History Table (BHT) along with Branch Target Buffer (BTB) for prediction of branch and jump type instructions.

BHT is 512x16-bit SRAM memory for each core. It is indexed by Virtual Branch History Register (VBHR) while performing prediction and by Global Branch History Register (GBHR) while updating or correcting the result (taken or not taken) on execution of branch-type instructions. GBHR contains the results of the last 13 branch-type instructions executed. VBHR contains the results of the last 12 branch-type instructions and predicted results of the current branch instruction. Thus, both registers hold the trajectory of previously executed branches. Based on 13 bits of VBHR and GBHR, 2 bits of saturation counter value stored in BHT are either read or written respectively.

As shown in Figure 2.12-1, 2-bit saturation counter indicates if a branch is

- weakly not taken (00)
- strongly not taken (01)
- weakly taken (10)
- strongly taken (11)

If the result of prediction is weakly or strongly not taken, then the branch is predicted as not taken. Similar is the case for weakly/strongly taken.

While updating BHT with the actual result of branch execution, the following transition logic is used to update the respective saturation counter.

BTB stores the 32-bit branch target address. It can hold a maximum of 16 entries of target addresses. It is indexed by the last 16 bits of the PC of conditional/unconditional branch-type instruction. Thus, the core predicts the result of branch-type instructions based on BHT and jumps to the target obtained from BTB if the branch is predicted as taken. For unconditional branches, the core directly jumps to the target obtained from BTB, as it does not need prediction in this case. When the actual result and the target of branch-type instructions are obtained during execution, the core takes a corrective jump by flushing the pipeline in case of misprediction. BTB and BHT entries are corrected accordingly.

Figure 2.12-1 shows 2-bit saturation scheme details used in each HP core.

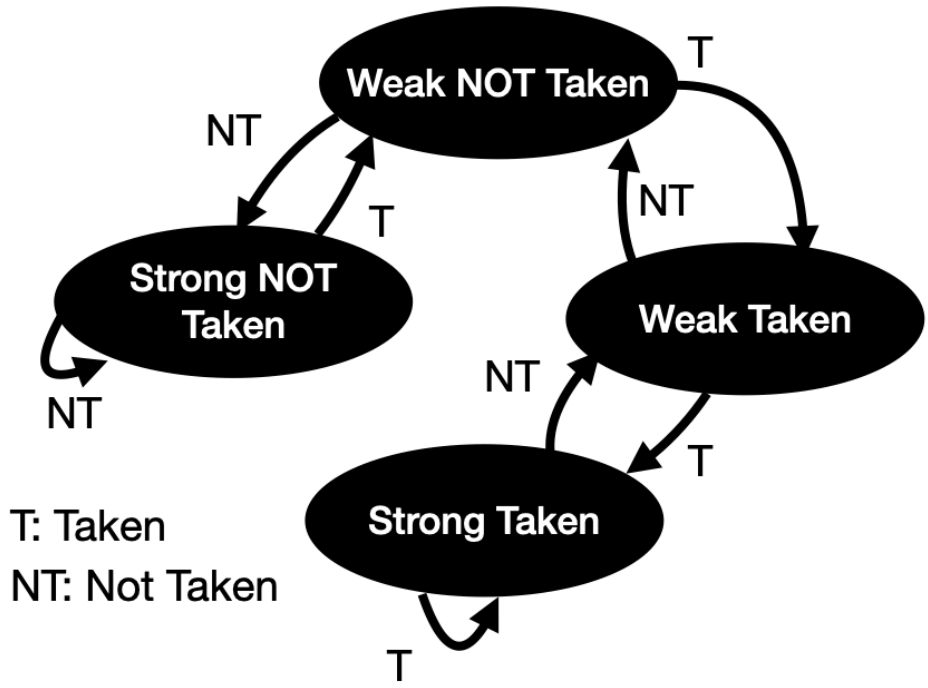


Figure 2.12-1. Two-bit Saturation Counter

2.12.2 RAS

2.12.2.1 Overview

Return Address Stack (RAS) is a stack maintained by the core to push the return addresses of jump and link (JAL/JALR) type instructions. Thus, the core can jump to the return address as soon as the RET instruction is pre-decoded, enhancing the performance of function call return.

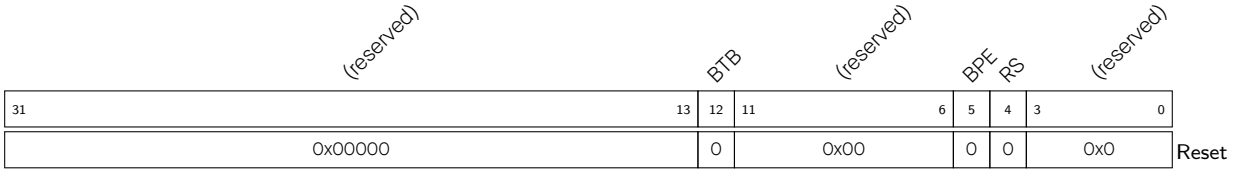
2.12.2.2 Features

- Increased core performance by avoiding pipeline stall on return of function call

- Able to store up to four levels of function call nesting

2.12.2.3 Functional Description

When JAL/JALR/C.JALR instruction is pre-decoded by the core, then the 32-bit PC of the next instruction is pushed to RAS.



The address is popped out from RAS when the return type instruction (JALR, C.JR, C.JALR) is pre-decoded by the core. The core then starts fetching from the popped address. On execution of the return instruction, if the popped address does not match the address stored in the link register, then the core flushes the pipeline and starts to fetch from the address in the link register. RAS can store a maximum of four entries of return addresses, that is, four levels of function call nesting are supported.

RAS prediction depends on the following conditions:

Target Register (Rd)	Source Register (Rs)	RAS action
rd != x1	rs1 != x1	No action
rd != x1	rs1 == x1	POP
rd == x1	rs1 != x1	PUSH
rd == x1	rs1 == x1	PUSH and POP

2.12.3 Control Status Register for Performance Configuration

Register 2.134. mhcr (0x7C1)

RS Configures whether to enable the return address stack logic for prediction.
0: Disable
1: Enable
(R/W)

BPE Configures whether to enable conditional branch prediction.
0: Disable
1: Enable
(R/W)

BTB Configures whether to enable branch target buffer.
0: Disable
1: Enable
(R/W)

2.13 Custom Features

2.13.1 Bus Error Response

2.13.1.1 Overview

In the HP core, load/store bus errors are handled as asynchronous exceptions, which means that by the time such an exception is detected, the CPU may have executed some of the instructions after the actual load/store instruction that caused the exception.

Due to the asynchronous nature of these exceptions, handling them requires more context than that available via the standard CSRs mcause, mepc and mtval, which are otherwise sufficient for synchronous exceptions. Therefore, additional CSRs have been provided to allow software to gain all the necessary context required to handle and resume a program that has encountered an asynchronous bus-error exception.

In the following sections, these bus-error-specific CSRs are described and the recommended approach is to gain context about a bus-error exception.

2.13.1.2 Functional Description

There are two ways to handle load/store bus errors:

- Synchronous bus-errors mode:
  When this mode is enabled, (by setting mhint.SBE bit) bus-error exceptions can be handled just like other synchronous exceptions. Therefore, execution traps at the exact PC corresponding to the bus error causing load/store instruction, and mepc holds the same PC.
  The side effect of enabling this mode is that it increases the latency of all load/store instructions.
- Asynchronous bus-errors mode (default):
  - For handling bus errors in asynchronous mode, it is recommended (although not necessary) to clear the mexstatus.NMFT bit at startup.
  - In asynchronous mode, bus errors cause the CPU to enter trap handler with MCAUSE value 5 or 7 (depending upon the type of operation which caused the error), and mepc will hold the PC of the last instruction that was about to be executed when CPU detected the bus error(s) due to (one or more) previously executed load/store instruction(s).
  - Upon entering the exception handler for cause 5 or 7, the mexstatus.BUS_ERR bit must be checked to confirm if it is due to load/store bus-error. If so, this bit must be cleared to acknowledge.
  - Next, bits ldpc0.vld, ldpc1.vld, stpc0.vld, stpc1.vld and stpc2.vld must be checked to confirm if they are valid. If so, these must be cleared, and the corresponding address fields (ldpc0.addr, ldpc1.addr, stpc0.addr, stpc1.addr, and stpc2.addr) can be extracted from these CSRs to get the program counters at which these faulting load/store instructions were executed. The CSRs ldtval0, ldtval1, sttval0, sttval1 and sttval2 hold the memory access addresses corresponding to the respective loads/stores. Note that the lower indexed CSRs hold the newest bus errors, while the higher indexed CSRs hold the older bus errors.
  - Note that, even if the cause is either 5 or 7, both load and store bus error CSRs must be checked as sometimes there are more than one load/store instructions (or misaligned accesses which are split into multiple loads/stores) that have been executed and are in flight. Prior to entering the trap

handler for the first encountered bus error, the CPU will allow all pending memory operations to finish and record any bus errors caused by them, thus it is important to check all the CSRs to make sure that all such exceptions were caught and handled.

- Also note that recovering a normal program execution after encountering a bus-error exception is not as simple as for synchronous cases, since program execution may have proceeded quite far ahead of the bus-error-causing instructions.

2.13.1.3 Control Status Registers

Name	Description	Address	Access
mexstatus	Machine extension control and status register.	0x7E1	R/W
mhint	Machine implicit operation register	0x7C5	R/W
ldpc0	Load bus error PC register 0	0xBE0	R/W
ldpc1	Load bus error PC register 1	0xBE1	R/W
ldtval0	Load bus error access address register 0	0xBE8	R/W
ldtval1	Load bus error access address register 1	0xBE9	R/W
stpc0	Store bus error PC register 0	0xBF0	R/W
stpc1	Store bus error PC register 1	0xBF1	R/W
stpc2	Store bus error PC register 2	0xBF2	R/W
sttval0	Store bus error access address register 0	0xBF8	R/W
sttval1	Store bus error access address register 1	0xBF9	R/W
sttval2	Store bus error access address register 2	0xBFA	R/W

2.13.2 Dedicated IO

2.13.2.1 Overview

Normally, GPIOs are an APB peripheral, which means that changes to outputs and reads from inputs can get stuck in write buffers or behind other transfers. They are slower because the APB bus runs at a lower speed than the CPU core. As an alternative, the CPU core implements I/O processor-specific CPU registers (CSRs) which are directly connected to the GPIO matrix or IO pads. As these registers can be accessed in one instruction, the speed is fast.

2.13.2.2 Features

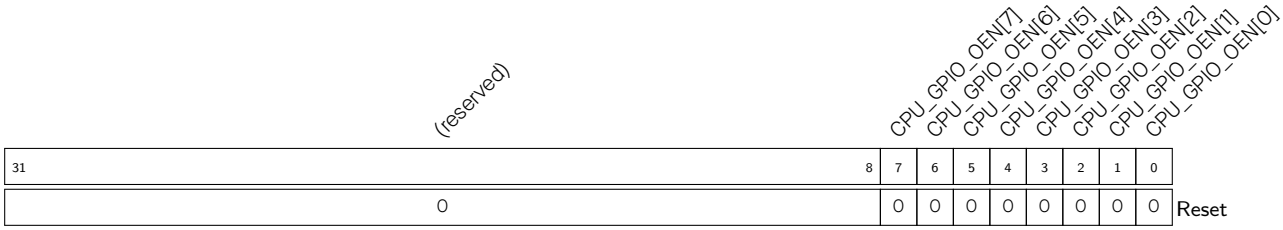
- 8 dedicated IOs directly mapped on GPIOs
- No latency for driving output ports
- Two CPU cycle latency for sensing input values

2.13.2.3 Functional Description

The CPU core has a set of 8 inputs and outputs (pin value + pin output enable). These input and output ports are directly connected to the GPIO matrix, through which they can be mapped on top-level pads. Please refer to Chapter 10 *GPIO Matrix and IO MUX* for more details.

The CPU implements three custom CSRs:

- GPIO_IN is read-only and reflects the input value.
- GPIO_OUT is R/W and reflects the output value for the GPIOs.
- GPIO_OEN is R/W and reflects the output enable state for the GPIOs. It controls the pad direction. Programming high would mean the pad should be configured in output mode. Programming low means it should be configured in input mode.



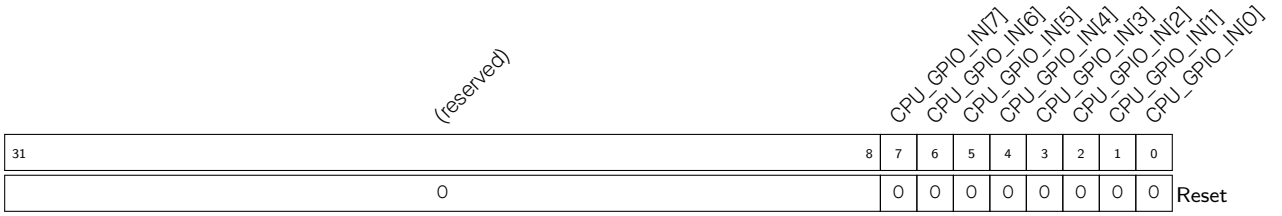
2.13.2.4 Register Summary

Below is a list of custom dedicated IO CSRs implemented inside the core.

Name	Description	Address	Access
cpu_gpio_oen	GPIO Output Enable	0x803	R/W
cpu_gpio_in	GPIO Input Value	0x804	RO
cpu_gpio_out	GPIO Output Value	0x805	R/W

2.13.2.5 Register Description

Register 2.135. cpu_gpio_oen (0x803)



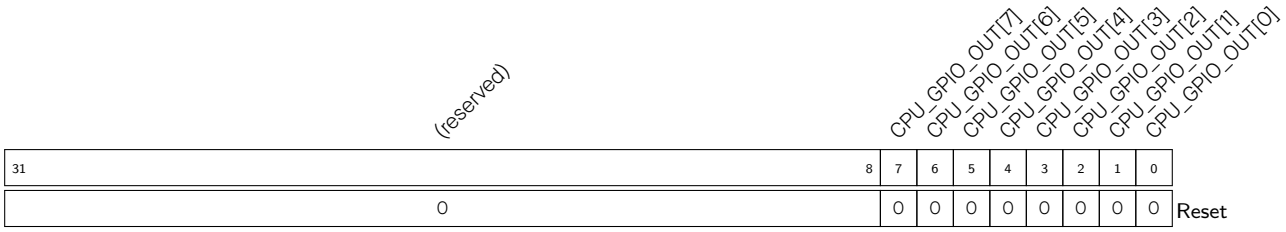
CPU_GPIO_OEN Configures whether to enable GPIOn (n=0 ~ 21) output. CPU_GPIO_OEN[7:0] correspond to output enable signals cpu_gpio_out_oen[7:0] in Table 10.12-1 *Peripheral Signals via GPIO Matrix*. CPU_GPIO_OEN value matches that of cpu_gpio_out_oen. CPU_GPIO_OEN is the enable signal of CPU_GPIO_OUT.

0: Disable GPIO output

1: Enable GPIO output

(R/W)

Register 2.136. cpu_gpio_in (0x804)



CPU_GPIO_IN Represents GPIOn (n=0 ~ 21) input value. It is a CPU CSR to read input value (1=high, 0=low) from SoC GPIO pin.

CPU_GPIO_IN[7:0] correspond to input signals cpu_gpio_in[7:0] in Table 10.12-1 *Peripheral Signals via GPIO Matrix* .

CPU_GPIO_IN[7:0] can only be mapped to GPIO pins through GPIO matrix. For details please refer to Section 10.4 in Chapter *GPIO Matrix and IO MUX*.

(RO)

Register 2.137. cpu_gpio_out (0x805)

CPU_GPIO_OUT Configures GPIOn (n=0 ~ 21) output value. It is a CPU CSR to write value (1=high, 0=low) to SoC GPIO pin. The value takes effect only when CPU_GPIO_OEN is set.

CPU_GPIO_OUT[7:0] correspond to output signals cpu_gpio_out[7:0] in Table 10.12-1 *Peripheral Signals via GPIO Matrix*.

CPU_GPIO_OUT[7:0] can only be mapped to GPIO pins through GPIO matrix. For details please refer to Section 10.5 in Chapter *GPIO Matrix and IO MUX*.

(R/W)

2.13.3 RunStall Support

2.13.3.1 Overview

The RunStall signal allows an external agent to stall the processor and shut off much of the clock tree to save operating power. The RunStall input allows external logic to stall the processor's internal pipeline. Any in-progress instructions in the pipeline will complete after the assertion of the RunStall input line. After the pipeline is stalled, the core outputs a handshake signal "corestalled" to indicate successful stalling of the CPU pipeline.

2.13.3.2 Functional Description

The RunStall input can be used in the following two scenarios:

- As a mechanism to initialize instruction and data RAMs after a reset. If the RunStall input is asserted during reset and remains asserted after the reset is removed, the processor will be in a stalled state. Instruction and data RAMs can be initialized and after these RAMs have been initialized, the RunStall can be released, allowing the processor to start code execution. This mechanism allows the processor's reset vector to point to an address in local instruction RAM, and the reset code can be written to the instruction RAM by an external agent before the processor starts executing code.
- To freeze the processor's internal pipeline. Assertion of RunStall reduces the processor's active power dissipation without using or requiring interrupts and the WAITI option. However, the power savings resulting from use of the RunStall signal will not be as great as for those using WAITI, because the RunStall logic allows some portions of the processor to be active even though the pipeline is stalled.

Figure 2.13-1 shows the timing diagram for RunStall and CoreStalled signals and CPU core state transition.

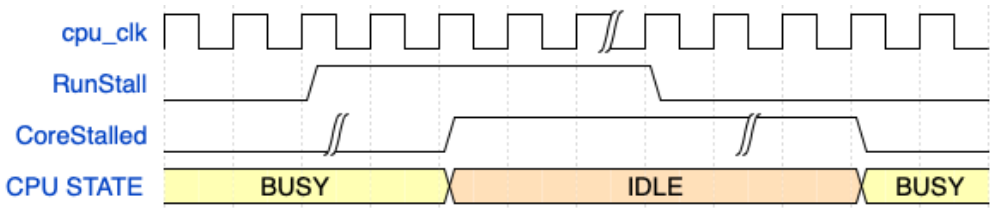


Figure 2.13-1. CPU Core State Transition Using RunStall

2.13.3.3 Register Summary

The SoC registers in Section 21.2.1.10 can be used to assert RunStall to HP cores.

2.13.4 Debug Assist Information

The HP CPU core complex provides additional debug information to the Debug Assistant module in ESP32-P4. For details, please refer to Chapter *22 Debug Assistant*.

2.13.5 Core Lock-up

2.13.5.1 Overview

Currently, there is no exception enable register defined in the RISC-V programming model, and when returning from the exception service program to the normal program flow, the exception vector number in the MCAUSE register is not cleared, so software developers cannot easily know whether the CPU is currently processing an exception or running a normal program track by the registers defined in the programming model. To address this concern, a custom LOCKUP field has been implemented. It is readable through the custom CSR.

2.13.5.2 Functional Description

When the CPU responds to an exception, it will determine whether the current program flow is in the exception service program (through EXPT_VLD in MEXSTATUS field). If the CPU is processing an exception and triggers a new exception before returning from the exception service program, the CPU will be locked. When CPU is locked:

- the lock-up signal is set high to inform the SoC that the CPU is in a locked state
- the CPU stops instruction fetch and execution
- the CPU keeps the PC at the instruction PC that triggers the CPU lock
- the LOCKUP field in the MEXSTATUS register is set to 1

In a locked-up state, a debugger can still break in and execute debug commands. It is recommended to reset the core when a lock state is detected.

There are some exceptions to the lock-up rule. Exceptions caused by ECALL or EBREAK, when nested in any exception type, will not trigger CPU lock-up.

2.13.5.3 Register Summary

The mexstatus.LOCKUP bit provides lock-up status of individual core.

2.13.5.4 Register Description

Please refer to mexstatus CSR.

2.13.6 External Wakeup

2.13.6.1 Overview

Each core features a dedicated input port for wake-up via an external event. This functionality is controlled and configured through registers in the SoC.

2.13.6.2 Functional Description

To save power, each CPU core can enter a sleep state by executing the WFI instruction. It can be awakened by three types of events: an interrupt, a halt request, or a signal from its dedicated wake-up input port. A high-level pulse lasting a single clock cycle on this dedicated port is sufficient to wake the corresponding core.

For details on how to configure this port, please refer to Chapter *21 System Registers (SYSREG)*.

Chapter 3

RISC-V Trace Encoder (TRACE)

The high-performance CPU (HP CPU) of ESP32-P4 supports the instruction trace interface through the trace encoder. The trace encoder connects to HP CPU's instruction trace interface, compresses the information into smaller packets, and then stores the packets into internal SRAM (see Chapter 9 *System and Memory*).

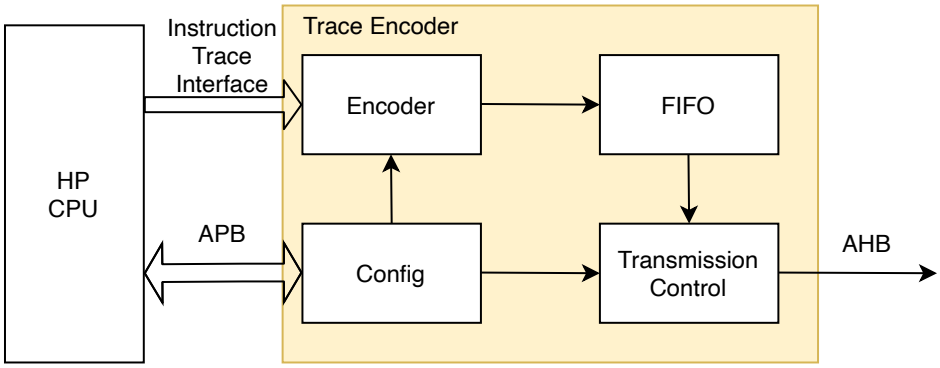

Figure 3.0-1. Trace Encoder Overview

3.1 Terminology

To better illustrate the functions of the RISC-V Trace Encoder, the following terms are used in this chapter.

hart	RISC-V hardware thread
branch	an instruction which conditionally changes the execution flow
uninferable discontinuity (updiscon)	a program counter change that can not be inferred from the program binary alone
delta	a change in the program counter that is other than the difference between two instructions placed consecutively in memory
trap	the transfer of control to a trap handler caused by either an exception or an interrupt
qualification	an instruction that meets the filtering criteria passes the qualification, and will be traced
te_inst	the name of the packet type emitted by the encoder
retire	the final stage of executing an instruction, when the machine state is updated
EPC	exception program counter

3.2 Introduction

In complex systems, understanding program execution flow is not straightforward. This may be due to a number of factors, for example, interactions with other cores, peripherals, real-time events, poor implementations, or some combination of all of the above.

It is hard to use a debugger to monitor the program execution flow of a running system in real time, as this is intrusive and might affect the running state. However, it is important to provide the visibility of program execution.

That is where instruction trace comes in, which provides trace of the program execution.

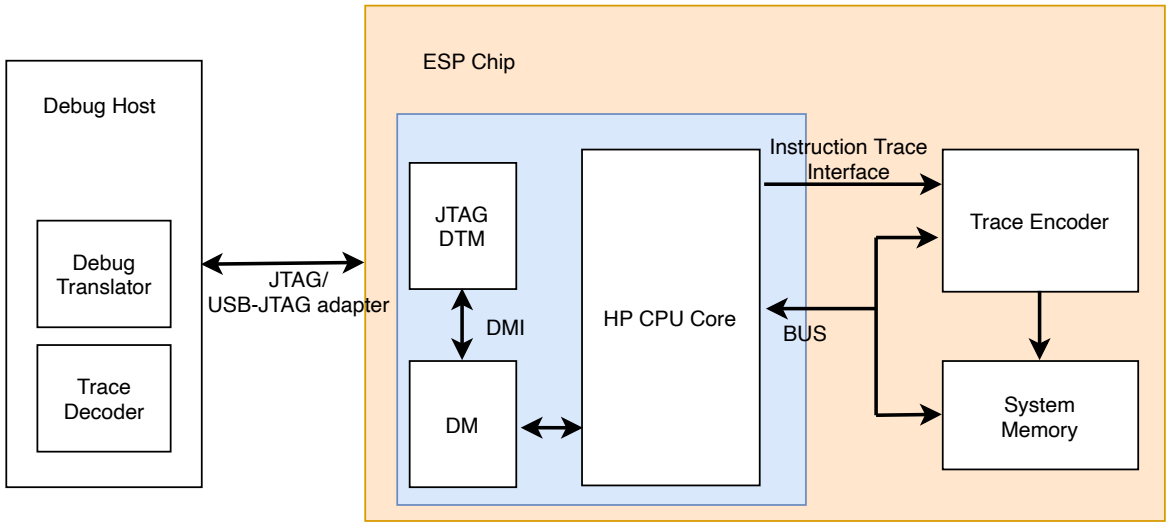

Figure 3.2-1. Trace Flow Overview

Figure 3.2-1 shows the instruction delta trace flow. Each HP Core has a private encoder that can work independently, and the trace flow of each core is the same:

- The HP CPU core provides an instruction trace interface that outputs the instruction information executed by the HP CPU. Such information includes instruction address, instruction type, etc. For more details about ESP32-P4 HP CPU's instruction trace interface, please refer to Chapter 2 *High-Performance CPU*.
- The trace encoder collects the relevant instruction trace information from HP CPU's instruction trace interface, compresses the information into lower bandwidth packets, and then stores the packets in system memory.
- The debugger (debug host) can dump the trace packets from the system memory via JTAG or USB Serial/JTAG, and use a decoder to decompress and reconstruct the program execution flow. The trace decoder, usually software on an external PC, takes in the trace packets and reconstructs the program instruction flow with the program binary that runs on the originating hart. This decoding step can be done offline or in real time while the hart is executing.

3.3 Features

- Compatible with Efficient Trace for RISC-V Version 2.0. See Table 3.3-1 for the implemented parameters
- Support for delta address mode and full address mode
- Support for a filter unit
- Support for notifying an instruction address via debug trigger or filter unit
- Support for the following sideband signals to control trace data flow:
  - Support for debugging trigger to start or end encoder
  - When the hart is halted, the encoder can report the last packet and then stop
  - When the hart is reset, the encoder can report the last packet and then stop
  - Support for stalling the hart when FIFO is almost full
- Arbitrary address range of the trace memory size
- Configurable synchronization modes:
  - Synchronization counter counts by packet
  - Synchronization counter counts by cycle
  - Synchronization counter can be disabled
- Trace lost status to indicate packet loss
- Automatic restart after packet loss
- Memory writing in the loop or non-loop mode
- Support two interrupts:
  - Triggered when the packet size exceeds the configured memory space
  - Triggered when a packet is lost
- FIFO (128 × 8 bits) to buffer packets
- AHB burst transmission with configurable burst length

Table 3.3-1. Trace Encoder Parameters

Parameter Name	Value	Description
arch_p	0	Initial version
bpred_size_p	0	Branch prediction mode is not supported
cache_size_p	0	Jump target cache mode is not supported
call_counter_size_p	0	Implicit return mode is not supported
ctype_width_p	0	Width of the ctype bus
context_width_p	0	Width of context bus
ecause_width_p	6	Width of exception cause
ecause_choice_p	0	Multiple choice is not supported
f0s_width_p	0	Format 0 packets are not supported
filter_context_p	0	Filtering on context is not supported

Parameter Name	Value	Description
filter_excint_p	1	Filtering on exception cause or interrupt is supported
filter_privilege_p	1	Filtering on privilege is supported
filter_tval_p	1	Filtering on trap value is supported
iaddress_lsb_p	1	Compressed instructions are supported
iaddress_width_p	32	The instruction bus is 32-bit
iretire_width_p	1	Width of the iretire bus
ilastsize_width_p	0	Width of the ilastsize
itype_width_p	3	Width of the itype bus
nocontext_p	1	Exclude context from te_inst packets
notime_p	1	Exclude time from te_inst packets
privilege_width_p	1	Only machine and user mode are supported
retires_p	1	Maximum number of instructions that can be retired per block
return_stack_size_p	0	Implicit return mode is not supported
sijump_p	0	Sequentially inferable jump mode is not supported
taken_branches_p	1	Only one instruction retired per cycle
impdef_width_p	0	Not implemented

For detailed descriptions of the above parameters, please refer to the Efficient Trace for RISC-V Version 2.0 > Chapter Parameters and Discovery.

3.4 Architectural Overview

This chapter mainly introduces the implementation details of ESP32-P4's trace encoder.

As shown in Figure 3.0-1, the trace encoder contains an encoder, a FIFO, a register configuration module, and a transmission control module.

The encoder receives the HP CPU's instruction information via the instruction trace interface, compresses it into different packets, and writes it to the internal FIFO.

The transmission control module writes the data in the FIFO to the internal SRAM through the AHB bus.

The FIFO is 128 deep and 8-bit wide. When the memory bandwidth is insufficient, the FIFO may overflow, and packet loss occurs. If a packet is lost, the encoder will send a packet to tell that a packet is lost, stop working until the FIFO is empty, and also trigger an interrupt meanwhile if the interrupt is enabled.

3.5 Functional Description

3.5.1 Synchronization

In order to make the trace robust there must be regular synchronization points within the trace. Synchronization is accomplished by sending a full valued instruction address. When the synchronization counter value reaches the value of the TRACE_RESYNC_PROLONGED field of the TRACE_RESYNC_PROLONGED_REG register, the encoder will send a synchronization packet (format 3 subformat 0, see Section 3.6.3.1).

The synchronization counter is configured via TRACE_RESYNC_MODE:

- 0: Disable the synchronization counter
- 1: Invalid. No effect
- 2: Synchronization counter counts by packet
- 3: Synchronization counter counts by cycle

You can adjust the trace bandwidth by increasing the value of TRACE_RESYNC_PROLONGED to reduce the frequency of sending synchronization packets, thereby reducing the bandwidth occupied by packets.

3.5.2 Address Mode

ESP32-P4 supports two address modes: delta address mode and full address mode.

- Delta address mode (default): In delta address mode, addresses are encoded as the difference between the actual address of the current instruction and the actual address of the instruction reported in the previous packet that contained an address. This differential encoding requires fewer bits than the full address, and thus results in more efficient trace compression.
- Full address mode: In full address mode, all addresses in the trace are encoded as absolute addresses instead of in differential form. This kind of encoding is always less efficient, but it can be a useful debugging aid for software decoder developers. This mode is enabled by setting TRACE_FULL_ADDRESS.

3.5.3 Optional Sideband Signals

The Efficient Trace for RISC-V Version 2.0 > Chapter Optional Sideband Signals has provided some optional sideband signals for encoder control. ESP32-P4 has implemented the following functions:

Table 3.5-1. Optional sideband signals

Signal	Function
trigger[2:0]	• A pulse on bit 0 will cause the encoder to start tracing, and continue until further notice, subject to other filtering criteria also being met. • A pulse on bit 1 will cause the encoder to stop tracing until further notice. • A pulse on bit 2 will cause the encoder to report a specific address. This function is enabled by setting TRACE_DM_TRIGGER_ENA. The trigger signal is asserted upon a trigger match. For example, if the action field of mcontrol is 2, while the trigger matched it will assert trigger bit0; if the action is 3, while the trigger matched it will assert trigger bit1. For details, please refer to Table 3.8-1.
halted	Hart is halted. Upon assertion, the encoder will output a packet to report the address of the last instruction retired before halting, followed by a support packet to indicate that tracing has stopped. Upon deassertion, the encoder will start tracing again, commencing with a synchronization packet. This function is enabled by setting TRACE_HALT_ENA.

Signal	Function
reset	Hart is in reset. Behavior is as described above for halted.
stall	Stall request to hart. Some applications may require lossless trace, which can be achieved by using this signal to stall the hart if the trace encoder is unable to output a trace packet (internal FIFO almost full). This function is enabled by setting TRACE_STALL_ENA.

3.5.4 Filtering

Filtering provides a mechanism to control the criteria for encoder to produce a trace. For example, it may be desirable to trace:

- When the instruction address is within a particular range
- Starting from one instruction address and continue until a second instruction address
- For one or more specified privilege levels
- Exception and/or interrupt handlers for specified exception causes

The filtering unit has a filter and a comparator unit.

Each comparator unit is actually a pair of comparators (Primary and Secondary, or P, S) allowing a bounded range to be matched with a single unit if required, and offers:

- Input selected from iaddress and tval
- A range of arithmetic options ($<$, $>$, $=$, $!=$, etc.) independently selectable for each comparator
- Secondary match value may be used as a mask for the primary comparator
- The two comparators can be combined in several ways: P, $P\&\&S$, $!(P\&\&S)$, latch (set on P clear on S)
- Each comparator can also be used to explicitly report a particular instruction address

Each filter can specify filtering against instruction from the hart, and offers:

- One run-time selectable comparator unit to match
- Multiple choice selection for priv and cause inputs
- Select matching for interrupt

3.5.5 Anchor Tag

Since the length of data packets is variable, in order to identify boundaries between data packets when packed packets are written to memory, the ESP32-P4 encoder inserts zero bytes between data packets:

- The maximum packet length is 13 bytes, so a sequence of at least 14 zero bytes cannot occur within a normal packet. Therefore, the first non-zero byte seen after a sequence of at least 14 zero bytes must be the first byte of a packet.
- Every time when 128 packets are transmitted, the encoder writes 14 zero bytes to the memory partition boundary as anchor tags.

3.5.6 Memory Writing Mode

When writing the trace memory, the size of the trace packets might exceed the capacity of the memory. In this case, you can choose whether to wrap around the trace memory or not by configuring the memory writing mode:

- Loop mode: When the size of the trace packets exceeds the capacity of the trace memory (namely when TRACE_MEM_CURRENT_ADDR_REG reaches the value of TRACE_MEM_END_ADDR_REG), the trace memory is wrapped around, so that the encoder loops back to the memory's starting address TRACE_MEM_START_ADDR_REG, and old data in the memory will be overwritten by new data.
- Non-loop mode: When the size of the trace packets exceeds the capacity of the trace memory, the trace memory is not wrapped around. The encoder stops at TRACE_MEM_END_ADDR_REG, and old data will be retained.

3.5.7 Automatic Restart

When packets are lost due to FIFO overflow, the encoder will stop working and need to be resumed by software manually or restarted by hardware automatically. If the TRACE_RESTART_ENA bit of TRACE_TRIGGER_REG is set, once the FIFO is empty, the encoder can automatically be restarted.

If the automatic restart feature is enabled, the encoder will be restarted in any case. Therefore, to disable the encoder, the automatic restart feature must be disabled first by clearing the TRACE_RESTART_ENA bit of the TRACE_TRIGGER_REG register.

3.6 Encoder Output Packets

This section mainly introduces ESP32-P4 trace encoder output packet format.

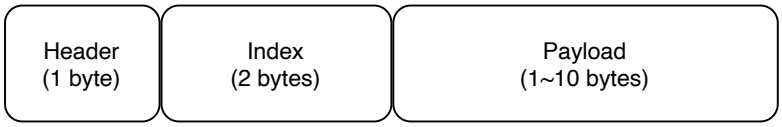

Figure 3.6-1. Trace packet Format

A packet includes header, index and payload. Header, index and payload are transmitted sequentially in bit stream form, from the fields listed at the top of tables below to the fields listed at the bottom. If a field consists of multiple bits, then the least significant bit is transmitted first.

3.6.1 Header

Header is 1-byte long. The format of header is shown in Table 3.6-1.

Table 3.6-1. Header Format

Field	Bits	Description	Value
length	5	Length of whole packet	4 ~ 13
flow	2	Reserved	0
timestamp	1	Reserved	0

3.6.2 Index

Index has 2 bytes. The format of index is shown in Table 3.6-2.

Table 3.6-2. Index Format

Field	Bits	Description	Value
index	16	The index of each packet	0~65535

3.6.3 Payload

The length of payload ranges from 1 byte to 10 bytes.

3.6.3.1 Format 3 Packets

Format 3 packets are used for synchronization, and report supporting information. There are 4 subformats defined in the specification. ESP32-P4 only supports 3 of them.

Format 3 Subformat 0 - Synchronization

This packet contains all the information the decoder needs to fully identify an instruction. It is sent for the first traced instruction (unless that instruction also happens to be the first one in an exception handler), and when synchronization has been scheduled by expiry of the synchronization timer. The payload length is 5 bytes.

Table 3.6-3. Packet format 3 subformat 0

Field name	Bits	Description
format	2	11 (sync): Synchronization
subformat	2	00 (start): Start of tracing, or resync
branch	1	Set to 0 if the address points to a branch instruction, and the branch was taken. Set to 1 if the instruction is not a branch or if the branch is not taken.
privilege	1	The privilege level of the reported instruction
address	31	Full instruction address. The address must be left shifted 1 bit in order to recreate the original byte address.
sign_extend	3	Reserved

Format 3 Subformat 1 - Exception

This packet also contains all the information the decoder needs to fully identify an instruction. It is sent following an exception or interrupt, and includes the cause, the 'trap value' (for exceptions), and the address

of the trap handler or of the exception itself. The length is variable: if the interrupt field is 1, the tvalepc field is omitted and the length is 6 bytes, otherwise the length is 10 bytes.

Table 3.6-4. Packet format 3 subformat 1

Field name	Bits	Description
format	2	11 (sync): Synchronization
subformat	2	01 (exception): Exception cause and trap handler address
branch	1	Set to 0 if the address points to a branch instruction, and the branch was taken. Set to 1 if the instruction is not a branch or if the branch is not taken.
privilege	1	The privilege level of the reported instruction
ecause	6	Exception cause
interrupt	1	Interrupt
theaddr	1	When set to 1, the address field points to the trap handler address. When set to 0, the address field points to the EPC (exception program counter) for an exception at the target for an updiscon, and is undefined for other exceptions and interrupts.
address	31	Full instruction address. The value of this field must be left shifted 1 bit in order to recreate the original byte address.
tvalepc	32	Value from appropriate utval/stval/mtval CSR (control/status register). Omitted if the interrupt is 1
sign_extend	3	Reserved

Format 3 Subformat 3 - Support

This packet provides supporting information to aid the decoder. It is issued when the trace is ended, filter match is failed, or a packet is lost. The length is 2 bytes.

Table 3.6-5. Packet format 3 subformat 3

Field name	Bits	Description
format	2	11 (sync): Synchronization
subformat	2	11 (support): Supporting information for the decoder
enable	1	Indicates if the encoder is enabled
encoder_mode	1	Always 0. Only supported by branch trace
qual_status	2	Indicates qualification status: • 00 (no_change): No change to filter qualification • 01 (ended_rep): Qualification ended, preceding instruction sent explicitly to indicate last qualification instruction • 10 (trace lost): One or more packets lost • 11 (ended_upd): Qualification ended, preceding te_inst would have been sent anyway due to an updiscon, even if wasn't the last qualified instruction

Field name	Bits	Description
ioptions	6	Indicates optional modes: • sequentially inferred jumps (Bits 5): When set to 1, the targets of sequentially inferable jumps will not be reported. (This feature is not implemented, so bit 5 should always be 0) • branch prediction (Bit 4): When set to 1, the branch prediction is enabled. (This feature is not implemented, so bit 4 should always be 0) • jump target cache (Bit 3): When set to 1, the jump target cache is enabled. (This feature is not implemented, so bit 3 should always be 0) • full address (Bit 2): – 0: delta address mode – 1: full address mode • implicit exception (Bit 1): Exclude address from format 3 subformat 1 packet if trap vector can be determined from ecause. (This feature is not implemented, so bit 1 should always be 0) • implicit return (Bit 0): When set to 1, function return addresses will not be reported. (This feature is not implemented, bit 0 should always be 0)
sign_extend	2	Reserved

3.6.3.2 Format 2 Packets

This packet contains only an instruction address, and is used when the address of an instruction must be reported (for example if the instruction is the target for an updiscon, or is the last instruction before exception), and there is no reported branch information.

The length is variable if delta address mode is enabled, ranging from 5 bytes to 8 bytes. The address field can be 8/16/24/32 bits, inferred from the packet length. For example, if the header length is n bytes, the address bits are $n - 4$ bytes. A sign bit is required to extend the address field to 32 bits.

Table 3.6-6. Packet format 2

Field name	Bits	Description
format	2	10 (addr-only): No branch information
notify	1	If the value of this bit is different from the MSB of address, it indicates that this packet is reporting an instruction that is not the target of an uninferable discontinuity because a notification was requested via trigger[2] or a filter matched.
updiscon	1	If the value of this bit is different from notify, it indicates that this packet is reporting the instruction following an uninferable discontinuity and is also the instruction before an exception, privilege change or resync.

Field name	Bits	Description
zero_extend	4	Reserved
address	Variable	Delta instruction address. These bits can be 8/16/24/32.

3.6.3.3 Format 1 Packets

This packet includes branch information, and is used when either the branch information must be reported (for example because the branch map is full), or when the address of instruction must be reported, and there has been at least one branch since the previous packet.

The packet length is variable if delta address mode is enabled, ranging from 5 bytes to 12 bytes. The address field can be 8/16/24/32 bits, inferred from the packet length. For example:

- The header length is n bytes
- The value of the format field is 1
- The value of the branch field is:
  - 0: the packet is format 1 without address
  - 1: branch_map is 1 bit wide, zero_ext is 6 bits wide, and address is $n - 5$ bits wide
  - 2 ~ 3: branch_map is 3 bits wide, zero_ext is 4 bits wide, and address is $n - 5$ bits wide
  - 4 ~ 7: branch_map is 7 bits wide, zero_ext is 0 bits wide, and address is $n - 5$ bits wide
  - 8 ~ 15: branch_map is 15 bits wide, zero_ext is 0 bits wide, and address is $n - 6$ bits wide
  - 16 ~ 31: branch_map is 31 bits wide, zero_ext is 0 bits wide, and address is $n - 8$ bits wide

Format 1 - address, branch_map

The length is variable.

Table 3.6-7. Packet format 1 with address

Field name	Bits	Description
format	2	01: Includes branch information
branches	5	Number of valid bits branch_map. The number of bits of branch_map is determined as follows: • 0: (cannot occur for this format) • 1: 1 bit • 2 ~ 3: 3 bits • 4 ~ 7: 7 bits • 8 ~ 15: 15 bits • 16 ~ 31: 31 bits For example if branches = 12, branch_map is 15-bit long, and the 12 LSBs are valid.

Field name	Bits	Description
branch_map	Variable	An array of bits indicating whether branches are taken or not. Bit 0 represents the oldest branch instruction executed. For each bit: • 0: branch taken • 1: branch not taken The field Bits is variable and determined by the branches field.
notify	1	If the value of this bit is different from the MSB of address, it indicates that this packet is reporting an instruction that is not the target of an uninferable discontinuity because a notification was requested via trigger[2] or a filter matched.
updiscon	1	If the value of this bit is different from notify, it indicates that this packet is reporting the instruction following an uninferable discontinuity and is also the instruction before an exception, privilege change or resync.
zero_ext	Variable	The length of this field is determined by branches as follows: • 1: 6 bits • 2 ~ 3: 4 bits • 4 ~ 31: 0 bits
address	Variable	Delta instruction address. These bits can be 8/16/24/32

Format 1 - no address, branch_map

The length is 5 bytes.

Table 3.6-8. Packet format 1 without address

Field name	Bits	Description
format	2	01: includes branch information
branches	5	Number of valid bits in branch_map. The length of branch_map is 31 bits. Only 0 valid.
branch_map	31	An array of bits indicating whether branches are taken or not. Bit 0 represents the oldest branch instruction executed. For each bit: • 0: branch taken • 1: branch not taken
sign_extend	2	Reserved

3.7 Interrupt

ESP32-P4's CORE*n*_TRACE (i.e., the trace encoder of core 0 or core 1) can generate the CORE*n*_TRACE_INTR interrupt signal that will be sent to the Interrupt Matrix.

There are several internal interrupt sources from CORE*n*_TRACE that can generate the above interrupt signal. The interrupt sources from CORE*n*_TRACE are listed with their trigger conditions and the resulted interrupt signals in Table 3.7-1.

Table 3.7-1. CORE*n*_TRACE's Internal Interrupt Sources

Internal Interrupt Source	Trigger Condition	Interrupt Signal
TRACE_MEM_FULL_INTR	Triggered when the packet size exceeds the capacity of the trace memory, namely when TRACE_MEM_CURRENT_ADDR_REG reaches the value of TRACE_MEM_END_ADDR_REG. If necessary, this interrupt can be enabled to notify the HP CPU for processing, such as applying for a new memory space again	CORE*n*_TRACE_INTR
TRACE_FIFO_OVERFLOW_INTR	Triggered when the internal FIFO overflows and one or more packets have been lost.	CORE*n*_TRACE_INTR

Note:
For definitions of *interrupt*, *interrupt signal*, *interrupt source*, and their correlations, please refer to Chapter 13 *Interrupt Matrix* > Section 13.2 *Interrupt Terminology in ESP32-P4*.

Each interrupt source can be configured by a common set of registers that are described in Section *Interrupt Configuration Registers*. The specific registers can be found in Section 3.9 *Register Summary*.

3.8 Programming Procedures

3.8.1 Encoder Option Configuration

The Encoder has some optional configuration options.

- Full address mode
  - The encoder uses delta address mode by default. Users can set TRACE_FULL_ADDRESS to enable full address mode for debugging.
- Restart after packet loss
  - Once the trace packet is lost due to FIFO overflow, the encoder automatically stops. If TRACE_RESTART_ENA is set, the encoder will automatically restart once the FIFO is empty.
- Stall CPU while FIFO is almost full
  - If TRACE_STALL_ENA is set, when the FIFO is almost full, a stall request will be asserted to the CPU, and the CPU will be stalled until the request is deasserted.
- Stop tracing when the CPU is halted

  If TRACE_HALT_ENA is set, when the CPU is halted, the encoder will output a packet to report the address of the last instruction before halting, followed by a support packet to indicate that tracing has stopped. Upon the deassertion of the halted signal, the encoder will start tracing again, commencing with a synchronization packet.
- Stop tracing when the CPU is in reset

The encoder will be reset separately, if TRACE_RESET_ENA is set. When the CPU is in reset, the encoder will output a packet to report the address of the last instruction before reset, followed by a support packet to indicate that tracing has stopped. Once the CPU exits from reset, the encoder will start tracing again, commencing with a synchronization packet.

- Using trigger outputs from the Debug Module

  The debug module of the RISC-V hart has a trigger unit. This defines a match control register (mcontrol) containing a 4-bit action field, and reserves codes 2 ~ 4 of this field for trace use. ESP32-P4 has implemented this feature. The values of the action field are listed in Table 3.8-1.

Table 3.8-1. Debug module trigger support (the action field of the mcontrol register)

Value	Description
2	Trace-on: start trace
3	Trace-off: end trace
4	Trace-notify: notify the encoder to report an address

For details about the debug module trigger unit, please refer to Chapter 2 *High-Performance CPU*.

3.8.2 Filter Configuration

The filter unit described in Section 3.5.4 can be configured as follows:

1. Select one of the following match modes:
   - Set TRACE_MATCH_PRIVILEGE to enable privilege match mode:
     - Configure TRACE_MATCH_CHOICE_PRIVILEGE to specify the privilege level.
   - Set TRACE_MATCH_ECAUSE to enable ecause match mode:
     - Configure TRACE_MATCH_CHOICE_ECAUSE to specify the ecause value
   - Set TRACE_MATCH_INTERRUPT to enable interrupt match mode:
     - Configure TRACE_MATCH_VALUE_INTERRUPT to specify interrupt level
   - Set TRACE_MATCH_COMP to enable comparator match mode:
     - Configure the primary comparator:
       * Configure TRACE_P_INPUT to choose the input
       * Configure TRACE_P_FUNCTION to select the comparator function
       * Configure TRACE_FILTER_P_COMPARATOR_MATCH_REG to define match value
     - Configure the secondary comparator if needed:
       * Configure TRACE_S_INPUT to choose the input
       * Configure TRACE_S_FUNCTION to select the comparator function
       * Configure TRACE_FILTER_S_COMPARATOR_MATCH_REG to define match value
     - Choose which comparator to match via TRACE_MATCH_MODE:
       * 0: only the primary comparator matches, and the secondary comparator has no effect

* 1: both the primary comparator and the secondary comparator match ($P\&\&S$)
* 2: neither the primary comparator nor secondary comparator match $!(P\&\&S)$
* 3: start filtering when primary matches up until secondary matches

If TRACE_P_NOTIFY or TRACE_S_NOTIFY is set, the comparator will report the matched address as a notification, the instructions will not be filtered. For example:

- If the TRACE_MATCH_MODE is 0, and TRACE_P_NOTIFY is set, then all instructions will be traced, and the matched primary comparator will be notified.
- If the TRACE_MATCH_MODE is 0, and TRACE_S_NOTIFY is set, the instruction will be filtered by the primary comparator, and the instruction that matches the secondary comparator will be notified.

2. Set TRACE_FILTER_EN to enable filter unit.

3.8.3 Enable Encoder

- Configure the address space for the trace memory via TRACE_MEM_START_ADDR_REG and TRACE_MEM_END_ADDR_REG. The encoder can access L2 MEM and PSRAM:
  - L2MEM: 0x4FF00000 ~ 0x4FFBFFFF
  - PSRAM: 0x48000000 ~ 0x4BFFFFFF
- Update the value of TRACE_MEM_CURRENT_ADDR_REG to the value of TRACE_MEM_START_ADDR_REG by setting TRACE_MEM_CURRENT_ADDR_UPDATE
- (Optional) Configure the memory writing mode via the TRACE_MEM_LOOP bit of TRACE_TRIGGER_REG
  - 0: Non-loop mode
  - 1: Loop mode (default)
- Configure the synchronization mode via the TRACE_RESYNC_MODE bit of TRACE_RESYNC_PROLONGED_REG
  - 0: Disable the synchronization counter
  - 1: Invalid. No effect
  - 2: Synchronization counter counts by packet
  - 3: Synchronization counter counts by cycle
- (Optional) Configures the threshold for the synchronization counter (default value is 128) via TRACE_RESYNC_PROLONGED_REG
- (Optional) Enable Interrupt
  - Set the corresponding bit of TRACE_INTR_ENA_REG to enable the corresponding interrupt
  - Set the corresponding bit of TRACE_INTR_CLR_REG to clear the corresponding interrupt
  - Read TRACE_INTR_RAW_REG to know which interrupt occurs
- (Optional) Enable automatic restart by setting the TRACE_RESTART_ENA bit of TRACE_TRIGGER_REG. This function is enabled by default

- There are 2 ways to enable the trace encoder:
  - Setting the TRACE_TRIGGER_ON bit of TRACE_TRIGGER_REG
  - Through the Debug module Trace-on to start the encoder. When the trigger is matched and the action is 2, it will start the encoder. For trigger configurations, please refer to the RISC-V Debug Specification.

Once the encoder is enabled, it will keep tracing the HP CPU's instruction trace interface and writing packets to the trace memory.

3.8.4 Disable Encoder

There are two ways to end output trace packets:

1. Set TRACE_TRIGGER_OFF of TRACE_TRIGGER_REG to end the encoder
2. Through the Debug module Trace-off to end the encoder. When the trigger is matched and the action is 3, it will end the encoder. For trigger configurations, please refer to the RISC-V Debug Specification.

Due to the internal FIFO, the packets are not written to the memory immediately after the end of the trace. It is recommended to query the TRACE_FIFO_STATUS_REG to confirm that the data is all written to memory.

Table 3.8-2. Trace Status

Field	Description
TRACE_FIFO_EMPTY	If 1 indicates that the FIFO is empty, all data have been written to memory
TRACE_WORK_STATUS	Encoder's work status: • 0: idle state, the encoder is not started • 1: the encoder is normally working that output packets • 2: the encoder is not outputting packets, the CPU is halted or in reset • 3: the encoder is not outputting packets, it occurs while a packet is lost, and is waiting for FIFO empty to restart.

3.8.5 Notify

Users may want to report a special address, even if it is not the target of an uninferable discontinuity. There are two ways to notify and report a special address:

1. The debug trigger unit matched, and the action is 4
2. The filter comparator matched

When a notification is requested, the encoder will report a format 2 or format 1 with an address packet, determined by the branch_map. If branch_map is 0, report format 2, otherwise report format 1. The notify field shows whether the packet is reporting a notification address. If it is the target of an uninferable discontinuity, even if it is a notification, the notify field will not be asserted, otherwise the decoder cannot reconstruct the instruction stream correctly.

3.8.6 Decode Data Packets

- Find the first address to decode
  - Read the TRACE_MEM_FULL_INTR_RAW bit of the TRACE_INTR_RAW_REG register to know if the trace memory is full
    * if read 0, read the trace packets from TRACE_MEM_START_ADDR_REG
    * if read 1, and the loop mode is enabled, then the old trace packets are overwritten. In this case, read the TRACE_MEM_CURRENT_ADDR_REG to know the last writing address, and use this address as the first address to decode
- Use the decoder to decode data packets
  - The decoder reads all data packets starting from the first address, and reconstructs the data stream with the binary file
  - As mentioned in 3.6, the encoder writes 14 zero bytes to the memory partition boundary every time when 128 packets are transmitted. Given this fact, the first non-zero byte after 14 zero bytes should be the header of a new packet

3.8.7 AHB Configuration

ESP32-P4 encoder supports the AHB bus. There are some optional configurations to control the transmission bandwidth of the encoder.

If there are many DMA masters, users can increase the bandwidth of Trace by setting AHB burst TRACE_AHB_CONFIG_REG.

- The TRACE_HBURST supports the following configurations:
  - 0x0: SINGLE
  - 0x1: INCR (length not defined)
  - 0x2: INCR4
  - 0x4: INCR8
  - Others: reserved

  Burst transfer means that once arbitration is successful, multiple words can be transferred continuously. For SINGLE, the length is 1; for INCR, the length is undefined; for INCR4, the length is 4; for INCR8, the length is 8. The longer the burst length, the better the bandwidth.
- When configured as INCR transfer, since INCR is a burst of indeterminate length, in order to avoid Trace occupying the bus for a long time, it will end the INCR transfer after the transfer length up to TRACE_MAX_INCR, and restart bus arbitration.

This is the configuration used to adjust the bandwidth. When the bandwidth is sufficient, it's not required to do the configuration, and users can use the default configuration.

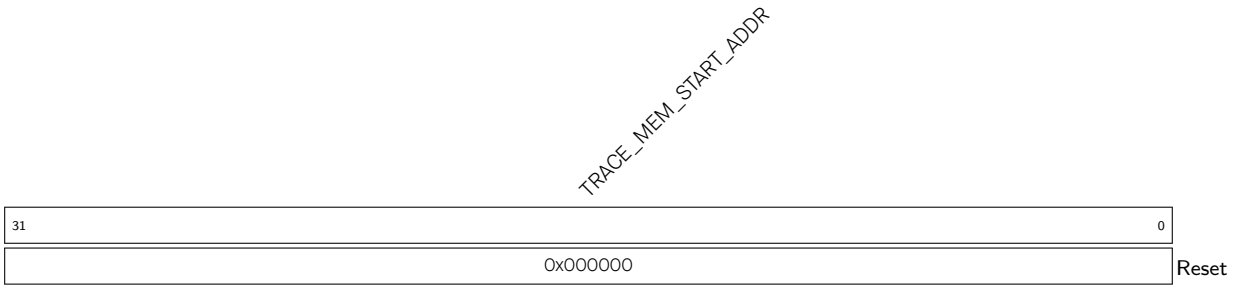
3.8.8 Software Retention

The TRACE_WORK_STATUS represents the state of the encoder. When the encoder is not in the IDLE state, it must backup and restore the configuration when the chip enters sleep.

3.9 Register Summary

The addresses in this section are relative to RISC-V Trace Encoder base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

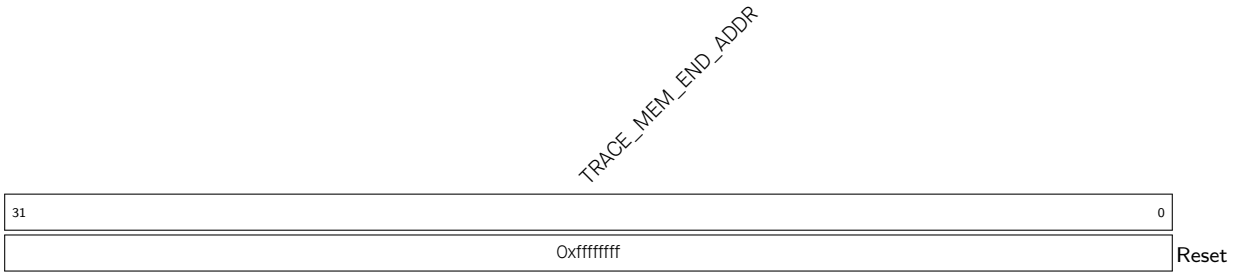
The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.



Name	Description	Address	Access
Memory configuration registers			
TRACE_MEM_START_ADDR_REG	Memory start address	0x0000	R/W
TRACE_MEM_END_ADDR_REG	Memory end address	0x0004	R/W
TRACE_MEM_CURRENT_ADDR_REG	Memory current address	0x0008	RO
TRACE_MEM_ADDR_UPDATE_REG	Memory address update	0x000C	WT
FIFO status register			
TRACE_FIFO_STATUS_REG	FIFO status register	0x0010	RO
Interrupt registers			
TRACE_INTR_ENA_REG	Interrupt enable register	0x0014	R/W
TRACE_INTR_RAW_REG	Interrupt raw status register	0x0018	RO
TRACE_INTR_CLR_REG	Interrupt clear register	0x001C	WT
Trace configuration registers			
TRACE_TRIGGER_REG	Trace trigger register	0x0020	varies
TRACE_CONFIG_REG	Trace configuration register	0x0024	R/W
TRACE_FILTER_CONTROL_REG	Filter control register	0x0028	R/W
TRACE_FILTER_MATCH_CONTROL_REG	Filter match control register	0x002C	R/W
TRACE_FILTER_COMPARATOR_CONTROL_REG	Filter comparator match control register	0x0030	R/W
TRACE_FILTER_P_COMPARATOR_MATCH_REG	Primary comparator match value register	0x0034	R/W
TRACE_FILTER_S_COMPARATOR_MATCH_REG	Secondary comparator match value register	0x0038	R/W
TRACE_RESYNC_PROLONGED_REG	Resynchronization configuration register	0x003C	R/W
TRACE_AHB_CONFIG_REG	AHB configuration register	0x0040	R/W
Clock gating control and configuration register			
TRACE_CLOCK_GATE_REG	Clock gating control register	0x0044	R/W
Version register			
TRACE_DATE_REG	Version control register	0x03FC	varies

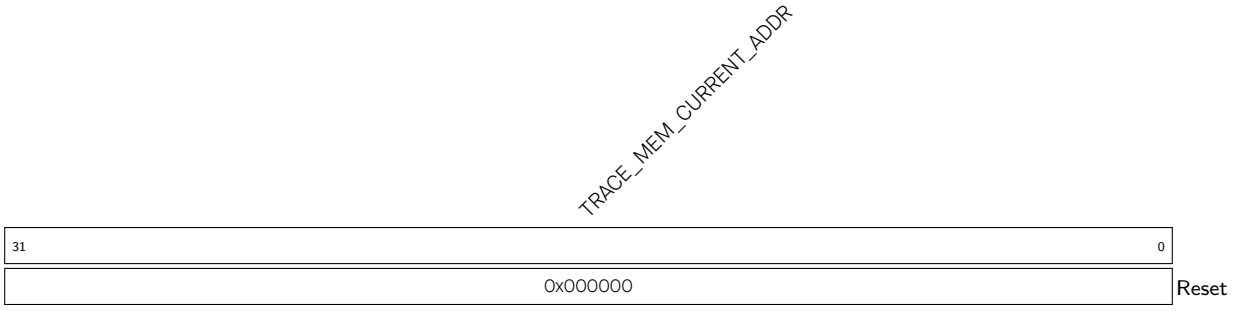
3.10 Registers

The addresses in this section are relative to RISC-V Trace Encoder base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.



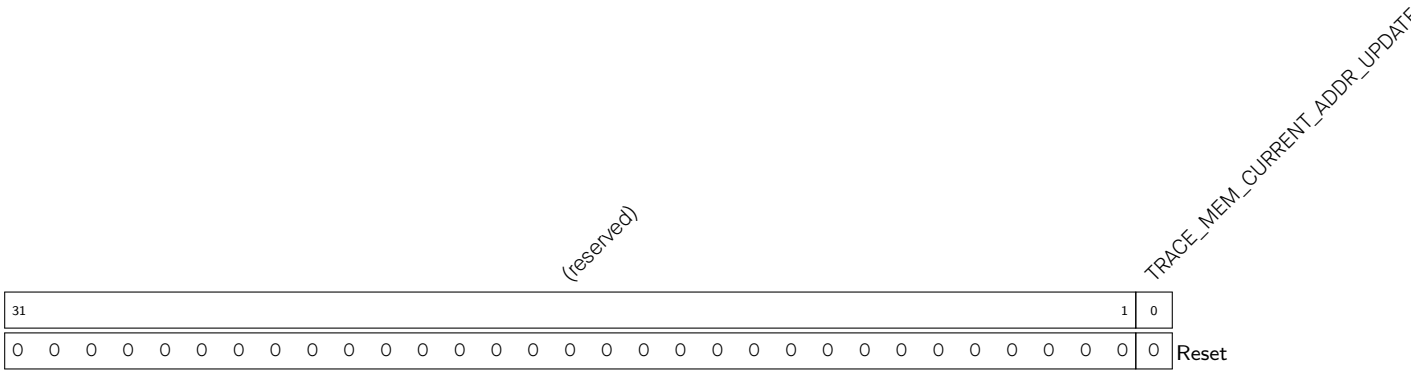
For how to program reserved fields, please refer to Section Programming Reserved Register Field.

Register 3.1. TRACE_MEM_START_ADDR_REG (0x0000)



TRACE_MEM_START_ADDR Configures the start address of the trace memory. (R/W)

Register 3.2. TRACE_MEM_END_ADDR_REG (0x0004)

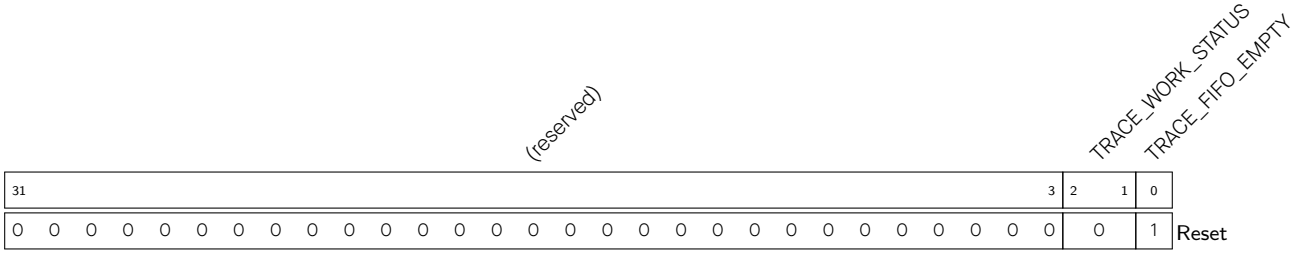


TRACE_MEM_END_ADDR Configures the end address of the trace memory. (R/W)

Register 3.3. TRACE_MEM_CURRENT_ADDR_REG (0x0008)

TRACE_MEM_CURRENT_ADDR Represents the current memory address for writing. (RO)

Register 3.4. TRACE_MEM_ADDR_UPDATE_REG (0x000C)



TRACE_MEM_CURRENT_ADDR_UPDATE Configures whether to update the value of TRACE_MEM_CURRENT_ADDR to TRACE_MEM_START_ADDR.

0: Not update

1: Update

(WT)

Register 3.5. TRACE_FIFO_STATUS_REG (0x0010)

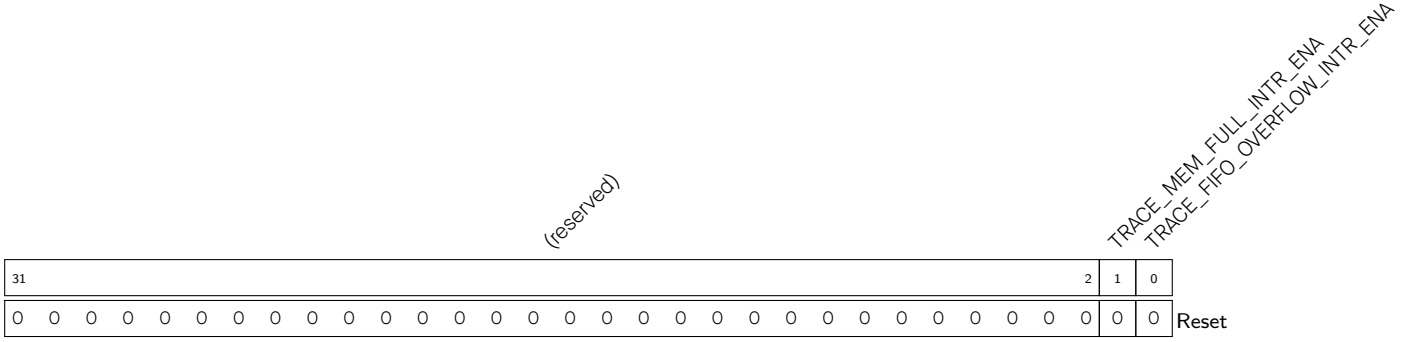
TRACE_FIFO_EMPTY Represents whether the FIFO is empty.

1: Empty

0: Not empty (RO)

TRACE_WORK_STATUS Represents the state of the encoder:

0: Idle state

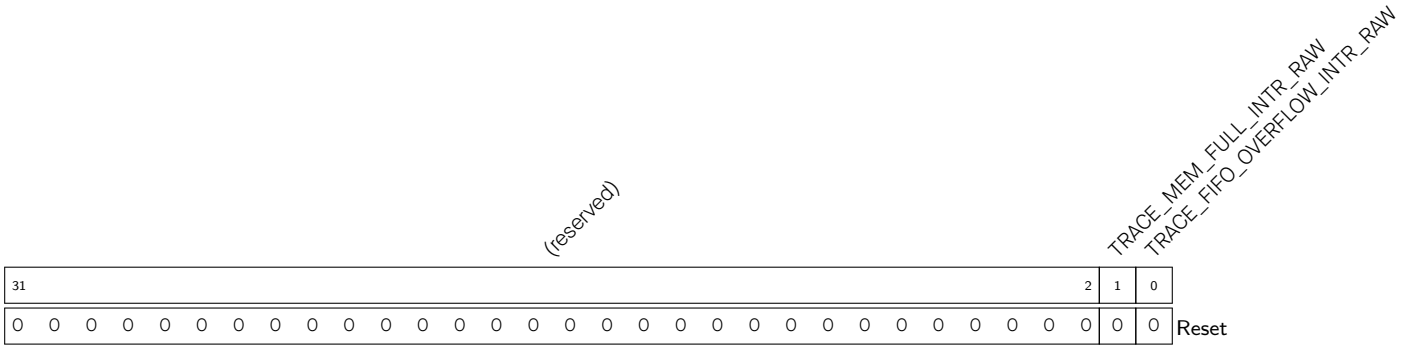


1: Working state

2: Wait state because the hart is halted or in reset

3: Lost state

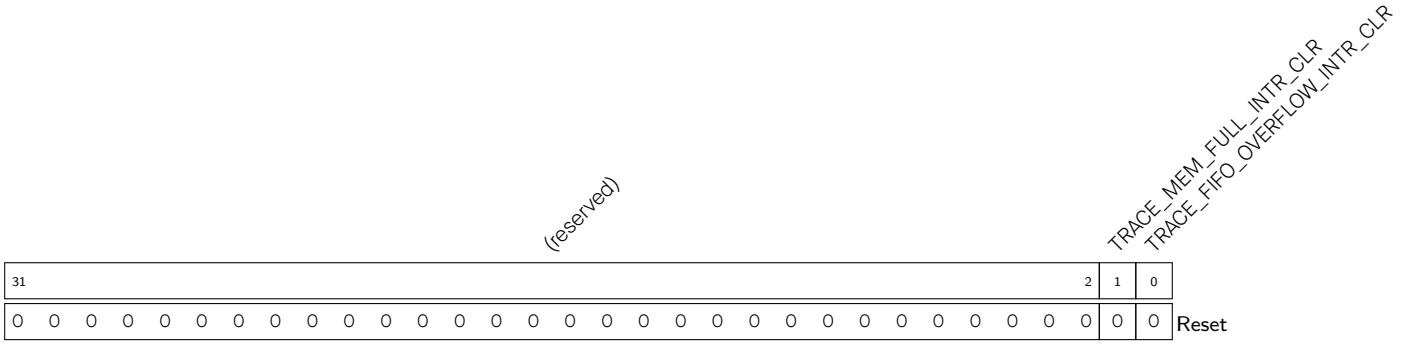
(RO)



Register 3.6. TRACE_INTR_ENA_REG (0x0014)

TRACE_FIFO_OVERFLOW_INTR_ENA Write 1 to enable TRACE_FIFO_OVERFLOW_INTR. (R/W)

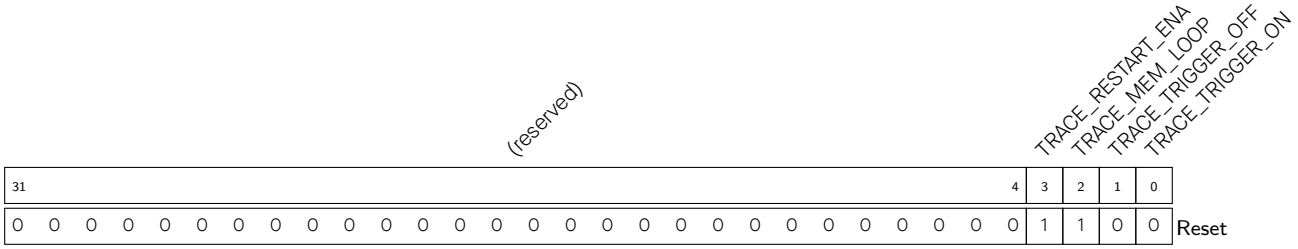
TRACE_MEM_FULL_INTR_ENA Write 1 to enable TRACE_MEM_FULL_INTR. (R/W)



Register 3.7. TRACE_INTR_RAW_REG (0x0018)

TRACE_FIFO_OVERFLOW_INTR_RAW The raw interrupt status of TRACE_FIFO_OVERFLOW_INTR. (RO)

TRACE_MEM_FULL_INTR_RAW The raw interrupt status of TRACE_MEM_FULL_INTR. (RO)



Register 3.8. TRACE_INTR_CLR_REG (0x001C)

TRACE_FIFO_OVERFLOW_INTR_CLR Write 1 to clear TRACE_FIFO_OVERFLOW_INTR. (WT)

TRACE_MEM_FULL_INTR_CLR Write 1 to clear TRACE_MEM_FULL_INTR. (WT)

Register 3.9. TRACE_TRIGGER_REG (0x0020)

TRACE_TRIGGER_ON Configures whether to enable the encoder.

0: Invalid

1: Enable

(WT)

TRACE_TRIGGER_OFF Configures whether to disable the encoder.

0: Invalid

1: Disable

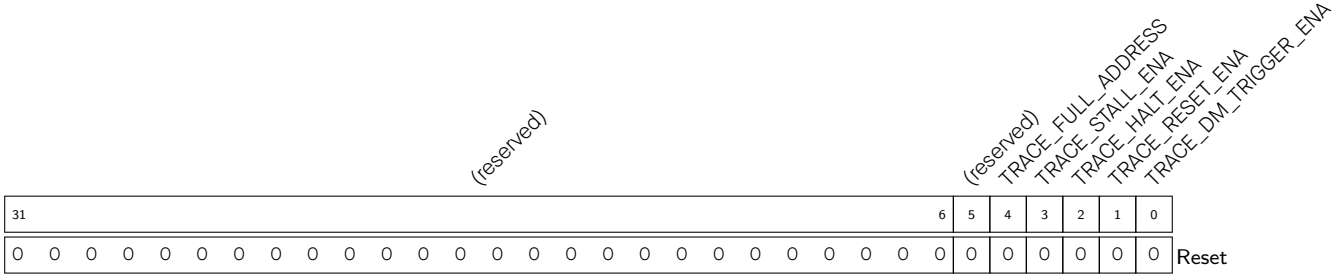
(WT)

TRACE_MEM_LOOP Configures the memory writing mode.

0: Non-loop mode

1: Loop mode

(R/W)



TRACE_RESTART_ENA Configures whether to enable automatic restart.

0: Disable

1: Enable

(R/W)

Register 3.10. TRACE_CONFIG_REG (0x0024)

TRACE_DM_TRIGGER_ENA Configure whether to enable the trigger signal.

0: Disable

1: Enable

(R/W)

TRACE_RESET_ENA Configures whether to enable the reset signal.

0: Disable

1: Enable

(R/W)

TRACE_HALT_ENA Configures whether to enable the halted signal.

0: Disable

1: Enable

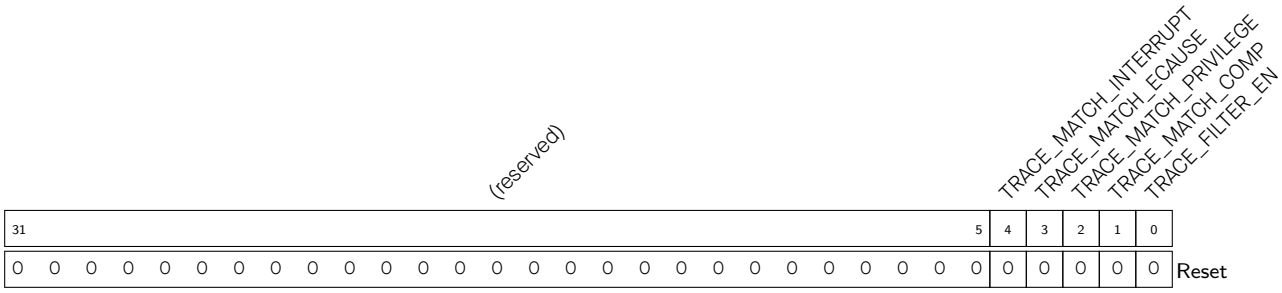
(R/W)

TRACE_STALL_ENA Configures whether to enable the stall signal.

0: Disable

1: Enable

(R/W)



TRACE_FULL_ADDRESS Configure the address mode.

0: Delta address mode

1: Full address mode

(R/W)

Register 3.11. TRACE_FILTER_CONTROL_REG (0x0028)

TRACE_FILTER_EN Configure whether to enable filtering.

0: Disable

1: Enable

(R/W)

TRACE_MATCH_COMP Configures whether to enable the comparator match mode.

0: Disable

1: Enable

(R/W)

TRACE_MATCH_PRIVILEGE Configures whether to enable the privilege match mode.

0: Disable

1: Enable

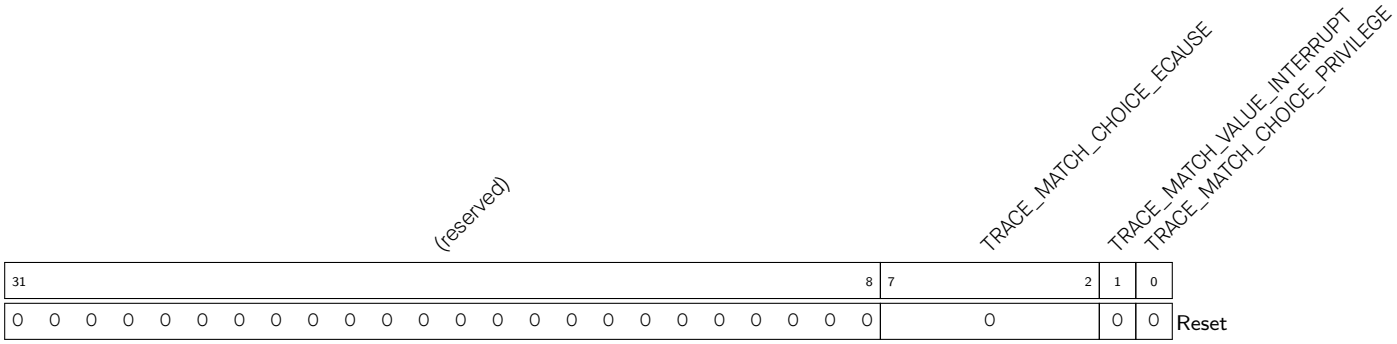
(R/W)

TRACE_MATCH_ECAUSE Configures whether to enable the ecause match mode.

0: Disable

1: Enable

(R/W)



TRACE_MATCH_INTERRUPT Configures whether to enable the interrupt match mode.

0: Disable

1: Enable

(R/W)

Register 3.12. TRACE_FILTER_MATCH_CONTROL_REG (0x002C)

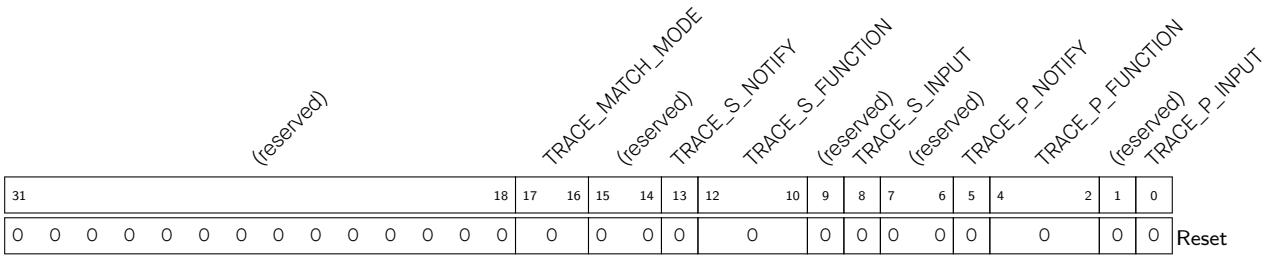
TRACE_MATCH_CHOICE_PRIVILEGE Configures the privilege level for matching.

0: User mode

1: Machine mode

(R/W)

TRACE_MATCH_VALUE_INTERRUPT Configures the interrupt level for matching. Valid only when TRACE_MATCH_INTERRUPT is set.



0: itype=1

1: itype=2

(R/W)

TRACE_MATCH_CHOICE_ECAUSE Configures the ecause code for matching. (R/W)

Register 3.13. TRACE_FILTER_COMPARATOR_CONTROL_REG (0x0030)

(reserved)
TRACE_MATCH_MODE
(reserved)
TRACE_S_NOTIFY
TRACE_S_FUNCTION
(reserved)
TRACE_S_INPUT
(reserved)
TRACE_P_NOTIFY
TRACE_P_FUNCTION
(reserved)
TRACE_P_INPUT
31 18 17 16 15 14 13 12 10 9 8 7 6 5 4 2 1 0
0 0 0

Register 3.13. TRACE_FILTER_COMPARATOR_CONTROL_REG (0x0030)

Continued from the previous page...

TRACE_S_NOTIFY Configures whether to explicitly report an instruction address matched against the secondary comparator.

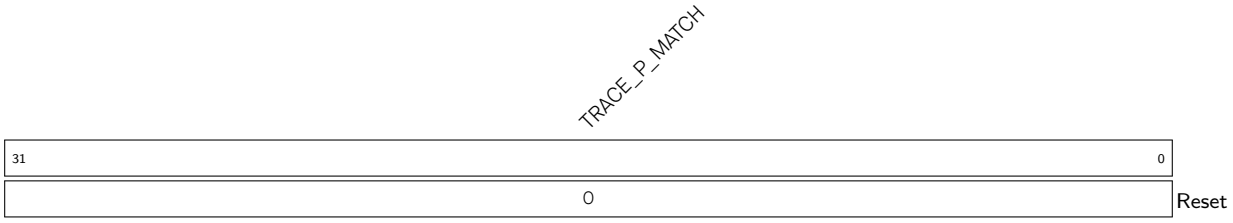
0: Not report

1: Report

(R/W)

TRACE_MATCH_MODE Configures the comparator match condition.

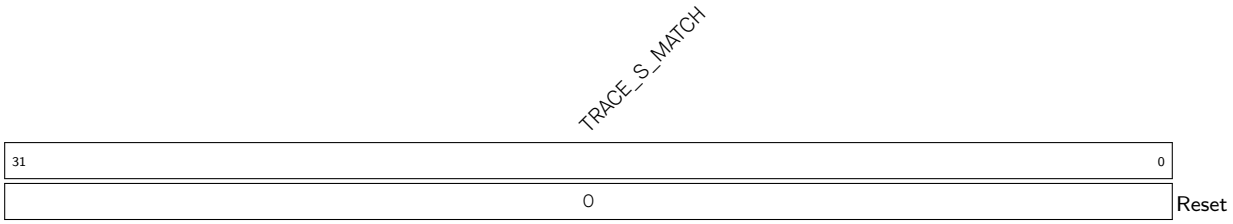
0: Only the primary comparator matches



1: Both primary and secondary comparators match (P&&S)

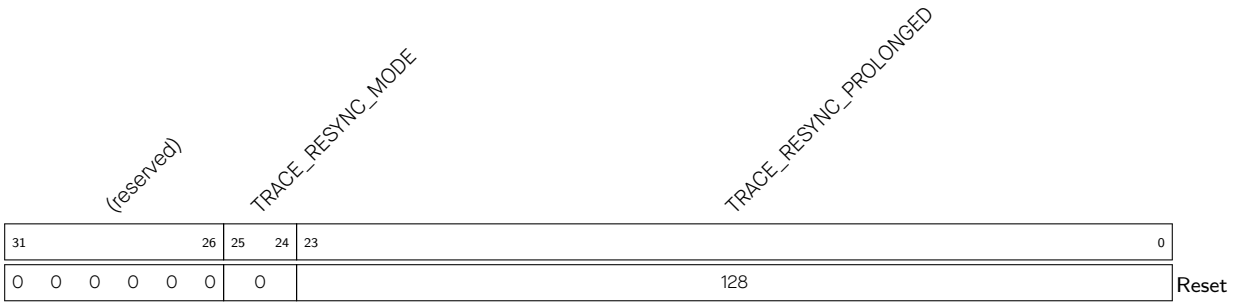
2: Neither primary nor secondary comparator match !(P&&S)

3: Start filtering when the primary comparator matches and stop filtering when the secondary comparator matches



(R/W)

Register 3.14. TRACE_FILTER_P_COMPARATOR_MATCH_REG (0x0034)



TRACE_P_MATCH Configures the match value for the primary comparator. (R/W)

Register 3.15. TRACE_FILTER_S_COMPARATOR_MATCH_REG (0x0038)

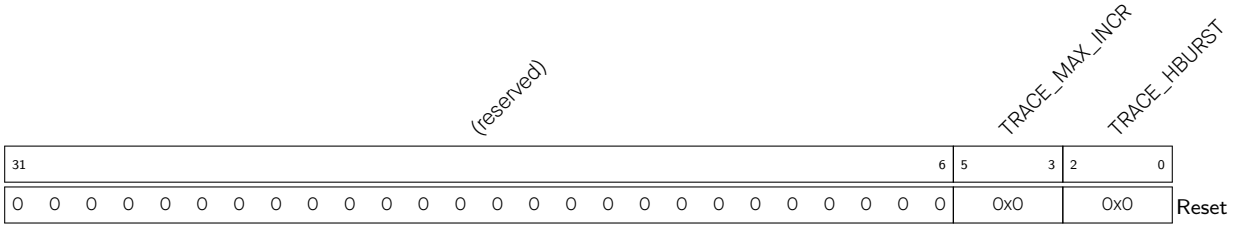
TRACE_S_MATCH Configures the match value for the secondary comparator. (R/W)

Register 3.16. TRACE_RESYNC_PROLONGED_REG (0x003C)

TRACE_RESYNC_PROLONGED Configures the threshold for the synchronization counter. (R/W)

TRACE_RESYNC_MODE Configures the synchronization mode.

0: Disable the synchronization counter



1: Invalid

2: Synchronization counter counts by packet

3: Synchronization counter counts by cycle

(R/W)

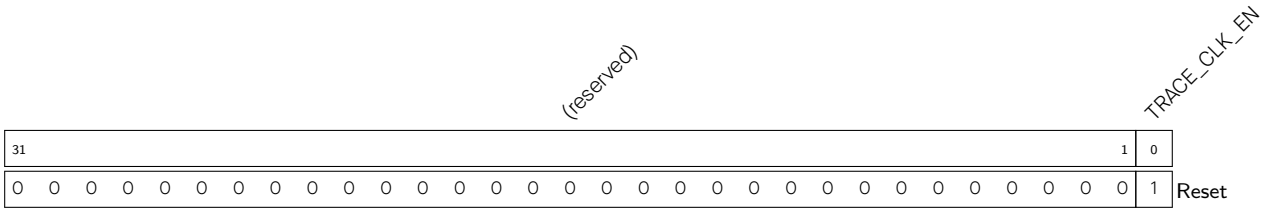
Register 3.17. TRACE_AHB_CONFIG_REG (0x0040)

TRACE_HBURST Configures the AHB burst mode.

0: SINGLE

1: INCR (length not defined)

2: INCR4



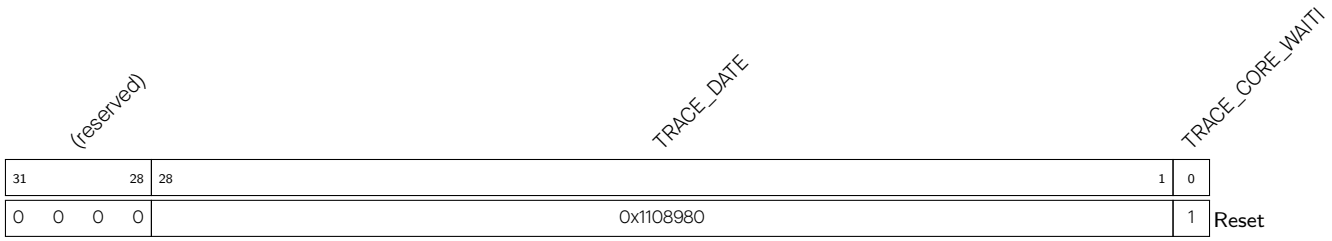
4: INCR8

Others: Invalid

(R/W)

TRACE_MAX_INCR Configures the maximum burst length for INCR mode. (R/W)

Register 3.18. TRACE_CLOCK_GATE_REG (0x0044)



TRACE_CLK_EN Configures register clock gating. 0: Support clock only when the application writes registers to save power

1: Always force the clock on for registers

This bit doesn't affect register access

(R/W)

Register 3.19. TRACE_DATE_REG (0x03FC)

TRACE_DATE Version control register. (R/W)

TRACE_CORE_WAITI Represents whether the HP CPU cores are in the Wait-For-Interrupt (WFI) state.

0: Not in WFI

1: In WFI

(RO)

Chapter 4

Processor Instruction Extensions (PIE)

4.1 Overview

The ESP32-P4 HP 32-bit RISC-V dual-core processor supports the standard RV32IMAFCZcZb extensions. It also includes a custom extension named Xesploop (hardware loop), which executes "for" loops in hardware to improve performance. For more details, see the 2High-Performance CPU chapter. In addition, a custom AI and DSP extension, Xespv2p2, accelerates selected AI and DSP algorithms.

This chapter describes the Xespv2p2 extension, which is based on the SIMD (Single Instruction Multiple Data) architecture. It supports 8-bit, 16-bit, and 32-bit vector operations, which improves data throughput. Arithmetic instructions such as multiplication, shifting, and accumulation can also transfer data while performing computation, further improving execution efficiency.

4.2 Features

The Xespv2p2 extension has the following features:

- 128-bit general-purpose registers
- 128-bit vector operations, e.g., multiplication, addition, subtraction, accumulation, shifting, and comparison
- Integration of data transfer into arithmetic instructions
- Support for non-aligned 128-bit vector data
- Configurable rounding and saturation modes

4.3 Structure Overview

4.3.1 Internal Structure Diagram

This section helps you understand the available instructions, their capabilities, and their limits. It is not intended to describe hardware implementation details.

The figure below shows the internal structure of the Xespv2p2 extension for multiply-accumulate (MAC) instructions:

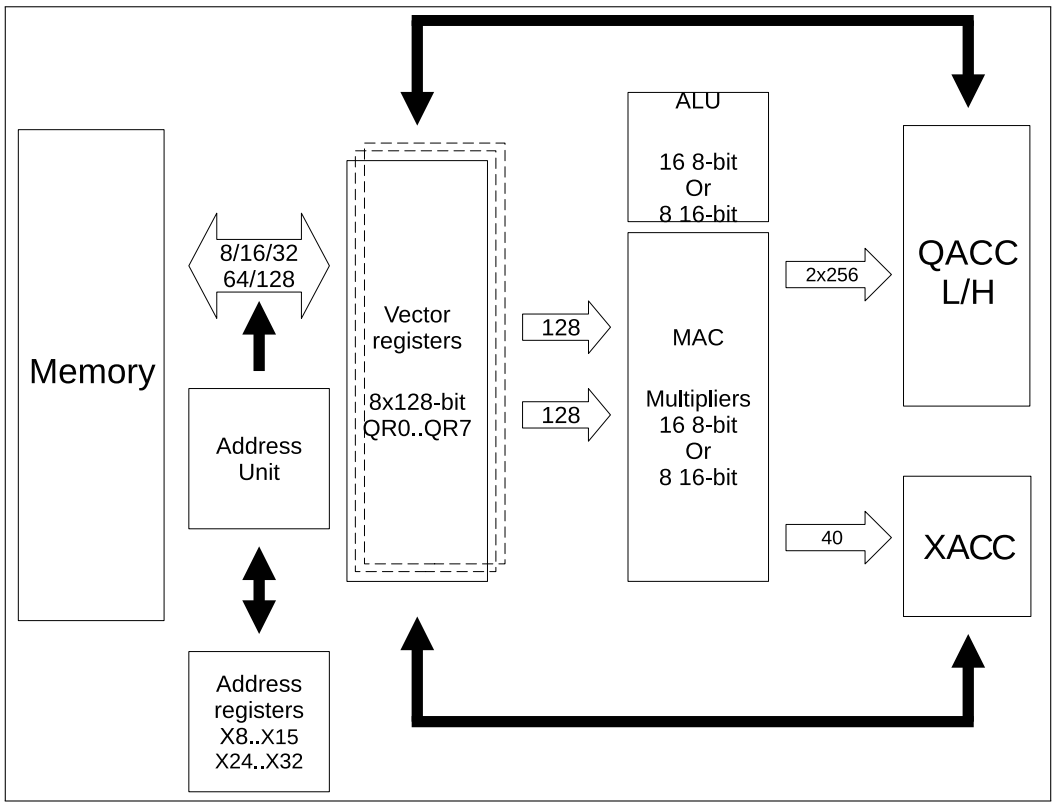


Figure 4.3-1. Xespv2p2 Internal Structure (MAC)

The diagram shows the data paths and Xespv2p2 components.

The Xespv2p2 unit contains:

- An address unit that reads 8/16/32/64/128-bit aligned data
- A bank of eight 128-bit vector QR registers
- An arithmetic logic unit (ALU) with
  - sixteen 8-bit multipliers
  - eight 16-bit multipliers
- QACC_H/QACC_L: two 256-bit accumulators
- XACC: a 40-bit accumulator

4.3.2 Vector Register Bank

Xespv2p2 provides eight 128-bit vector registers (QR). Each register can be viewed as an array of sixteen 8-bit elements, eight 16-bit elements, or four 32-bit elements. The element width depends on the instruction being executed.

4.3.3 Arithmetic Logic Unit (ALU)

The ALU can operate on 8-bit, 16-bit, or 32-bit data, matching the input width: an 8-bit ALU for 8-bit inputs, a 16-bit ALU for 16-bit inputs, and a 32-bit ALU for 32-bit inputs. It performs arithmetic operations such as addition and subtraction, and bitwise operations such as AND, OR, and shift.

ALU operands come from QR registers, and results can be written back to QR registers.

4.3.4 Multiply-and-Accumulate (MAC) Unit

The multiply-accumulate (MAC) unit performs MAC operations. It includes eight 16-bit multipliers and sixteen 8-bit multipliers. MAC results are stored in the special accumulator registers XACC and QACC.

4.3.4.1 QACC Accumulator Register

The QACC accumulator stores sixteen 8-bit MAC results or eight 16-bit MAC results. It consists of two parts: 256-bit QACC_H and 256-bit QACC_L. For 8-bit MAC operations, each 256-bit QACC register is treated as eight 32-bit elements. For 16-bit MAC operations, each is treated as four 64-bit elements.

To write an accumulator result back to a QR register, a 32-bit result can be reduced to 8 bits by right-shifting. For 16-bit MAC operations, a 64-bit result can be reduced to 16 bits by right-shifting.

Data can be loaded from memory into QACC, or QACC can be cleared to 0.

4.3.4.2 XACC Accumulator Register

XACC is a 40-bit accumulator that stores the sum of all multiplier outputs.
Data can be loaded from memory into XACC, or XACC can be cleared to 0.

4.3.5 Address Unit

Most Xespv2p2 instructions can load from or store to the 128-bit QR registers in parallel with computation. The address unit updates address registers in parallel, reducing the cost of explicit address updates.
Supported address updates include AR + signed immediate, ARx + ARy, and AR + 16.

4.4 Components of Extended Instruction Set

4.4.1 Registers

This section describes the registers used by the ESP32-P4 extended instruction set. See Table 4.4-1 for a register summary.

Table 4.4-1. Register List of ESP32-P4 Extended Instruction Set

Register	Quantity	Bit Width	Access	RW Instructions	Type
AR	16[1]	32	R/W	-	General-purpose register
QR	8	128	R/W	ESP.VLD.128.IP ESP.VST.128.IP	Customized vector register
SAR	1	6	R/W	ESP.MOVX.R.SAR ESP.MOVX.W.SAR	Special register
SAR_BYTE	1	4	R/W	ESP.MOVX.R.SAR.BYTES ESP.MOVX.W.SAR.BYTES	Customized special register
XACC	1	40	R/W	ESP.LD.XACC.IP ESP.ST.S.XACC.IP	Customized special register

Cont'd on next page

Table 4.4-1 – cont'd from previous page

Register	Quantity	Bit Width	Access	RW Instructions	Type
				ESP.ST.U.XACC.IP	
QACC_H	1	256	R/W	ESP.LD.QACC.H.L.128.IP	Customized special register
				ESP.LD.QACC.H.H.128.IP	
				ESP.ST.QACC.H.L.128.IP	
				ESP.ST.QACC.H.H.128.IP	
QACC_L	1	256	R/W	ESP.LD.QACC.L.L.128.IP	Customized special register
				ESP.LD.QACC.L.H.128.IP	
				ESP.ST.QACC.L.L.128.IP	
				ESP.ST.QACC.L.H.128.IP	
FFT_BIT_WIDTH	1	4	R/W	ESP.MOVX.R.FFT.BIT.WIDTH	Customized special register
				ESP.MOVX.W.FFT.BIT.WIDTH	
UA_STATE	1	128	R/W	ESP.LD.UA.STATE.IP	Customized special register
				ESP.ST.UA.STATE.IP	
CFG	1	32	R/W	ESP.MOVX.R.CFG	Customized special register
				ESP.MOVX.W.CFG	

4.4.1.1 General-Purpose Registers

4.4.1.1.1 AR

Although the HP core has 32 general-purpose registers, only 16 of them are available to Xespv2p2 extension instructions: x8–x15 and x24–x31 (s0–s1, a0–a5, s8–s11, t3–t6).

4.4.1.2 Vector Registers

4.4.1.2.1 QR

General-purpose registers are only 32 bits wide, while ESP32-P4 can access 128-bit data at a time, so they use only a quarter of the available data-bus bandwidth. For this reason, ESP32-P4 provides eight 128-bit vector registers (QR). QR registers mainly hold data transferred over the 128-bit bus for memory load and store, and temporary results of 128-bit vector operations.

During instruction execution, a QR register is treated as sixteen 8-bit, eight 16-bit, or four 32-bit operands, depending on the vector width defined by the instruction, so that one instruction can operate on multiple elements.

When a QR register is used as an instruction operand, you must specify its index explicitly. For example:

$$ESP.VADD.S8 \quad q2, q0, q1$$

This instruction uses QR registers q0 and q1 as inputs and stores the vector addition result in q2.

4.4.1.3 Special Registers

Unlike general-purpose registers, special registers are used implicitly by certain instructions. You neither need to nor can specify them as instruction operands. For example:

$$ESP.VMUL.S16 \quad q2, q0, q1$$

This vector multiplication uses q0 and q1 as inputs. Internally, each intermediate 32-bit product is right-shifted, and the lower 16 bits are retained to form the 128-bit result written to q2. The shift amount comes from the Shift Amount Register (SAR), which does not appear in the instruction operand list.

4.4.1.3.1 SAR

The Shift Amount Register (SAR) stores the shift amount in bits. Two classes of ESP32-P4 extension instructions use SAR: vector shift instructions, including ESP.VSR.S32, ESP.VSL.S32, and ESP.VSL.U32; and multiplication-related instructions, including ESP.VMUL.*, ESP.CMUL.*, ESP.FFT.AMS.*, and ESP.FFT.CMUL.*.

Vector shift instructions use the lower 5 bits of SAR as the right-shift or left-shift amount. Multiplication-related instructions use SAR to right-shift intermediate products, which affects the precision of the final result.

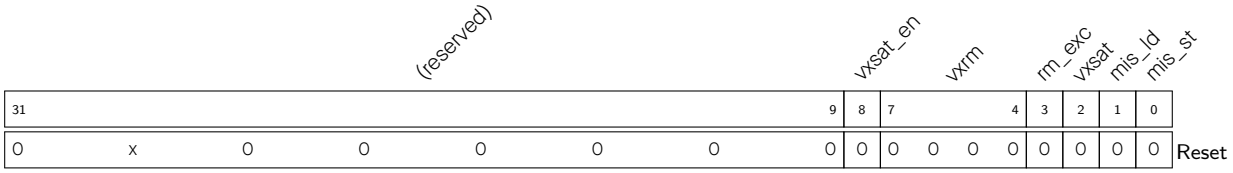
4.4.1.3.2 SAR_BYTE

SAR_BYTE stores the shift amount in bytes. It is used to handle misaligned 128-bit data (see Section 4.4.2). For vector arithmetic instructions, loads and stores are forced to 16-byte alignment, but application data addresses are not always 16-byte aligned.

While loading 128-bit data from memory, ESP.LD.128.USAR.IP and ESP.LD.128.USAR.XP write the lower 4 bits of the access address (the misalignment offset) to SAR_BYTE.

Two classes of ESP32-P4 extension instructions use SAR_BYTE. The first handles misaligned data in QR registers and includes ESP.SRCQ.* and ESP.SRC.Q*. These instructions load two 16-byte blocks from the aligned addresses before and after the misaligned address, concatenate them, and right-shift by the byte count in SAR_BYTE to obtain 128-bit data at the misaligned address. The second class handles misalignment during arithmetic and usually has the ".QUP" suffix.

4.4.1.3.3 FFT_BIT_WIDTH



This special register is used only by ESP.FFT.BITREV. Its value selects the operating mode of ESP.FFT.BITREV: 0 through 7 correspond to 3-bit through 10-bit modes. For details, see ESP.FFT.BITREV.

4.4.1.3.4 UA_STATE

This special register is used only by ESP.FFT.AMS.S16.LD.INCP.UAUP. It holds misaligned 128-bit data previously read from memory. Each time the instruction runs, the contents of this register are concatenated with newly loaded misaligned data and then shifted to produce a 128-bit aligned result.

4.4.1.3.5 Core Configuration and Status Register

Register 4.1. CFG

vxsat_en Enables the saturation status flag.
(R/W)

vxrm Configures the rounding mode. See Table 4.4-3.
(R/W)

rm_exc Exception status for UNNECESSARY rounding (when both the instruction `rm` field and vxrm are DYNAMIC).
(RO)

vxsat Saturation status flag.
(RO)

mis_ld Enables hardware handling of misaligned loads.
(R/W)

mis_st Enables hardware handling of misaligned stores.
(R/W)

4.4.2 Data Format and Alignment

The extended instruction set supports 1-byte, 2-byte, 4-byte, 8-byte, and 16-byte data formats. QACC_H and QACC_L also use a 32-byte format, but there is no direct path between these special registers and memory. You can transfer QACC_H and QACC_L data through five 4-byte (AR) registers or two 16-byte (QR) registers.

Table 4.4-2 lists the bit length and alignment of common formats ('x' means the bit can be 0 or 1). In all formats, the HP core uses the byte as the smallest addressable unit in memory.

Table 4.4-2. Data Format and Alignment

Data Format	Length	Lower 4 Bits of Aligned Addresses in Memory
1-byte	8 bits	xxxx
2-byte	16 bits	xxx0
4-byte	32 bits	xx00
8-byte	64 bits	x000
16-byte	128 bits	0000

4.4.3 Misaligned Access Handling

Misaligned load and store for the ESP32-P4 HP core Xespv2p2 extension can be configured through mis_ld and mis_st:

- 0: Force-alignment mode
- 1: Hardware misaligned mode

4.4.3.1 Force-alignment mode

In this mode, every access address used by the extended instruction set is forced into alignment by clearing its lowest bits. For example, a 128-bit load from 0x3fc8_0024 forces the lowest 4 bits to 0, so the data at 0x3fc8_0020 is read. Likewise, the lowest 3 bits are cleared for 64-bit accesses, the lowest 2 bits for 32-bit accesses, and the lowest 1 bit for 16-bit accesses.

Therefore, access addresses must be correctly aligned; otherwise the returned data is not what you expect. In application code, declare the required alignment for variables or arrays. 16-byte alignment covers most use cases.

When the address of data used in an operation is not known to be aligned, the extension provides SAR_BYTE and related instructions such as ESP.LD.128.USAR.* and ESP.SRC.* to reconstruct misaligned 128-bit data.

Assume that register a8 holds the address of misaligned 128-bit data. The following sequence loads that data into QR register q2:

$ESP.LD.128.USAR.IP \quad q0, \quad a8, \quad 16$
$ESP.VLD.128.IP \quad q1, \quad a8, \quad 16$
$ESP.SRC.Q \quad q2, \quad q0, \quad q1$

4.4.3.2 Hardware misaligned mode

In this mode, hardware automatically handles misaligned accesses by splitting them into multiple aligned accesses. The results match the expected data.

4.4.4 Data Overflow and Saturation

Data overflow occurs when a result does not fit in the destination register. For example, in ESP.VMUL.S8, each product of two 8-bit values is 16 bits wide and remains 16 bits after a right shift, but the final storage width is 8 bits, so overflow is possible.

The ESP32-P4 extensions handle overflow in two ways: saturation and wraparound (retaining only the lower bits). Saturation clamps the result to the minimum or maximum value representable in the destination. Instructions that use saturation state this explicitly—for example, ESP.VADDS.* saturates addition results. Other internal overflow cases use wraparound: only the lower bits that fit the destination width are kept.

The 1-bit status flag vxsat indicates whether saturation occurred in the last operation (only when vxsat_en is set). Reading the CFG register clears this bit.

4.4.5 Data Rounding

Selected instructions include an `rm` field that selects the rounding mode for right shifts. Table 4.4-3 lists the eight modes and their encodings.

When `rm` is DYNAMIC (7), the instruction uses the 4-bit vxrm field in the CFG register. If both `rm` and vxrm are DYNAMIC, the operation is treated as UNNECESSARY: it behaves like FLOOR, and rm_exc is set when the right-shift result is not exact.

Table 4.4-3. Rounding Mode Configuration

Mode	Value of `rm`/vxrm	Description
FLOOR	0	Round toward negative infinity
CEILING	1	Round toward positive infinity
UP	2	Round away from zero
DOWN	3	Round toward zero
HALF_UP	4	Round to nearest; if equidistant, round up
HALF_DOWN	5	Round to nearest; if equidistant, round down
HALF_EVEN	6	Round to nearest; if equidistant, round to the even neighbor
DYNAMIC	7	Use the mode in vxrm. If vxrm is also DYNAMIC, use UNNECESSARY (FLOOR behavior with rm_exc reporting).

The following table shows example results for each rounding mode.

Table 4.4-4. Rounding Operation Results

Input number	FLOOR	CEILING	UP	DOWN	HALF_UP	HALF_DOWN	HALF_EVEN	UNNECESSARY
5.5	5	6	6	5	6	5	6	Exception
2.5	2	3	3	2	3	2	2	Exception
1.6	1	2	2	1	2	2	2	Exception
1.1	1	2	2	1	1	1	1	Exception
1.0	1	1	1	1	1	1	1	1
-1.0	-1	-1	-1	-1	-1	-1	-1	-1
-1.1	-2	-1	-2	-1	-1	-1	-1	Exception
-1.6	-2	-1	-2	-1	-2	-2	-2	Exception
-2.5	-3	-2	-3	-2	-3	-2	-2	Exception
-5.5	-6	-5	-6	-5	-6	-5	-6	Exception

4.5 Extended Instruction List

Table 4.5-1 lists the instruction categories in the extended instruction set. This section briefly introduces each category.

Table 4.5-1. Extended Instruction List

Instruction Type	Instruction[1]	Reference Section

4.5.1 Read Instructions

Read instructions use an AR register that holds the access address to issue a virtual-address memory access. Most read instructions load from memory first, then update the address. ESP.LDXQ.32 is an exception: it first selects a 16-bit element from a QR register with an immediate, adds that value to the address, and then performs the load.

The following table summarizes the memory behavior of read instructions. For details, see Section 4.7.

Table 4.5-2. Read Instructions

Instructions	Description
ESP.VLD.128.XP	Read the 16-byte data, then add the value stored in the AR register to the access address.
ESP.VLD.128.IP	Read the 16-byte data, then add the immediate value to the access address.
ESP.VLD.[H/L].64.XP	Read the 8-byte data, then add the value stored in the AR register to the access address.
ESP.VLD.[H/L].64.IP	Read the 8-byte data, then add the immediate value to the access address.
ESP.VLDBC.[8/16/32].XP	Read the 1-byte/2-byte/4-byte data, then add the value stored in the AR register to the access address.
ESP.VLDBC.[8/16/32].IP	Read the 1-byte/2-byte/4-byte data, then add the immediate value to the access address.
ESP.VLDHBC.16.INCP	Read the 16-byte data, then add 16 to the access address.
ESP.LD.128.USAR.XP	Read the 16-byte data, then add the value stored in the AR register to the access address.
ESP.LD.128.USAR.IP	Read the 16-byte data, then add the immediate value to the access address.
ESP.LDQA.U8.128.[XP/IP]	Load 16-byte data, slice by 1 byte, zero-extend each slice to 32 bits, write to QACC_H and QACC_L, then add an AR value or immediate to the access address.
ESP.LDQA.U16.128.[XP/IP]	Load 16-byte data, slice by 2 bytes, zero-extend each slice to 64 bits, write to QACC_H and QACC_L, then add an AR value or immediate to the access address.
ESP.LDQA.S8.128.[XP/IP]	Load 16-byte data, slice by 1 byte, sign-extend each slice to 32 bits, write to QACC_H and QACC_L, then add an AR value or immediate to the access address.
ESP.LDQA.S16.128.[XP/IP]	Load 16-byte data, slice by 2 bytes, sign-extend each slice to 64 bits, write to QACC_H and QACC_L, then add an AR value or immediate to the access address.
ESP.LD.QACC.[H/L].H.128.IP	Read the 16-byte data, then add the immediate value to the access address.
ESP.LD.QACC.[H/L].L.128.IP	Read the 16-byte data, then add the immediate value to the access address.
ESP.LD.XACC.IP	Read the 8-byte data, then add the immediate value to the access address.
ESP.LD.UA.STATE.IP	Read the 16-byte data, then add the immediate value to the access address.
ESP.LDXQ.32	Update access address first, then read the 4-byte data.
ESP.VLDEXT.[U/S][8/16].[IP/XP]	Vector zero-/sign-extend the loaded 8-bit/16-bit segments to 16-bit/32-bit segments.

4.5.2 Write Instructions

Write instructions use an AR register that holds the access address to issue a virtual-address memory access. Most write instructions store to memory first, then update the address. ESP.STXQ.32 is an exception: it first selects a 16-bit element from a QR register with an immediate, adds that value to the address, and then performs the store.

The following table summarizes the memory behavior of write instructions. For details, see Section 4.7.

Table 4.5-3. Write Instructions

Instructions	Description
ESP.VST.128.XP	Write the 16-byte data to memory, then add the value stored in the AR register to the access address.
ESP.VST.128.IP	Write the 16-byte data to memory, then add the immediate value to the access address.
ESP.VST.[H/L].64.XP	Write the 8-byte data to memory, then add the value stored in the AR register to the access address.
ESP.VST.[H/L].64.IP	Write the 8-byte data to memory, then add the immediate value to the access address.
ESP.ST.QACC.[H/L].H.128.IP	Write the 16-byte data to memory, then add the immediate value to the access address.
ESP.ST.QACC.[H/L].L.128.IP	Write the 16-byte data to memory, then add the immediate value to the access address.
ESP.ST.[U/S].XACC.IP	Zero-extend or signed-extend the value in the XACC register to 8-byte data and write it to memory, then add the immediate value to the access address.
ESP.ST.UA.STATE.IP	Write the 16-byte data to memory, then add the immediate value to the access address.
ESP.STXQ.32	Update the access address first, then write the 4-byte data to memory.

4.5.3 Data Exchange Instructions

Data exchange instructions transfer data between registers. Because register widths differ, immediate values select elements or fields, and both zero-extension and sign-extension instructions are provided.

For details, see Section 4.7.

Table 4.5-4. Data Exchange Instructions

Instructions	Description
ESP.MOVI.8.A	Assign a piece of 8-bit data from the QR register to the AR register.
ESP.MOVI.16.A	Assign a piece of 16-bit data from the QR register to the AR register.
ESP.MOVI.32.A	Assign a piece of 32-bit data from the QR register to the AR register.
ESP.MOVI.8.Q	Assign the data stored in the AR register to a piece of 8-bit data space in the QR register.
ESP.MOVI.16.Q	Assign the data stored in the AR register to a piece of 16-bit data space in the QR register.
ESP.MOVI.32.Q	Assign the data stored in the AR register to a piece of 32-bit data space in the QR register.
ESP.MOVX.R.CFG	Read CFG value to an AR register.
ESP.MOVX.W.CFG	Write CFG register.
ESP.MOVX.R.SAR.BYTES	Read SAR_BYTE value to an AR register.
ESP.MOVX.W.SAR.BYTES	Write SAR_BYTE register.
ESP.MOVX.R.SAR	Read SAR value to an AR register.

Instructions	Description
ESP.MOVX.W.SAR	Write SAR register.
ESP.MOVX.R.FFT.BIT.WIDTH	Read FFT_BIT_WIDTH value to an AR register.
ESP.MOVX.W.FFT.BIT.WIDTH	Write FFT_BIT_WIDTH register.
ESP.MOVX.R.PERF	Read performance counter value to an AR register.
ESP.MOVX.R.XACC.H	Read highest 8-bit value of XACC to an AR register.
ESP.MOVX.R.XACC.L	Read lowest 32-bit value of XACC to an AR register.
ESP.MOVX.W.XACC.H	Write highest 8-bit value of XACC.
ESP.MOVX.W.XACC.L	Write lowest 32-bit value of XACC.
ESP.VZIP.[8/16/32]	Encode the two QR registers in 1-byte/2-byte/4-byte unit.
ESP.VUNZIP.[8/16/32]	Decode the two QR registers in 1-byte/2-byte/4-byte unit.
ESP.VZIPT.[8/16]	Encode the 3 QR registers in 1-byte/2-byte unit.
ESP.VUNZIPT.[8/16]	Decode the 3 QR registers in 1-byte/2-byte unit.
ESP.VEXT.[U/S]8	Vector-extend the loaded 8-bit segments to 16-bit segments.
ESP.VEXT.[U/S]16	Vector-extend the loaded 16-bit segments to 32-bit segments.
ESP.ZERO.Q	Clear a specified QR register.
ESP.ZERO.QACC	Clear QACC_H and QACC_L registers.
ESP.ZERO.XACC	Clear a specified XACC register.
ESP.MOV.S8.QACC	Slice the QR register by 1-byte, and sign-extend it to 32-bit data, then assign this value to QACC_H and QACC_L registers.
ESP.MOV.S16.QACC	Slice the QR register by 2-byte, and sign-extend it to 64-bit data, then assign this value to QACC_H and QACC_L registers.
ESP.MOV.U8.QACC	Slice the QR register by 1-byte, and zero-extend it to 32-bit data, then assign this value to QACC_H and QACC_L registers.
ESP.MOV.U16.QACC	Slice the QR register by 2-byte, and zero-extend it to 64-bit data, then assign this value to QACC_H and QACC_L registers.

4.5.4 Arithmetic Instructions

Arithmetic instructions perform SIMD vector operations, including vector addition, multiplication, complex multiplication, multiply-accumulate, and vector–scalar multiply-accumulate.

4.5.4.1 Vector Addition Instructions

ESP32-P4 provides vector addition and subtraction instructions for 1-byte, 2-byte, and 4-byte elements.

Because vector operands are often stored in memory, some vector addition instructions combine the arithmetic with a 16-byte memory access and then add 16 to the address register so that it points to the next contiguous 16-byte block. Choose the instruction that matches your algorithm.

These instructions also saturate addition and subtraction results to preserve numeric range.

Table 4.5-5. Vector Addition Instructions

Instructions	Description
ESP.VADD.S[8/16/32]	Perform vector addition operation on 1-byte/2-byte/4-byte data.

Instructions	Description
ESP.VADD.S[8/16/32].LD.INCP	Perform vector addition operation on 1-byte/2-byte/4-byte data, and read 16-byte data from memory at the same time.
ESP.VADD.S[8/16/32].ST.INCP	Perform vector addition operation on 1-byte/2-byte/4-byte data, and write 16-byte data to memory at the same time.
ESP.VSUB.S[8/16/32]	Perform vector subtraction operation on 1-byte/2-byte/4-byte data.
ESP.VSUB.S[8/16/32].LD.INCP	Perform vector subtraction operation on 1-byte/2-byte/4-byte data, and read 16-byte data from memory at the same time.
ESP.VSUB.S[8/16/32].ST.INCP	Perform vector subtraction operation on 1-byte/2-byte/4-byte data, and write 16-byte data to memory at the same time.
ESP.VSSUBS.S[8/16/32]	Perform vector subtraction operation on 1-byte/2-byte/4-byte data.
ESP.VSSUBS.U[8/16/32]	Perform vector subtraction operation on 1-byte/2-byte/4-byte data.
ESP.VSADDS.S[8/16/32]	Perform vector addition operation on 1-byte/2-byte/4-byte data.
ESP.VSADDS.U[8/16/32]	Perform vector addition operation on 1-byte/2-byte/4-byte data.

4.5.4.2 Vector Multiplication Instructions

ESP32-P4 provides signed and unsigned vector multiplication for 1-byte and 2-byte elements.

Some vector multiplication instructions combine the multiply with a 16-byte memory access and then add 16 to the access address. Choose the instruction that matches your algorithm.

Table 4.5-6. Vector Multiplication Instructions

Instructions	Description
ESP.VMUL.U[8/16]	Perform vector multiplication operation on unsigned 1-byte/2-byte data.
ESP.VMUL.S[8/16]	Perform vector multiplication operation on signed 1-byte/2-byte data.
ESP.VMUL.U[8/16].LD.INCP	Perform vector multiplication operation on unsigned 1-byte/2-byte data, and read 16-byte data from memory at the same time.
ESP.VMUL.S[8/16].LD.INCP	Perform vector multiplication operation on signed 1-byte/2-byte data, and read 16-byte data from memory at the same time.
ESP.VMUL.U[8/16].ST.INCP	Perform vector multiplication operation on unsigned 1-byte/2-byte data, and write 16-byte data to memory at the same time.
ESP.VMUL.S[8/16].ST.INCP	Perform vector multiplication operation on signed 1-byte/2-byte data, and write 16-byte data to memory at the same time.
ESP.VMUL.S32.S16xS16	Perform 16bit vector multiplication operation and right shift the result.

4.5.4.3 Vector Complex Multiplication Instructions

ESP32-P4 provides vector complex multiplication for 1-byte and 2-byte signed data.

Some complex-multiplication instructions combine the multiply with a 16-byte memory access and then add 16 to the access address. Choose the instruction that matches your algorithm.

Table 4.5-7. Vector Complex Multiplication Instructions

Instructions	Description
ESP.CMUL.S16	Perform vector complex multiplication operation to 2-byte data.
ESP.CMUL.S16.LD.INCP	Perform vector complex multiplication operation to 2-byte data, and read 16-byte data from memory at the same time.
ESP.CMUL.S16.ST.INCP	Perform vector complex multiplication operation to 2-byte data, and write 16-byte data to memory at the same time.
ESP.CMUL.S8	Perform vector complex multiplication operation to 1-byte data.
ESP.CMUL.S8.LD.INCP	Perform vector complex multiplication operation to 1-byte data, and read 16-byte data from memory at the same time.
ESP.CMUL.S8.ST.INCP	Perform vector complex multiplication operation to 1-byte data, and write 16-byte data to memory at the same time.

4.5.4.4 Vector Multiplication Accumulation Instructions

ESP32-P4 provides two kinds of vector multiply-accumulate instructions: one accumulates into the 40-bit XACC register; the other accumulates into the corresponding segments of QACC_H and QACC_L. Both support 1-byte and 2-byte segments.

Some of these instructions also perform a 16-byte memory access in parallel and then update the address by an AR value or an immediate.

Table 4.5-8. Vector Multiplication Accumulation Instructions

Instructions	Description
ESP.VMULAS.[U/S][8/16].XACC	Perform vector multiplication accumulation to signed/unsigned data in 1-byte/2-byte segment, and store the result to the XACC register temporarily.
ESP.VMULAS.[U/S][8/16].XACC.LD.IP	Perform vector multiplication accumulation to signed/unsigned data in 1-byte/2-byte segment, and store the result to the XACC register temporarily, then read 16-byte data from memory. Add immediate to address register.
ESP.VMULAS.[U/S][8/16].XACC.LD.XP	Perform vector multiplication accumulation to signed/unsigned data in 1-byte/2-byte segment, and store the result to the XACC register temporarily, then read 16-byte data from memory. Add the value of AR register to address register.
ESP.VCMULAS.S[8/16].QACC.[H/L]	Perform vector multiplication operation on signed data in 1-byte/2-byte segment, and accumulate the results to corresponding bit segments in QACC_H or QACC_L registers.
ESP.VCMULAS.S[8/16].QACC.[H/L].LD.IP	Perform vector multiplication operation on signed data in 1-byte/2-byte segment, and accumulate the results to corresponding bit segments in QACC_H or QACC_L registers.
ESP.VCMULAS.S[8/16].QACC.[H/L].LD.XP	Perform vector multiplication operation on signed data in 1-byte/2-byte segment, and accumulate the results to corresponding bit segments in QACC_H or QACC_L registers.

Instructions	Description
ESP.VMULAS.[U/S][8/16].QACC	Perform vector multiplication operation on signed/unsigned data in 1-byte/2-byte segment, and accumulate the results to corresponding bit segments in QACC_H and QACC_L registers.
ESP.VMULAS.[U/S][8/16].QACC.LD.IP	Perform vector multiplication operation on signed/unsigned data in 1-byte/2-byte segment, and accumulate the results to corresponding bit segments in QACC_H and QACC_L registers, then read 16-byte data from memory. Add immediate to address register.
ESP.VMULAS.[U/S][8/16].QACC.LD.XP	Perform vector multiplication operation on signed/unsigned data in 1-byte/2-byte segment, and accumulate the results to corresponding bit segments in QACC_H and QACC_L registers, then read 16-byte data from memory. Add the value of AR register to address register.
ESP.VMULAS.[U/S][8/16].QACC.LDBC.INCP	Perform vector multiplication operation on signed/unsigned data in 1-byte/2-byte segment, and accumulate the results to corresponding bit segments in QACC_H and QACC_L registers. Then read 1-byte/2-byte data from memory and broadcast it to the 128-bit QR register. Add 16 to address register.

4.5.4.5 Vector and Scalar Multiplication Accumulation Instructions

These instructions are similar to QACC-based vector multiply-accumulate, except that one operand is a vector and the other is a scalar. Variants that access memory during the operation are also available.

Table 4.5-9. Vector and Scalar Multiplication Accumulation Instructions

Instructions	Description
ESP.VSMULAS.S[8/16].QACC	Perform vector and scalar multiplication accumulation on signed data in 1-byte/2-byte segment.
ESP.VSMULAS.S[8/16].QACC.LD.INCP	Perform vector and scalar multiplication accumulation on signed data in 1-byte/2-byte segment, and read 16-byte data from memory at the same time. Add 16 to address register.

4.5.4.6 Other Instructions

This group includes arithmetic right shifts of multiply-accumulate results in QACC_H, QACC_L, and XACC. Adjust the shift amount to obtain the desired precision. It also includes conditionally enabled vector multiplications.

Table 4.5-10. Other Instructions

Instructions	Description
ESP.SRCMB.S[8/16].QACC	Perform signed right-shifting on data in QACC_H and QACC_L registers in segment unit.
ESP.SRCMB.U[8/16].QACC	Perform unsigned right-shifting on data in QACC_H and QACC_L registers in segment unit.
ESP.SRCMB.S[8/16].Q.QACC	Perform signed right-shifting on data in QACC_H and QACC_L registers in segment unit.
ESP.SRCMB.U[8/16].Q.QACC	Perform unsigned right-shifting on data in QACC_H and QACC_L registers in segment unit.
ESP.SRS.S.XACC	Perform signed right-shifting on data in the XACC register.
ESP.SRS.U.XACC	Perform unsigned right-shifting on data in the XACC register.
ESP.VRELU.S[8/16]	Perform vector and scalar multiplication based on enabling conditions.
ESP.VPRELU.S[8/16]	Perform vector-to-vector multiplication based on enabling conditions.
ESP.SAT	Saturate 32-bit general register between rs1 and rs2.
ESP.ADDX2	Perform addition between rs1 and rs2.
ESP.ADDX4	Perform addition between rs1 and rs2.
ESP.SUBX2	Perform subtraction between rs1 and rs2.
ESP.SUBX4	Perform subtraction between rs1 and rs2.
ESP.VABS.[8/16/32]	Take the absolute value of the signed data.

4.5.5 Comparison Instructions

Vector comparison instructions operate on 1-byte, 2-byte, or 4-byte elements. They include finding the larger or smaller of two values, and generating an all-ones or all-zeros mask for equal-to, greater-than, and less-than comparisons.

Some comparison instructions also perform a 16-byte memory access and then add 16 to the address register. Choose the instruction that matches your algorithm.

Table 4.5-11. Comparison Instructions

Instructions	Description
ESP.VMAX.S[8/16/32]	Take the larger value between the two 1-byte/2-byte/4-byte values.
ESP.VMAX.S[8/16/32].LD.INCP	Take the larger value between the two 1-byte/2-byte/4-byte values, and read 16-byte data from memory at the same time.
ESP.VMAX.S[8/16/32].ST.INCP	Take the larger value between the two 1-byte/2-byte/4-byte values, and write 16-byte data to memory at the same time.
ESP.VMAX.S[16/32].A	Find the maximum signed value in all elements of a QR register.
ESP.VMIN.S[8/16/32]	Take the smaller value between the two 1-byte/2-byte/4-byte values.
ESP.VMIN.S[8/16/32].LD.INCP	Take the smaller value between the two 1-byte/2-byte/4-byte values, and read 16-byte data from memory at the same time.
ESP.VMIN.S[8/16/32].ST.INCP	Take the smaller value between the two 1-byte/2-byte/4-byte values, and write 16-byte data to memory at the same time.
ESP.VMIN.S[16/32].A	Find the minimum signed value in all elements of a QR register.

Instructions	Description
ESP.VCMP.EQ.S[8/16/32]	Compare two 1-byte/2-byte/4-byte values, set all bits to 1 when the two values are equal, or set all bits to 0 when they are not equal.
ESP.VCMP.LT.S[8/16/32]	Compare two 1-byte/2-byte/4-byte values, set all bits to 1 when the former value is smaller than the latter one, or set them to 0 otherwise.
ESP.VCMP.GT.S[8/16/32]	Compare two 1-byte/2-byte/4-byte values, set all bits to 1 when the former value is larger than the latter one, or set them to 0 otherwise.
ESP.VCLAMP.S16	Clamp all elements in a QR register to a specified range.
ESP.VSAT.[U/S][8/16/32]	Saturate all elements in a QR register.

4.5.6 Bitwise Logical Instructions

Bitwise logical instructions provide OR, AND, XOR, and NOT on QR registers.

Table 4.5-12. Bitwise Logical Instructions

Instructions	Description
ESP.ORQ	Bitwise logical OR $qa = qx \mid qy$
ESP.XORQ	Bitwise logical XOR $qa = qx \text{ ^ } qy$
ESP.ANDQ	Bitwise logical AND $qa = qx \& qy$
ESP.NOTQ	Bitwise NOT $qa = \sim qx$

4.5.7 Shift Instructions

Shift instructions include 4-byte vector left and right shifts, and shifts of concatenated 16-byte data. For vector shifts, the amount comes from SAR. For concatenated 16-byte shifts, the amount can come from SAR_BYTE, an immediate, or the lower bits of an AR register. Choose the instruction that fits your application. These shifts follow signed-shift semantics where applicable.

Table 4.5-13. Shift Instructions

Instructions	Description
ESP.SRC.Q	Perform logical right-shift on the spliced 16-byte data, and the shift value is determined by the SAR_BYTE register.
ESP.SRC.Q.LD.XP	Perform logical right-shift on the spliced 16-byte data, and the shift value is determined by the SAR_BYTE register. At the same time, read 16-byte data from memory and add a register value to the read address.
ESP.SRC.Q.LD.IP	Perform logical right-shift on the spliced 16-byte data, and the shift value is determined by the SAR_BYTE register. At the same time, read 16-byte data from memory and add an immediate number to the read address.
ESP.SLCI.2Q	Perform logical left-shift on the spliced 16-byte data, and the shift value is determined by the immediate value.
ESP.SLCXXP.2Q	Perform logical left-shift on the spliced 16-byte data, and the shift value is determined by the value in the AR register.
ESP.SRCI.2Q	Perform logical right-shift on the spliced 16-byte data, and the shift value is determined by the immediate value.

Instructions	Description
ESP.SRCXXP.2Q	Perform logical right-shift on the spliced 16-byte data, and the shift value is determined by the value in the AR register.
ESP.SRCQ.128.ST.INCP	Perform logical right-shift on the spliced 16-byte data, which will be written to memory after the shift.
ESP.VSR.U32	Perform vector arithmetic right-shift on the 4-byte data.
ESP.VSR.S32	Perform vector arithmetic right-shift on the 4-byte data.
ESP.VSL.S32 hline ESP.VSL.U32	Perform vector arithmetic left-shift on the 4-byte signed data. Perform vector arithmetic left-shift on the 4-byte unsigned data.
ESP.VSRD.[8/16/32]	Perform vector arithmetic right or left shift on the 1-byte/2-byte/4-byte data.
ESP.VSLD.[8/16/32]	Perform vector arithmetic right or left shift on the 1-byte/2-byte/4-byte data.

4.5.8 Fast Fourier Transform (FFT) Instructions

FFT instructions include butterfly operations, bit reversal, and real FFT helpers.

4.5.8.1 Butterfly Computation Instructions

These instructions support radix-2 butterfly computation.

Table 4.5-14. Butterfly Computation Instructions

Instructions	Description
ESP.FFT.R2BF.S16.	Perform radix-2 butterfly computation.
ESP.FFT.R2BF.S16.ST.INCP	Perform radix-2 butterfly computation, and write the 16-byte result to memory at the same time.
ESP.FFT.CMUL.S16.LD.XP	Perform radix-2 complex butterfly computation, and read 16-byte data from memory at the same time.
ESP.FFT.CMUL.S16.ST.XP	Perform radix-2 complex butterfly computation, and write the 16-byte data (consists of the result and partial data segments in QR register) to memory at the same time.

4.5.8.2 Bit Reverse Instruction

The bit-reversal width is set by FFT_BIT_WIDTH.

Table 4.5-15. Bit Reverse Instruction

Instruction	Description
ESP.FFT.BITREV	Bit-reverse indices using FFT_BIT_WIDTH.

4.5.8.3 Real FFT Instructions

A single real-FFT instruction can combine additions, multiplications, shifts, and related operations.

Table 4.5-16. Real Number FFT Instructions

Instructions	Description
ESP.FFT.AMS.S16.LD.INCP.UAUP	Perform complex calculations and read 16-byte data from memory at the same time, then output 16-byte aligned data.
ESP.FFT.AMS.S16.LD.INCP	Perform complex calculations and read 16-byte data from memory at the same time. Add 16 to address register.
ESP.FFT.AMS.S16.LD.R32.DECP	Perform complex calculations and read 16-byte data from memory at the same time. Reverse the word order of read data. Add 16 to address register.
ESP.FFT.AMS.S16.ST.INCP	Perform complex calculation and write 16-byte data (consists of the data in AR and partial data segments in QR) to memory at the same time.
ESP.FFT.VST.R32.DECP	Splice the QR register in 2-byte unit, shift the result and write this 16-byte data to memory.

4.6 Instruction Performance

On a pipelined processor, the ideal case is to issue one instruction per cycle. The ESP32-P4 processor uses a five-stage pipeline: F (fetch), D (decode), E (execute), M (memory), and W (write-back). Table 4.6-1 summarizes each stage.

Table 4.6-1. Five-Stage Pipeline of the ESP32-P4 Processor

Pipeline Stage	Number	Operation
F	-	Fetch instructions
D	0	Read general-purpose registers AR and QR Decode instructions, detect interlocks, and forward operands
E	1	For arithmetic instructions, run the ALU (add, subtract, multiply, and so on) For loads, generate the virtual address For branches, select the target address
M	2	Issue memory reads and writes
W	3	Write results and loaded data back to registers

An instruction can enter the pipeline only when its operands and required hardware resources are ready. In practice, the following hazards can stall the pipeline and delay instruction issue.

4.6.1 Data Hazard

If instruction A writes register X (an explicit general-purpose register or an implicit special register) and instruction B reads the same register, then B depends on A. If A produces the value at the end of stage SA and B needs it at the start of stage SB, A must be issued $D = max(SA - SB + 1, 0)$ cycles before B.
If B is fetched fewer than D cycles after A, the processor delays issuing B until D cycles have elapsed. That delay is called an interlock.
For example, if SA for A is W and SB for B is E, then $D = max(2 - 1 + 1, 0) = 2$, as shown in Figure 4.6-1.

When a result becomes available at the end of a stage, dependent instructions normally wait until it is written to a register. The processor also supports bypass (forwarding): it can forward a value from the producing stage to the consuming stage without waiting for write-back.

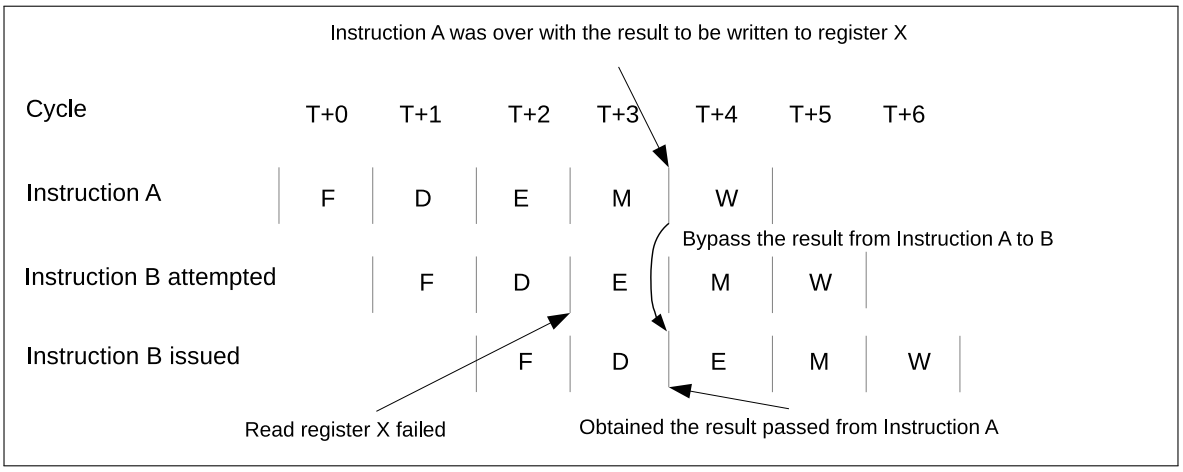

Figure 4.6-1. Interlock Caused by Operand Dependency

Data dependencies depend on which operands each instruction uses and at which stages they are read or written. Section 4.7 lists the use and def stages for each instruction operand.

4.6.2 Hardware Resource Hazard

If multiple instructions need the same hardware resource in the same cycle, only one may use it and the others are delayed. For example, the processor has eight 16-bit multipliers. If instruction C needs all eight in stage M and instruction D needs four in stage E, and C and D are issued in cycles T+0 and T+1 as in Figure 4.6-2, both contend for four multipliers in cycle T+3. The processor then delays D by one cycle to avoid the conflict.

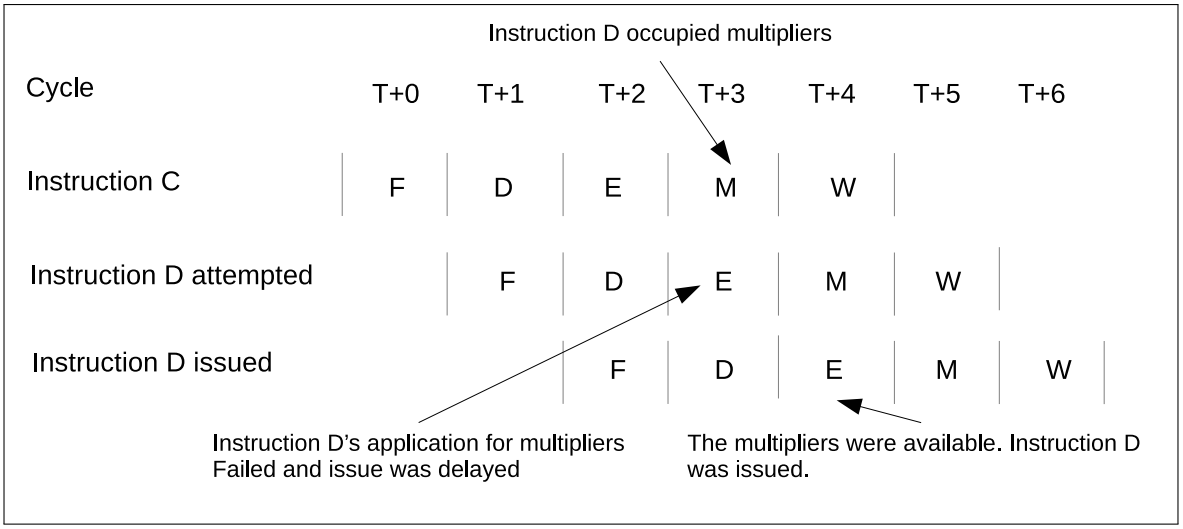

Figure 4.6-2. Hardware Resource Hazard

4.6.3 Control Hazard

Data and resource hazards can often be reduced by reordering code; control hazards are harder to hide. Conditional code becomes branch and jump instructions: if the condition is true, fetch continues from the target; otherwise sequential fetch continues. When a taken branch redirects fetch, as in Figure 4.6-3, instructions already in the F and D stages are discarded, which costs two pipeline cycles.

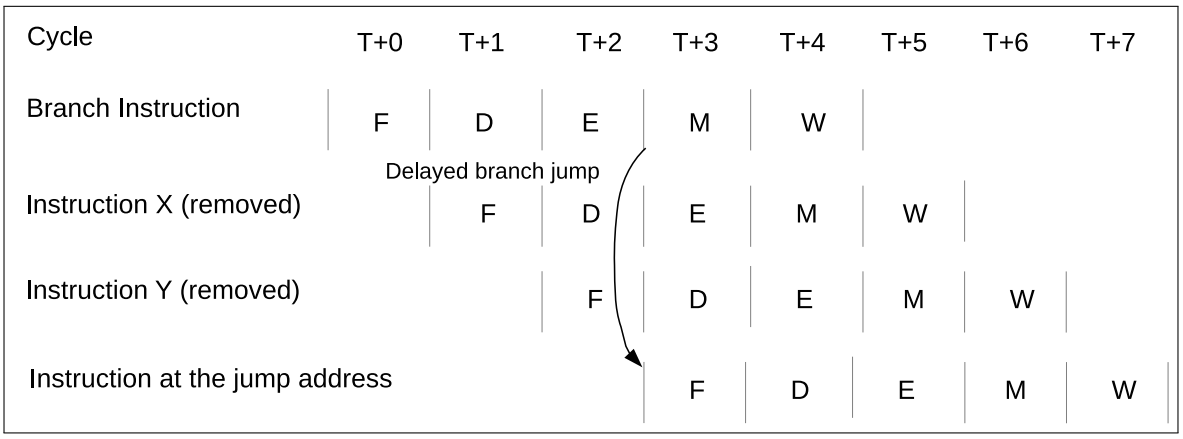

Figure 4.6-3. Control Hazard

4.7 Extended Instruction Functional Description

4.7.1 Instruction Symbols and Field Definitions

Table 4.7-1 describes the meaning of the symbols used in instruction descriptions. When reading the per-instruction functional descriptions below, use this table to understand operands and encoding fields.

`[N:M]` denotes a bit range within a field. Both the upper and lower bit positions N and M are inclusive, so the field width is `(N-M+1)`. For example, `Qx[2:0]` consists of 3 bits: bit0, bit1, and bit2; `Qx[1]` represents the value of bit1.

Table 4.7-1. Instruction Field Names and Descriptions

Name			Description
r*	32-bit RISC-V standard general-purpose registers	rs1	In type or In-out type. 32-bit general-purpose register which stores address and data value.
		rs2	In type. 32-bit general-purpose register which stores shift value, increment value, or calculation result.
		rd	Out type. 32-bit general-purpose register which stores the output value.
q*	128-bit general-purpose registers	qu	In/Out/Inout type. 128-bit general-purpose register which stores the load/store data or exchange data.
		qv	In/Out/Inout type. 128-bit general-purpose register.
		qx, qy, qw	In type. Stores data used for vector operations.
		qz	Out type. Stores results of vector operations.
sat			1-bit immediate value. Enables or disables saturation for the instruction result.
rm			3-bit immediate value ranging from 0 to 7. Selects the rounding mode for right-shift operations. Value 7 (DYNAMIC) uses `vxrm` from the CFG register.
sel2			1-bit immediate value ranging from 0 to 1. Used to select signals.
sel4,upd4			2-bit immediate value ranging from 0 to 3. Used to select signals.
sel8			3-bit immediate value ranging from 0 to 7. Used to select signals.
sel16			4-bit immediate value ranging from 0 to 15. Used to select signals.
sar2			1-bit immediate value ranging from 0 to 1. Represents shifting numbers.
sar4			2-bit immediate value ranging from 0 to 3. Represents shifting numbers.
sar16			4-bit immediate value ranging from 0 to 15. Represents shifting numbers.

Cont'd on next page

Table 4.7-1 – cont'd from previous page

Name	Description
imm1	7-bit unsigned immediate value ranging from 0 to 127 with an interval of 1. This is used to show the size of the updated read/write operation address value.
imm2	7-bit unsigned immediate value ranging from 0 to 254 with an interval of 2. This is used to show the size of the updated read/write operation address value.
imm4	8-bit signed immediate value ranging from -256 to 252 with an interval of 8. This is used to show the size of the updated read/write operation address value.
imm16	8-bit signed immediate value ranging from -2048 to 2032 with an interval of 16. This is used to show the size of the updated read/write operation address value.

4.7.2 List of Instructions

4.7.2.1 ESP.VCMULAS.S16.QACC.H

Syntax

ESP.VCMULAS.S16.QACC.H qx,qy,sat

Description

This instruction performs multiplication of 16-bit vectors and stores the result in `QACC_H`.

Operation

```
add_0[64:0] = QACC_H[ 63:  0] + (qx[ 79: 64]*qy[ 79: 64] - qx[95:80]*qy[95:80])
add_1[64:0] = QACC_H[127: 64] + (qx[ 95: 80]*qy[ 79: 64] + qx[79:64]*qy[95:80])
add_2[64:0] = QACC_H[191:128] + (qx[111:96]*qy[111:96] - qx[127:112]*qy[127:112])
add_3[64:0] = QACC_H[255:192] + (qx[127:112]*qy[111:96] - qx[111:96]*qy[127:112])
QACC_H[ 63:  0] = min(max(add_0[64:0], -2^{63}), 2^{63}-1)
QACC_H[127: 64] = min(max(add_1[64:0], -2^{63}), 2^{63}-1)
QACC_H[191:128] = min(max(add_2[64:0], -2^{63}), 2^{63}-1)
QACC_H[255:192] = min(max(add_3[64:0], -2^{63}), 2^{63}-1)
```

4.7.2.2 ESP.VCMULAS.S16.QACC.H.LD.IP

Syntax

ESP.VCMULAS.S16.QACC.H.LD.IP qu,rs1,imm16,qx,qy,sat

Description

This instruction performs multiplication of 16-bit vectors and stores the result in `QACC_H`.

During the operation, it loads the 16-byte data from the memory into the register `qu`. After the access is completed, the value in the register `rs1` is incremented by a 4-bit sign-extended constant in the instruction code segment, left-shifted by 4.

imm16 starts at -128, ends at 112, with a step of 16.

Operation

```
add_0[64:0] = QACC_H[63:0] + (qx[79:64]*qy[79:64] - qx[95:80]*qy[95:80])
add_1[64:0] = QACC_H[127:64] + (qx[95:80]*qy[79:64] + qx[79:64]*qy[95:80])
add_2[64:0] = QACC_H[191:128] + (qx[111:96]*qy[111:96] - qx[127:112]*qy[127:112])
add_3[64:0] = QACC_H[255:192] + (qx[127:112]*qy[111:96] - qx[111:96]*qy[127:112])

QACC_H[ 63:  0] = min(max(add_0[64:0], -2^{63}), 2^{63}-1)

4.7.2.13 ESP.VMULAS.S16.QACC

Syntax

ESP.VMULAS.S16.QACC qx,qy,sat

Description

This instruction divides registers qx and qy into 8 data segments of 16 bits each. Then, the signed multiplication result of the 8 sets of segments is added to the corresponding 64-bit data segment in the special registers QACC_H and QACC_L respectively. The calculated result is saturated to a 64-bit signed number and then stored in the corresponding 64-bit data segment in QACC_H and QACC_L.

Operation

```
QACC_L[63 :  0] = min(max(QACC_L[63 :  0] + qx[15 :  0] * qy[15 :  0], -2^63),
    2^63-1)
QACC_L[127: 64] = min(max(QACC_L[127: 64] + qx[31 : 16] * qy[31 : 16], -2^63),
    2^63-1)
QACC_L[191:128] = min(max(QACC_L[191:128] + qx[47 : 32] * qy[47 : 32], -2^63),
    2^63-1)
QACC_L[255:192] = min(max(QACC_L[255:192] + qx[63 : 48] * qy[63 : 48], -2^63),
    2^63-1)
QACC_H[63 :  0] = min(max(QACC_H[63 :  0] + qx[79 : 64] * qy[79 : 64], -2^63),
    2^63-1)
QACC_H[127: 64] = min(max(QACC_H[127: 64] + qx[95 : 80] * qy[95 : 80], -2^63),
    2^63-1)
QACC_H[191:128] = min(max(QACC_H[191:128] + qx[111: 96] * qy[111: 96], -2^63),
    2^63-1)
QACC_H[255:192] = min(max(QACC_H[255:192] + qx[127:112] * qy[127:112], -2^63),

4.7.2.14 ESP.VMULAS.S16.QACC.LD.IP

Syntax

ESP.VMULAS.S16.QACC.LD.IP qu,rs1,imm16,qx,qy,sat

Description

This instruction divides registers `qx` and `qy` into 8 data segments of 16 bits each. Then, the signed multiplication result of the 8 sets of segments is added to the corresponding 64-bit data segment in special registers `QACC_H` and `QACC_L` respectively. The calculated result is saturated to a 64-bit signed number and then stored in the corresponding 64-bit data segment in `QACC_H` and `QACC_L`.

During the operation, it loads the 16-byte data from the memory into the register `qu`. After the access is completed, the value in the register `rs1` is incremented by the 4-bit sign-extended constant in the instruction code segment, which is left-shifted by 4.

The value of imm starts at -128, ends at 112, and steps by 16.

Operation

```
QACC_L[63 :  0] = min(max(QACC_L[63 :  0] + qx[15 :  0] * qy[15 :  0], -2^63),
    2^63-1)
QACC_L[127: 64] = min(max(QACC_L[127: 64] + qx[31 : 16] * qy[31 : 16], -2^63),

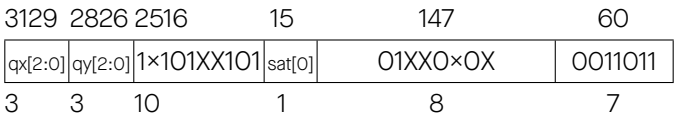

Figure 4.7-23. ESP.VMULAS.S8.QACC

4.7.2.24 ESP.VMULAS.S8.QACC.LD.IP

Syntax

ESP.VMULAS.S8.QACC.LD.IP qu,rs1,imm16,qx,qy,sat

Description

This instruction divides registers `qx` and `qy` into 16 data segments of 8 bits each. Then, the signed multiplication results of the 16 sets of segments are added to the corresponding 32-bit data segments in special registers `QACC_H` and `QACC_L` respectively. The calculated result is saturated to a 32-bit signed number and then stored in the corresponding 32-bit data segment in `QACC_H` and `QACC_L`.

During the operation, the 16-byte data is loaded from the memory to the register `qu`. After the access is completed, the value in the register `rs1` is incremented by the 4-bit sign-extended constant in the instruction code segment, which is left-shifted by 4.

imm starts at -128, ends at 112, with a step of 16.

Operation

```
QACC_L[31 :  0] = min(max(QACC_L[31 :  0] + qx[7  :  0] * qy[7  :  0], -2^31),
    2^31-1)

4.7.2.31 ESP.VMULAS.S8.XACC.ST.IP

Syntax

ESP.VMULAS.S8.XACC.ST.IP qu,rs1,imm16,qx,qy,sat

Description

This instruction divides registers `qx` and `qy` into 16 data segments of 8 bits each. Then, it performs a signed multiply-accumulate operation on each of the 16 segments. The accumulated result is added to the value in the special register `XACC`. The resulting sum is then saturated and stored in `XACC`.

During the operation, the register `qu` is stored to memory. After the access is completed, the value in the register `rs1` is incremented by a 4-bit sign-extended constant from the instruction code segment, which is left-shifted by 4.

The imm starts at -128, ends at 112, and steps in increments of 16.

Operation

```
add0[15:0] = qx[  7:  0] * qy[  7:  0]
add1[15:0] = qx[ 15:  8] * qy[ 15:  8]
...
add15[15:0] = qx[127:120] * qy[127:120]
sum[40:0] = XACC[39:0] + add0[15:0] + add1[15:0] + ... + add15[15:0]

XACC[39:0] = min(max(sum[40:0], -2^{39}), 2^{39}-1)
qu[127:0] => store128(rs1[31:0])
rs1[31:0] = rs1[31:0] + imm
```

4.7.2.33 ESP.VMULAS.U16.QACC

Syntax

ESP.VMULAS.U16.QACC qx,qy,sat

Description

This instruction divides registers qx and qy into 8 data segments of 16 bits each. Then, the unsigned multiplication results of the 8 sets of segments are added to the corresponding 64-bit data segments in special registers QACC_H and QACC_L respectively. The calculated results are saturated to 64-bit signed numbers and then stored in the corresponding 64-bit data segments in QACC_H and QACC_L.

Operation

```
QACC_L[63 :  0] = min(QACC_L[63 :  0] + qx[15 :  0] * qy[15 :  0], 2^63-1)
QACC_L[127: 64] = min(QACC_L[127: 64] + qx[31 : 16] * qy[31 : 16], 2^63-1)
QACC_L[191:128] = min(QACC_L[191:128] + qx[47 : 32] * qy[47 : 32], 2^63-1)

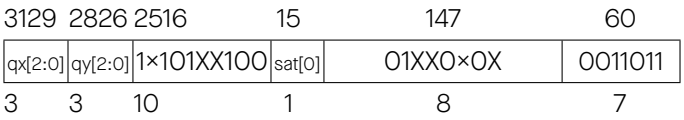

Figure 4.7-43. ESP.VMULAS.U8.QACC

4.7.2.44 ESP.VMULAS.U8.QACC.LD.IP

Syntax

ESP.VMULAS.U8.QACC.LD.IP qu,rs1,imm16,qx,qy,sat

Description

This instruction divides registers `qx` and `qy` into 16 data segments of 8 bits each. Then, the unsigned multiplication results of the 16 sets of segments are added to the corresponding 32-bit data segments in special registers `QACC_H` and `QACC_L` respectively. The calculated result is saturated to a 32-bit unsigned number and then stored in the corresponding 32-bit data segment in `QACC_H` and `QACC_L`.
During the operation, the 16-byte data is loaded from the memory to the register `qu`. After the access is completed, the value in the register `rs1` is incremented by the 4-bit sign-extended constant in the instruction code segment, which is left-shifted by 4.

The value of imm starts at -128, ends at 112, and steps by 16.

Operation

```
QACC_L[31 :  0] = min(QACC_L[31 :  0] + qx[7  :  0] * qy[7  :  0], 2^31-1)

4.7.2.52 ESP.VMULAS.U8.XACC.ST.XP

Syntax

ESP.VMULAS.U8.XACC.ST.XP qu,rs1,rs2,qx,qy,sat

Description

This instruction divides registers `qx` and `qy` into 16 data segments of 8 bits each. Then, it performs an unsigned multiply-accumulate operation on each of the 16 segments. The accumulated result is added to the value in the special register `XACC`. The resulting sum is then saturated and stored in `XACC`.

During the operation, the value of the register `qu` is stored to memory. After the access is completed, the value in the register `rs1` is incremented by the value of the register `rs2`.

Operation

```
add0[15:0] = qx[  7:  0] * qy[  7:  0]
add1[15:0] = qx[ 15:  8] * qy[ 15:  8]
...
add15[15:0] = qx[127:120] * qy[127:120]
sum[40:0] = XACC[39:0] + add0[15:0] + add1[15:0] + ... + add15[15:0]
XACC[39:0] = min(max(sum[40:0], 0), 2^{40}-1)

qu[127:0] => store128(rs1[31:0])

Syntax

ESP.VMULAS.S16.QACC.LDBC.INCP qu,rs1,qx,qy,sat

Description

This instruction divides registers `qx` and `qy` into 8 data segments of 16 bits each. Then, the signed multiplication results of the 8 sets of segments are added to the corresponding 64-bit data segments in special registers `QACC_H` and `QACC_L` respectively. The calculated result is saturated to a 64-bit signed number and then stored in the corresponding 64-bit data segment in `QACC_H` and `QACC_L`.

During the operation, the 2-byte data is loaded from the memory and broadcast to the register `qu`. After the access is completed, the value in the register `rs1` is incremented by 2.

Operation

```
QACC_L[ 63:  0] = min(max(QACC_L[ 63:  0] + qx[ 15:  0] * qy[ 15:  0], -2^{63}),

4.7.2.60 ESP.VSMULAS.S8.QACC.LD.INCP

Syntax

ESP.VSMULAS.S8.QACC.LD.INCP qu,rs1,qx,qy,sel16,sat

Description

This instruction selects one out of the 16 8-bit data segments in the register `qy` according to the immediate number `sel16` and performs a signed multiplication on it and the 16 8-bit data segments in the register `qx` respectively. The 16 results obtained are added to the corresponding 32-bit data segments in the special registers `QACC_H` and `QACC_L` respectively. Then, the result is saturated to a 32-bit signed number and stored in the corresponding 32-bit data segment in `QACC_H` and `QACC_L`.

During the operation, the 16-byte data is loaded from the memory into the register `qu`. After the access is completed, the value in the register `rs1` is incremented by 16.

Operation

```
temp[7:0] = qy[sel16*8+7:sel16*8]

Description

This instruction performs a 16-bit signed complex multiplication. The range of the immediate number `sel4` is 0 ~ 3, which specifies the 32 bits in the two QR registers `qx` and `qy` for complex multiplication. The real and imaginary parts of the complex numbers are stored in the upper 16 bits and lower 16 bits of the 32 bits, respectively. The calculated real part and imaginary part results are stored in the corresponding 32 bits of the register `qz`.

Operation

```
if sel4 == 0:

Syntax

ESP.CMUL.S16.ST.INCP qu,rs1,qz,qx,qy,sel4,sat,rm

Description

This instruction performs a 16-bit signed complex multiplication. The range of the immediate number `sel4` is 0 ~ 3, which specifies the 32 bits in the two QR registers `qx` and `qy` for complex multiplication. The real and imaginary parts of complex numbers are stored in the upper 16 bits and lower 16 bits of the 32 bits, respectively. The calculated real part and imaginary part results are stored in the corresponding 32 bits of the `qz` register.

Meanwhile, it also stores the 16-byte data of `qu` in memory. After the access, the value in the `rs1` register is incremented by 16.

Operation

```
if sel4 == 0:
  qz[ 15:  0] = (qx[ 15:  0] * qy[ 15:  0] - qx[ 31: 16] * qy[ 31: 16]) >> SAR[5:0]

Description

This instruction performs a 16-bit unsigned complex multiplication. The range of the immediate number `sel4` is 0 ~ 3, which specifies the 32 bits in the two QR registers `qx` and `qy` for complex multiplication. The real and imaginary parts of the complex numbers are stored in the upper 16 bits and lower 16 bits of the 32 bits, respectively. The calculated real part and imaginary part results are stored in the corresponding 32 bits of the register `qz`.

Operation

```
if sel4 == 0:
  qz[ 15:  0] = (qx[ 15:  0] * qy[ 15:  0] - qx[ 31: 16] * qy[ 31: 16]) >> SAR[5:0]

Description

This instruction performs a 16-bit unsigned complex multiplication. The range of the immediate number `sel4` is 0 ~ 3, which specifies the 32 bits in the two QR registers `qx` and `qy` for complex multiplication. The real and imaginary parts of complex numbers are stored in the upper 16 bits and lower 16 bits of the 32 bits respectively. The calculated real part and imaginary part results are stored in the corresponding 32 bits of the register `qz`.

Meanwhile, it also loads 16-byte data from the memory into the register `qu`. After the access, the value in the register `rs1` is incremented by 16.

Operation

```
if sel4 == 0:

4.7.2.75 ESP.CMUL.U8.LD.INCP

Syntax

ESP.CMUL.U8.LD.INCP qu,rs1,qz,qx,qy,sel4,sat,rm

Description

This instruction performs an 8-bit unsigned complex multiplication. The range of the immediate number `sel4` is 0 ~ 3, which specifies the 16 bits in the two QR registers `qx` and `qy` for complex multiplication. The real and imaginary parts of complex numbers are stored in the upper 8 bits and lower 8 bits of the 16 bits respectively. The calculated real part and imaginary part results are stored in the corresponding 16 bits of the register `qz`.

Meanwhile, it also loads 16-byte data from the memory into the register `qu`. After the access, the value in the register `rs1` is incremented by 16.

Operation

```
if sel4 == 0:

ESP.VADD.U8.LD.INCP qu,rs1,qv,qx,qy,sat

Description

This instruction performs a vector unsigned addition on 8-bit data in the two registers `qx` and `qy`. Then, the 16 results obtained from the calculation are saturated, and the saturated results are written to the register `qv`.

During the operation, 16 bytes are loaded from the memory to the register `qu`. After the access, the value in the register `rs1` is incremented by 16.

Operation

```
qv[  7:  0] = min(qx[  7:  0] + qy[  7:  0], 2^{8}-1)
qv[ 15:  8] = min(qx[ 15:  8] + qy[ 15:  8], 2^{8}-1)
...

qu[127:0] = load128(rs1[31:0])
rs1[31:0] = rs1[31:0] + 16
```

4.7.2.128 ESP.VMAX.U8.ST.INCP

Syntax

ESP.VMAX.U8.ST.INCP qu,rs1,qz,qx,qy

Description

This instruction compares the numerical values of the 16 8-bit unsigned vector data segments in registers `qx` and `qy`. The data segment with the larger value is written into the corresponding 8-bit data segment in register `qz`.

During the operation, the value in register `qu` is stored in memory. After the access, the value in register `rs1` is incremented by 16.

Operation

```
qz[  7:  0] = (qx[  7:  0]>=qy[  7:  0]) ? qx[  7:  0] : qy[  7:  0]
qz[ 15:  8] = (qx[ 15:  8]>=qy[ 15:  8]) ? qx[ 15:  8] : qy[ 15:  8]
...
qz[127:120] = (qx[127:120]>=qy[127:120]) ? qx[127:120] : qy[127:120]

  qu[127:0] => store128(rs1[31:0])
rs1 [31:0] = rs1[31:0] + 16
```

4.7.2.147 ESP.VMUL.S16

Syntax

ESP.VMUL.S16 qz,qx,qy,sat,rm

Description

This instruction performs a signed vector multiplication on 16-bit data. Registers qx and qy are the multiplier and the multiplicand respectively. The eight 32-bit data results obtained from the calculation are arithmetically right-shifted by the value in the special register SAR. Then, the lower 16-bit data of the shift result are written into the corresponding segment of the register qz.

Operation

```
qz[ 15:  0] = (qx[ 15:  0] * qy[ 15:  0]) >> SAR[5:0]
qz[ 31: 16] = (qx[ 31: 16] * qy[ 31: 16]) >> SAR[5:0]
qz[ 47: 32] = (qx[ 47: 32] * qy[ 47: 32]) >> SAR[5:0]
qz[ 63: 48] = (qx[ 63: 48] * qy[ 63: 48]) >> SAR[5:0]
qz[ 79: 64] = (qx[ 79: 64] * qy[ 79: 64]) >> SAR[5:0]
qz[ 95: 80] = (qx[ 95: 80] * qy[ 95: 80]) >> SAR[5:0]
qz[111: 96] = (qx[111: 96] * qy[111: 96]) >> SAR[5:0]
qz[127:112] = (qx[127:112] * qy[127:112]) >> SAR[5:0]
```

Syntax

ESP.VMUL.S16.LD.INCP qu,rs1,qz,qx,qy,sat,rm

Description

This instruction performs a signed vector multiplication on 16-bit data. Registers `qx` and `qy` are the multiplier and the multiplicand respectively. The eight 32-bit data results obtained from the calculation are arithmetically right-shifted by the value in the special register `SAR`. Then, the lower 16-bit data of the shift result are written into the corresponding segment of the register `qz`.

During the operation, 16 bytes are loaded from the memory into the register `qu`. After the access, the value in the register `rs1` is incremented by 16.

Operation

```
qz[ 15:  0] = (qx[ 15:  0] * qy[ 15:  0]) >> SAR[5:0]
qz[ 31: 16] = (qx[ 31: 16] * qy[ 31: 16]) >> SAR[5:0]
qz[ 47: 32] = (qx[ 47: 32] * qy[ 47: 32]) >> SAR[5:0]
qz[ 63: 48] = (qx[ 63: 48] * qy[ 63: 48]) >> SAR[5:0]
qz[ 79: 64] = (qx[ 79: 64] * qy[ 79: 64]) >> SAR[5:0]
qz[ 95: 80] = (qx[ 95: 80] * qy[ 95: 80]) >> SAR[5:0]
qz[111: 96] = (qx[111: 96] * qy[111: 96]) >> SAR[5:0]
qz[127:112] = (qx[127:112] * qy[127:112]) >> SAR[5:0]

Syntax

ESP.VMUL.U8 qz,qx,qy,sat,rm

Description

This instruction performs an unsigned vector multiplication on 8-bit data. Registers `qx` and `qy` are the multiplier and the multiplicand respectively. The 16 16-bit data results obtained from the calculation are logically right-shifted by the value in the special register `SAR`. Then, the lower 8-bit data of the shift result are written into the corresponding segment of the register `qz`.

Operation

```
qz[  7:  0] = (qx[  7:  0] * qy[  7:  0]) >> SAR[5:0]
qz[ 15:  8] = (qx[ 15:  8] * qy[ 15:  8]) >> SAR[5:0]
qz[ 23: 16] = (qx[ 23: 16] * qy[ 23: 16]) >> SAR[5:0]

4.7.2.159 ESP.VMUL.U8.LD.INCP

Syntax

ESP.VMUL.U8.LD.INCP qu,rs1,qz,qx,qy,sat,rm

Description

This instruction performs an unsigned vector multiplication on 8-bit data. Registers `qx` and `qy` are the multiplier and the multiplicand respectively. The 16 32-bit data results obtained from the calculation are logically right-shifted by the value in the special register `SAR`. Then, the lower 8-bit data of the shift result are written into the corresponding segment of the register `qz`.

During the operation, the 16-byte data are loaded from the memory to the register `qu`. After the access, the value in the register `rs1` is incremented by 16.

Operation

```
qz[  7:  0] = (qx[  7:  0] * qy[  7:  0]) >> SAR[5:0]
qz[ 15:  8] = (qx[ 15:  8] * qy[ 15:  8]) >> SAR[5:0]

4.7.2.161 ESP.VPRELU.S16

Syntax

ESP.VPRELU.S16 qz,qy,qx,rs1,sat,rm

Description

This instruction divides the register `qx` into 8 data segments of 16 bits each. If the value of a segment is not greater than 0, it performs multiplication with the value of the corresponding 16-bit segment in the register `qy`, right-shifted by the lower 6-bit value in the register `rs1`. The result obtained is then assigned to the corresponding 16-bit data segment in the register `qz`. Otherwise, the value of the segment in `qx` is assigned to `qz`. The data is signed.

Operation

```
qz[ 15:  0] = (qx[ 15:  0]<=0) ? (qx[ 15:  0] * qy[ 15:  0]) >> rs1[5:0] : qx[ 15:  0]
qz[ 31: 16] = (qx[ 31: 16]<=0) ? (qx[ 31: 16] * qy[ 31: 16]) >> rs1[5:0] : qx[ 31: 16]
...
qz[127:112] = (qx[127:112]<=0) ? (qx[127:112] * qy[127:112]) >> rs1[5:0] : qx[127:112]
```

Syntax

ESP.VPRELU.S8 qz,qy,qx,rs1,sat,rm

Description

This instruction divides the register `qx` into 16 data segments of 8 bits each. If the value of a segment is not greater than 0, it performs multiplication with the value of the corresponding 8-bit segment in the register `qy`, right-shifts by the lower 5-bit value in the register `rs1`, and then assigns the calculated result to the corresponding 8-bit data segment in the register `qz`. Otherwise, the value of the segment in `qx` is assigned to `qz`.

Operation

```
qz[  7:  0] = (qx[  7:  0]<=0) ? (qx[  7:  0] * qy[  7:  0]) >> rs1[4:0] : qx[  7:  0]
qz[ 15:  8] = (qx[ 15:  8]<=0) ? (qx[ 15:  8] * qy[ 15:  8]) >> rs1[4:0] : qx[ 15:  8]
...
qz[127:120] = (qx[127:120]<=0) ? (qx[127:120] * qy[127:120]) >> rs1[4:0] : qx[127:120]
```

Syntax

ESP.VRELU.S16 qy,rs2,rs1,sat,rm

Description

This instruction divides register `qy` into 8 data segments by 16 bits. If the value of the segment is not greater than 0, it will be multiplied by the value of the lower 16 bits in register `rs2` and right-shifted by the value of the lower 6 bits in register `rs1`, and then the result obtained will overwrite the value of the segment. Otherwise, the value of the segment will remain unchanged.

Operation

```
qy[ 15:  0] = (qy[ 15:  0]<=0) ? (qy[ 15:  0] * rs2[15:0]) >> rs1[5:0] : qy[ 15:
    0]
qy[ 31: 16] = (qy[ 31: 16]<=0) ? (qy[ 31: 16] * rs2[15:0]) >> rs1[5:0] : qy[ 31:
    16]
...
qy[127:112] = (qy[127:112]<=0) ? (qy[127:112] * rs2[15:0]) >> rs1[5:0] : qy

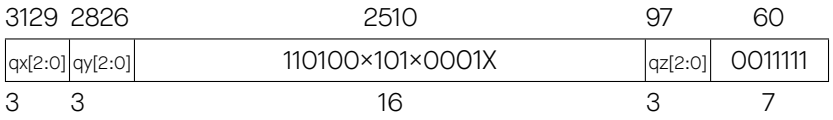

Figure 4.7-213. ESP.VCMP.GT.S32

4.7.2.214 ESP.VCMP.GT.S8

Syntax

ESP.VCMP.GT.S8 qz,qx,qy

Description

This instruction compares 8-bit signed vector data. It compares the numerical values of the 16 8-bit data segments in the registers `qx` and `qy`. If the former is larger than the latter, it writes 0xFF into the corresponding 8-bit data segment in the register `qz`. Otherwise, it writes 0 into the segment.

Operation

```
qz[  7:  0] = (qx[  7:  0]>qy[  7:  0]) ? 0xFF : 0
qz[ 15:  8] = (qx[ 15:  8]>qy[ 15:  8]) ? 0xFF : 0
...
qz[127:120] = (qx[127:120]>qy[127:120]) ? 0xFF : 0
```

ESP.MOVX.R.CFG rd

Description

This instruction moves data from the special register `CFG` to the `rd` register.

Operation

```
    rd[31 :  0] = CFG[31:0]
```

Schedule

Operands	Use	Def
rd	-	2
CFG	1	-

Format

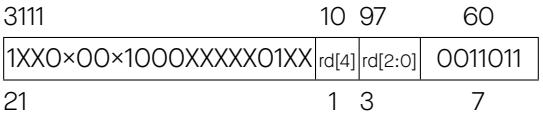

Figure 4.7-234. ESP.MOVX.R.CFG

4.7.2.235 ESP.MOVX.R.FFT.BIT.WIDTH

Syntax

ESP.MOVX.R.FFT.BIT.WIDTH rd

Description

This instruction moves data from the special register `FFT_BIT_WIDTH` to the `rd` register.

Operation

```
    rd[31 :  0] = {28{0}, FFT_BIT_WIDTH[3  :  0]}
```

Schedule

Operands	Use	Def

4.7.2.238 ESP.MOVX.R.SAR.BYTES

Syntax

ESP.MOVX.R.SAR.BYTES rd

Description

This instruction moves data from the special register `SAR_BYTES` to the `rd` register.

Operation

```
rd[31 :  0] = '{28b0, SAR_BYTES[3:0]}
```

Schedule

Operands	Use	Def
rd	-	2
SAR_BYTES	1	-

Format

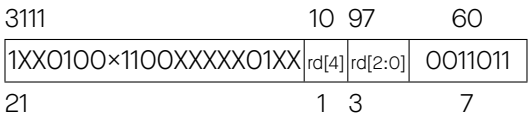

Figure 4.7-238. ESP.MOVX.R.SAR.BYTES

4.7.2.239 ESP.MOVX.R.XACC.H

Syntax

ESP.MOVX.R.XACC.H rd

Description

This instruction moves 8-bit data from the special register `XACC` to the `rd` register.

Operation

```
rd[31 :  0] = '{24b0, XACC[39 : 32]}
```

Schedule

Operands	Use	Def
rd	-	2
XACC	2	-

Format

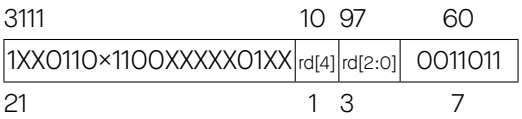

Figure 4.7-239. ESP.MOVX.R.XACC.H

4.7.2.240 ESP.MOVX.R.XACC.L

Syntax

ESP.MOVX.R.XACC.L rd

Description

This instruction moves 32 bits of the special register `XACC` to the `rd` register.

Operation

```
rd[31 :  0] = XACC[31 :  0]
```

Schedule

Operands	Use	Def

Syntax

ESP.FFT.AMS.S16.LD.INCP.UAUP qu,rs1,qz,qv,qx,qw,qy,sel2,sat

Description

This is a dedicated FFT instruction designed to perform addition, subtraction, multiplication, addition and subtraction, and shift operations on 16-bit data segments.

During the operation, the 16-byte data are loaded from the memory. The instruction combines the loaded data and the data in the special register `UA_STATE` into 32-byte data, right-shifts the 32-byte data by the result of the `SAR_BYTE` value multiplied by 8, and assigns the lower 128 bits of the shifted result to the register `qu`. Meanwhile, the register `UA_STATE` is updated with the loaded 16-byte data. After the access, the value in the register `rs1` is incremented by 16.

Operation

```
  temp0[16:0] = qx[ 15:  0] + qw[ 15:  0]
  temp1[16:0] = qx[ 31: 16] - qw[ 31: 16]

Syntax

ESP.FFT.AMS.S16.LD.R32.DECP qu,rs1,qz,qv,qx,qw,qy,sel2,sat

Description

It is a dedicated FFT instruction to perform addition, subtraction, multiplication, addition and subtraction, and shift operations on 16-bit data segments.

During the operation, the instruction forces the lower 4 bits of the access address in register `rs1` to 0 and loads the 16-byte data from the memory to register `qu` in the big-endian word order, namely, loads the segment [127: 96] of the data to [31:0] of `qu`. After the access is completed, the value in register `rs1` is decreased by 16.

Operation

```
  temp0[15:0] = qx[ 79: 64] + qy[ 79: 64]
  temp1[15:0] = qx[ 95: 80] - qy[ 95: 80]

4.7.2.268 ESP.FFT.AMS.S16.ST.INCP

Syntax

ESP.FFT.AMS.S16.ST.INCP qu,qz,rs2,rs1,qx,qw,qy,sel2,sat

Description

It is a dedicated FFT instruction to perform addition, subtraction, multiplication, addition and subtraction, and shift operations on 16-bit data segments.

During the operation, splices the values in registers `qu` and `rs2` into 16-byte data, and stores the spliced result to memory. After the access is completed, the value in register `rs1` is incremented by 16. Besides, the operation result is updated to register `rs2`.

Operation

```
  temp0[15:0] = qx[111: 96] + qw[111: 96]

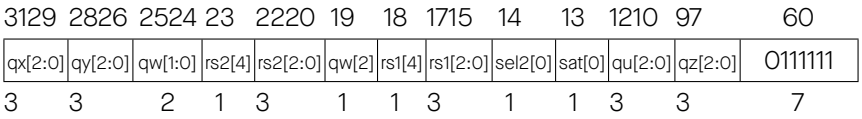

Figure 4.7-268. ESP.FFT.AMS.S16.ST.INCP

4.7.2.269 ESP.FFT.CMUL.S16.LD.XP

Syntax

ESP.FFT.CMUL.S16.LD.XP qu,rs1,rs2,qz,qy,qx,sel8,sat

Description

This instruction performs a 16-bit signed complex multiplication. It is similar to ESP.CMUL.S16, except that the order of registers `qx` and `qy` is reversed.

During the operation, the 16-byte data are loaded from the memory to the register `qu`. After the access is completed, the value in the register `rs1` is incremented by the value in the register `rs2`.

Operation

```
if sel8 == 0:
  qz[ 15:  0] = (qy[ 15:  0] * qx[ 15:  0] + qy[ 31: 16] * qx[ 31: 16]) >> SAR[5:0]
  qz[ 31: 16] = (qy[ 31: 16] * qx[ 15:  0] - qy[ 15:  0] * qx[ 31: 16]) >> SAR[5:0]
if sel8 == 1:
  qz[ 15:  0] = (qy[ 15:  0] * qx[ 15:  0] - qy[ 31: 16] * qx[ 31: 16]) >> SAR[5:0]

Syntax

ESP.FFT.CMUL.S16.ST.XP qy,qx,qu,rs1,rs2,sel8,upd4,sel4,sat

Description

This instruction performs a 16-bit signed complex multiplication. It is similar to ESP.CMUL.S16, except that the order of registers `qx` and `qy` is reversed.

The result of the operation and the data segments in registers `qx` and `qu`, specified by the immediate data `upd4`, are concatenated into 128 bits. These are then written into memory. After the access is completed, the value in register `rs1` is incremented by the value in register `rs2`.

Operation

```
if sel8 == 6:
  temp[15: 0] = (qy[111: 96] * qx[111: 96] + qy[127:112] * qx[127:112]) >> SAR[5:0]

Syntax

ESP.FFT.R2BF.S16.ST.INCP qz,qx,qy,rs1,sel4,sat

Description

This instruction performs the radix-2 butterfly operation on the 16-byte values in registers `qx` and `qy`, and the data bit width is 16 bits. Some of the calculation results are written to the register `qz`, while others perform an arithmetic shift and are written into the memory address indicated by `rs1`. After the access is completed, the value in the register `rs1` is incremented by 16.

Operation

```
qz[ 15:  0] = qx[ 15:  0] - qy[ 15:  0]
qz[ 31: 16] = qx[ 31: 16] - qy[ 31: 16]

4.7.2.273 ESP.FFT.VST.R32.DECP

Syntax

ESP.FFT.VST.R32.DECP qu,rs1,sel2

Description

It is a dedicated FFT instruction. This instruction divides data in register `qu` into 8 segments of 16-bit data and performs an arithmetic right shift on them by 0 or 1 depending on the immediate number `sel2`, and finally writes the result to the memory address indicated by register `rs1` in word big-endian order. After the access is completed, the value in register `rs1` is decreased by 16.

Operation

```
{
  qu[ 31: 16] >> sel2,
  qu[ 15:  0] >> sel2,
  qu[ 63: 48] >> sel2,
  qu[ 47: 32] >> sel2,
  qu[ 95: 80] >> sel2,
  qu[ 79: 64] >> sel2,
  qu[127:112] >> sel2,
  qu[111: 96] >> sel2
} => store128(rs1[31:0])

4.7.2.274 ESP.LD.128.USAR.IP

Syntax

ESP.LD.128.USAR.IP qu,rs1,imm16

Description

This instruction loads 16-byte data from memory to the register `qu`. Meanwhile, it saves the value of the lower 4 bits in the register `rs1` to the special register `SAR_BYTE`. After the access is completed, the value in the register `rs1` is incremented by an 8-bit sign-extended constant in the instruction code segment, left-shifted by 4.

imm starts at -2048, ends at 2032, and steps by 16.

Operation

```
qu[127:0] = load128(rs1[31:0])
SAR_BYTE = rs1[3:0]
rs1[31:0] = rs1[31:0] + imm
```

Description

This instruction loads 16-byte data from memory, divides it into 8 segments of 16 bits, zero-extends each segment to 64 bits, and then stores the results in the 256-bit special registers `QACC_L` and `QACC_H` respectively. After the access is completed, the value in the register `rs1` is incremented by an 8-bit sign-extended constant in the instruction code segment, left-shifted by 4.
imm starts at -2048, ends at 2032, with a step of 16.

Operation

```
dataIn[127:0] = load128(rs1[31:0])
QACC_L[ 63:  0] = {48{0}, dataIn[ 15:  0]}
QACC_L[127: 64] = {48{0}, dataIn[ 31: 16]}
QACC_L[191:128] = {48{0}, dataIn[ 47: 32]}
QACC_L[255:192] = {48{0}, dataIn[ 63: 48]}

QACC_H[ 63:  0] = {48{0}, dataIn[ 79: 64]}
QACC_H[127: 64] = {48{0}, dataIn[ 95: 80]}
QACC_H[191:128] = {48{0}, dataIn[111: 96]}
QACC_H[159:192] = {48{0}, dataIn[127:112]}

rs1[31:0] = rs1[31:0] + imm
```

Syntax

ESP.VLDHBC.16.INCP qu,qz,rs1

Description

This instruction loads 16-byte data from memory, extends it to 256 bits in the following way, and assigns the result to the registers `qu` and `qz`. After the access, the value in the register `rs1` is incremented by 16.

Operation

```
dataIn[127:0] = load128(rs1[31:0])
qu  = {2{dataIn[ 63: 48]}, 2{dataIn[ 47: 32]}, 2{dataIn[ 31: 16]}, 2{dataIn[ 15: 0]} }
qz = {2{dataIn[127:112]}, 2{dataIn[111: 96]}, 2{dataIn[ 95: 80]}, 2{dataIn[ 79: 64]} }
rs1[31:0] = rs1[31:0] + 16
```

4.7.2.321 ESP.VST.H.64.XP

Syntax

ESP.VST.H.64.XP qu,rs1,rs2

Description

This instruction stores the 64 bits in the upper 64 bits of the register `qu` to memory, with the pointer incremented by the value in the register `rs2`.

Operation

```
MEM(rs1[31:0]) = qu[127:  64]
rs1[31:0] = rs1[31:0] + rs2[31:0]
```

Schedule

4.7.2.322 ESP.VST.L.64.IP

Syntax

ESP.VST.L.64.IP qu,rs1,imm8

Description

This instruction stores the 64 bits in the lower 64 bits of the register qu to memory, with the pointer incremented by an immediate.
imm starts at -1024, ends at 1016, and steps by 8.

Operation

```
MEM(rs1[31:0]) = qu[63:  0]
rs1[31:0] = rs1[31:0] + imm
```

4.7.2.324 ESP.SLCI.2Q

Syntax

ESP.SLCI.2Q qy,qw,sel16

Description

This instruction performs a left shift on the 32-byte concatenation of registers `qw` and `qy`, and pads the lower bits with 0. The upper 128 bits of the shift result are written to register `qy`, and the lower 128 bits are written to `qw`. The left shift amount is 8 times the sum of `sel16` and 1.

Operation

```
{qy[127:  0], qw[127:  0]} = {qy[127:  0], qw[127:  0]} << ((sel16[3:0]+1)*8)
```

Schedule

Format

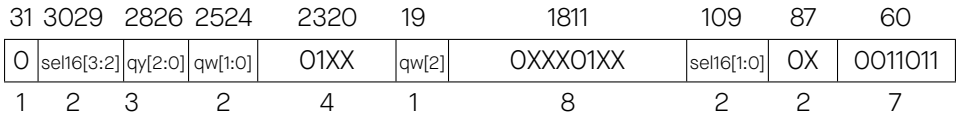

Figure 4.7-324. ESP.SLCI.2Q

4.7.2.325 ESP.SLCXXP.2Q

Syntax

ESP.SLCXXP.2Q qy,qw,rs1,rs2

Description

This instruction performs a left shift on the 32-byte concatenation of registers `qy` and `qw`, and pads the lower bits with 0. The upper 128 bits of the shift result are written to register `qy`, and the lower 128 bits are written to `qw`. The left shift amount is 8, performed by the sum of 1 plus the lower 4-bit value of register `rs1`. After the above operations, the value in `rs1` is incremented by the value in `rs2`.

Operation

```
{qy[127:  0], qw[127:  0]} = {qy[127:  0], qw[127:  0]} << ((rs1[3:0]+1)*8)
rs1[31:0] = rs1[31:0] + rs2[31:0]
```

Format

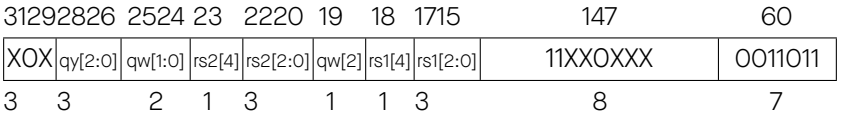

Figure 4.7-325. ESP.SLCXXP.2Q

4.7.2.326 ESP.SRC.Q

Syntax

ESP.SRC.Q qz,qw,qy

Description

This instruction performs an arithmetic right shift on the 32-byte concatenation of registers qy and qw, which hold the loaded data from two consecutive aligned addresses. In this way, you can obtain unaligned 16-byte data, which will then be written to the register qw. The right shift amount is SAR_BYTE performed by 8.

Operation

```
qz[127:0] = {qy[127: 0], qw[127: 0]} >> {SAR_BYTE[3:0] << 3}
```

Schedule

Operands	Use	Def

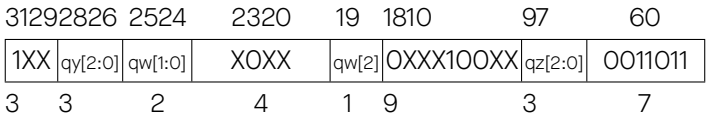

Figure 4.7-326. ESP.SRC.Q

4.7.2.327 ESP.SRC.Q.LD.IP

Syntax

ESP.SRC.Q.LD.IP qu,rs1,imm16,qw,qy

Description

This instruction performs an arithmetic right shift on the 32-byte concatenation of registers `qy` and `qw`, which hold the loaded data from two consecutive aligned addresses. In this way, you can obtain unaligned 16-byte data, which will be written to the register `qw`. The right shift amount is `SAR_BYTE` performed by 8. Simultaneously, the 16-byte data is loaded from the memory into the register `qu`. After the access is completed, the value in the register `rs1` is incremented by `imm`.
`imm` starts at -2048, ends at 2032, with a step of 16.

Operation

```
qw[127:0] = {qy[127: 0], qw[127: 0]} >> {SAR_BYTE[3:0] << 3}
qu[127:0] = load128(rs1[31:0])
rs1[31:0] = rs1[31:0] + imm
```

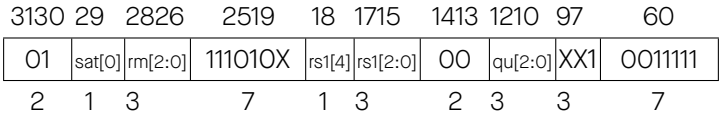

Figure 4.7-333. ESP.SRCMB.S8.QACC

4.7.2.334 ESP.SRCMB.U16.Q.QACC

Syntax

ESP.SRCMB.U16.Q.QACC qu,qw,sat,rm

Description

This instruction extracts 8 data segments of 64 bits from special registers QACC_H and QACC_L and performs arithmetic right shift operations respectively, the shift amounts are from qw. While writing the shift results back to QACC_H and QACC_L, the instruction saturates the results to 16-bit unsigned numbers and writes the 8 16-bit data obtained after saturation into the register qu.

Operation

```

4.7.2.338 ESP.SRCQ.128.ST.INCP

Syntax

ESP.SRCQ.128.ST.INCP qw,qy,rs1

Description

This instruction performs an arithmetic right shift on the 32-byte concatenation of registers `qw` and `qy`. Then, it writes the lower 128 bits of the shift result to memory. After the access, the value in the register `rs1` is incremented by 16.

Operation

```
{qy[127:  0], qw[127:  0]} >> {SAR_BYTE[3:0] << 3}  => store128(rs1[31:0])
rs1[31:0] = rs1[31:0] + 16
```

4.7.2.339 ESP.SRCXXP.2Q

Syntax

ESP.SRCXXP.2Q qy,qw,rs1,rs2

Description

This instruction performs a logical right shift on the 32-byte concatenation of registers `qw` and `qy`, and pads the higher bits with 0. The upper 128 bits of the shift result are written to register `qy`, and the lower 128 bits are written to `qw`. The right shift amount is 8 times the sum of 1 plus the lower 4-bit value of register `rs1`. After the above operations, the value in `rs1` is incremented by the value in `rs2`.

Operation

```
{qy[127:  0], qw[127:  0]} = {qy[127:  0], qw[127:  0]} >> ((rs1[3:0]+1)*8)
qy[127:127-8*rs1[3:  0]] = 0
rs1[31:0] = rs1[31:0] + rs2[31:0]

Syntax

ESP.SRS.S.XACC rd,rs1,sat,rm

Description

This instruction performs an arithmetic right shift on the special register `XACC`. While writing the shift result back to `XACC`, the instruction saturates the shift result to a 32-bit signed number and writes the saturated result into the register `rd`.

Operation

```
temp_shf[39:0] = XACC[39:0] >> rs1[5:0]
XACC = temp_shf[39:0]
rd = min(max(temp_shf[39:0], -2^{31}), 2^{31}-1)

4.7.2.352 ESP.FFT.BITREV

Syntax

ESP.FFT.BITREV qv,rs1

Description

This instruction swaps the bit order of data of different bit widths according to the value of the special register `FFT_BIT_WIDTH`. Then, it compares the data before and after the swap, takes the larger value, pads the higher bits with 0 until it reaches 16 bits, and writes the result into the corresponding data segment of the register `qa`. In the following, Switchx is a function that represents the bit inversion of the x-bit. Switch5(0b10100) = 0b00101. Here, 0b10100 represents 5-bit binary data.

Operation

```
  temp0[15:0] = rs1[15:0]
  temp1[15:0] = rs1[15:0] + 1
  temp2[15:0] = rs1[15:0] + 2
  temp3[15:0] = rs1[15:0] + 3
  temp4[15:0] = rs1[15:0] + 4
  temp5[15:0] = rs1[15:0] + 5
  temp6[15:0] = rs1[15:0] + 6
  temp7[15:0] = rs1[15:0] + 7
if FFT_BIT_WIDTH==3:
  Switch3(X[2:0]) = X[0:2]
  qv[ 15:  0] = {13'h0, max(tmp0[2:0], Switch3(tmp0[2:0]))}
  qv[ 31: 16] = {13'h0, max(tmp1[2:0], Switch3(tmp1[2:0]))}
  qv[ 47: 32] = {13'h0, max(tmp2[2:0], Switch3(tmp2[2:0]))}

Format

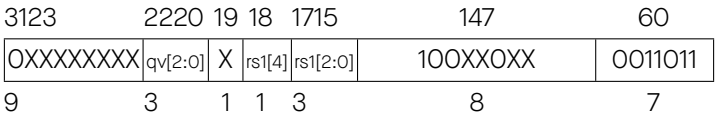

Figure 4.7-352. ESP.FFT.BITREV

4.7.2.353 ESP.SRC.Q.QUP

Syntax

ESP.SRC.Q.QUP qz,qw,qy

Description

This instruction performs an arithmetic right shift on the 32-byte concatenation of registers `qw` and `qy`, which hold the loaded data from two consecutive aligned addresses. In this way, it is possible to obtain unaligned 16-byte data, which will then be written to the register `qz`. The right shift amount is `SAR_BYTE` performed by 8. Simultaneously, the value of the register `qy` is updated to `qw`.

Operation

```
qz[127:  0] = {qy[127:  0], qw[127:  0]} >> {SAR_BYTE[3:0] << 3}
qw = qy
```

Format

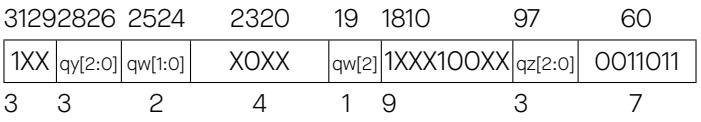

Figure 4.7-353. ESP.SRC.Q.QUP

4.7.2.354 ESP.VSL.S32

Syntax

ESP.VSL.S32 qu,qy,sat

Description

This instruction performs a left shift on the four 32-bit signed data segments in the register qy respectively. The left shift amount is the value in the 6-bit special register SAR. During the shift process, the lower bits are padded with 0. The lower 32 bits of the shift result are stored in the corresponding data segment in the register qu.

Operation

```
qu[ 31:  0] = (qy[ 31:  0] << SAR[5:0])
qu[ 63: 32] = (qy[ 63: 32] << SAR[5:0])
qu[ 95: 64] = (qy[ 95: 64] << SAR[5:0])
qu[127: 96] = (qy[127: 96] << SAR[5:0])
```

Chapter 5

Low-Power CPU

5.1 Overview

The ESP32-P4 Low-Power CPU (LP CPU) is a 32-bit processor based upon RISC-V ISA comprising integer (I), multiplication/division (M), atomic (A), and compressed (C) standard extensions. It features ultra-low power consumption and has a 2-stage, in-order, and scalar pipeline. The LP CPU core complex has an interrupt controller (INTC), a debug module (DM), and system bus (SYS BUS) interfaces for memory and peripheral access.

The LP CPU is in sleep mode by default (see Section 5.10). It can stay powered on when the chip enters Deep-sleep mode (see Chapter 15 *Low-Power Management* for details) and can access most peripherals and memories (see Chapter 9 *System and Memory* for details). It has two application scenarios:

- Power insensitive scenario: When the High-Performance CPU (HP CPU) is active, the LP CPU can assist the it with some speed- and efficiency-insensitive controls and computations.
- Power sensitive scenario: When the HP CPU is in the power-down state to save power, the LP CPU can be woken up to handle some external wake-up events.

Figure 5.1-1 shows the resources accessible to the HP CPU and the LP CPU.

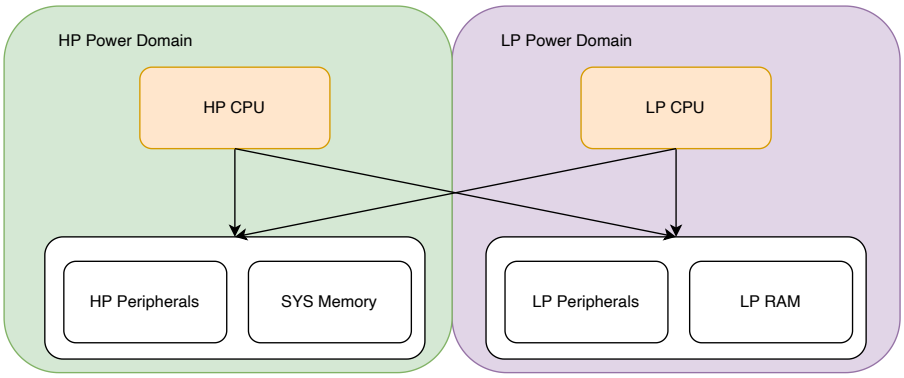

Figure 5.1-1. LP CPU Overview

In the figure above, the HP Power Domain and LP Power Domain can be powered on and off independently. When one domain is powered down, the CPU of the other domain cannot access the resources of that domain. In other words, only when the domain is powered on can its resources be accessed. For more information about power, please refer to the chapter 15 *Low-Power Management*.

5.2 Features

The LP CPU has the following features:

- Operating clock frequency of up to 40 MHz
- 18 vector interrupts
- Debug module compliant with RISC-V External Debug Support Version 0.13 with external debugger support over an industry-standard JTAG/USB port
- Hardware trigger compliant with RISC-V External Debug Support Version 0.13 with up to 2 breakpoints/watchpoints
- Core performance metric events
- Wake-up interrupt for HP CPU
- Access to HP memory and LP memory
- Access to the entire peripheral address space

5.3 Configuration and Status Registers (CSRs)

5.3.1 Register Summary

Below is a list of CSRs that are supported by the LP CPU. Except for the custom performance counter CSRs, all the implemented CSRs follow the standard mapping of bit fields as described in the RISC-V Instruction Set Manual, Volume II: Privileged Architecture, Version 1.10. It must be noted that even among the standard CSRs, not all bit fields have been implemented, limited by the subset of features implemented in the CPU. For a detailed description of the subset of fields implemented under each of these CSRs, please refer to Section 5.3.2.

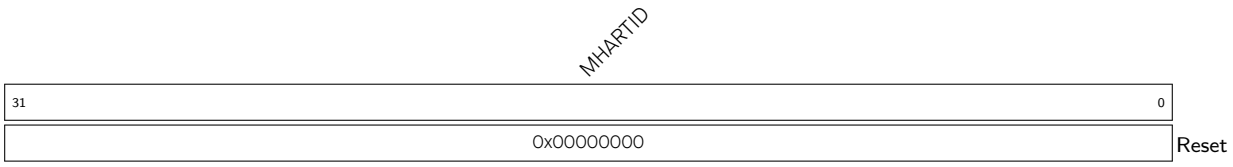
The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Machine Information CSR			
mhartid	Machine Hart ID	0xF14	RO
Machine Trap Setup CSRs			
mstatus	Machine Mode Status	0x300	R/W
misa [1]	Machine ISA	0x301	R/W
mie	Machine Interrupt Enable	0x304	R/W
mtvec [2]	Machine Trap Vector	0x305	R/W
Machine Trap Handling CSRs			
mscratch	Machine Scratch	0x340	R/W
mepc	Machine Trap Program Counter	0x341	R/W
mcause [3]	Machine Trap Cause	0x342	R/W
mtval	Machine Trap Value	0x343	R/W
mip	Machine Interrupt Pending	0x344	R/W
Trigger Module CSRs (shared with Debug Mode)			
tselect	Trigger Select Register	0x7A0	R/W

[1] Although misa is specified as having both read and write access (R/W), its fields are hardwired and thus write has no effect. This is what would be termed WARL (Write Any Read Legal) in RISC-V terminology.

[2] mtvec only provides configuration for trap handling in vectored mode with the base address aligned to 256 bytes.

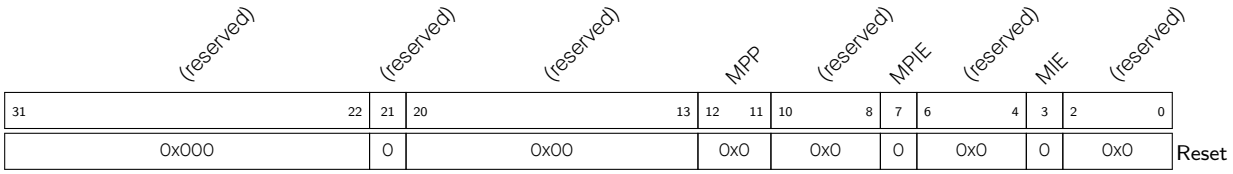
[3] External interrupt IDs reflected in mcause include even those IDs which have been reserved by RISC-V standard for core internal sources.



Name	Description	Address	Access
tdata1	Trigger Abstract Data 1	0x7A1	R/W
tdata2	Trigger Abstract Data 2	0x7A2	R/W
Debug Mode CSRs			
dcsr	Debug Control and Status	0x7B0	R/W
dpc	Debug PC	0x7B1	R/W
dscratch0	Debug Scratch Register 0	0x7B2	R/W
dscratch1	Debug Scratch Register 1	0x7B3	R/W
Machine Counter/Timer CSRs			
mcycle	Machine Clock Cycle Counter	0xB00	R/W
minstret	Machine Retired Instruction Counter	0xB02	R/W
mhpmcounter*n*(*n*:3-12)	Machine Performance Monitor Counter	0xB00+*n*	R/W
mcycleh	The higher 32 bits of mcycle	0xB80	R/W
minstreth	The higher 32 bits of minstret	0xB82	R/W
mhpmcounter*n*h(*n*:3-12)	The higher 32 bits of mhpmcounter*n*(*n*:3-12)	0xB80+*n*	R/W
Machine Counter Setup CSR			
mcountinhibit	Machine Counter Control	0x320	R/W

Note that if write, set, or clear operation is attempted on any of the read-only (RO) CSRs indicated in the above table, the CPU will generate an illegal instruction exception.

5.3.2 Registers



For how to program reserved fields, please refer to Section *Programming Reserved Register Field*.

Register 5.1. mhartid (0xF14)

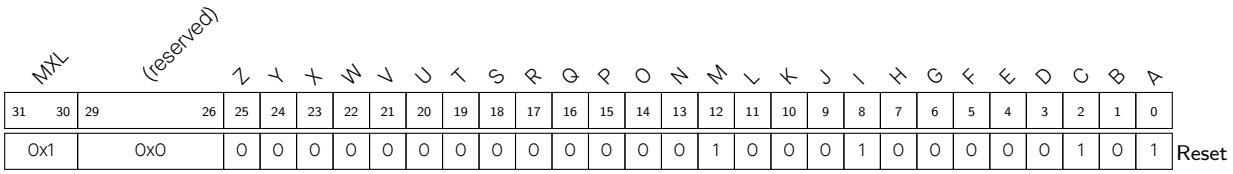
MHARTID Represents hart ID. The LP CPU hart ID is 0. (RO)

Register 5.2. mstatus (0x300)

MIE Write 1 to enable the global machine mode interrupt. (R/W)

MPIE Write 1 to enable the machine previous interrupt (before trap). (R/W)

MPP Configures machine previous privilege mode (before trap).



0x3: Machine mode

Other values: Invalid

Note: Only the lower bit is writable. Any write to the higher bit is ignored as it is directly tied to the lower bit.

(R/W)

Register 5.3. misa (0x301)

MXL	(reserved)	Z	Y	X	W	V	U	T	S	R	Q	P	O	N	M	L	K	J	I	H	G	F	E	D	C	B	A
31 30	29 26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Reset

MXL Machine XLEN = 1 (32-bit). (RO)

Z Reserved = 0. (RO)

Y Reserved = 0. (RO)

X Non-standard extensions present = 0. (RO)

W Reserved = 0. (RO)

V Reserved = 0. (RO)

U User mode implemented = 0. (RO)

T Reserved = 0. (RO)

S Supervisor mode implemented = 0. (RO)

R Reserved = 0. (RO)

Q Quad-precision floating-point extension = 0. (RO)

P Reserved = 0. (RO)

O Reserved = 0. (RO)

N User-level interrupts supported = 0. (RO)

M Integer Multiply/Divide extension = 1. (RO)

L Reserved = 0. (RO)

K Reserved = 0. (RO)

J Reserved = 0. (RO)

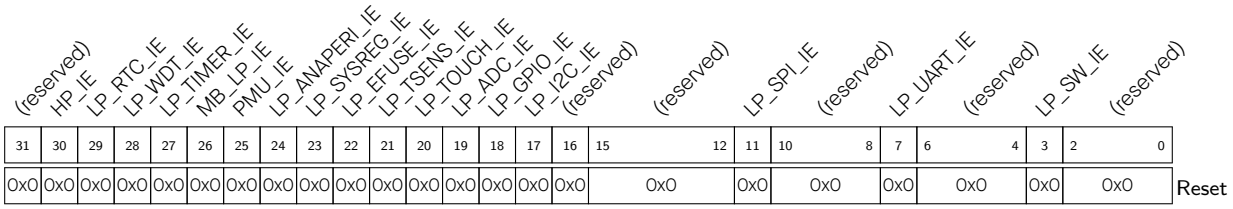
I RV32I base ISA = 1. (RO)

H Hypervisor extension = 0. (RO)

G Additional standard extensions present = 0. (RO)

F Single-precision floating-point extension = 0. (RO)

E RV32E base ISA = 0. (RO)



D Double-precision floating-point extension = 0. (RO)

C Compressed Extension = 1. (RO)

B Reserved = 0. (RO)

A Atomic Standard Extension = 1. (RO)

Register 5.4. mie (0x304)

LP_SW_IE Write 1 to enable LP software interrupt. (R/W)

LP_UART_IE Write 1 to enable LP UART interrupt. (R/W)

LP_SPI_IE Write 1 to enable LP SPI interrupt. (R/W)

LP_I2C_IE Write 1 to enable I2C interrupt. (R/W)

LP_GPIO_IE Write 1 to enable LP GPIO interrupt. (R/W)

LP_ADC_IE Write 1 to enable LP ADC interrupt. (R/W)

LP_TOUCH_IE Write 1 to enable LP TOUCH interrupt. (R/W)

LP_TSENS_IE Write 1 to enable LP TSENS interrupt. (R/W)

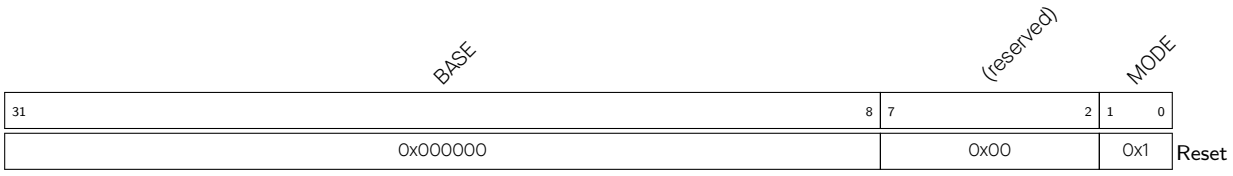
LP_EFUSE_IE Write 1 to enable LP eFuse interrupt. (R/W)

LP_SYSREG_IE Write 1 to enable SYSREG interrupt. (R/W)

LP_ANAPERI_IE Write 1 to enable ANAPERI interrupt. (R/W)

LP_PMU_IE Write 1 to enable PMU interrupt. (R/W)

LP_MB_IE Write 1 to enable Mailbox interrupt. (R/W)

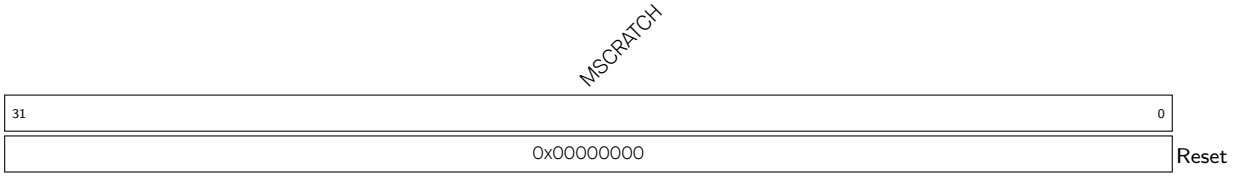


LP_TIMER_IE Write 1 to enable LP Timer interrupt. (R/W)

LP_WDT_IE Write 1 to enable WDT interrupt. (R/W)

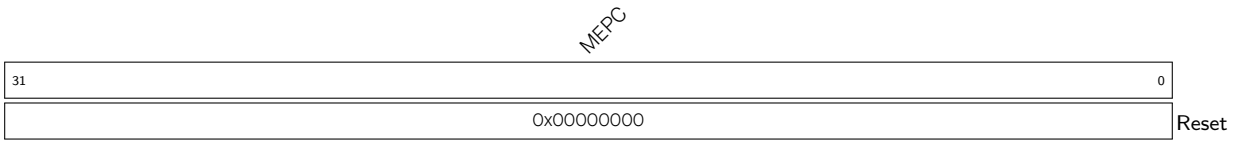
LP_RTC_IE Write 1 to enable RTC interrupt. (R/W)

HP_IE Write 1 to enable HP interrupt. (R/W)



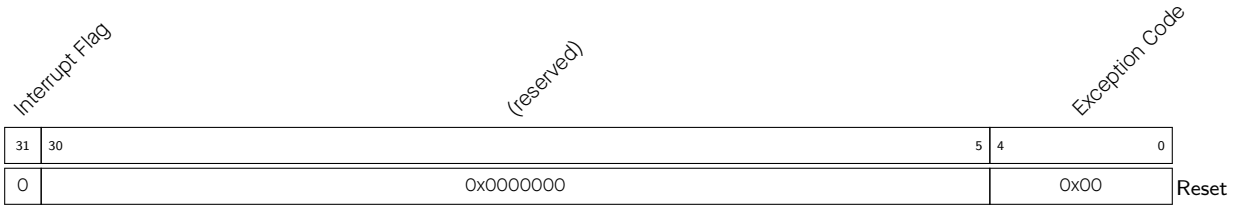
Register 5.5. mtvec (0x305)

MODE Represents whether machine mode interrupts are vectored. Only vectored mode **0x1** is available. (RO)



BASE Configures the higher 24 bits of trap vector base address aligned to 256 bytes. (R/W)

Register 5.6. mscratch (0x340)



MSCRATCH Contains machine scratch information for custom use. (R/W)

Register 5.7. mepc (0x341)

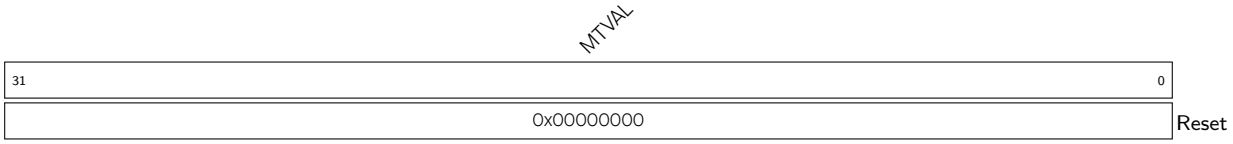
MEPC Configures the machine trap/exception program counter. This is automatically updated with address of the instruction which was about to be executed while CPU encountered the most recent trap. (R/W)

Register 5.8. mcause (0x342)

Exception Code This field is automatically updated with unique ID of the most recent exception or interrupt due to which CPU entered trap. Possible exception IDs are:

0x2: Illegal instruction

0x3: Hardware breakpoint/watchpoint or EBREAK



0x6: Misaligned atomic instructions

Note: Exception ID 0x0 (instruction access misaligned) is not present because CPU always masks the lowest bit of the address during instruction fetch.

(R/W)

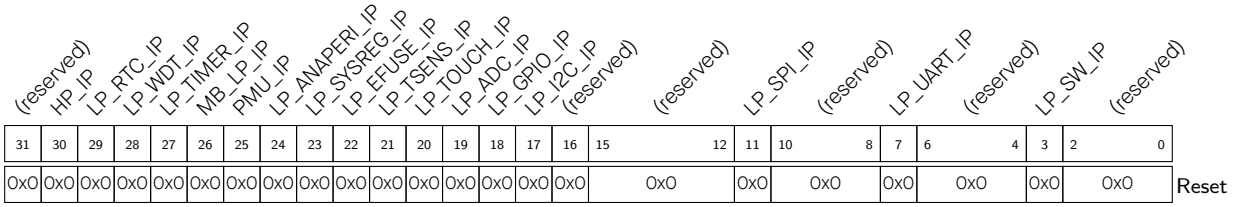
Interrupt Flag This flag is automatically updated when CPU enters trap. If this is found to be set, it indicates that the latest trap occurred due to an interrupt. For exceptions it remains unset. (R/W)

Register 5.9. mtval (0x343)

MTVAL Configures machine trap value. This is automatically updated with an exception dependent data which may be useful for handling that exception. Data is to be interpreted depending upon exception IDs:

0x1: Faulting address of instruction

0x2: Faulting instruction opcode



0x5: Faulting data address of load operation

0x7: Faulting data address of store operation

Note: The value of this register is not valid for other exception IDs and interrupts.

(R/W)

Register 5.10. mip (0x344)

LP_SW_IP Configures the pending status of the LP software interrupt.

0□Not pending

1□Pending

(R/W)

LP_UART_IP Configures the pending status of the LP UART interrupt.

0□Not pending

1□Pending

(R/W)

LP_SPI_IP Configures the pending status of the LP SPI interrupt.

0□Not pending

1□Pending

(R/W)

LP_I2C_IP Configures the pending status of the LP I2C interrupt.

0□Not pending

1□Pending

(R/W)

LP_GPIO_IP Configures the pending status of the LP GPIO interrupt.

0□Not pending

1□Pending

(R/W)

LP_ADC_IP Configures the pending status of the LP ADC interrupt.

0□Not pending

1□Pending

(R/W)

LP_TOUCH_IP Configures the pending status of the LP TOUCH interrupt.

0□Not pending

1□Pending

(R/W)

LP_TSENS_IP Configures the pending status of the LP TSENS interrupt.

0□Not pending

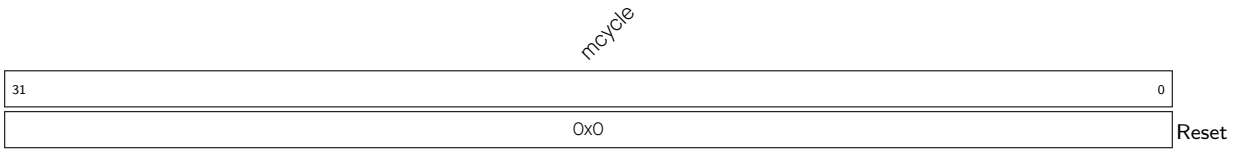
1□Pending

(R/W)

LP_EFUSE_IP Configures the pending status of the LP eFuse interrupt.

0□Not pending

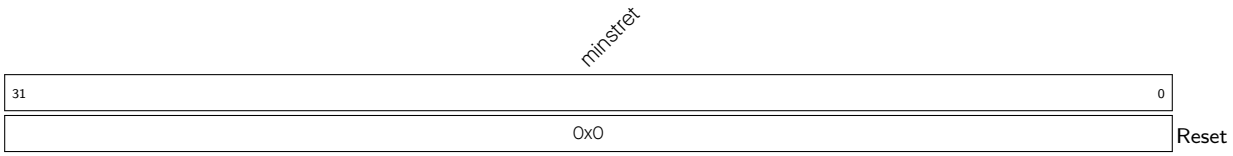
1□Pending



(R/W)

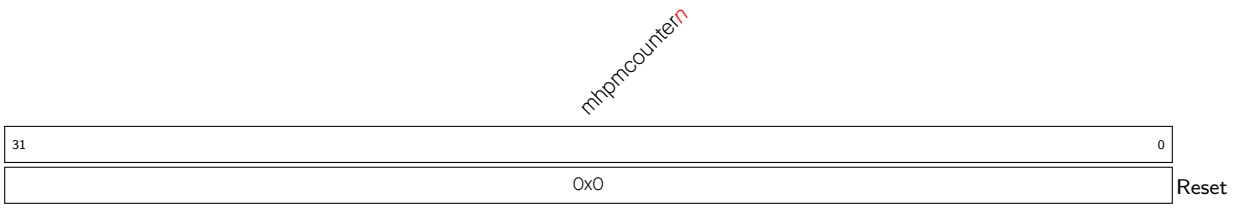
LP_SYSREG_IP Configures the pending status of the LP SYSREG interrupt.

0□Not pending



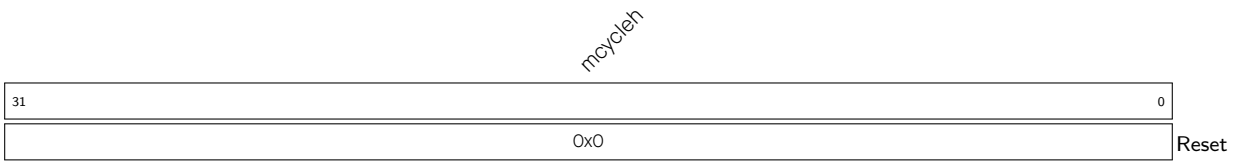
1□Pending

Register 5.11. mcycle (0xB00)



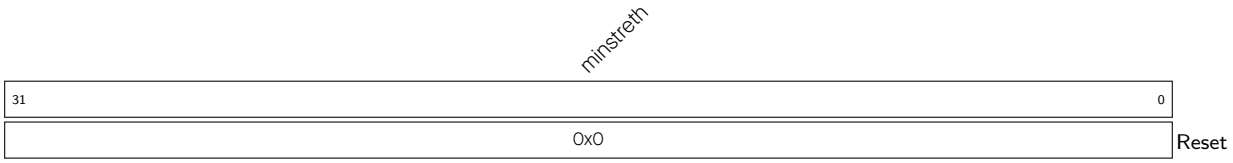
MCYCLE Configures the lower 32 bits of the clock cycle counter. (R/W)

Register 5.12. minstret (0xB02)



MINSTRET Configures the lower 32 bits of the instruction counter. (R/W)

Register 5.13. mhpmcounter*n*(*n*: 3-12) (0xB00+*n*)

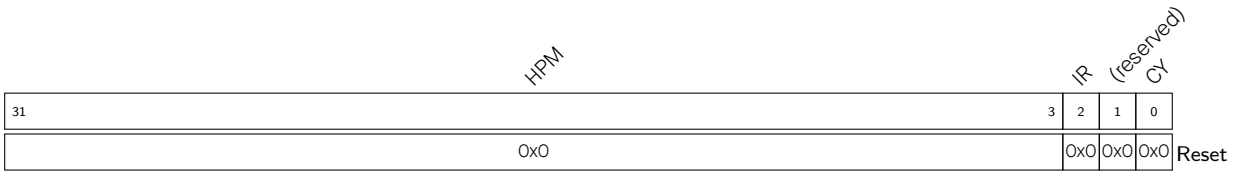


MHPMCOUNTER*n* Configures the lower 32 bits of the performance counter *n*. (R/W)

Register 5.14. mcycleh (0xB80)

MCYCLEH Configures the higher 32 bits of the clock cycle counter. (R/W)

Register 5.15. minstreth (0xB82)



MINSTRETH Configures the higher 32 bits of the instruction counter. (R/W)

Register 5.16. mhpmcounter*n*(*n*: 3-12)h (0xB80+*n*)

MHPMCOUNTER*n*h Configures the higher 32 bits of the performance counter *n*. (R/W)

Register 5.17. mcountinhibit (0x320)

HPM Configures whether the performance counter *n*(*n*:3-12) increments.

0: The counter does not count

1: The counter increments

(R/W)

IR Configure whether the instruction counter increments.

0: The counter does not count

1: The counter increments

(R/W)

CY Configure whether the clock cycle counter increments.

0: The counter does not count

1: The counter increments

(R/W)

5.4 Interrupts and Exceptions

The LP CPU handles interrupts and exceptions according to RISC-V Instruction Set Manual, Volume II: Privileged Architecture, Version 1.10. After entering an interrupt/exception handler, the CPU:

- Saves the current program counter (PC) value to the mepc CSR
- Copies the state of MIE of mstatus to MPIE of mstatus
- Saves the current privileged mode to MPP of mstatus
- Clears MIE of mstatus
- Toggles the privileged mode to machine mode (M mode)
- Jumps to the handler address
  - For exceptions, the handler address is the base address of the vector table in the mtvec CSR
  - For interrupts, the handler address is $mtvec + 4 * ID$, where ID is the interrupt ID. For more information, see Section 5.4.1
- After the mret instruction is executed, the core jumps to the PC saved in the mepc CSR, restores the value of MPIE of mstatus to MIE of mstatus, and restores the privileged mode to that indicated by MPP of mstatus

When the core starts up, the base address of the vector table is initialized to the boot address 0x50000000. After startup, the base address can be changed by writing to the mtvec CSR. For more information about CSRs, see Section 5.3.1.

After a reset, the core starts to fetch instructions from the memory address specified by the LP_SYSTEM_LP_CORE_BOOT_ADDR_REG register with an offset of 0x80. The default value for this register is 0x50100000, which corresponds to the starting address of the LP ROM.

5.4.1 Interrupts

The LP CPU in the ESP32-P4 supports 18 interrupt inputs. Each interrupt corresponds to an ID, which is denoted as n (where n = 3, 7, 11, 16 to 30), and has a specific entry address of $mtvec + 4 * n$. These interrupts are associated with specific peripheral sources. For the mapping between peripheral sources and interrupt IDs, please refer to 5.4-1.

Table 5.4-1. LP CPU Interrupt Mapping

Interrupt ID	Peripheral Source
3	LP_SW_INTR
7	LP_UART_INTR
11	LP_SPI_INTR
17	LP_I2C_INTR
18	LP_GPIO_INTR
19	LP_ADC_INTR
20	LP_TOUCH_INTR
21	LP_TSENS_INTR
22	LP_EFUSE_INTR

Interrupt ID	Peripheral Source
23	LP_SYSREG_INTR
24	LP_ANAPERI_INTR
25	PMU_REG_0_INTR, PMU_REG_1_INTR
26	MB_HP_INTR, MB_LP_INTR
27	LP_TIMER_REG_0_INTR, LP_TIMER_REG_1_INTR
28	LP_WDT_INTR
29	LP_RTC_INTR
30	HP_INTR

The read-only register LPINTR_STATUS_REG indicates the current status of the LP CPU external interrupt sources. For the mapping between this register and the interrupt sources, please refer to the description of this register.

5.4.2 Interrupt Handling

By default, interrupts are disabled globally because the MIE bit in mstatus has a reset value of 0. Software must set this bit to enable global interrupts.

Assuming the interrupt to enable is Interrupt n:

1. Enable Interrupt n:
   - To enable interrupts globally, write 1 to the MIE bit of mstatus.
   - To enable Interrupt n, write 1 to the nth bit of mie CSR.
2. After Interrupt n is enabled, the LP CPU can respond to it. Meanwhile, the corresponding peripheral interrupt should be configured to send an interrupt signal to the LP CPU.
3. After the interrupt is triggered, the LP CPU jumps to the $mtvec + 4 * n$ address.
4. To clear Interrupt n, the peripheral needs to clear the interrupt signal.

5.4.3 Exceptions

The LP CPU supports the RISC-V standard exceptions and can trigger the following exceptions:

Table 5.4-2. LP CPU Exception Causes

Exception ID	Description
1	Instruction access fault
2	Illegal instructions
3	Breakpoints (EBREAK)
5	Load access fault
6	Misaligned atomic instructions
7	Store access fault

5.5 Debugging

This section describes how to debug and test the LP CPU. Debug support is provided through standard JTAG pins and complies with RISC-V External Debug Support Version 0.13.

For ESP32-P4 system debugging overview, please refer to Chapter 2 *High-Performance CPU* > Figure 2.11-1 *Debug System Overview*.

The user interacts with the Debug Host (e.g., laptop), which is running a debugger (e.g., gdb). The debugger communicates with a Debug Translator (e.g., OpenOCD, which may include a hardware driver) to communicate with Debug Transport Hardware (e.g., ESP-Prog adapter). The Debug Transport Hardware connects the Debug Host to the CPU's Debug Transport Module (DTM) through a standard JTAG interface. The DTM provides access to the debug module (DM) using the Debug Module Interface (DMI).

ESP32-P4 features two DTMs interconnected in a daisy-chain configuration. Specifically, TAP0 connects to the HP CPU, while TAP1 is dedicated to the LP CPU.

The HP DM supports multicore debugging according to the specification RISC-V External Debug Support Version 0.13. It can simultaneously control both cores of the HP CPU. In contrast, the LP DM is designed for debugging the single-core LP CPU.

The LP CPU implements four registers for core debugging: dcsr, dpc, dscratch0, and dscratch1. All of those registers can only be accessed from debug mode. If software attempts to access them when the LP CPU is not in debug mode, an illegal instruction exception will be triggered.

5.5.1 Features

The Low-Power CPU debug module has the following debugging features:

- Access to necessary information about the implementation
- CPU core halt and resume
- Read and write of CPU core registers (including CSRs)
- CPU core reset
- CPU halted on software breakpoint (planted breakpoint instruction)
- Hardware single-stepping
- Two hardware triggers (which can be used as breakpoints/watchpoints). See Section 5.6 for details

5.5.2 Functional Description

The debugging mechanism adheres to the specification RISC-V External Debug Support Version 0.13. For a detailed description of the debugging features, refer to the specification.

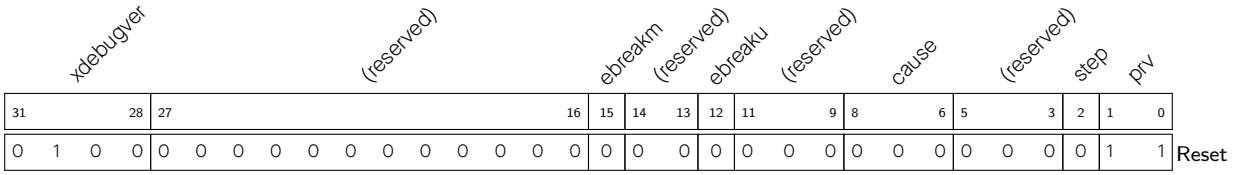
According to the specification, a hart has the following states: nonexistent, unavail, running, and halted. By default, the LP CPU is in the unavail state. To connect the LP CPU for debugging, users need to clear that state by configuring the LPPERI_CPU_REG register.

5.5.3 Register Summary

The following table lists the debug CSRs supported for the LP CPU.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
dcsr	Debug Control and Status	0x7B0	R/W
dpc	Debug PC	0x7B1	R/W
dscratch0	Debug Scratch Register 0	0x7B2	R/W
dscratch1	Debug Scratch Register 1	0x7B3	R/W



All debug module registers are implemented in accordance with the specification RISC-V External Debug Support Version 0.13. For more information, refer to the specification.

5.5.4 Registers

The following is a detailed description of the debug CSR supported by the LP CPU.

For how to program reserved fields, please refer to Section *Programming Reserved Register Field*.

Register 5.18. dcsr (0x7B0)

xdebugver Represents the debug version.

4: External debug support exists

(RO)

ebreakm Configures execution of the EBREAK instruction in machine mode.

0: Trigger an exception with mcause = 3

1: Enter debug mode

(R/W)

ebreaku Configures execution of the EBREAK instruction in user mode.

0: Trigger an exception with mcause = 3 as described in privileged mode

1: Enter debug mode

(R/W)

cause Represents the reason why debug mode was entered. When there are multiple reasons to enter debug mode in a single cycle, the cause with the highest priority number is the one written.

1: An EBREAK instruction was executed. (priority 3)

2: The Trigger Module caused a halt. (priority 4)

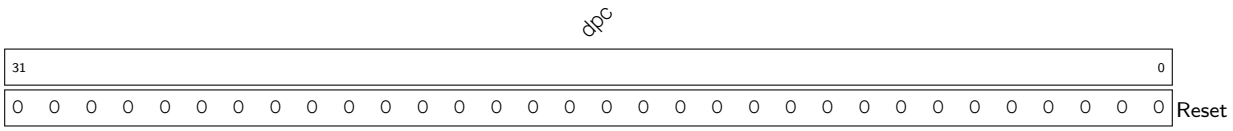
3: haltreq was set. (priority 2)

4: The CPU core single stepped because step was set. (priority 1)

Other values: reserved for future use

(RO)

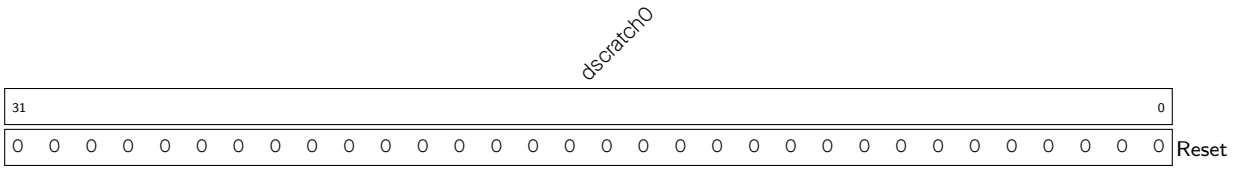
step When set and not in Debug Mode, the core will only execute a single instruction and then enter Debug Mode.



If the instruction does not complete due to an exception, the core will immediately enter Debug Mode before executing the trap handler, with appropriate exception registers set.

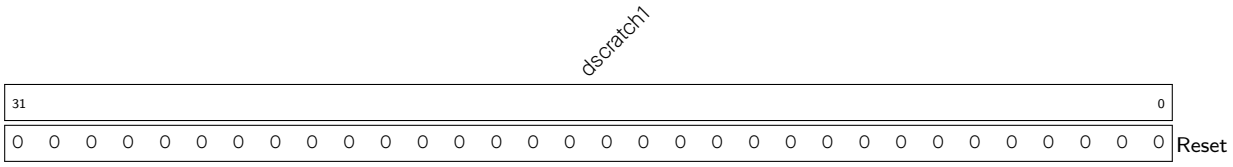
Setting this bit does not mask interrupts. This is a deviation from the RISC-V External Debug Support Specification Version 0.13.

(R/W)



prv Contains the privilege level the core is operating in when debug mode is entered. A debugger can change this value to change the core's privilege level when exiting debug mode. Only **0x3** (machine mode) and **0x0** (user mode) are supported. (RO)

Register 5.19. dpc (0x7B1)



dpc Upon entry to debug mode, dpc is written with the address of the next instruction that will be executed. When resuming, the CPU core's PC is updated to the address stored in dpc. In debug mode, dpc can be modified. This field can be accessed in debug mode. (R/W)

Register 5.20. dscratch0 (0x7B2)

dscratch0 Used by the debug module internally. (R/W)

Register 5.21. dscratch1 (0x7B3)

dscratch1 Used by the debug module internally. (R/W)

5.6 Hardware Trigger

5.6.1 Features

Hardware Trigger module provides breakpoint and watchpoint capability for debugging. It has the following features:

- Two independent trigger units
- Configurable unit to match the address of the program counter
- Able to halt execution and transfer control to the debugger

5.6.2 Functional Description

The hardware trigger module provides three CSRs. See Section 5.6 for details. Among them, tdata1 and tdata2 are abstract CSRs, which means they are shadow registers for accessing internal registers in the trigger units, one at a time.

To select a specific trigger unit, the corresponding number (0-1) needs to be written to the tselect CSR. When a valid value is written, the abstract CSRs, tdata1 and tdata2, automatically match the internal registers of the trigger unit. Each trigger unit has two internal registers, namely mcontrol and maddress, which are mapped to tdata1 and tdata2, respectively.

Writing a value more than 1 to tselect will set tselect to 1.

Since software or debugger may need to know the type of the selected trigger to correctly interpret tdata1 and tdata2, the 4-bit field (31-28) of tdata1 encodes the type of the selected trigger. This type field is read-only and always provides a value of 0x2 for every trigger, which stands for support for address and data matching. Hence, it is inferred that tdata1 and tdata2 are to be interpreted as fields of mcontrol and maddress, respectively. The specification RISC-V External Debug Support Version 0.13 provides information on other possible values, but the trigger module only supports the 0x2 type.

Once a trigger unit has been chosen by writing its index to tselect, it will become possible to configure it by setting the appropriate bits in mcontrol CSR (tdata1) and writing the target address to maddress CSR (tdata2).

5.6.3 Trigger Execution Flow

When a hart is halted and enters debug mode due to the firing of a trigger (action = 1):

- dpc is set to the current PC in the decoding phase
- The cause field in dcsr is set to 2, which means halt due to trigger

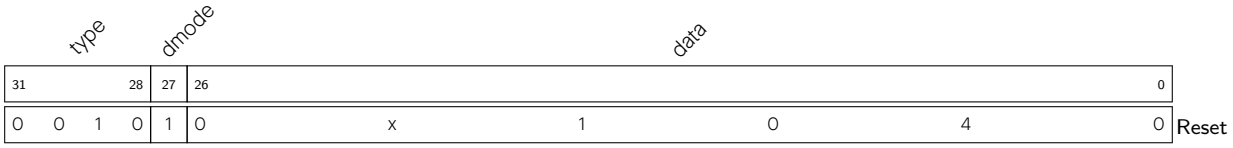
5.6.4 Register Summary

Below is a list of Trigger Module CSRs supported by the CPU. These are only accessible from machine mode.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
tselect	Trigger Select Register	0x7A0	R/W
tdata1	Trigger Abstract Data 1	0x7A1	R/W
mcontrol	tdata1 Shadow Register	0x7A1	R/W
tdata2	Trigger Abstract Data 2	0x7A2	R/W
maddress	tdata2 Shadow Register	0x7A2	R/W

5.6.5 Registers



For how to program reserved fields, please refer to Section *Programming Reserved Register Field*.

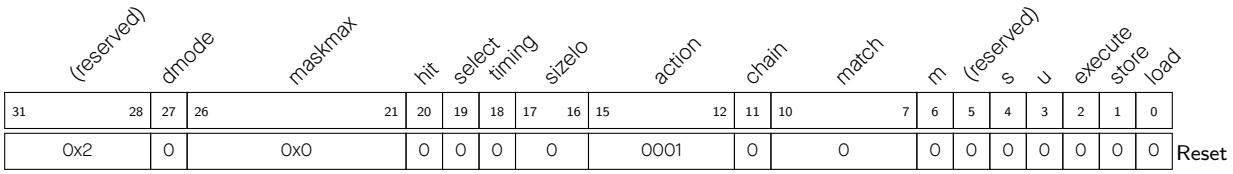
Register 5.22. tselect (0x7A0)

tselect Configures the index of the selected trigger unit. (R/W)

Register 5.23. tdata1 (0x7A1)

type Represents the trigger type. This field is reserved since only match type (0x2) triggers are supported. (RO)

dmode This is set to 1 if a trigger is being used by the debugger. This field is reserved since it is only supported in debug mode. (RO)



data Configures the abstract tdata1 content. This will always be interpreted as fields of mcontrol since only match type (0x2) triggers are supported. (R/W)

Register 5.24. tdata2 (0x7A2)

tdata2 Configures the abstract tdata2 content. This will always be interpreted as maddress since only match type (0x2) triggers are supported. (R/W)

Register 5.25. mcontrol (0x7A1)

dmode Same as dmode in tdata1. (RO)

maskmax Represents the maximum NAPOT range.

0: A byte. Only exact match is supported.

Other values: Not supported.

(RO)

hit Not implemented in hardware. This field remains 0. (RO)

select Configures to select between an address match or a data match.

0: Perform a match on the virtual address

1: Perform a match on the data value loaded or stored, or the instruction executed

Note: Only address match is implemented. This field remains 0.

(RO)

timing Configures when the trigger will take action.

0: Take action before the instruction is executed

1: Take action after the instruction is executed

Note: The field remains 0.

(RO)

sizelo Only match of any size is supported. This field remains 0. (RO)

action Configure action of the selected trigger after it is triggered.

0x0: Cause a breakpoint exception

0x1: Enter debug mode (Valid only when dmode = 1)

Note: Only entering debug mode is supported. This field remains 1.

(RO)

CHAIN Not implemented in hardware. This field remains 0. (RO)

match Configures the trigger to perform the matching operation of the lower data/instruction address.

0x0: Exact match. Namely, the address corresponding to a certain byte during the access must exactly match the value of maddress.

0x1: NAPOT match. Namely, at least one byte during the access is in the NAPOT region specified in maddress.

Note: Only exact byte match is supported. This field remains 0.

(R/W)

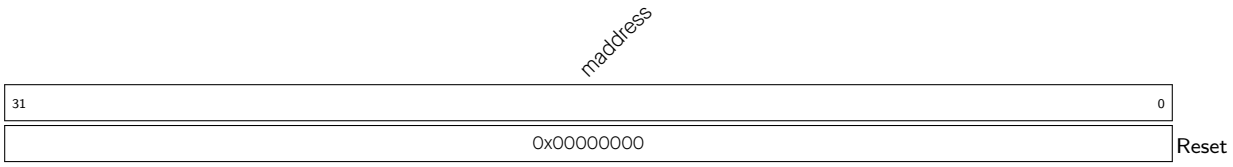
m Set this field to make the selected trigger operate in machine mode. (RO)

s Set this field to make the selected trigger operate in supervisor mode. Operation in supervisor mode is not supported. This field is always 0. (RO)

Continued on the next page...

Register 5.25. mcontrol (0x7A1)

Continued from the previous page...



u Set this field to make the selected trigger operate in user mode. Operation in user mode is not supported. This field is always 0. (RO)

execute Configures whether to enable the selected trigger to match the virtual address of instructions.
0: Not enable
1: Enable
(R/W)

store Set this field to make the selected trigger match the virtual address of the memory write operation. Not supported by hardware. This field is always 0. (RO)

load Set this field to make the selected trigger match the virtual address of a memory read operation. Not supported by hardware. This field is always 0. (RO)

Register 5.26. maddress (0x7A2)

maddress Configures the address used by the selected trigger when performing match operation. (R/W)

5.7 Performance Counter

The LP CPU implements one clock cycle counter mcycle(h), one instruction counter minstret(h), and ten event counters mhpmcounter*n*(*n*:3-12). The clock cycle counter and instruction counter are always available and each is 64-bit wide. The performance counters are 40-bit wide each.

By default, all counters are enabled after reset. A counter can be enabled or disabled individually via the corresponding bit in the mcountinhibit CSR.

As shown in Table 5.7-1, each counter is dedicated to counting a particular event.

Table 5.7-1. Performance Counter

Counter	Counted Event
mcycle	Clock cycles
minstret	The number of instructions
mhpmcounter3	Wait cycles for memory access

Counter	Counted Event
mhpmcounter4	Wait cycles for fetching instructions
mhpmcounter5	The number of memory read operations. An unaligned read is counted as two.
mhpmcounter6	The number of memory write operations. An unaligned write is counted as two.
mhpmcounter7	The number of unconditional jump instructions (jal, jr, jalr)
mhpmcounter8	The number of branch instructions
mhpmcounter9	The number of taken branch instructions
mhpmcounter10	The number of compressed instructions
mhpmcounter11	Wait cycles for multiplication instructions
mhpmcounter12	Wait cycles for division instructions

5.8 System Access

The LP CPU has access to both memory and peripherals. When accessing an illegal address, i.e., outside the memory's or peripherals' address space, it will trigger the corresponding access error exception based on the type of access.

5.8.1 Memory Access

The ESP32-P4 LP CPU can access LP ROM, LP SRAM, and L2 SRAM. For more information, please refer to Section 9 *System and Memory*.

- LP ROM: 16 KB region starting from 0x5010_0000 to 0x5010_3FFF. It is used for instruction fetch, data read, etc.
- LP SRAM: 32 KB region starting from 0x5010_8000 ~ 0x5010_FFFF. It is used for instruction fetch, data read, data write, etc.
- L2 SRAM: 768 KB region starting from 0x4FF0_0000 to 0x4FFB_FFFF. It is used for instruction fetch, data read, data write, etc.

Note:
The LP CPU experiences significant latency when accessing L2 SRAM, with each access taking approximately 20 LP CPU clock cycles. However, it can access LP ROM and LP SRAM with no latency.

The LP CPU supports the atomic instruction set. Both the LP CPU and the HP CPU can access memory through atomic instructions, thus achieving atomicity of memory access. For details on the atomic instruction set, please refer to RISC-V Instruction Set Manual Volume I: Unprivileged ISA, Version 2.2.

Note that only L2 SRAM region supports atomic access from HP CPU and LP CPU.

5.8.2 Peripheral Access

Table 9.3-2 in Chapter 9 *System and Memory* lists the peripherals accessible by the LP CPU and their base addresses.

5.9 Event Task Matrix Feature

The LP CPU on ESP32-P4 supports the Event Task Matrix (ETM) function, which allows LP CPU's ETM tasks to be triggered by any peripherals' ETM events, or LP CPU's ETM events to trigger any peripherals' ETM tasks. This section introduces the ETM tasks and events related to the LP CPU. For more information, please refer to Chapter 14 Event Task Matrix (ETM).

LP CPU can receive the following ETM task:

- ULP_TASK_WAKEUP_CPU: Wakes up the LP CPU.
- ULP_TASK_INT_CPU: Triggers an LP CPU interrupt.

LP CPU can generate the following ETM events:

- ULP_EVT_ERR_INTR: Indicates that an LP CPU exception occurs.
- ULP_EVT_START_INTR: Indicates that the LP CPU clock is turned on.
- ULP_EVT_HALT: Indicates that the LP CPU enters the sleep state

5.10 Sleep and Wake-Up Process

5.10.1 Features

Here are the sleep and wake-up features supported by the LP CPU.

- Independent operation, sleeping, and waking-up in the low-power system when the HP CPU is sleeping
- Actively configuring registers to enter the sleep state based on software operating status
- Multiple wake-up sources
- Sleep entry rejection by peripherals

5.10.2 Process

The LP CPU is in sleep by default and its wake-up module follows the process below to wake it up for work and make it sleep.

To configure wake-up sources, please refer to Table 5.10-1.

The first startup of the LP CPU after power-up depends on the wake-up enable and wake-up source configuration by the HP CPU.

- Initialization of the LP CPU
  - Initialize the LP memory.
  - Start the LP CPU. Since the startup of the LP CPU depends on the wake-up process, it is recommended to use the PMU_HP_TRIGGER_LP register to start the initialization of the LP CPU in the following way:
    * Set PMU_LP_CPU_WAKEUP_EN to 0x400000
    * Set PMU_HP_TRIGGER_LP to 0x1

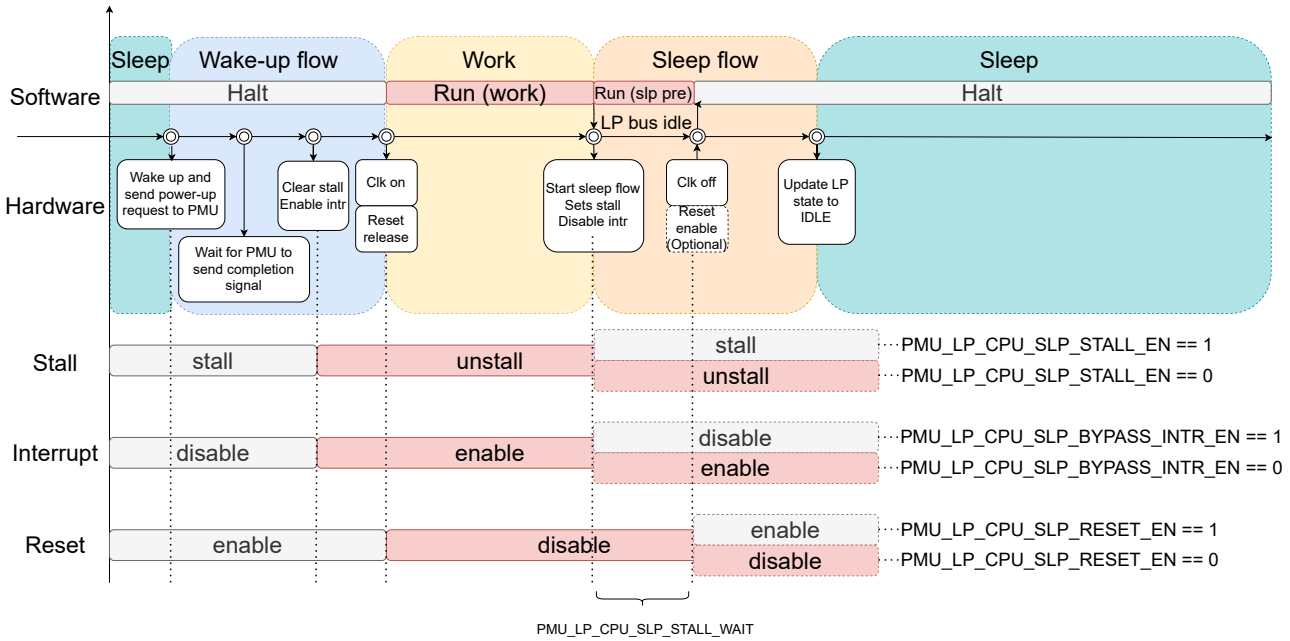


Figure 5.10-1. Wake-Up and Sleep Flow of LP CPU

* The LP CPU will go through the wake-up process to start running

- Wake-up process:
  - The wake-up module receives a wake-up signal and sends a power-up request to the PMU.
  - If the current power consumption state (clock, power supply, etc.) meets the requirements of the LP CPU, the PMU will immediately reply with the completion signal. Otherwise, it will adjust the power consumption state before replying with the completion signal.
  - The wake-up module disables the STALL state of the LP CPU and enables interrupt receiving.
  - The wake-up module starts the clock, releases reset (ignore this step if reset is not enabled for sleep), and starts working.
- Sleep process:
  - The LP CPU configures the PMU_LP_CPU_SLEEP_REQ register to enable the wake-up module to start the sleep process.
  - If PMU_LP_CPU_SLP_STALL_EN is 1, the wake-up module enables the STALL state of the LP CPU. If it is 0, the module does not enable that state. If PMU_LP_CPU_SLP_BYPASS_INTR_EN is 1, the module masks all the LP CPU's interrupts. If it is 0, the module does not mask them.
  - The wake-up module waits for PMU_LP_CPU_SLP_STALL_WAIT LP CPU clock cycles, and then turns off the LP CPU clock. If PMU_LP_CPU_SLP_RESET_EN is 1, the module enables reset of the LP CPU.
  - The wake-up module changes the state of the LP CPU to IDLE and the PMU can enter a deeper level of sleep state.

5.10.3 Wake-Up Sources

Table 5.10-1. Wake Sources

Register Value [1]	Wake-Up Source	Description
BIT(9)	LP IO	The LP CPU can be waken up by the LP IO interrupt status register signal. For more information, please refer to Chapter 10 *GPIO Matrix and IO MUX*.
BIT(10)	LP UART	The LP CPU can be waken up when the LP UART receives a certain number of RX pulses. REG_UART_WAKEUP_EN needs to be enabled. For more information, please refer to Chapter 45 *UART Controller (UART)*.
BIT(13)	RTC timer	The LP CPU can be waken up by the RTC timer target 0 timeout interrupt. For more information, please refer to Chapter 15 *Low-Power Management*.
BIT(14)	Brownout detection	The LP CPU can be waken up when a brownout occurs. For more information, please refer to Chapter 25 *Brown-out Detector*.
BIT(17)	ETM	The LP CPU can be waken up by the ETM task. For more information, please refer to Chapter 14 *Event Task Matrix (ETM)*.
BIT(18)	RTC timer	The LP CPU can be waken up by the RTC timer target 0 timeout interrupt. For more information, please refer to Chapter 15 *Low-Power Management*.
BIT(19)	LP I2S audio	The LP CPU can be waken up when the predefined audio is received via I2S. For more details, please refer to Chapter 49 *I2S Controller (I2S)*.
BIT(22)	PMU_HP_TRIGGER_LP register	The HP CPU sets the register PMU_HP_TRIGGER_LP to wake up the LP CPU, and sets REG_HP_SW_TRIGGER_INT_CLR to clear this wake-up source.

[1] Value of the PMU_LP_CPU_WAKEUP_EN register

5.10.4 Sleep Rejection

When the LP CPU is preparing to enter the sleep state, it can be rejected by peripheral events. In other words, peripheral events have the capability to prevent the LP CPU from entering sleep mode. Below is the configuration process for the rejection:

1. The LP CPU configures PMU_SLP_REJECT_EN to enable the functionality that allows peripherals to reject the LP CPU from entering the sleep mode.
2. The LP CPU configures PMU_SLEEP_REJECT_ENA to enable the corresponding peripheral event to prevent the LP CPU from entering the sleep state.

The peripheral sources that can prevent the LP CPU from sleeping are the same as the wake-up sources.

Part II

System DMA

Focused on managing and transferring data within the system, this part explores controllers for Direct Memory Access (DMA), providing guidelines for efficient data movement supporting various peripherals and devices.

Chapter 6

GDMA Controller (GDMA-AHB, GDMA-AXI)

6.1 Overview

General Direct Memory Access (GDMA) is a feature that allows peripheral-to-memory, memory-to-peripheral, and memory-to-memory data transfer at high speed. The CPU is not involved in the GDMA transfer and therefore is more efficient with less workload.

ESP32-P4 has two types of general-purpose DMA controllers, namely GDMA-AHB and GDMA-AXI, to directly access the AHB bus or the AXI bus respectively. Both GDMA-AHB and GDMA-AXI have six independent channels, i.e., three transmit channels and three receive channels.

The GDMA-AHB channels are shared and can be assigned to I3C, UHCI, I2S, ADC, or RMT to access internal and external memory.

The GDMA-AXI channels are also shared and can be assigned to LCD, CAM, two general-purpose SPIs, PARLIO, AES, or SHA to access internal and external memory.

GDMA-AHB and GDMA-AXI use configurable priority and weight arbitration schemes to manage peripherals' needs for bandwidth.

Unless otherwise specified, the term "GDMA controller" refers to both GDMA-AHB and GDMA-AXI in the following text.

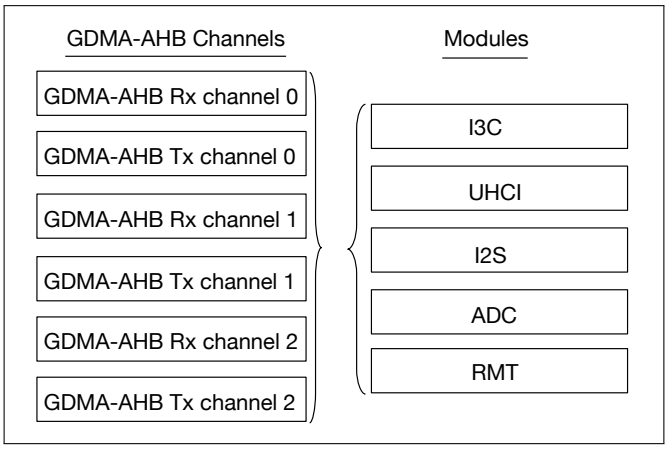

Figure 6.1-1. Modules that Share GDMA-AHB Channels

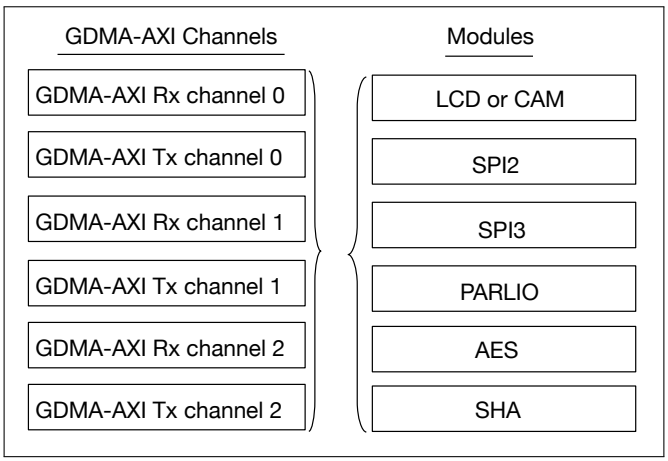

Figure 6.1-2. Modules that Share GDMA-AXI Channels

6.2 Features

GDMA-AHB and GDMA-AXI have the following features:

- Architecture:
  - GDMA-AHB: AHB bus architecture
  - GDMA-AXI: AXI bus architecture, which gives the possibility to complete up to 8 transactions out of order and up to 8 outstanding transactions
- Programmable length of data to be transferred in bytes
- Access via any address and size
- Alignment:
  - GDMA-AHB:
    * Descriptor address: 1-word aligned
    * Data address and length:
      · Internal memory and non-encrypted external memory address space: no requirements
      · Encrypted external memory address space: 16-byte aligned
  - GDMA-AXI:
    * Descriptor address: 2-word aligned
    * Data address and length:
      · Internal memory and non-encrypted external memory address space: no requirements
      · Encrypted external memory address space: 16-byte aligned
- Linked list of descriptors
- When accessing memory, GDMA-AHB supports INCR4, INCR8, or INCR16 burst transfer, and GDMA-AXI supports INCR burst transfer
- Three transmit channels and three receive channels for each controller

- Software-configurable selection of peripheral requesting its service
- Configurable channel priority and weight arbitration
- Support for memory transfer
- CRC calculation of data
- Interrupt response mechanism for GDMA-AXI linked list switching

6.3 Architecture

In ESP32-P4, all modules that need high-speed data transfer support GDMA. The GDMA controller and CPU data bus have access to the same address space in memory. Figure 6.3-1 shows the basic architecture of the GDMA controller.

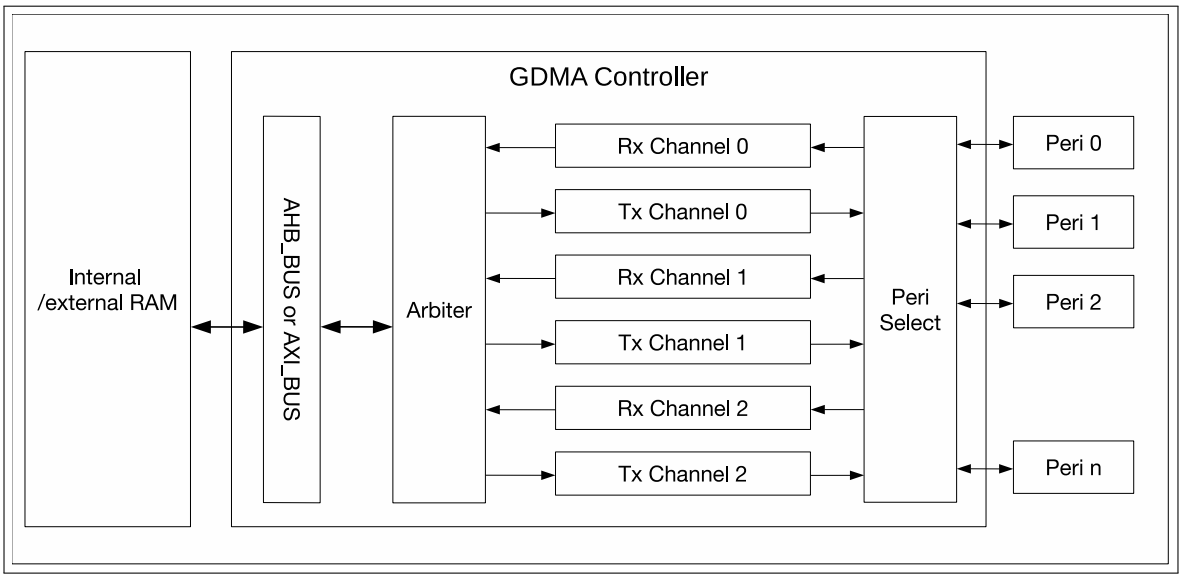

Figure 6.3-1. GDMA controller Architecture

GDMA-AHB and GDMA-AXI have six independent channels respectively, i.e., three transmit channels and three receive channels. Every channel can be connected to different peripherals. In other words, channels are general-purpose, and shared by peripherals.

GDMA-AHB and GDMA-AXI read data from or write data to internal and external memory via AHB_BUS or AXI_BUS respectively. Before this, GDMA uses configurable arbitration schemes for channels requesting read or write access. For the available address range of internal and external memory, please see Chapter 9 *System and Memory*.

Software can use the GDMA through linked lists. GDMA-AHB linked lists are stored in internal memory, while GDMA-AXI linked lists are stored in internal or external memory. These linked lists consist of outlink*n* and inlink*n*, where *n* indicates the channel number (ranging from 0 to 2). The GDMA reads an outlink*n* (i.e., a linked list of transmit descriptors) from memory and transmit data in corresponding memory according to the outlink*n*, or read an inlink*n* (i.e., a linked list of receive descriptors) and store received data into specific address space in memory according to the inlink*n*.

6.4 Functional Description

6.4.1 Linked List

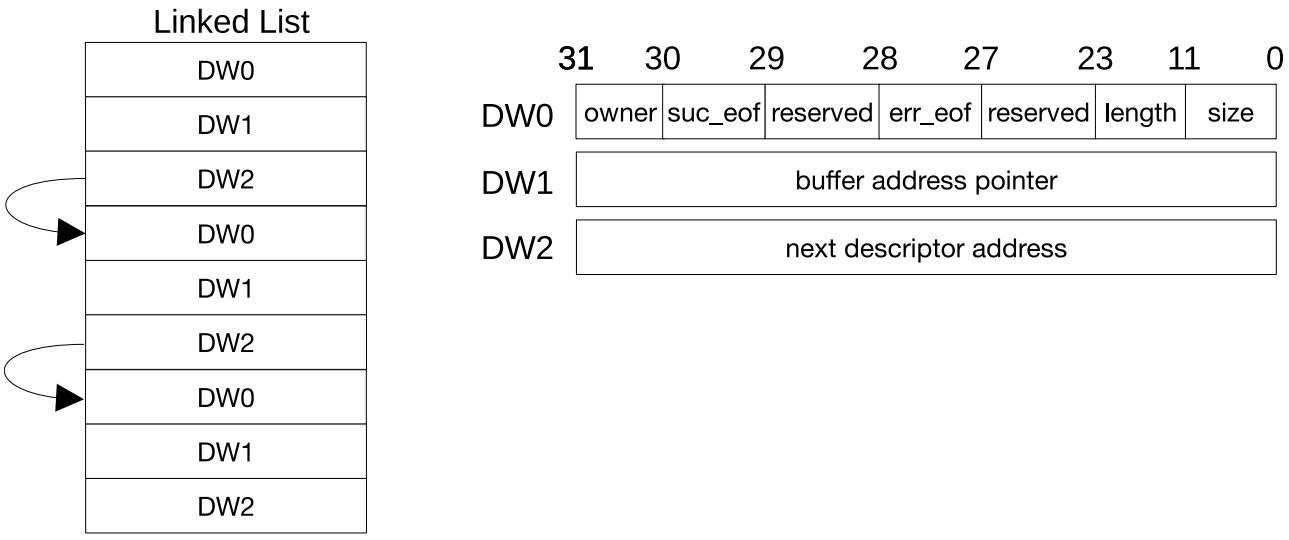

Figure 6.4-1. Structure of a Linked List

Figure 6.4-1 shows the structure of a linked list. An outlink and an inlink have the same structure. A linked list is formed by one or more descriptors, and each descriptor consists of three words. Linked lists should be stored in the memory for the GDMA to be able to use them. The meanings of a descriptor's fields are as follows:

- owner (DW0) [31]: Specifies who is allowed to access the buffer that this descriptor points to.
  0: CPU can access the buffer.
  1: The GDMA controller can access the buffer.
  When the GDMA controller stops using the buffer, this bit in a receive descriptor is automatically cleared by hardware, while this bit in a transmit descriptor can only be automatically cleared by hardware if AHB/AXI_DMA_OUT_AUTO_WRBACK_CH*n* is set to 1. Software can disable automatic clearing by hardware by setting the AHB/AXI_DMA_OUT_LOOP_TEST_CH*n* or AHB/AXI_DMA_IN_LOOP_TEST_CH*n* bit. When software loads a linked list, this bit should be set to 1.
  Note: AHB/AXI_DMA_OUT is the prefix of transmit channel registers, and AHB/AXI_DMA_IN is the prefix of receive channel registers.
- suc_eof (DW0) [30]: Specifies whether the AHB/AXI_DMA_IN_SUC_EOF_CH*n*_INT or AHB/AXI_DMA_OUT_EOF_CH*n*_INT interrupt will be triggered when the data corresponding to this descriptor has been received or transmitted.
  0: No interrupt will be triggered after the current descriptor's successful transfer;
  1: An interrupt will be triggered after the current descriptor's successful transfer.
  For receive descriptors, software needs to clear this bit to 0, and hardware will set it to 1 after receiving data containing the EOF flag.
  For transmit descriptors, software needs to set this bit to 1 as needed.
  If software configures this bit to 1 in a descriptor, the GDMA will include the EOF flag in the data sent to the corresponding peripheral, indicating to the peripheral that this data segment marks the end of one

transfer phase.

- reserved (DW0) [29]: Reserved. The value of this bit does not matter.
- err_eof (DW0) [28]: Specifies whether the received data has errors.
  0: The received data does not have errors.
  1: The received data has errors.
  This bit is used only when UHCI or PARLIO uses the GDMA to receive data. When an error is detected in the received data segment corresponding to a descriptor, this bit in the receive descriptor is set to 1 by hardware.
- reserved (DW0) [27:24]: Reserved.
- length (DW0) [23:12]: Specifies the number of valid bytes in the buffer that this descriptor points to. This field in a transmit descriptor is written by software and indicates how many bytes can be read from the buffer; this field in a receive descriptor is written by hardware automatically and indicates how many valid bytes have been stored in the buffer.
- size (DW0) [11:0]: Specifies the size of the buffer that this descriptor points to.
- buffer address pointer (DW1): Address of the buffer.
- next descriptor address (DW2): Address of the next descriptor. If the current descriptor is the last one, this value is 0. For GDMA-AHB, this field can only point to the internal memory space; for GDMA-AXI, this field can point to the internal or external memory space.

> **Note:**
> Please note that addresses of GDMA-AHB descriptors should be 4-byte aligned, and addresses of GDMA-AXI descriptors should be 8-byte aligned.

If the length of data received is smaller than the size of the buffer, the GDMA controller will not use the available space of the buffer in the next transaction.

6.4.2 Peripheral-to-Memory and Memory-to-Peripheral Data Transfer

The GDMA controller can transfer data from memory to peripheral (transmit) and from peripheral to memory (receive). A transmit channel transfers data in the specified memory location to a peripheral's transmitter via an outlink*n*, whereas a receive channel transfers data received by a peripheral to the specified memory location via an inlink*n*.

Every transmit and receive channel can be connected to any peripheral with the GDMA feature. Table 6.4-1 and Table 6.4-2 illustrate how to select the peripheral to be connected via registers. "Dummy-*n*" corresponds to register values for memory-to-memory data transfer. When a channel is connected to a peripheral, the rest of the channels cannot be connected to that peripheral.

Table 6.4-1. GDMA-AHB Selecting Peripherals via Register Configuration

AHB_DMA_PERI_IN_SEL_CH*n* AHB_DMA_PERI_OUT_SEL_CH*n*	Peripheral
0	I3C
1	Dummy-1

2	UHCI
3	I2S0
4	I2S1
5	I2S2
6 ~ 7	Dummy-6 ~ 7
8	ADC
9	Dummy-9
10	RMT
11 ~ 15	Dummy-11 ~ 15
16 ~ 63	Invalid

Table 6.4-2. GDMA-AXI Selecting Peripherals via Register Configuration

AXI_DMA_PERI_IN_SEL_CH*n* AXI_DMA_PERI_OUT_SEL_CH*n*	Peripheral
0	LCD or CAM
1	SPI2
2	SPI3
3	PARLIO
4	AES
5	SHA
6 ~ 15	Dummy-6 ~ 15
16 ~ 63	Invalid

6.4.3 Memory-to-Memory Data Transfer

The GDMA controller also allows memory-to-memory data transfer. Such data transfer can be enabled by setting AHB/AXI_DMA_MEM_TRANS_EN_CH*n*, which connects the output of transmit channel *n* to the input of receive channel *n*. Note that a transmit channel is only connected to the receive channel with the same number (*n*), and AHB/AXI_DMA_PERI_IN_SEL_CH*n* and AHB/AXI_DMA_PERI_OUT_SEL_CH*n* should be configured to the same value corresponding to "Dummy".

GDMA-AHB only supports memory-to-memory data transfer on channels 1 and 2. The AHB_DMA_PERI_IN_SEL_CH*n* and AHB_DMA_PERI_OUT_SEL_CH*n* (*n* = 1 ~2) fields need to be configured to the same value corresponding to "Dummy", but the ID captured by AHB_DMA_AHBINF_RESP_ERR_ID is a fixed value. When using GDMA-AHB channel 1, the ID is 11; when using GDMA-AHB channel 2, the ID is 12.

6.4.4 Enabling GDMA

The software uses the GDMA controller through linked lists. When the GDMA controller receives data, software loads an inlink, configures the AHB/AXI_DMA_INLINK_ADDR_CH*n* field with the address of the first receive descriptor, and sets the AHB/AXI_DMA_INLINK_START_CH*n* bit to enable GDMA. When the GDMA controller transmits data, software loads an outlink, prepares data to be transmitted, configures the AHB/AXI_DMA_OUTLINK_ADDR_CH*n* field with address of the first transmit descriptor, and sets the AHB/AXI_DMA_OUTLINK_START_CH*n* bit to enable GDMA. The AHB/AXI_DMA_INLINK_START_CH*n* bit and AHB/AXI_DMA_OUTLINK_START_CH*n* bit are cleared automatically by hardware.

In some cases, you may want to append more descriptors to a DMA transfer that is already started. Naively, it would seem to be possible to do this by clearing the EOF bit of the final descriptor in the existing list and setting its next descriptor address pointer field (DW2) to the first descriptor of the to-be-added list. However, this strategy fails if the existing DMA transfer is almost or entirely finished. Instead, the GDMA controller has specialized logic to make sure a DMA transfer can be continued or restarted: if the transfer is ongoing, the controller will make sure to take the appended descriptors into account; if the transfer has already finished, the controller will restart with the new descriptors. This is implemented by the Restart function.

When using the Restart function, software needs to rewrite the address of the first descriptor in the new list to DW2 of the last descriptor in the loaded list, and set AHB/AXI_DMA_INLINK_RESTART_CH*n* bit or AHB/AXI_DMA_OUTLINK_RESTART_CH*n* bit (these two bits are cleared automatically by hardware). As shown in Figure 6.4-2, by doing so hardware can obtain the address of the first descriptor in the new list when reading the last descriptor in the loaded list, and then read the new list.

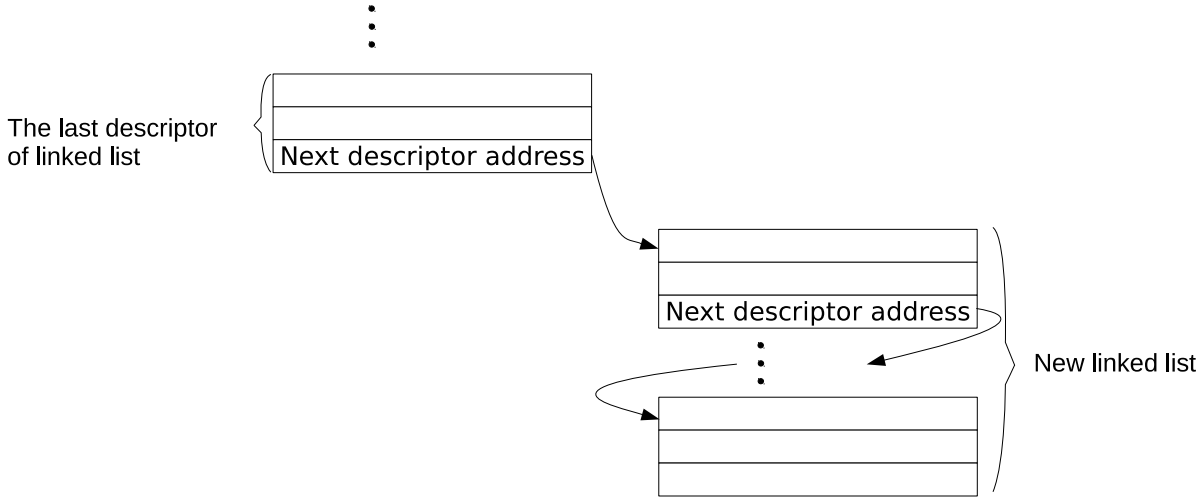

Figure 6.4-2. Relationship among Linked Lists

6.4.5 Linked List Reading Process

Once configured and enabled by software, the GDMA controller starts to read the linked list from memory. The GDMA performs checks on descriptors in the linked list. Only if descriptors pass the checks, the corresponding GDMA channel will start data transfer. If the descriptors fail any of the checks, hardware will trigger descriptor error interrupt (either AHB/AXI_DMA_IN_DSCR_ERR_CH*n*_INT or AHB/AXI_DMA_OUT_DSCR_ERR_CH*n*_INT), and the channel will halt.

The checks performed on descriptors are:

- Owner bit check when AHB/AXI_DMA_IN_CHECK_OWNER_CH*n* or AHB/AXI_DMA_OUT_CHECK_OWNER_CH*n* is set to 1. If the owner bit is 0, the buffer is accessed by the CPU. In this case, the owner bit fails the check. The owner bit will not be checked if AHB/AXI_DMA_IN_CHECK_OWNER_CH*n* or AHB/AXI_DMA_OUT_CHECK_OWNER_CH*n* is 0.
- Descriptor address check, which checks if the descriptor address is located in configured memory space. If a GDMA-AHB descriptor points to AHB_DMA_ACCESS_INTR_MEM_START_ADDR ~ AHB_DMA_ACCESS_INTR_MEM_END_ADDR, it passes the check. If a GDMA-AXI descriptor points to AXI_DMA_ACCESS_INTR_MEM_START_ADDR ~ AXI_DMA_ACCESS_INTR_MEM_END_ADDR, or AXI_DMA_ACCESS_EXTR_MEM_START_ADDR ~ AXI_DMA_ACCESS_EXTR_MEM_END_ADDR, it passes

the check. For details, please refer to Section 6.4.8.

After the software detects a descriptor error interrupt, it must reset the corresponding channel, and enable GDMA by setting AHB/AXI_DMA_OUTLINK_START_CH*n* or AHB/AXI_DMA_INLINK_START_CH*n* bit.

6.4.6 Interrupt Response Mechanism for GDMA-AXI Linked List Switching

GDMA-AXI supports generating an interrupt when a linked list switching is completed. Software can set the AXI_DMA_LINK_SWITCH_STATE_CH*n* bit to 1 to enable the linked list switching. Once the linked list switching is completed, if the AXI_DMA_OUT_LINK_SWITCH_CH*n*_INT interrupt is enabled, GDMA-AXI will generate this interrupt, and clear the AXI_DMA_LINK_SWITCH_STATE_CH*n* bit, indicating that the linked list has been switched.

This feature serves only as a status indication and does not affect normal GDMA-AXI data transfers.

6.4.7 EOF

Note: In this chapter, EOF of transmit descriptors refers to suc_eof (i.e., bit 30 of DW0), while EOF of receive descriptors refers to both suc_eof and err_eof (i.e., bit 28 of DW0).

The GDMA controller uses EOF (end of frame) flags to indicate the end of data segment transfer corresponding to a specific descriptor.

For data transmission, the GDMA generates two types of EOF interrupts:

- AHB/AXI_DMA_OUT_EOF_CH*n*_INT, generated when the suc_eof bit of any descriptor in the linked list is set, and the data corresponding to this descriptor has been transmitted. This interrupt is enabled by setting the AHB/AXI_DMA_OUT_EOF_CH*n*_INT_ENA bit.
- AHB/AXI_DMA_OUT_TOTAL_EOF_CH*n*_INT, generated when the suc_eof bit of the last descriptor in the linked list is set, and the data corresponding to the last descriptor has been transmitted. This interrupt is enabled by setting the AHB/AXI_DMA_OUT_TOTAL_EOF_CH*n*_INT_ENA bit.

For data reception, the GDMA also generates two types of EOF interrupts:

- AHB/AXI_DMA_IN_SUC_EOF_CH*n*_INT, generated when a data segment with an EOF flag has been received. This interrupt is enabled by setting the AHB/AXI_DMA_IN_SUC_EOF_CH*n*_INT_ENA bit.
- (UHCI and PARLIO only) AHB/AXI_DMA_IN_ERR_EOF_CH*n*_INT, generated when a data segment corresponding to a descriptor has been received with errors. This interrupt is enabled by setting the AHB/AXI_DMA_IN_ERR_EOF_CH*n*_INT_ENA bit, and is valid only when the channel is connected to UHCI or PARLIO.

When detecting an AHB/AXI_DMA_OUT_TOTAL_EOF_CH*n*_INT or AHB/AXI_DMA_IN_SUC_EOF_CH*n*_INT interrupt, software can read the value of the AHB/AXI_DMA_OUT_EOF_DES_ADDR_CH*n* or AHB/AXI_DMA_IN_SUC_EOF_DES_ADDR_CH*n* field, which stores the address of the finished descriptor. Therefore, the software can tell which descriptors have been used and reclaim them as needed. For RX, the address of the descriptor can also be stored to the AHB/AXI_DMA_IN_ERR_EOF_DES_ADDR_CH*n* field when an AHB/AXI_DMA_IN_ERR_EOF_CH*n*_INT interrupt is triggered.

6.4.8 Accessing Memory

The transmit and receive channels of GDMA-AHB can access the internal and external memory space configured by AHB_DMA_ACCESS_INTR_MEM_START_ADDR and AHB_DMA_ACCESS_INTR_MEM_END_ADDR.

The transmit and receive channels of GDMA-AXI can access:

- Internal memory space configured by AXI_DMA_ACCESS_INTR_MEM_START_ADDR and AXI_DMA_ACCESS_INTR_MEM_END_ADDR.
- External memory space configured by AXI_DMA_ACCESS_EXTR_MEM_START_ADDR and AXI_DMA_ACCESS_EXTR_MEM_END_ADDR.

To improve data transfer efficiency, GDMA can send data in burst mode. For GDMA-AHB, this mode is disabled by default, and can be enabled for receive channels by setting AHB_DMA_IN_DATA_BURST_EN_CH*n*, and enabled for transmit channels by setting AHB_DMA_OUT_DATA_BURST_EN_CH*n*. For GDMA-AXI, this mode is enabled by default, and cannot be disabled. Users can configure the number of data bytes in a single AXI burst (burst length) to 8, 16, 32, 64, or 128 bytes via AXI_DMA_IN_BURST_SIZE_SEL_CH*n* and AXI_DMA_OUT_BURST_SIZE_SEL_CH*n*.

When GDMA-AHB and GDMA-AXI access the configured internal memory and non-encrypted external memory space, there are no requirements for descriptor field alignment; when they access the encrypted external memory space (see Chapter 34 *External Memory Encryption and Decryption (XTS_AES)*), buffer address pointer and data should be 16-byte aligned, and other fields are not required to be aligned.

6.4.9 Arbitration

To ensure timely response to peripherals running at a high speed with low latency (such as SPI), the GDMA controller implements two arbitration schemes, based on channel priority and channel weight respectively.

- Priority arbitration: Each channel can be assigned a priority from 0 ~ 5 (in total 6 levels). The larger the number, the higher the priority. When several channels perform data transfers at the same time, the GDMA would respond to the transfer requests according to priority levels, and the channel with higher priority would get a response more timely.
- Weight arbitration:
  - Each channel is assigned a weight (i.e., the number of tokens) from 0 ~ 15. The GDMA divides the AHB or AXI bus clock period into multiple time slots, and in each time slot, the number of transfers performed by a channel is determined by the number of its tokens. Every time a channel performs a data transfer, one of its tokens is spent. If all of its tokens have been spent in a time slot, then this channel's transfer request will no longer be responded to until the time slot expires, or until tokens of all channels have been spent and the new time slot starts.
  - If the number of tokens assigned to a channel is not zero, the GDMA waits for this channel's tokens to be spent even if it does not have data transfer requests, and will not exit from this time slot ahead of expiration. This leads to a waste of bandwidth. Therefore, the GDMA provides weight arbitration optimization. When this feature is enabled, a channel without data transfer requests will not be involved in the arbitration and its tokens will be ignored. When all channels no longer have transfer

requests, the GDMA arbiter exits from the current time slot before expiration. This way, the arbitration response is accelerated and the transfer efficiency is improved.

Note:

- If channels have the same weight but different priorities, on condition that the number of bytes to be transferred is the same and not large, channels with higher priorities would finish data transfers first.
- If channels have different priorities and weights, on condition that the number of bytes to be transferred is the same, channels with higher weights would be allocated more bandwidth and finish data transfers first.

6.4.10 Bus Error Response Information Logging

During GDMA-AHB data transfers, if a slave device on the bus returns an error response, the data transfer will not be interrupted; GDMA-AHB will continue to transfer data according to the existing linked list. As a result, the actual data received after the transfer may not match the expected data. To facilitate troubleshooting, if an error response is received during GDMA-AHB data transfer, the following internal registers can be used to store relevant transfer information:

- AHB_DMA_AHBINF_RESP_ERR_ADDR: Records the 32-bit address corresponding to the current bus transfer.
- AHB_DMA_AHBINF_RESP_ERR_CH_ID: Records the GDMA-AHB channel used for the current bus transfer.
- AHB_DMA_AHBINF_RESP_ERR_ID: Records the transfer ID corresponding to the current peripheral-to-memory, memory-to-peripheral, or memory-to-memory transfer on the bus.
- AHB_DMA_AHBINF_RESP_ERR_WR: Records the type of transfer for the current bus transfer.

When GDMA-AHB initiates an AHB bus transfer as the master and receives an error response, it will also generate an error response interrupt to notify the CPU. After the interrupt is generated, GDMA-AHB will not interrupt the data transfer. In addition, GDMA-AHB does not latch data into registers for the first AHB bus transfer that triggers an error response. If GDMA-AHB receives multiple consecutive error responses, the error response logging registers always reflect the most recent error; only the last error response prior to reading the registers is retained.

6.4.11 Automatic Clock Gating

When GDMA-AHB is operating, not all channels are needed in certain scenarios; in this case, the clocks for unused channels can be disabled to reduce power consumption. Similarly, the internal arbitration and bus interface modules only need to operate during data transfer, and their clocks can also be disabled during idle periods to save power. Currently, GDMA-AHB has the following internal modules:

- Bus interface processing module
- Arbitration module
- RX data processing module
- RX descriptor processing module
- TX data processing module

- TX descriptor processing module
- Register configuration synchronization module

Clocks of above modules are automatically disabled when idle to further minimize power consumption. These clocks can also be forced to enable by setting corresponding register bits. For example, setting AHB_DMA_AHBINF_CLK_EN will keep the bus interface processing module clock always on; the configurations for keeping other module clocks always on are similar.

6.4.12 CRC Calculation

The GDMA has a CRC calculation module for both TX and RX. This module supports arbitrary polynomials and 8-bit parallel computation, namely 8 bits at a time. The CRC result is up to 32-bit wide for GDMA-AHB, and up to 16-bit for GDMA-AXI. It is calculated for each linked list descriptor by descriptor and becomes invalid when the Restart function is triggered during transfer.

For easier understanding of register configuration rules, assume:

- The 8-bit data to calculate each time is data[7:0].
- The required CRC result is 5-bit wide, and the polynomial used is $crc[4:0] = x \oplus 5 + x \oplus 2 + 1$;
- The initial CRC value is 0x1F, and the intermediate result calculated in each clock cycle is crc_tmp[4:0].

Taking as an example the GDMA reading data from memory and transmitting the data to peripherals, the following fields are provided by hardware for CRC computation:

- AHB/AXI_DMA_OUT_CRC_INIT_DATA_CH*n*: Configures the initial CRC value, i.e., 0x1F in the above example. AHB_DMA_OUT_CRC_INIT_DATA_CH*n* can be configured with a 32-bit value at the maximum, while AXI_DMA_OUT_CRC_INIT_DATA_CH*n* can be configured with a 16-bit value at the maximum, meaning that the CRC result could be 32 bits or 16 bits at most.
- AHB/AXI_DMA_OUT_CRC_FINAL_RESULT_CH*n*: Stores the computation result of all data in a DMA transfer (until data pointed by the last descriptor in the linked list has been transferred). The computation result could be 32 bits at most.
- AHB/AXI_DMA_TX_CRC_WIDTH_CH*n*: Configures the CRC result length.
- AHB/AXI_DMA_TX_CRC_LAUTCH_FLGA_CH*n*, which latches the CRC result.
- AHB/AXI_DMA_TX_CRC_EN_WR_DATA_CH*n*: Indicates which bits in crc_tmp[4:0] are used to compute crc[x] (x is configured via AHB/AXI_DMA_TX_CRC_EN_ADDR_CH*n*). If AHB/AXI_DMA_TX_CRC_EN_WR_DATA_CH*n* is configured as 0xF, it means that only crc_tmp[3], crc_tmp[2], crc_tmp[1], and crc_tmp[0] are used for computation, and other bits are not used (in this case crc_tmp[4]).
- AHB/AXI_DMA_TX_CRC_DATA_EN_WR_DATA_CH*n*: Indicates which bits in data[7:0] are used to compute crc[x] (x is configured via AHB/AXI_DMA_TX_CRC_DATA_EN_ADDR_CH*n*). GDMA calculates the CRC in the unit of byte, so only the lower 8 bits of this field needs to be configured. If AHB/AXI_DMA_TX_CRC_DATA_EN_WR_DATA_CH*n* is configured as 0xF, it means that only data[3], data[2], data[1], and data[0] are used for computation.

CRC calculation is achieved in the GDMA by configuring a parallel calculation matrix derived from the polynomial. If the expected CRC result is n bits, then the matrix has n rows and $n + 8$ columns.

Based on the assumptions at the beginning of this section, the calculation matrix would be 5 rows and 13 columns, and the actual hardware CRC calculation formulas would be as follows ($\oplus$represents the XOR operation):

$$crc[0] = crc_tmp[0] \oplus crc_tmp[2] \oplus crc_tmp[3] \oplus data[0] \oplus data[3] \oplus data[5] \oplus data[6]$$
$$crc[1] = crc_tmp[1] \oplus crc_tmp[3] \oplus crc_tmp[4] \oplus data[1] \oplus data[4] \oplus data[6] \oplus data[7]$$
$$crc[2] = crc_tmp[0] \oplus crc_tmp[3] \oplus crc_tmp[4] \oplus data[0] \oplus data[2] \oplus data[3] \oplus data[6] \oplus data[7]$$
$$crc[3] = crc_tmp[0] \oplus crc_tmp[1] \oplus crc_tmp[4] \oplus data[1] \oplus data[4] \oplus data[3] \oplus data[7]$$
$$crc[4] = crc_tmp[1] \oplus crc_tmp[2] \oplus data[2] \oplus data[4] \oplus data[5]$$

The above calculation formula can be abstracted as a switch matrix shown in Figure 6.4-3:

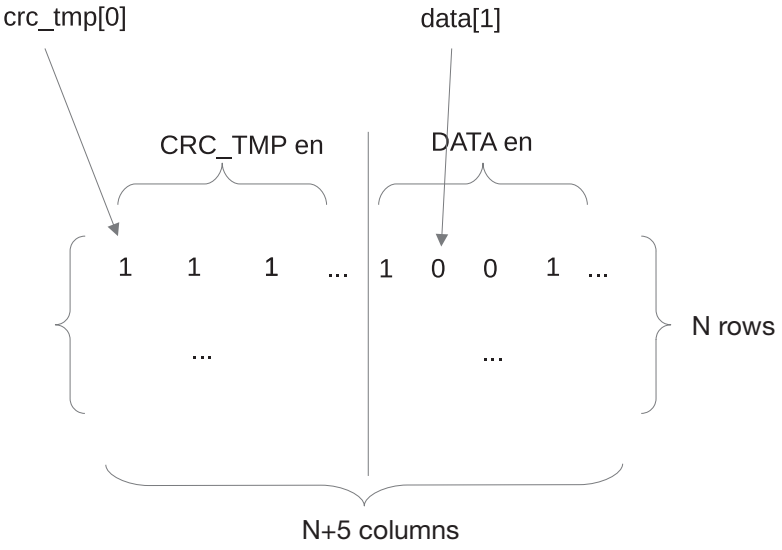

Figure 6.4-3. CRC Calculation Matrix

Note:
The CRC calculation described above is a Linear Feedback Shift Register (LFSR) implementation of the bytewise CRC algorithm. The formulas can be generated with some online tools according to the polynomial and the data width for parallel computation (always 8 bits for ESP32-P4).

6.5 Event Task Matrix Feature

The GDMA controller on ESP32-P4 supports the Event Task Matrix (ETM) function, which allows GDMA's ETM tasks to be triggered by any peripherals' ETM events, or GDMA's ETM events to trigger any peripherals' ETM tasks. This section introduces the ETM tasks and events related to GDMA. For more information, please refer to Chapter 14 Event Task Matrix (ETM).

GDMA can receive the following ETM tasks:

- GDMA_AHB/AXI_TASK_IN_START_CH*n*: Enables the corresponding RX channel *n* for data transfer.
- GDMA_AHB/AXI_TASK_OUT_START_CH*n*: Enables the corresponding TX channel *n* for data transfer.

Note:
Above ETM tasks can achieve the same functions as CPU configuring AHB/AXI_DMA_INLINK_START_CH*n* and AHB/AXI_DMA_OUTLINK_START_CH*n*. When AHB/AXI_DMA_IN_ETM_EN_CH*n* or AHB/AXI_DMA_OUT_ETM_EN_CH*n* is 1, only ETM tasks can be used to configure the transfer direction and enable the corresponding GDMA channel. When AHB/AXI_DMA_IN_ETM_EN_CH*n* or AHB_DMA_OUT_ETM_EN_CH*n* is 0, only CPU can be used to enable the corresponding GDMA channel.

GDMA can generate the following ETM events:

- GDMA_AHB/AXI_EVT_IN_DONE_CH*n*: Indicates that the data has been received according to the receive descriptor via channel *n*.
- GDMA_AHB/AXI_EVT_IN_SUC_EOF_CH*n*: Indicates that the data corresponding to a receive descriptor has been received via channel *n* and the EOF bit of this descriptor is 1.
- GDMA_AHB/AXI_EVT_IN_FIFO_EMPTY_CH*n*: Indicates that the RX FIFO has become empty.
- GDMA_AHB/AXI_EVT_IN_FIFO_FULL_CH*n*: Indicates that the RX FIFO has become full.
- GDMA_AHB/AXI_EVT_OUT_DONE_CH*n*: Indicates that the data has been transmitted according to the transmit descriptor via channel *n*.
- GDMA_AHB/AXI_EVT_OUT_SUC_EOF_CH*n*: Indicates that the data corresponding to a transmit descriptor has been transmitted or received via channel *n* and the EOF bit of this descriptor is 1.
- GDMA_AHB/AXI_EVT_OUT_TOTAL_EOF_CH*n*: Indicates that the data corresponding to the last transmit descriptors has been sent via transmit channel *n* and the EOF bit of this descriptor is 1.
- GDMA_AHB/AXI_EVT_OUT_FIFO_EMPTY_CH*n*: Indicates that the TX FIFO has become empty.
- GDMA_AHB/AXI_EVT_OUT_FIFO_FULL_CH*n*: Indicates that the TX FIFO has become full.

In practical applications, GDMA's ETM events can trigger its own ETM tasks. For example, the GDMA_AHB/AXI_EVT_OUT_TOTAL_EOF_CH0 event can trigger the GDMA_AHB/AXI_TASK_IN_START_CH1 task, and in this way trigger a new round of GDMA operations.

6.6 Interrupts

ESP32-P4's GDMA module can generate the following interrupt signals that will be sent to the Interrupt Matrix.

- AHB/AXI_PDMA_IN_CH0_INTR
- AHB/AXI_PDMA_IN_CH1_INTR
- AHB/AXI_PDMA_IN_CH2_INTR
- AHB/AXI_PDMA_OUT_CH0_INTR
- AHB/AXI_PDMA_OUT_CH1_INTR
- AHB/AXI_PDMA_OUT_CH2_INTR

There are several internal interrupt sources from GDMA that can generate the above interrupt signals.

The AHB/AXI_PDMA_IN_CH*n*_INTR (*n* is 0 ~ 2) signals are generated by the following interrupt sources:

- AHB/AXI_DMA_IN_DONE_CH*n*_INT: Triggered when all data corresponding to a receive descriptor has been received via receive channel *n*.
- AHB/AXI_DMA_IN_SUC_EOF_CH*n*_INT: Triggered when the suc_eof bit in a receive descriptor is 1 and the data corresponding to this receive descriptor has been received via receive channel *n*.
- AHB/AXI_DMA_IN_ERR_EOF_CH*n*_INT: Triggered when an error is detected in the data segment corresponding to a descriptor received via receive channel *n*. This interrupt is used only for UHCI (UART0 or UART1) or PARLIO.
- AHB/AXI_DMA_IN_DSCR_EMPTY_CH*n*_INT: Triggered when the size of the buffer pointed by receive descriptors is smaller than the length of data to be received via receive channel *n*.
- AHB/AXI_DMA_IN_DSCR_ERR_CH*n*_INT: Triggered when a receive descriptor on receive channel *n* fails any of the two descriptor checks.
- AHB_DMA_INFIFO_OVF_CH*n*_INT or AXI_DMA_INFIFO_L1/L2/L3_OVF_CH*n*_INT: Triggered when the RX FIFO of GDMA-AHB or the L1/L2/L3 RX FIFO of GDMA-AXI overflows.
- AHB_DMA_INFIFO_UDF_CH*n*_INT or AXI_DMA_INFIFO_L1/L2/L3_UDF_CH*n*_INT: Triggered when the RX FIFO of GDMA-AHB or the L1/L2/L3 RX FIFO of GDMA-AXI underflows.
- AHB_DMA_IN_AHBINF_RESP_ERR_CH*n*_INT: Triggered when GDMA-AHB receive channel *n* performs a data transfer on the AHB bus and an error response is received during the transfer.

The AHB/AXI_PDMA_OUT_CH*n*_INTR (*n* is 0 ~ 2) signals are generated by the following interrupt sources:

- AHB/AXI_DMA_OUT_DONE_CH*n*_INT: Triggered when all data corresponding to a transmit descriptor has been sent via transmit channel *n*.
- AHB/AXI_DMA_OUT_EOF_CH*n*_INT: Triggered when the suc_eof bit in a transmit descriptor is 1 and data corresponding to this descriptor has been sent via transmit channel *n*. If AHB/AXI_DMA_OUT_EOF_MODE_CH*n* is 0, this interrupt will be triggered when the last byte of data corresponding to this descriptor enters GDMA's transmit channel; if AHB/AXI_DMA_OUT_EOF_MODE_CH*n* is 1, this interrupt is triggered when the last byte of data is taken from GDMA's transmit channel.
- AHB/AXI_DMA_OUT_DSCR_ERR_CH*n*_INT: Triggered when a transmit descriptor on transmit channel *n* fails any of the two descriptor checks.
- AHB/AXI_DMA_OUT_TOTAL_EOF_CH*n*_INT: Triggered when all data corresponding to a linked list (including multiple descriptors) has been sent via transmit channel *n*.
- AHB_DMA_OUTFIFO_OVF_CH*n*_INT or AXI_DMA_OUTFIFO_L1/L2/L3_OVF_CH*n*_INT: Triggered when the TX FIFO of GDMA-AHB or the L1/L2/L3 TX FIFO of GDMA-AXI overflows.
- AHB_DMA_OUTFIFO_UDF_CH*n*_INT or AXI_DMA_OUTFIFO_L1/L2/L3_UDF_CH*n*_INT: Triggered when the TX FIFO of GDMA-AHB or the L1/L2/L3 TX FIFO of GDMA-AXI underflows.
- AXI_DMA_OUT_LINK_SWITCH_CH*n*_INT: Triggered when GDMA-AXI has switched to a new linked list on transmit channel *n*.
- AHB_DMA_OUT_AHBINF_RESP_ERR_CH*n*_INT: Triggered when GDMA-AHB transmit channel *n* performs a data transfer on the AHB bus and an error response is received during the transfer.

6.7 Programming Procedures

The clock gating for GDMA can be configured via HP_SYS_CLKRST_AHB/AXI_PDMA_SYS_CLK_EN, and is enabled by default. GDMA can be reset by configuring HP_SYS_CLKRST_RST_EN_AHB/AXI_PDMA.

6.7.1 Programming Procedures for GDMA's Transmit Channel

To transmit data, GDMA's transmit channel should be configured by software as follows:

1. Set AHB/AXI_DMA_OUT_RST_CH*n* first to 1 and then to 0, to reset the state machine of GDMA's transmit channel and FIFO pointer.
2. Load an outlink, and configure AHB/AXI_DMA_OUTLINK_ADDR_CH*n* with address of the first transmit descriptor.
3. Configure AHB/AXI_DMA_PERI_OUT_SEL_CH*n* with the value corresponding to the peripheral to be connected, as shown in Table 6.4-1 and Table 6.4-2.
4. Set AHB/AXI_DMA_OUTLINK_START_CH*n* to enable GDMA's transmit channel for data transfer.
5. Configure and enable the corresponding peripheral (SPI2, UHCI (UART0 or UART1), I2S, AES, SHA, and ADC). See details in individual chapters of these peripherals.
6. Wait for the AHB/AXI_DMA_OUT_TOTAL_EOF_CH*n*_INT interrupt, which indicates the completion of data transfer.

6.7.2 Programming Procedures for GDMA's Receive Channel

To receive data, GDMA's receive channel should be configured by software as follows:

1. Set AHB/AXI_DMA_IN_RST_CH*n* first to 1 and then to 0, to reset the state machine of GDMA's receive channel and FIFO pointer.
2. Load an inlink, and configure AHB/AXI_DMA_INLINK_ADDR_CH*n* with address of the first receive descriptor.
3. Configure AHB/AXI_DMA_PERI_IN_SEL_CH*n* with the value corresponding to the peripheral to be connected, as shown in Table 6.4-1 and Table 6.4-2.
4. Set AHB/AXI_DMA_INLINK_START_CH*n* to enable GDMA's receive channel for data transfer.
5. Configure and enable the corresponding peripheral (SPI2, UHCI (UART0 or UART1), I2S, AES, SHA, and ADC). See details in individual chapters of these peripherals.

6.7.3 Programming Procedures for Memory-to-Memory Transfer

To transfer data from one memory location to another, GDMA should be configured by software as follows:

1. Set AHB/AXI_DMA_OUT_RST_CH*n* first to 1 and then to 0, to reset the state machine of GDMA's transmit channel and FIFO pointer.
2. Set AHB/AXI_DMA_IN_RST_CH*n* first to 1 and then to 0, to reset the state machine of GDMA's receive channel and FIFO pointer.

3. Load an outlink, and configure AHB/AXI_DMA_OUTLINK_ADDR_CH*n* with address of the first transmit descriptor.
4. Load an inlink, and configure AHB/AXI_DMA_INLINK_ADDR_CH*n* with address of the first receive descriptor.
5. Set AHB/AXI_DMA_MEM_TRANS_EN_CH*n* to enable memory-to-memory transfer.
6. Set AHB/AXI_DMA_OUTLINK_START_CH*n* to enable GDMA's transmit channel for data transfer.
7. Set AHB/AXI_DMA_INLINK_START_CH*n* to enable GDMA's receive channel for data transfer.
8. If the suc_eof bit is set in a transmit descriptor, an AHB/AXI_DMA_IN_SUC_EOF_CH*n*_INT interrupt will be triggered when the data segment corresponding to this descriptor has been transmitted.

6.7.4 Programming Procedures for Channel Priority and Weight

The priority arbitration can be configured as follows:

1. Configure the channel priority for TX and RX respectively via AHB/AXI_DMA_TX_PRI_CH*n* and AHB/AXI_DMA_RX_PRI_CH*n*.

The weight arbitration can be configured as follows:

1. Configure the time slot
   - GDMA-AHB: TX and RX share the same time slot configured by AHB_DMA_ARB_TIMEOUT.
   - GDMA-AXI: TX and RX use independent time slots configured by AXI_DMA_ARB_TIMEOUT_TX and AXI_DMA_ARB_TIMEOUT_RX.
2. Configure the number of tokens for TX and RX respectively via AHB/AXI_DMA_TX_CH_ARB_WEIGH_CH*n* and AHB/AXI_DMA_RX_CH_ARB_WEIGH_CH*n*.
3. Enable weight arbitration optimization for TX and RX respectively by clearing AHB/AXI_DMA_TX_ARB_WEIGH_OPT_DIR_CH*n* and AHB/AXI_DMA_RX_ARB_WEIGH_OPT_DIR_CH*n*.
4. Enable the arbitration:
   - GDMA-AHB: Enable the arbitration for both TX and RX by setting AHB_DMA_WEIGHT_EN.
   - GDMA-AXI: Enable the arbitration for TX and RX respectively by setting AXI_DMA_WEIGHT_EN_TX and AXI_DMA_WEIGHT_EN_RX.

6.7.5 Programming Procedures for CRC Calculation

The CRC calculation registers can be configured as follows:

1. Configure which bits in crc_tmp and data are used in the matrix via AHB/AXI_DMA_TX_CRC_EN_ADDR_CH*n*, AHB/AXI_DMA_TX_CRC_DATA_EN_ADDR_CH*n*, AHB/AXI_DMA_TX_CRC_EN_WR_DATA_CH*n*, and AHB/AXI_DMA_TX_CRC_DATA_EN_WR_DATA_CH*n*.
2. Latch the values of the above four fields by first writing 1 and then 0 to AHB/AXI_DMA_TX_CRC_LAUTCH_FLGA_CH*n*. Then the configuration for a row is complete.
3. Repeat Step 1 and Step 2 until all rows in the matrix are set up, and then start DMA transfer.

6.8 Register Summary

6.8.1 GDMA-AHB Register Summary

The addresses in this section are relative to GDMA-AHB base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Interrupt Registers			
AHB_DMA_IN_INT_RAW_CH0_REG	RX channel 0 raw interrupt status register	0x0000	R/WTC/SS
AHB_DMA_IN_INT_ST_CH0_REG	RX channel 0 masked interrupt status register	0x0004	RO
AHB_DMA_IN_INT_ENA_CH0_REG	RX channel 0 interrupt enable register	0x0008	R/W
AHB_DMA_IN_INT_CLR_CH0_REG	RX channel 0 interrupt clear register	0x000C	WT
AHB_DMA_IN_INT_RAW_CH1_REG	RX channel 1 raw interrupt status register	0x0010	R/WTC/SS
AHB_DMA_IN_INT_ST_CH1_REG	RX channel 1 masked interrupt status register	0x0014	RO
AHB_DMA_IN_INT_ENA_CH1_REG	RX channel 1 interrupt enable register	0x0018	R/W
AHB_DMA_IN_INT_CLR_CH1_REG	RX channel 1 interrupt clear register	0x001C	WT
AHB_DMA_IN_INT_RAW_CH2_REG	RX channel 2 raw interrupt status register	0x0020	R/WTC/SS
AHB_DMA_IN_INT_ST_CH2_REG	RX channel 2 masked interrupt status register	0x0024	RO
AHB_DMA_IN_INT_ENA_CH2_REG	RX channel 2 interrupt enable register	0x0028	R/W
AHB_DMA_IN_INT_CLR_CH2_REG	RX channel 2 interrupt clear register	0x002C	WT
AHB_DMA_OUT_INT_RAW_CH0_REG	TX channel 0 raw interrupt status register	0x0030	R/WTC/SS
AHB_DMA_OUT_INT_ST_CH0_REG	TX channel 0 masked interrupt status register	0x0034	RO
AHB_DMA_OUT_INT_ENA_CH0_REG	TX channel 0 interrupt enable register	0x0038	R/W
AHB_DMA_OUT_INT_CLR_CH0_REG	TX channel 0 interrupt clear register	0x003C	WT
AHB_DMA_OUT_INT_RAW_CH1_REG	TX channel 1 raw interrupt status register	0x0040	R/WTC/SS
AHB_DMA_OUT_INT_ST_CH1_REG	TX channel 1 masked interrupt status register	0x0044	RO
AHB_DMA_OUT_INT_ENA_CH1_REG	TX channel 1 interrupt enable register	0x0048	R/W
AHB_DMA_OUT_INT_CLR_CH1_REG	TX channel 1 interrupt clear register	0x004C	WT
AHB_DMA_OUT_INT_RAW_CH2_REG	TX channel 2 raw interrupt status register	0x0050	R/WTC/SS

GoBack

Name	Description	Address	Access

AHB_DMA_RX_CRC_EN_WR_DATA_CH2_REG	RX channel 2 CRC intermediate result mask register	0x0394	R/W
AHB_DMA_RX_CRC_EN_ADDR_CH2_REG	RX channel 2 CRC data input mask target register	0x0398	R/W
AHB_DMA_RX_CRC_DATA_EN_WR_DATA_CH2_REG	RX channel 2 CRC data input mask register	0x039C	R/W
AHB_DMA_RX_CRC_DATA_EN_ADDR_CH2_REG	RX channel 2 CRC data input mask target register	0x03A0	R/W
AHB_DMA_RX_CH_ARB_WEIGH_CH2_REG	RX channel 2 arbitration weight configuration register	0x03A4	R/W
AHB_DMA_RX_ARB_WEIGH_OPT_DIR_CH2_REG	RX channel 2 weight arbitration optimization enable register	0x03A8	R/W
AHB_DMA_IN_LINK_ADDR_CH0_REG	Linked list descriptor configuration register of RX channel 0	0x03AC	R/W
AHB_DMA_IN_LINK_ADDR_CH1_REG	Linked list descriptor configuration register of RX channel 1	0x03B0	R/W
AHB_DMA_IN_LINK_ADDR_CH2_REG	Linked list descriptor configuration register of RX channel 2	0x03B4	R/W
AHB_DMA_OUT_LINK_ADDR_CH0_REG	Linked list descriptor configuration register of TX channel 0	0x03B8	R/W
AHB_DMA_OUT_LINK_ADDR_CH1_REG	Linked list descriptor configuration register of TX channel 1	0x03BC	R/W
AHB_DMA_OUT_LINK_ADDR_CH2_REG	Linked list descriptor configuration register of TX channel 2	0x03C0	R/W
AHB_DMA_INTR_MEM_START_ADDR_REG	Accessible address space start address configuration register	0x03C4	R/W
AHB_DMA_INTR_MEM_END_ADDR_REG	Accessible address space end address configuration register	0x03C8	R/W
AHB_DMA_ARB_TIMEOUT_REG	Weight arbitration timeout configuration register	0x03DC	R/W
AHB_DMA_WEIGHT_EN_REG	Weight arbitration enable register	0x0400	R/W
AHB_DMA_MODULE_CLK_EN_REG	Force clock enable register for all internal AHB DMA modules	0x0404	R/W
Version Register			
AHB_DMA_DATE_REG	Version control register	0x0068	R/W
Status Registers			
AHB_DMA_INFIFO_STATUS_CH0_REG	RX channel 0 FIFO status	0x0078	RO
AHB_DMA_IN_STATE_CH0_REG	RX channel 0 status	0x0084	RO
AHB_DMA_IN_SUC_EOF_DES_ADDR_CH0_REG	Receive descriptor address when EOF occurs on RX channel 0	0x0088	RO
AHB_DMA_IN_ERR_EOF_DES_ADDR_CH0_REG	Receive descriptor address when errors occur on RX channel 0	0x008C	RO

Name	Description	Address	Access
AHB_DMA_IN_DSCR_CH0_REG	Address of the next receive descriptor pointed by the current pre-read receive descriptor on RX channel 0	0x0090	RO
AHB_DMA_IN_DSCR_BF0_CH0_REG	Address of the current pre-read receive descriptor on RX channel 0	0x0094	RO
AHB_DMA_IN_DSCR_BF1_CH0_REG	Address of the previous pre-read receive descriptor on RX channel 0	0x0098	RO
AHB_DMA_OUTFIFO_STATUS_CH0_REG	TX channel 0 FIFO status	0x00D8	RO
AHB_DMA_OUT_STATE_CH0_REG	TX channel 0 status	0x00E4	RO
AHB_DMA_OUT_EOF_DES_ADDR_CH0_REG	Transmit descriptor address when EOF occurs on TX channel 0	0x00E8	RO
AHB_DMA_OUT_EOF_BFR_DES_ADDR_CH0_REG	The last transmit descriptor address when EOF occurs on TX channel 0	0x00EC	RO
AHB_DMA_OUT_DSCR_CH0_REG	Address of the next transmit descriptor pointed by the current pre-read transmit descriptor on TX channel 0	0x00F0	RO
AHB_DMA_OUT_DSCR_BF0_CH0_REG	Address of the current pre-read transmit descriptor on TX channel 0	0x00F4	RO
AHB_DMA_OUT_DSCR_BF1_CH0_REG	Address of the previous pre-read transmit descriptor on TX channel 0	0x00F8	RO
AHB_DMA_INFIFO_STATUS_CH1_REG	RX channel 1 FIFO status	0x0138	RO
AHB_DMA_IN_STATE_CH1_REG	RX channel 1 status	0x0144	RO
AHB_DMA_IN_SUC_EOF_DES_ADDR_CH1_REG	Receive descriptor address when EOF occurs on RX channel 1	0x0148	RO
AHB_DMA_IN_ERR_EOF_DES_ADDR_CH1_REG	Receive descriptor address when errors occur on RX channel 1	0x014C	RO
AHB_DMA_IN_DSCR_CH1_REG	Address of the next receive descriptor pointed by the current pre-read receive descriptor on RX channel 1	0x0150	RO
AHB_DMA_IN_DSCR_BF0_CH1_REG	Address of the current pre-read receive descriptor on RX channel 1	0x0154	RO
AHB_DMA_IN_DSCR_BF1_CH1_REG	Address of the previous pre-read receive descriptor on RX channel 1	0x0158	RO
AHB_DMA_OUTFIFO_STATUS_CH1_REG	TX channel 1 FIFO status	0x0198	RO
AHB_DMA_OUT_STATE_CH1_REG	TX channel 1 status	0x01A4	RO

Name	Description	Address	Access
AHB_DMA_OUT_EOF_DES_ADDR_CH1_REG	Transmit descriptor address when EOF occurs on TX channel 1	0x01A8	RO
AHB_DMA_OUT_EOF_BFR_DES_ADDR_CH1_REG	The last transmit descriptor address when EOF occurs on TX channel 1	0x01AC	RO
AHB_DMA_OUT_DSCR_CH1_REG	Address of the next transmit descriptor pointed by the current pre-read transmit descriptor on TX channel 1	0x01B0	RO
AHB_DMA_OUT_DSCR_BF0_CH1_REG	Address of the current pre-read transmit descriptor on TX channel 1	0x01B4	RO
AHB_DMA_OUT_DSCR_BF1_CH1_REG	Address of the previous pre-read transmit descriptor on TX channel 1	0x01B8	RO
AHB_DMA_INFIFO_STATUS_CH2_REG	RX channel 2 FIFO status	0x01F8	RO
AHB_DMA_IN_STATE_CH2_REG	RX channel 2 status	0x0204	RO
AHB_DMA_IN_SUC_EOF_DES_ADDR_CH2_REG	Receive descriptor address when EOF occurs on RX channel 2	0x0208	RO
AHB_DMA_IN_ERR_EOF_DES_ADDR_CH2_REG	Receive descriptor address when errors occur on RX channel 2	0x020C	RO
AHB_DMA_IN_DSCR_CH2_REG	Address of the next receive descriptor pointed by the current pre-read receive descriptor on RX channel 2	0x0210	RO
AHB_DMA_IN_DSCR_BF0_CH2_REG	Address of the current pre-read receive descriptor on RX channel 2	0x0214	RO
AHB_DMA_IN_DSCR_BF1_CH2_REG	Address of the previous pre-read receive descriptor on RX channel 2	0x0218	RO
AHB_DMA_OUTFIFO_STATUS_CH2_REG	TX channel 2 FIFO status	0x0258	RO
AHB_DMA_OUT_STATE_CH2_REG	TX channel 2 status	0x0264	RO
AHB_DMA_OUT_EOF_DES_ADDR_CH2_REG	Transmit descriptor address when EOF occurs on TX channel 2	0x0268	RO
AHB_DMA_OUT_EOF_BFR_DES_ADDR_CH2_REG	The last transmit descriptor address when EOF occurs on TX channel 2	0x026C	RO
AHB_DMA_OUT_DSCR_CH2_REG	Address of the next transmit descriptor pointed by the current pre-read transmit descriptor on TX channel 2	0x0270	RO
AHB_DMA_OUT_DSCR_BF0_CH2_REG	Address of the current pre-read transmit descriptor on TX channel 2	0x0274	RO

Name	Description	Address	Access
AHB_DMA_OUT_DSCR_BF1_CH2_REG	Address of the previous pre-read transmit descriptor on TX channel 2	0x0278	RO
AHB_DMA_AHBINF_RESP_ERR_STATUS0_REG	Address of the transfer for which AHB DMA received an AHB bus error response	0x0408	RO
AHB_DMA_AHBINF_RESP_ERR_STATUS1_REG	Transfer type, ID, and channel ID of the transfer for which AHB DMA received an AHB bus error response	0x040C	RO
AHB_DMA_IN_DONE_DES_ADDR_CH0_REG	Address of the completed descriptor for RX channel 0	0x0410	RO
AHB_DMA_OUT_DONE_DES_ADDR_CH0_REG	Address of the completed descriptor for TX channel 0	0x0414	RO
AHB_DMA_IN_DONE_DES_ADDR_CH1_REG	Address of the completed descriptor for RX channel 1	0x0418	RO
AHB_DMA_OUT_DONE_DES_ADDR_CH1_REG	Address of the completed descriptor for TX channel 1	0x041C	RO
AHB_DMA_IN_DONE_DES_ADDR_CH2_REG	Address of the completed descriptor for RX channel 2	0x0420	RO
AHB_DMA_OUT_DONE_DES_ADDR_CH2_REG	Address of the completed descriptor for TX channel 2	0x0424	RO
Priority Registers			
AHB_DMA_IN_PRI_CH0_REG	Priority register of RX channel 0	0x009C	R/W
AHB_DMA_OUT_PRI_CH0_REG	Priority register of TX channel 0	0x00FC	R/W
AHB_DMA_IN_PRI_CH1_REG	Priority register of RX channel 1	0x015C	R/W
AHB_DMA_OUT_PRI_CH1_REG	Priority register of TX channel 1	0x01BC	R/W
AHB_DMA_IN_PRI_CH2_REG	Priority register of RX channel 2	0x021C	R/W
AHB_DMA_OUT_PRI_CH2_REG	Priority register of TX channel 2	0x027C	R/W
Peripheral Select Registers			
AHB_DMA_IN_PERI_SEL_CH0_REG	Peripheral selection register of RX channel 0	0x00A0	R/W
AHB_DMA_OUT_PERI_SEL_CH0_REG	Peripheral selection register of TX channel 0	0x0100	R/W
AHB_DMA_IN_PERI_SEL_CH1_REG	Peripheral selection register of RX channel 1	0x0160	R/W
AHB_DMA_OUT_PERI_SEL_CH1_REG	Peripheral selection register of TX channel 1	0x01C0	R/W
AHB_DMA_IN_PERI_SEL_CH2_REG	Peripheral selection register of RX channel 2	0x0220	R/W
AHB_DMA_OUT_PERI_SEL_CH2_REG	Peripheral selection register of TX channel 2	0x0280	R/W

6.8.2 GDMA-AXI Register Summary

The addresses in this section are relative to GDMA-AXI base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Interrupt Registers			
AXI_DMA_IN_INT_RAW_CH0_REG	RX channel 0 raw interrupt status register	0x0000	R/WTC/SS
AXI_DMA_IN_INT_ST_CH0_REG	RX channel 0 masked interrupt status register	0x0004	RO
AXI_DMA_IN_INT_ENA_CH0_REG	RX channel 0 interrupt enable register	0x0008	R/W
AXI_DMA_IN_INT_CLR_CH0_REG	RX channel 0 interrupt clear register	0x000C	WT
AXI_DMA_IN_INT_RAW_CH1_REG	RX channel 1 raw interrupt status register	0x0068	R/WTC/SS
AXI_DMA_IN_INT_ST_CH1_REG	RX channel 1 masked interrupt status register	0x006C	RO
AXI_DMA_IN_INT_ENA_CH1_REG	RX channel 1 interrupt enable register	0x0070	R/W
AXI_DMA_IN_INT_CLR_CH1_REG	RX channel 1 interrupt clear register	0x0074	WT
AXI_DMA_IN_INT_RAW_CH2_REG	RX channel 2 raw interrupt status register	0x00D0	R/WTC/SS
AXI_DMA_IN_INT_ST_CH2_REG	RX channel 2 masked interrupt status register	0x00D4	RO
AXI_DMA_IN_INT_ENA_CH2_REG	RX channel 2 interrupt enable register	0x00D8	R/W
AXI_DMA_IN_INT_CLR_CH2_REG	RX channel 2 interrupt clear register	0x00DC	WT
AXI_DMA_OUT_INT_RAW_CH0_REG	TX channel 0 raw interrupt status register	0x0138	R/WTC/SS
AXI_DMA_OUT_INT_ST_CH0_REG	TX channel 0 masked interrupt status register	0x013C	RO
AXI_DMA_OUT_INT_ENA_CH0_REG	TX channel 0 interrupt enable register	0x0140	R/W
AXI_DMA_OUT_INT_CLR_CH0_REG	TX channel 0 interrupt clear register	0x0144	WT
AXI_DMA_OUT_INT_RAW_CH1_REG	TX channel 1 raw interrupt status register	0x01A0	R/WTC/SS
AXI_DMA_OUT_INT_ST_CH1_REG	TX channel 1 masked interrupt status register	0x01A4	RO
AXI_DMA_OUT_INT_ENA_CH1_REG	TX channel 1 interrupt enable register	0x01A8	R/W
AXI_DMA_OUT_INT_CLR_CH1_REG	TX channel 1 interrupt clear register	0x01AC	WT
AXI_DMA_OUT_INT_RAW_CH2_REG	TX channel 2 raw interrupt status register	0x0208	R/WTC/SS
AXI_DMA_OUT_INT_ST_CH2_REG	TX channel 2 masked interrupt status register	0x020C	RO
AXI_DMA_OUT_INT_ENA_CH2_REG	TX channel 2 interrupt enable register	0x0210	R/W

GoBack

Name	Description	Address	Access
AXI_DMA_OUT_INT_CLR_CH2_REG	TX channel 2 interrupt clear register	0x0214	WT
Configuration Registers			
AXI_DMA_IN_CONF0_CH0_REG	Configuration register 0 of RX channel 0	0x0010	R/W
AXI_DMA_IN_CONF1_CH0_REG	Configuration register 1 of RX channel 0	0x0014	R/W
AXI_DMA_IN_POP_CH0_REG	Pop control register of RX channel 0	0x001C	varies
AXI_DMA_IN_LINK1_CH0_REG	Linked list descriptor configuration and control register 1 of RX channel 0	0x0020	varies
AXI_DMA_IN_LINK2_CH0_REG	Linked list descriptor configuration and control register 2 of RX channel 0	0x0024	R/W
AXI_DMA_IN_CRC_INIT_DATA_CH0_REG	RX channel 0 CRC initial value configuration register	0x0048	R/W
AXI_DMA_RX_CRC_WIDTH_CH0_REG	RX channel 0 CRC result width configuration register	0x004C	R/W
AXI_DMA_IN_CRC_CLEAR_CH0_REG	RX channel 0 CRC result clear register	0x0050	R/W
AXI_DMA_IN_CRC_FINAL_RESULT_CH0_REG	RX channel 0 CRC result register	0x0054	RO
AXI_DMA_RX_CRC_EN_ADDR_CH0_REG	TX channel 0 CRC intermediate result mask target register	0x005C	R/W
AXI_DMA_RX_CRC_DATA_EN_WR_DATA_CH0_REG	CRC RX channel 0 CRC intermediate result mask register	0x0060	R/W
AXI_DMA_RX_CRC_DATA_EN_ADDR_CH0_REG	RX channel 0 CRC data input mask target register	0x0064	R/W
AXI_DMA_IN_CONF0_CH1_REG	Configuration register 0 of RX channel 1	0x0078	R/W
AXI_DMA_IN_CONF1_CH1_REG	Configuration register 1 of RX channel 1	0x007C	R/W
AXI_DMA_IN_POP_CH1_REG	Pop control register of RX channel 1	0x0084	varies
AXI_DMA_IN_LINK1_CH1_REG	Linked list descriptor configuration and control register 1 of RX channel 1	0x0088	varies
AXI_DMA_IN_LINK2_CH1_REG	Linked list descriptor configuration and control register 2 of RX channel 1	0x008C	R/W
AXI_DMA_IN_CRC_INIT_DATA_CH1_REG	RX channel 1 CRC initial value configuration register	0x00B0	R/W
AXI_DMA_RX_CRC_WIDTH_CH1_REG	RX channel 1 CRC result width configuration register	0x00B4	R/W

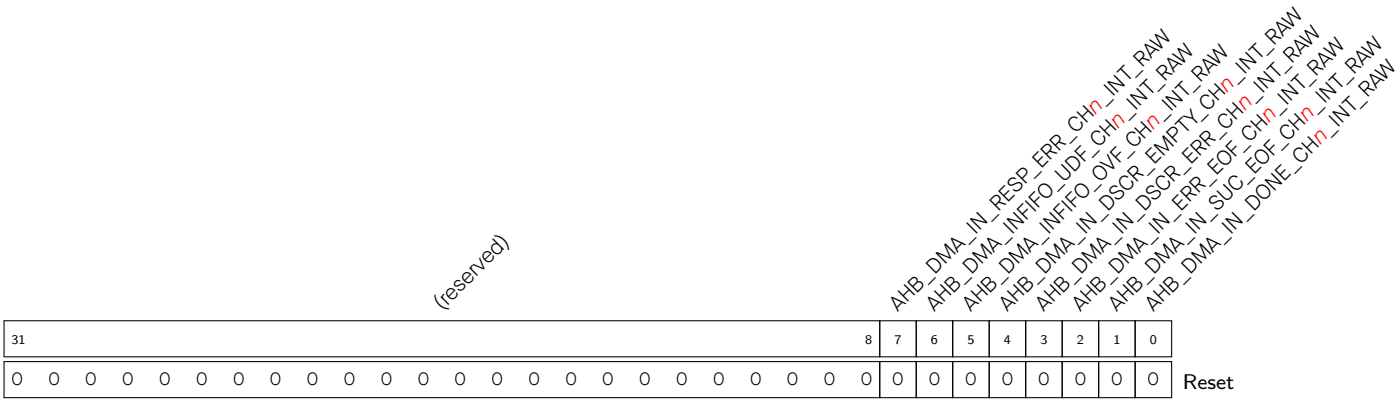
Status Registers			
AXI_DMA_INFIFO_STATUS_CH0_REG	RX channel 0 FIFO status register	0x0018	RO
AXI_DMA_IN_STATE_CH0_REG	RX channel 0 status register	0x0028	RO
AXI_DMA_IN_SUC_EOF_DES_ADDR_CH0_REG	Receive descriptor address when EOF occurs on RX channel 0	0x002C	RO
AXI_DMA_IN_ERR_EOF_DES_ADDR_CH0_REG	Receive descriptor address when errors occur on RX channel 0	0x0030	RO
AXI_DMA_IN_DSCR_CH0_REG	Address of the next receive descriptor pointed by the current pre-read receive descriptor on RX channel 0	0x0034	RO
AXI_DMA_IN_DSCR_BF0_CH0_REG	Address of the current pre-read receive descriptor on RX channel 0	0x0038	RO
AXI_DMA_IN_DSCR_BF1_CH0_REG	Address of the previous pre-read receive descriptor on RX channel 0	0x003C	RO
AXI_DMA_INFIFO_STATUS_CH1_REG	RX channel 1 FIFO status register	0x0080	RO
AXI_DMA_IN_STATE_CH1_REG	RX channel 1 status register	0x0090	RO
AXI_DMA_IN_SUC_EOF_DES_ADDR_CH1_REG	Receive descriptor address when EOF occurs on RX channel 1	0x0094	RO
AXI_DMA_IN_ERR_EOF_DES_ADDR_CH1_REG	Receive descriptor address when errors occur on RX channel 1	0x0098	RO

Name	Description	Address	Access
AXI_DMA_IN_DSCR_CH1_REG	Address of the next receive descriptor pointed by the current pre-read receive descriptor on RX channel 1	0x009C	RO
AXI_DMA_IN_DSCR_BF0_CH1_REG	Address of the current pre-read receive descriptor on RX channel 1	0x00A0	RO
AXI_DMA_IN_DSCR_BF1_CH1_REG	Address of the previous pre-read receive descriptor on RX channel 1	0x00A4	RO
AXI_DMA_INFIFO_STATUS_CH2_REG	RX channel 2 FIFO status register	0x00E8	RO
AXI_DMA_IN_STATE_CH2_REG	RX channel 2 status register	0x00F8	RO
AXI_DMA_IN_SUC_EOF_DES_ADDR_CH2_REG	Receive descriptor address when EOF occurs on RX channel 2	0x00FC	RO
AXI_DMA_IN_ERR_EOF_DES_ADDR_CH2_REG	Receive descriptor address when errors occur on RX channel 2	0x0100	RO
AXI_DMA_IN_DSCR_CH2_REG	Address of the next receive descriptor pointed by the current pre-read receive descriptor on RX channel 2	0x0104	RO
AXI_DMA_IN_DSCR_BF0_CH2_REG	Address of the current pre-read receive descriptor on RX channel 2	0x0108	RO
AXI_DMA_IN_DSCR_BF1_CH2_REG	Address of the previous pre-read receive descriptor on RX channel 2	0x010C	RO
AXI_DMA_OUTFIFO_STATUS_CH0_REG	TX channel 0 FIFO status	0x0150	RO
AXI_DMA_OUT_STATE_CH0_REG	TX channel 0 status	0x0160	RO
AXI_DMA_OUT_EOF_DES_ADDR_CH0_REG	Transmit descriptor address when EOF occurs on TX channel 0	0x0164	RO
AXI_DMA_OUT_EOF_BFR_DES_ADDR_CH0_REG	The last transmit descriptor address when EOF occurs on TX channel 0	0x0168	RO
AXI_DMA_OUT_DSCR_CH0_REG	Address of the next transmit descriptor pointed by the current pre-read transmit descriptor on TX channel 0	0x016C	RO
AXI_DMA_OUT_DSCR_BF0_CH0_REG	Address of the current pre-read transmit descriptor on TX channel 0	0x0170	RO
AXI_DMA_OUT_DSCR_BF1_CH0_REG	Address of the previous pre-read transmit descriptor on TX channel 0	0x0174	RO
AXI_DMA_OUTFIFO_STATUS_CH1_REG	TX channel 0 FIFO status	0x01B8	RO
AXI_DMA_OUT_STATE_CH1_REG	TX channel 1 status	0x01C8	RO

Name	Description	Address	Access
AXI_DMA_OUT_EOF_DES_ADDR_CH1_REG	Transmit descriptor address when EOF occurs on TX channel 1	0x01CC	RO
AXI_DMA_OUT_EOF_BFR_DES_ADDR_CH1_REG	The last transmit descriptor address when EOF occurs on TX channel 1	0x01D0	RO
AXI_DMA_OUT_DSCR_CH1_REG	Address of the next transmit descriptor pointed by the current pre-read transmit descriptor on TX channel 1	0x01D4	RO
AXI_DMA_OUT_DSCR_BF0_CH1_REG	Address of the current pre-read transmit descriptor on TX channel 1	0x01D8	RO
AXI_DMA_OUT_DSCR_BF1_CH1_REG	Address of the previous pre-read transmit descriptor on TX channel 1	0x01DC	RO
AXI_DMA_OUTFIFO_STATUS_CH2_REG	TX channel 2 FIFO status	0x0220	RO
AXI_DMA_OUT_STATE_CH2_REG	TX channel 2 status	0x0230	RO
AXI_DMA_OUT_EOF_DES_ADDR_CH2_REG	Transmit descriptor address when EOF occurs on TX channel 2	0x0234	RO
AXI_DMA_OUT_EOF_BFR_DES_ADDR_CH2_REG	The last transmit descriptor address when EOF occurs on TX channel 2	0x0238	RO
AXI_DMA_OUT_DSCR_CH2_REG	Address of the next transmit descriptor pointed by the current pre-read transmit descriptor on TX channel 2	0x023C	RO
AXI_DMA_OUT_DSCR_BF0_CH2_REG	Address of the current pre-read transmit descriptor on TX channel 2	0x0240	RO
AXI_DMA_OUT_DSCR_BF1_CH2_REG	Address of the previous pre-read transmit descriptor on TX channel 2	0x0244	RO
AXI_DMA_IN_RESET_AVAIL_CH0_REG	RX channel 0 reset status register	0x028C	RO
AXI_DMA_IN_RESET_AVAIL_CH1_REG	RX channel 1 reset status register	0x0290	RO
AXI_DMA_IN_RESET_AVAIL_CH2_REG	RX channel 2 reset status register	0x0294	RO
AXI_DMA_OUT_RESET_AVAIL_CH0_REG	TX channel 0 reset status register	0x0298	RO
AXI_DMA_OUT_RESET_AVAIL_CH1_REG	TX channel 1 reset status register	0x029C	RO
AXI_DMA_OUT_RESET_AVAIL_CH2_REG	TX channel 2 reset status register	0x02A0	RO
Priority Registers			
AXI_DMA_IN_PRI_CH0_REG	Priority register of RX channel 0	0x0040	R/W
AXI_DMA_IN_PRI_CH1_REG	Priority register of RX channel 1	0x00A8	R/W

Name	Description	Address	Access
AXI_DMA_IN_PRI_CH2_REG	Priority register of RX channel 2	0x0110	R/W
AXI_DMA_OUT_PRI_CH0_REG	Priority register of TX channel 0	0x0178	R/W
AXI_DMA_OUT_PRI_CH1_REG	Priority register of TX channel 1	0x01E0	R/W
AXI_DMA_OUT_PRI_CH2_REG	Priority register of TX channel 2	0x0248	R/W
Peripheral Select Registers			
AXI_DMA_IN_PERI_SEL_CH0_REG	Peripheral selection register of RX channel 0	0x0044	R/W
AXI_DMA_IN_PERI_SEL_CH1_REG	Peripheral selection register of RX channel 1	0x00AC	R/W
AXI_DMA_IN_PERI_SEL_CH2_REG	Peripheral selection register of RX channel 2	0x0114	R/W
AXI_DMA_OUT_PERI_SEL_CH0_REG	Peripheral selection register of TX channel 0	0x017C	R/W
AXI_DMA_OUT_PERI_SEL_CH1_REG	Peripheral selection register of TX channel 1	0x01E4	R/W
AXI_DMA_OUT_PERI_SEL_CH2_REG	Peripheral selection register of TX channel 2	0x024C	R/W
Version Register			
AXI_DMA_DATE_REG	Version control register	0x02D8	R/W



6.9 Registers

6.9.1 GDMA-AHB Registers

The addresses in this section are relative to GDMA-AHB base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

For how to program reserved fields, please refer to Section Programming Reserved Register Field.

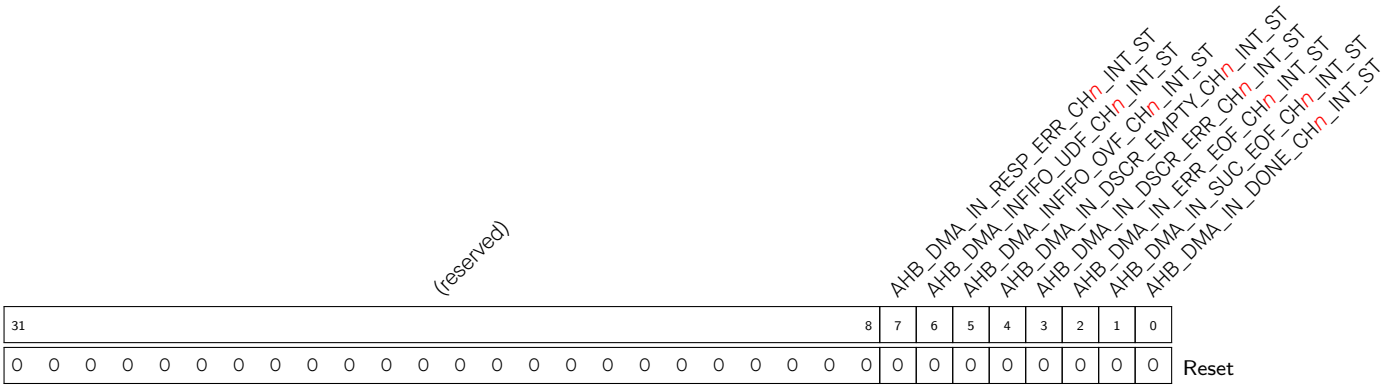
Register 6.1. AHB_DMA_IN_INT_RAW_CH*n*_REG (*n*: 0-2) (0x0000+0x10n*)**

AHB_DMA_IN_DONE_CH*n*_INT_RAW The raw interrupt status of AHB_DMA_IN_DONE_CH*n*_INT. (R/WTC/SS)

AHB_DMA_IN_SUC_EOF_CH*n*_INT_RAW The raw interrupt status of AHB_DMA_IN_SUC_EOF_CH*n*_INT. For UHCI, this bit turns to 1 when the last data byte pointed by one receive descriptor has been received and no data error is detected for RX channel *n*. (R/WTC/SS)

AHB_DMA_IN_ERR_EOF_CH*n*_INT_RAW The raw interrupt status of AHB_DMA_IN_ERR_EOF_CH*n*_INT. Valid only for UHCI. (R/WTC/SS)

AHB_DMA_IN_DSCR_ERR_CH*n*_INT_RAW The raw interrupt status of AHB_DMA_IN_DSCR_ERR_CH*n*_INT. (R/WTC/SS)



AHB_DMA_IN_DSCR_EMPTY_CH*n*_INT_RAW The raw interrupt status of AHB_DMA_IN_DSCR_EMPTY_CH*n*_INT. (R/WTC/SS)

AHB_DMA_INFIFO_OVF_CH*n*_INT_RAW The raw interrupt status of AHB_DMA_INFIFO_OVF_CH*n*_INT. (R/WTC/SS)

AHB_DMA_INFIFO_UDF_CH*n*_INT_RAW The raw interrupt status of AHB_DMA_INFIFO_UDF_CH*n*_INT. (R/WTC/SS)

AHB_DMA_IN_RESP_ERR_CH*n*_INT_RAW The raw interrupt status of AHB_DMA_IN_RESP_ERR_CH*n*_INT. (R/WTC/SS)

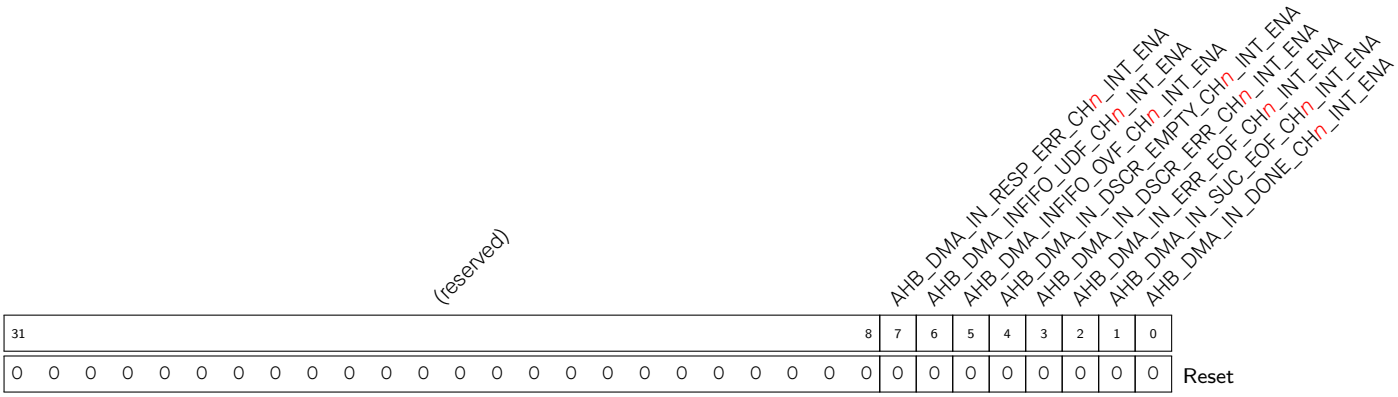
Register 6.2. AHB_DMA_IN_INT_ST_CH*n*_REG (*n*: 0-2) (0x0004+0x10***n*)

AHB_DMA_IN_DONE_CH*n*_INT_ST The masked interrupt status of AHB_DMA_IN_DONE_CH*n*_INT. (RO)

AHB_DMA_IN_SUC_EOF_CH*n*_INT_ST The masked interrupt status of AHB_DMA_IN_SUC_EOF_CH*n*_INT. (RO)

AHB_DMA_IN_ERR_EOF_CH*n*_INT_ST The masked interrupt status of AHB_DMA_IN_ERR_EOF_CH*n*_INT. (RO)

AHB_DMA_IN_DSCR_ERR_CH*n*_INT_ST The masked interrupt status of AHB_DMA_IN_DSCR_ERR_CH*n*_INT. (RO)



AHB_DMA_IN_DSCR_EMPTY_CH*n*_INT_ST The masked interrupt status of AHB_DMA_IN_DSCR_EMPTY_CH*n*_INT. (RO)

AHB_DMA_INFIFO_OVF_CH*n*_INT_ST The masked interrupt status of AHB_DMA_INFIFO_OVF_CH*n*_INT. (RO)

AHB_DMA_INFIFO_UDF_CH*n*_INT_ST The masked interrupt status of AHB_DMA_INFIFO_UDF_CH*n*_INT. (RO)

AHB_DMA_IN_RESP_ERR_CH*n*_INT_ST The masked interrupt status of AHB_DMA_IN_RESP_ERR_CH*n*_INT. (RO)

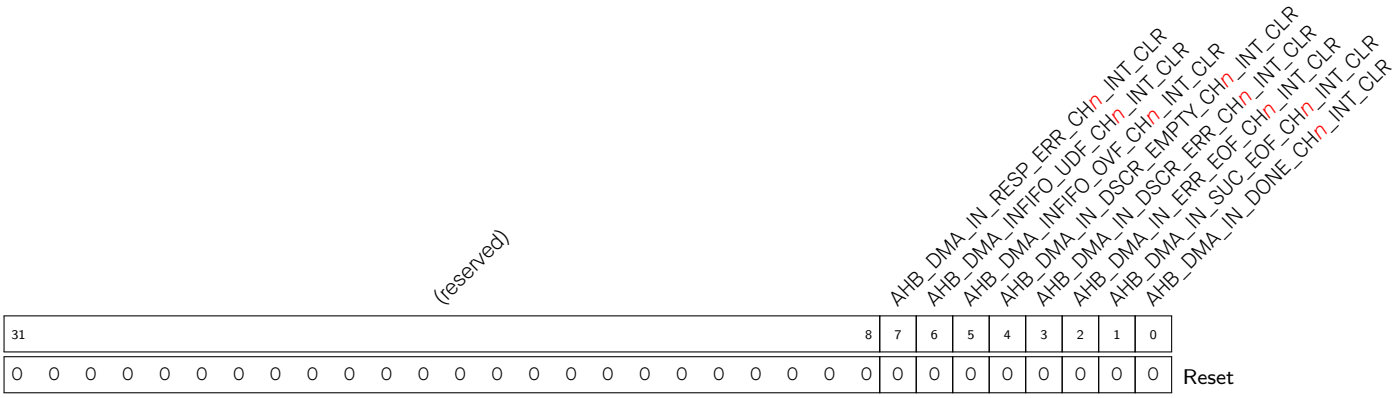
Register 6.3. AHB_DMA_IN_INT_ENA_CH*n*_REG (*n*: 0-2) (0x0008+0x10n*)**

AHB_DMA_IN_DONE_CH*n*_INT_ENA Write 1 to enable AHB_DMA_IN_DONE_CH*n*_INT. (R/W)

AHB_DMA_IN_SUC_EOF_CH*n*_INT_ENA Write 1 to enable AHB_DMA_IN_SUC_EOF_CH*n*_INT. (R/W)

AHB_DMA_IN_ERR_EOF_CH*n*_INT_ENA Write 1 to enable AHB_DMA_IN_ERR_EOF_CH*n*_INT. (R/W)

AHB_DMA_IN_DSCR_ERR_CH*n*_INT_ENA Write 1 to enable AHB_DMA_IN_DSCR_ERR_CH*n*_INT. (R/W)



AHB_DMA_IN_DSCR_EMPTY_CH*n*_INT_ENA Write 1 to enable AHB_DMA_IN_DSCR_EMPTY_CH*n*_INT. (R/W)

AHB_DMA_INFIFO_OVF_CH*n*_INT_ENA Write 1 to enable AHB_DMA_INFIFO_OVF_CH*n*_INT. (R/W)

AHB_DMA_INFIFO_UDF_CH*n*_INT_ENA Write 1 to enable AHB_DMA_INFIFO_UDF_CH*n*_INT. (R/W)

AHB_DMA_IN_RESP_ERR_CH*n*_INT_ENA Write 1 to enable AHB_DMA_IN_RESP_ERR_CH*n*_INT. (R/W)

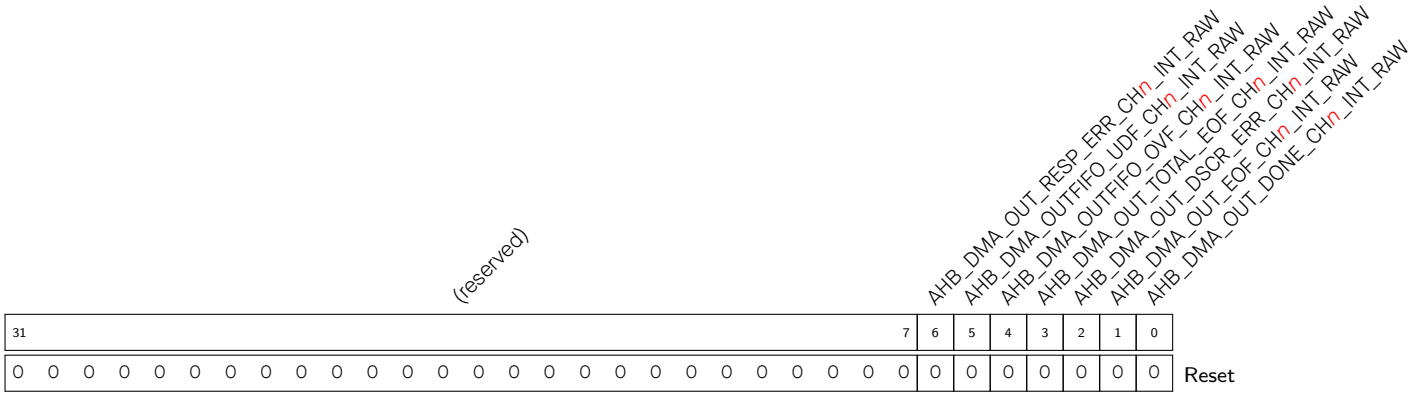
Register 6.4. AHB_DMA_IN_INT_CLR_CH*n*_REG (*n*: 0-2) (0x000C+0x10n*)**

AHB_DMA_IN_DONE_CH*n*_INT_CLR Write 1 to clear AHB_DMA_IN_DONE_CH*n*_INT. (WT)

AHB_DMA_IN_SUC_EOF_CH*n*_INT_CLR Write 1 to clear AHB_DMA_IN_SUC_EOF_CH*n*_INT. (WT)

AHB_DMA_IN_ERR_EOF_CH*n*_INT_CLR Write 1 to clear AHB_DMA_IN_ERR_EOF_CH*n*_INT. (WT)

AHB_DMA_IN_DSCR_ERR_CH*n*_INT_CLR Write 1 to clear AHB_DMA_IN_DSCR_ERR_CH*n*_INT. (WT)



AHB_DMA_IN_DSCR_EMPTY_CH*n*_INT_CLR Write 1 to clear AHB_DMA_IN_DSCR_EMPTY_CH*n*_INT. (WT)

AHB_DMA_INFIFO_OVF_CH*n*_INT_CLR Write 1 to clear AHB_DMA_INFIFO_OVF_CH*n*_INT. (WT)

AHB_DMA_INFIFO_UDF_CH*n*_INT_CLR Write 1 to clear AHB_DMA_INFIFO_UDF_CH*n*_INT. (WT)

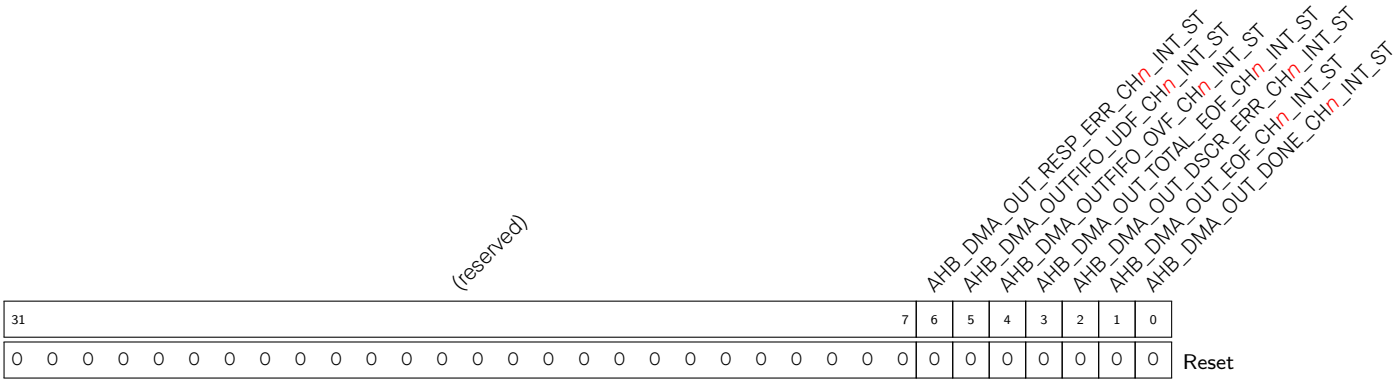
AHB_DMA_IN_RESP_ERR_CH*n*_INT_CLR Write 1 to clear AHB_DMA_IN_RESP_ERR_CH*n*_INT. (WT)

Register 6.5. AHB_DMA_OUT_INT_RAW_CH*n*_REG (*n*: 0-2) (0x0030+0x10n*)**

AHB_DMA_OUT_DONE_CH*n*_INT_RAW The raw interrupt status of AHB_DMA_OUT_DONE_CH*n*_INT. (R/WTC/SS)

AHB_DMA_OUT_EOF_CH*n*_INT_RAW The raw interrupt status of AHB_DMA_OUT_EOF_CH*n*_INT. (R/WTC/SS)

AHB_DMA_OUT_DSCR_ERR_CH*n*_INT_RAW The raw interrupt status of AHB_DMA_OUT_DSCR_ERR_CH*n*_INT. (R/WTC/SS)



AHB_DMA_OUT_TOTAL_EOF_CH*n*_INT_RAW The raw interrupt status of AHB_DMA_OUT_TOTAL_EOF_CH*n*_INT. (R/WTC/SS)

AHB_DMA_OUTFIFO_OVF_CH*n*_INT_RAW The raw interrupt status of AHB_DMA_OUTFIFO_OVF_CH*n*_INT. (R/WTC/SS)

AHB_DMA_OUTFIFO_UDF_CH*n*_INT_RAW The raw interrupt status of AHB_DMA_OUTFIFO_UDF_CH*n*_INT. (R/WTC/SS)

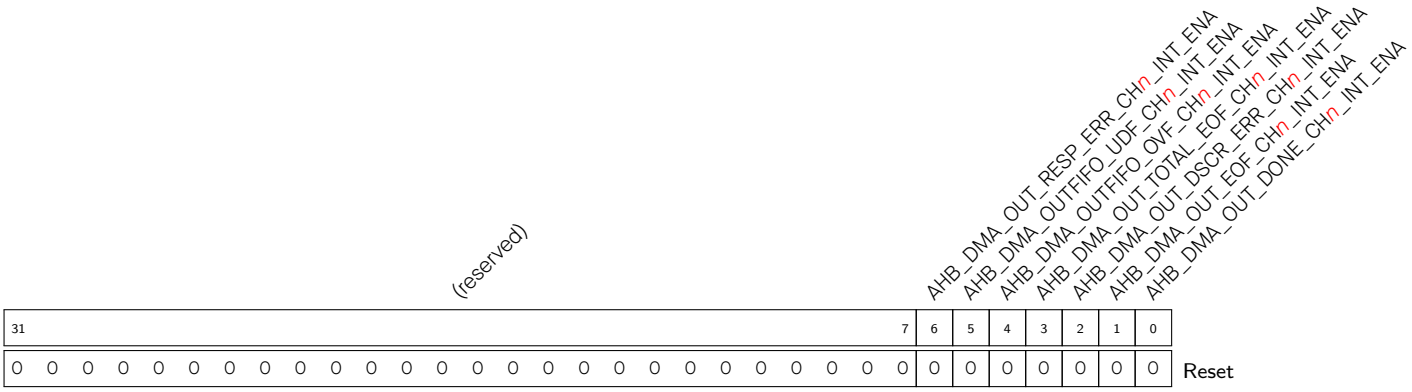
AHB_DMA_OUT_RESP_ERR_CH*n*_INT_RAW The raw interrupt status of AHB_DMA_OUT_RESP_ERR_CH*n*_INT. (R/WTC/SS)

Register 6.6. AHB_DMA_OUT_INT_ST_CH*n*_REG (*n*: 0-2) (0x0034+0x10n*)**

AHB_DMA_OUT_DONE_CH*n*_INT_ST The masked interrupt status of AHB_DMA_OUT_DONE_CH*n*_INT. (RO)

AHB_DMA_OUT_EOF_CH*n*_INT_ST The masked interrupt status of AHB_DMA_OUT_EOF_CH*n*_INT. (RO)

AHB_DMA_OUT_DSCR_ERR_CH*n*_INT_ST The masked interrupt status of AHB_DMA_OUT_DSCR_ERR_CH*n*_INT. (RO)



AHB_DMA_OUT_TOTAL_EOF_CH*n*_INT_ST The masked interrupt status of AHB_DMA_OUT_TOTAL_EOF_CH*n*_INT. (RO)

AHB_DMA_OUTFIFO_OVF_CH*n*_INT_ST The masked interrupt status of AHB_DMA_OUTFIFO_OVF_CH*n*_INT. (RO)

AHB_DMA_OUTFIFO_UDF_CH*n*_INT_ST The masked interrupt status of AHB_DMA_OUTFIFO_UDF_CH*n*_INT. (RO)

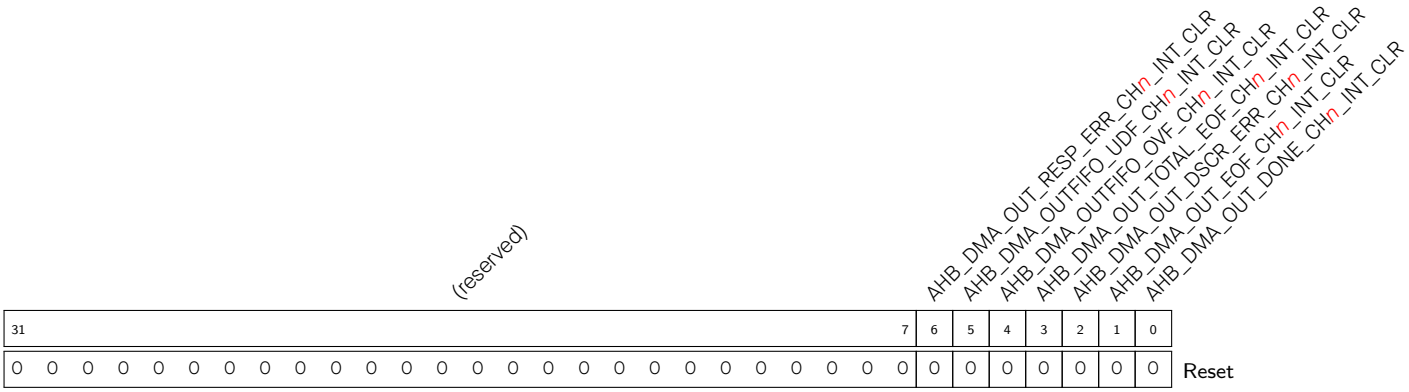
AHB_DMA_OUT_RESP_ERR_CH*n*_INT_ST The masked interrupt status of AHB_DMA_OUT_RESP_ERR_CH*n*_INT. (RO)

Register 6.7. AHB_DMA_OUT_INT_ENA_CH*n*_REG (*n*: 0-2) (0x0038+0x10**n*)

AHB_DMA_OUT_DONE_CH*n*_INT_ENA Write 1 to enable AHB_DMA_OUT_DONE_CH*n*_INT. (R/W)

AHB_DMA_OUT_EOF_CH*n*_INT_ENA Write 1 to enable AHB_DMA_OUT_EOF_CH*n*_INT. (R/W)

AHB_DMA_OUT_DSCR_ERR_CH*n*_INT_ENA Write 1 to enable AHB_DMA_OUT_DSCR_ERR_CH*n*_INT. (R/W)



AHB_DMA_OUT_TOTAL_EOF_CH*n*_INT_ENA Write 1 to enable AHB_DMA_OUT_TOTAL_EOF_CH*n*_INT. (R/W)

AHB_DMA_OUTFIFO_OVF_CH*n*_INT_ENA Write 1 to enable AHB_DMA_OUTFIFO_OVF_CH*n*_INT. (R/W)

AHB_DMA_OUTFIFO_UDF_CH*n*_INT_ENA Write 1 to enable AHB_DMA_OUTFIFO_UDF_CH*n*_INT. (R/W)

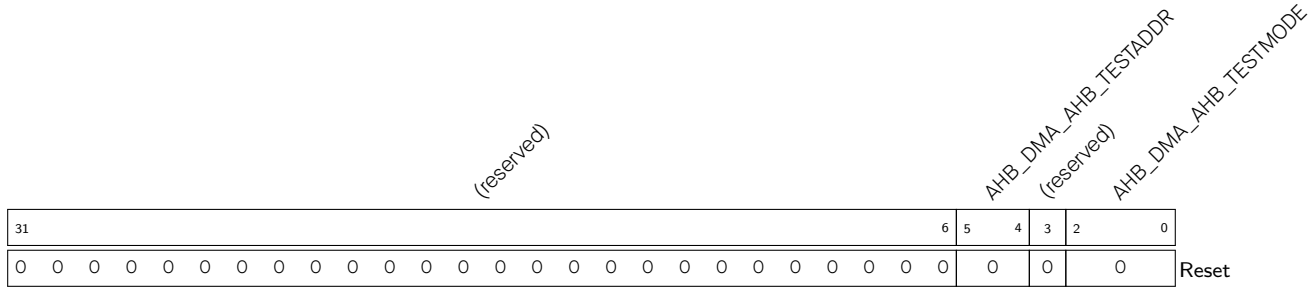
AHB_DMA_OUT_RESP_ERR_CH*n*_INT_ENA Write 1 to enable AHB_DMA_OUT_RESP_ERR_CH*n*_INT. (R/W)

Register 6.8. AHB_DMA_OUT_INT_CLR_CH*n*_REG (*n*: 0-2) (0x003C+0x10**n*)

AHB_DMA_OUT_DONE_CH*n*_INT_CLR Write 1 to clear AHB_DMA_OUT_DONE_CH*n*_INT. (WT)

AHB_DMA_OUT_EOF_CH*n*_INT_CLR Write 1 to clear AHB_DMA_OUT_EOF_CH*n*_INT. (WT)

AHB_DMA_OUT_DSCR_ERR_CH*n*_INT_CLR Write 1 to clear AHB_DMA_OUT_DSCR_ERR_CH*n*_INT. (WT)

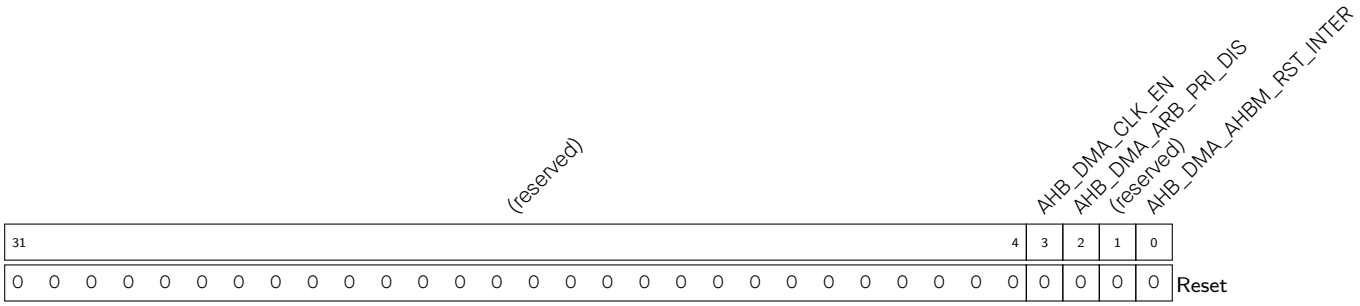


AHB_DMA_OUT_TOTAL_EOF_CH*n*_INT_CLR Write 1 to clear AHB_DMA_OUT_TOTAL_EOF_CH*n*_INT. (WT)

AHB_DMA_OUTFIFO_OVF_CH*n*_INT_CLR Write 1 to clear AHB_DMA_OUTFIFO_OVF_CH*n*_INT. (WT)

AHB_DMA_OUTFIFO_UDF_CH*n*_INT_CLR Write 1 to clear AHB_DMA_OUTFIFO_UDF_CH*n*_INT. (WT)

AHB_DMA_OUT_RESP_ERR_CH*n*_INT_CLR Write 1 to clear AHB_DMA_OUT_RESP_ERR_CH*n*_INT. (WT)



Register 6.9. AHB_DMA_AHB_TEST_REG (0x0060)

AHB_DMA_AHB_TESTMODE Reserved. (R/W)

AHB_DMA_AHB_TESTADDR Reserved. (R/W)

Register 6.10. AHB_DMA_MISC_CONF_REG (0x0064)

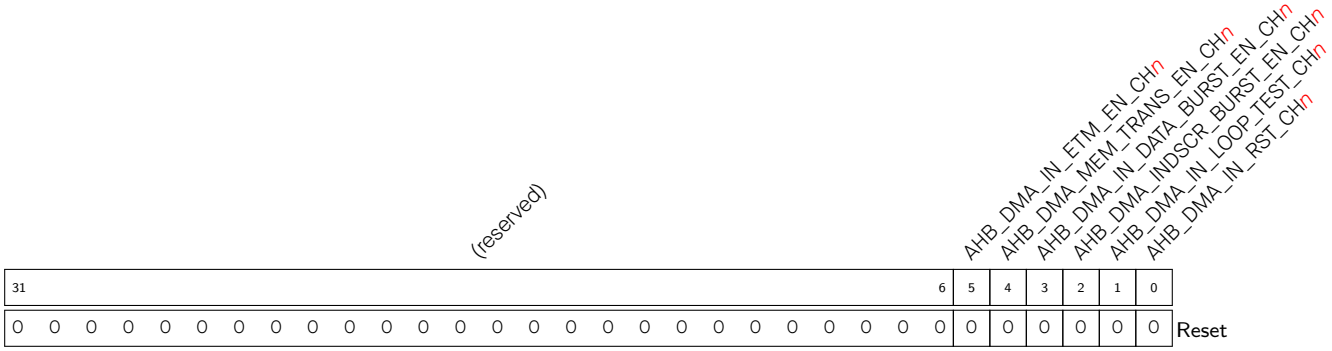
AHB_DMA_AHBM_RST_INTER Write 1 and then 0 to reset the internal AHB FSM. (R/W)

AHB_DMA_ARB_PRI_DIS Configures whether to disable the priority arbitration.

0: Enable

1: Disable

(R/W)



AHB_DMA_CLK_EN Configures AHB DMA clock gating.

0: Support clock only when the application writes registers

1: Always force the clock on for registers

(R/W)

Register 6.11. AHB_DMA_IN_CONF0_CH*n*_REG (*n*: 0-2) (0x0070+0xC0*n*)

AHB_DMA_IN_RST_CH*n* Write 1 and then 0 to reset RX channel *n* FSM and RX FIFO pointer.(R/W)

AHB_DMA_IN_LOOP_TEST_CH*n* Reserved. (R/W)

AHB_DMA_INDSCR_BURST_EN_CH*n* Configures whether to enable INCR burst transfer for RX channel *n* to read descriptors.

0: Disable

1: Enable

(R/W)

AHB_DMA_IN_DATA_BURST_EN_CH*n* Configures whether to enable INCR burst transfer for RX channel *n*.

0: Disable

1: Enable

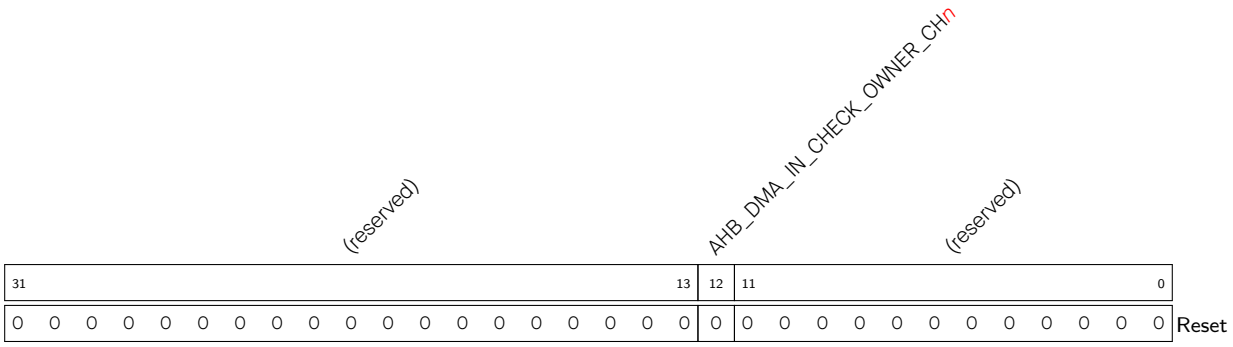
(R/W)

AHB_DMA_MEM_TRANS_EN_CH*n* (*n* = 1 ~2) Configures whether to enable memory-to-memory data transfer. Channel 0 does not support this feature.

0: Disable

1: Enable

(R/W)



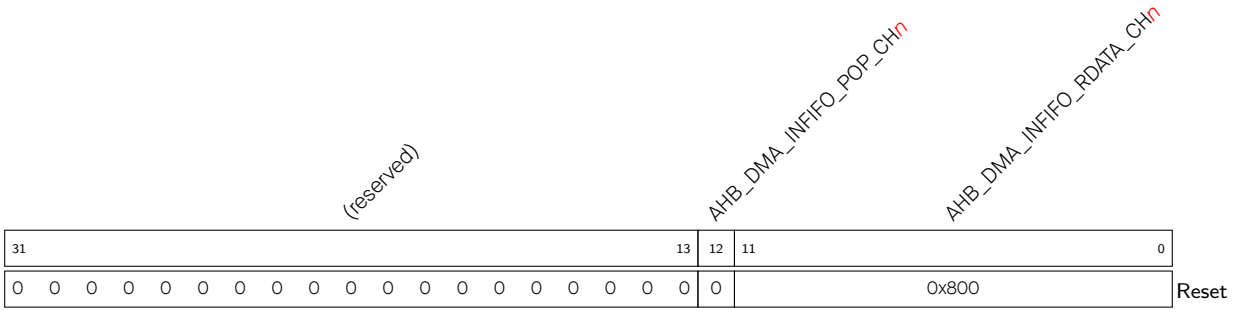
AHB_DMA_IN_ETM_EN_CH*n* Configures whether to enable ETM control for RX channel*n*.

0: Disable

1: Enable

(R/W)

Register 6.12. AHB_DMA_IN_CONF1_CH*n*_REG (*n*: 0-2) (0x0074+0xC0*n*)



AHB_DMA_IN_CHECK_OWNER_CH*n* Configures whether to enable owner bit check for RX channel *n*.

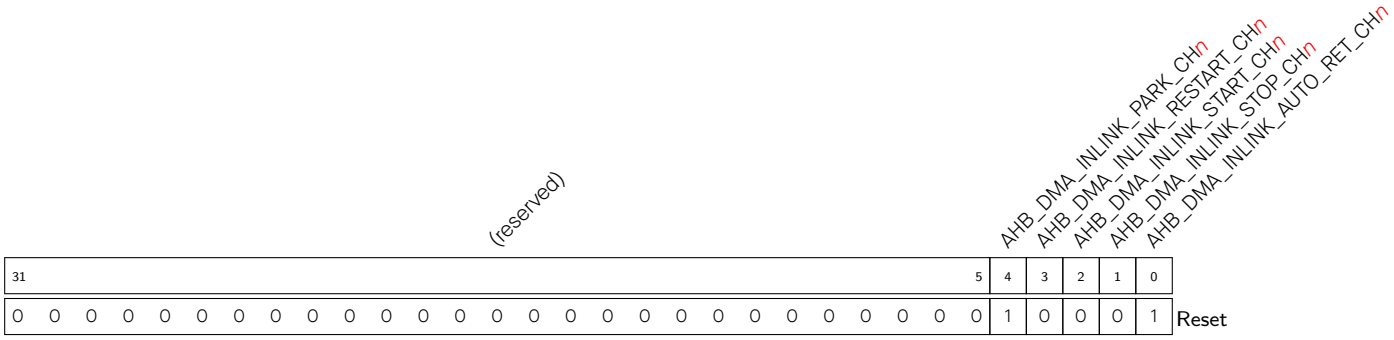
0: Disable

1: Enable

(R/W)

Register 6.13. AHB_DMA_IN_POP_CH*n*_REG (*n*: 0-2) (0x007C+0xC0*n*)

AHB_DMA_INFIFO_RDATA_CH*n* Represents the data popped from AHB DMA RX FIFO. (RO)



AHB_DMA_INFIFO_POP_CH*n* Configures whether to pop data from AHB DMA RX FIFO.

0: Invalid. No effect

1: Pop

(WT)

Register 6.14. AHB_DMA_IN_LINK_CH*n*_REG (*n*: 0-2) (0x0080+0xC0n*)**

AHB_DMA_INLINK_AUTO_RET_CH*n* Configures whether to return to the current receive descriptor's address when there are some errors in current receiving data.

0: Not return

1: Return

(R/W)

AHB_DMA_INLINK_STOP_CH*n* Configures whether to stop RX channel *n* from receiving data.

0: Invalid. No effect

1: Stop

(WT)

AHB_DMA_INLINK_START_CH*n* Configures whether to enable RX channel *n* for data transfer.

0: Disable

1: Enable

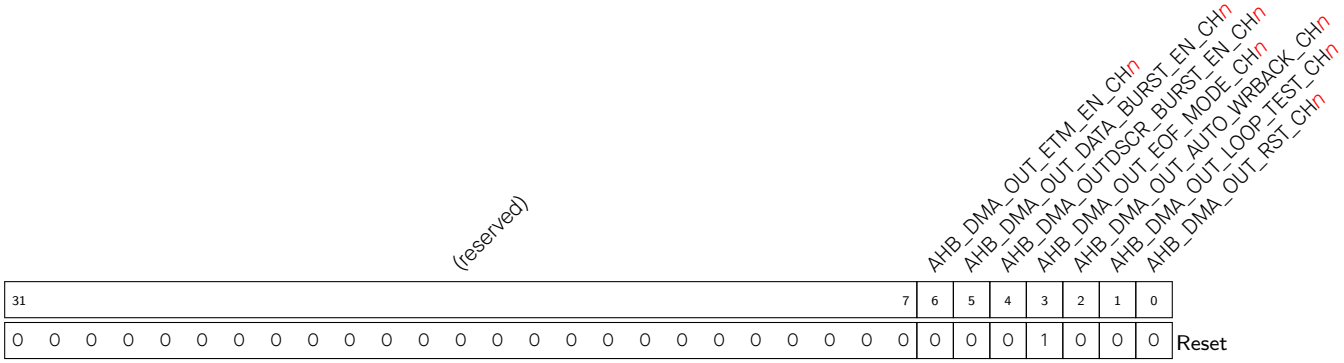
(WT)

AHB_DMA_INLINK_RESTART_CH*n* Configures whether to restart RX channel *n* for AHB DMA transfer.

0: Invalid. No effect

1: Restart

(WT)



AHB_DMA_INLINK_PARK_CH*n* Represents the status of the receive descriptor's FSM.

0: Running

1: Idle

(RO)

Register 6.15. AHB_DMA_OUT_CONF0_CH*n*_REG (*n*: 0-2) (0x00D0+0xC0n*)**

AHB_DMA_OUT_RST_CH*n* Configures the reset state of TX channel *n* FSM and TX FIFO pointer.

0: Release reset

1: Reset

(R/W)

AHB_DMA_OUT_LOOP_TEST_CH*n* Reserved. (R/W)

AHB_DMA_OUT_AUTO_WRBACK_CH*n* Configures whether to enable automatic outlink write-back when all the data in TX FIFO has been transmitted.

0: Disable

1: Enable

(R/W)

AHB_DMA_OUT_EOF_MODE_CH*n* Configures when to generate EOF flag.

0: EOF flag for TX channel *n* is generated when data to be transmitted has been pushed into FIFO in AHB DMA.

1: EOF flag for TX channel *n* is generated when data to be transmitted has been popped from FIFO in AHB DMA.

(R/W)

AHB_DMA_OUTDSCR_BURST_EN_CH*n* Configures whether to enable INCR burst transfer for TX channel *n* reading descriptors.

0: Disable

1: Enable

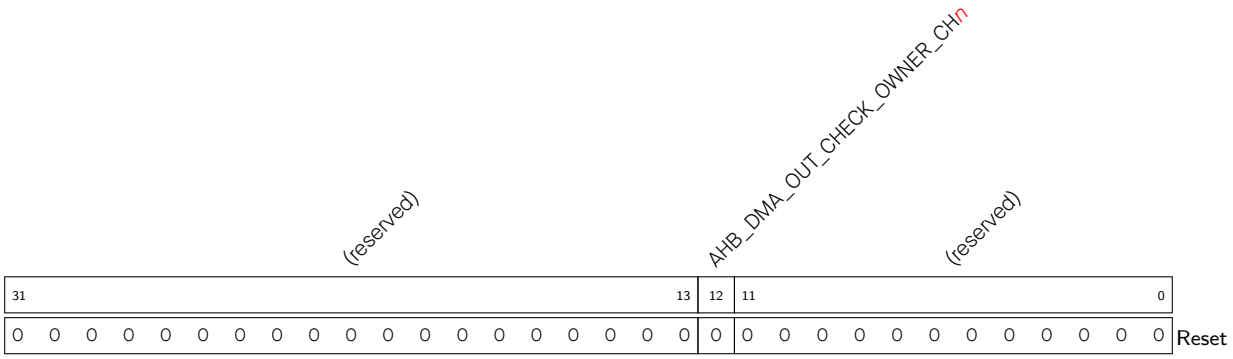
(R/W)

AHB_DMA_OUT_DATA_BURST_EN_CH*n* Configures whether to enable INCR burst transfer for TX channel *n*.

0: Disable

1: Enable

(R/W)



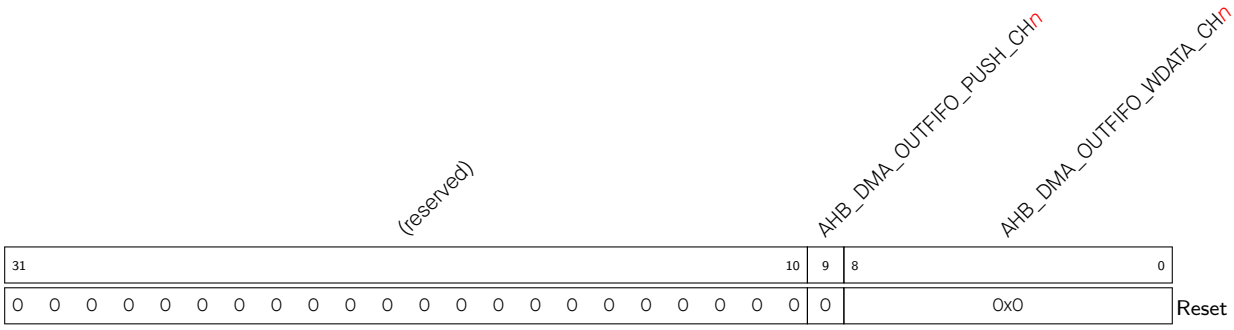
AHB_DMA_OUT_ETM_EN_CH*n* Configures whether to enable ETM control for TX channel *n*.

0: Disable

1: Enable

(R/W)

Register 6.16. AHB_DMA_OUT_CONF1_CH*n*_REG (*n*: 0-2) (0x00D4+0xC0*n*)



AHB_DMA_OUT_CHECK_OWNER_CH*n* Configures whether to enable owner bit check for TX channel *n*.

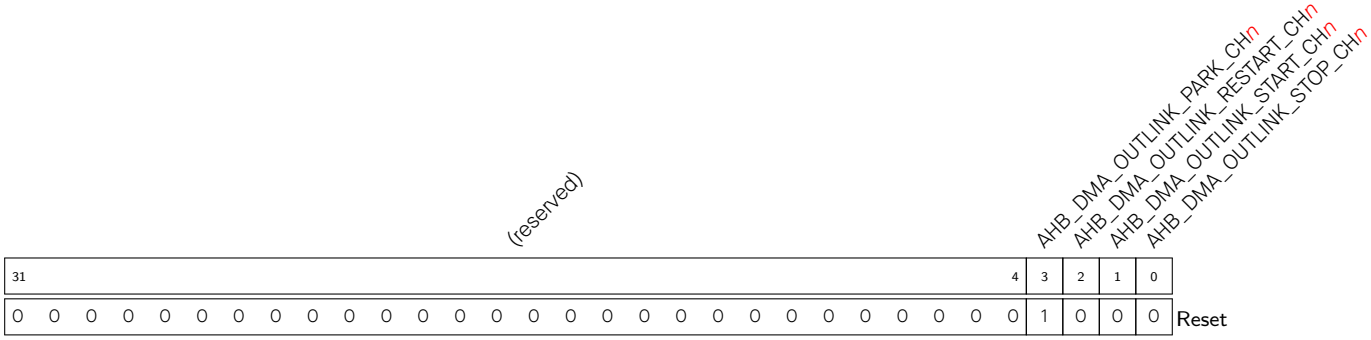
0: Disable

1: Enable

(R/W)

Register 6.17. AHB_DMA_OUT_PUSH_CH*n*_REG (*n*: 0-2) (0x00DC+0xC0*n*)

AHB_DMA_OUTFIFO_WDATA_CH*n* Represents the data that need to be pushed into AHB DMA TX FIFO. (R/W)



AHB_DMA_OUTFIFO_PUSH_CH*n* Configures whether to push data into AHB DMA TX FIFO.

0: Invalid. No effect

1: Push

(WT)

Register 6.18. AHB_DMA_OUT_LINK_CH*n*_REG (*n*: 0-2) (0x00E0+0xC0**n*)

AHB_DMA_OUTLINK_STOP_CH*n* Configures whether to stop TX channel *n* from transmitting data.

0: Invalid. No effect

1: Stop

(WT)

AHB_DMA_OUTLINK_START_CH*n* Configures whether to enable TX channel *n* for data transfer.

0: Disable

1: Enable

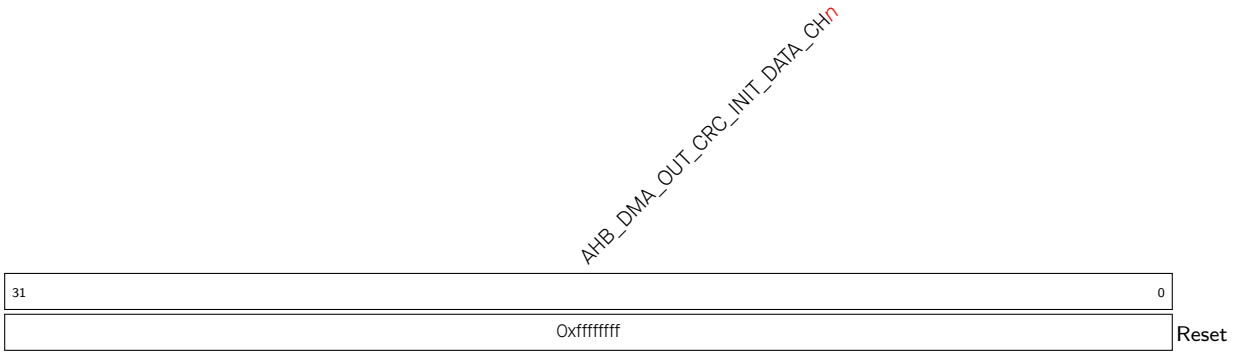
(WT)

AHB_DMA_OUTLINK_RESTART_CH*n* Configures whether to restart TX channel *n* for AHB DMA transfer.

0: Invalid. No effect

1: Restart

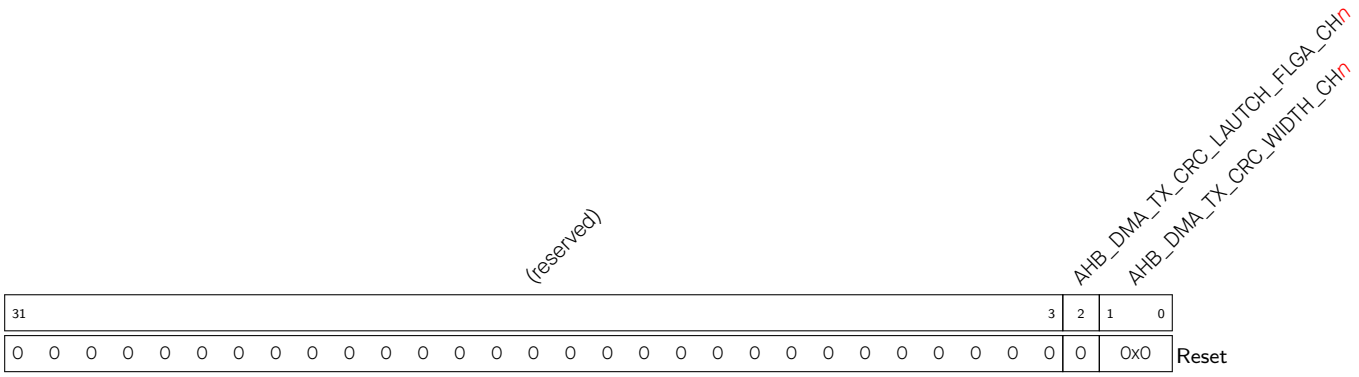
(WT)



AHB_DMA_OUTLINK_PARK_CH*n* Represents the status of the transmit descriptor's FSM.

0: Running

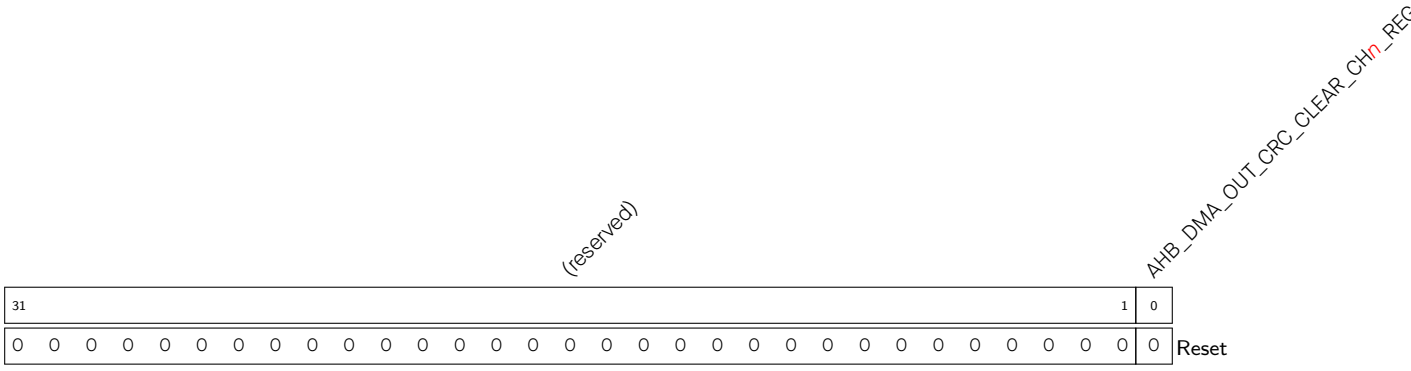
1: Idle



(RO)

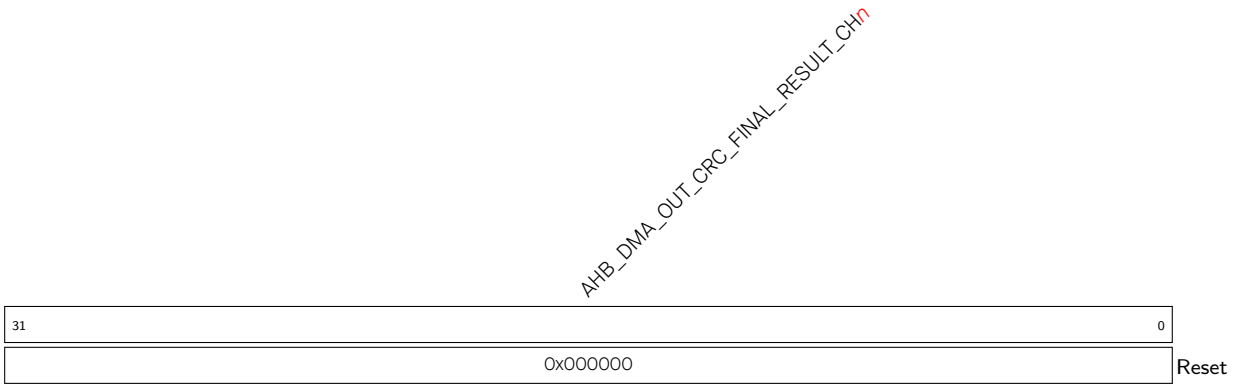
Register 6.19. AHB_DMA_OUT_CRC_INIT_DATA_CH*n*_REG (*n*: 0-2) (0x02BC+0x28**n*)

AHB_DMA_OUT_CRC_INIT_DATA_CH*n* Configures the CRC initial value for TX channel *n*. (R/W)



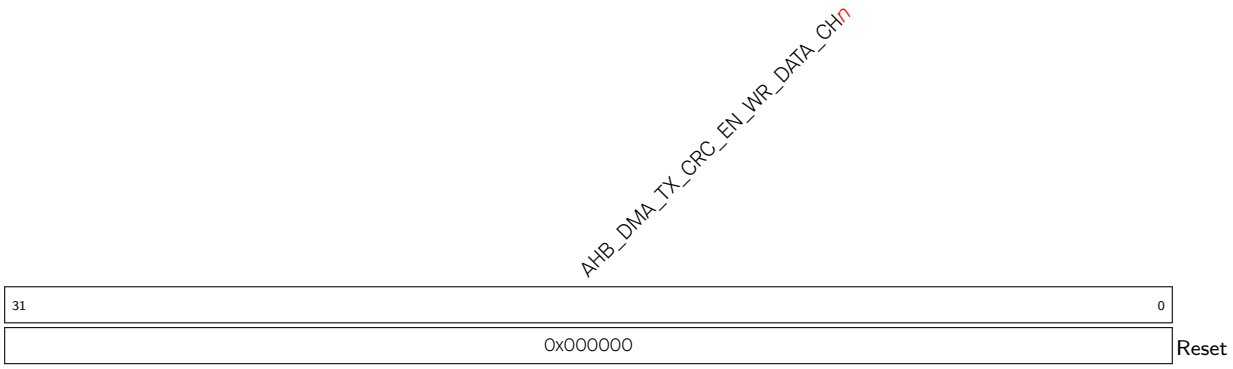
Register 6.20. AHB_DMA_TX_CRC_WIDTH_CH*n*_REG (*n*: 0-2) (0x02C0+0x28**n*)

AHB_DMA_TX_CRC_WIDTH_CH*n* Configures the CRC result width for TX channel *n*. 0: $\leq$ 8 bits
1: $\leq$ 16 bits
2: $\leq$ 24 bits
3: $\leq$ 32 bits
(R/W)



AHB_DMA_TX_CRC_LAUTCH_FLGA_CH*n* Write 1 and then 0 to latch the values of AHB_DMA_TX_CRC_EN_ADDR_CH*n*, AHB_DMA_TX_CRC_DATA_EN_ADDR_CH*n*, AHB_DMA_TX_CRC_EN_WR_DATA_CH*n*, and AHB_DMA_TX_CRC_DATA_EN_WR_DATA_CH*n*. (R/W)

Register 6.21. AHB_DMA_OUT_CRC_CLEAR_CH*n*_REG (*n*: 0-2) (0x02C4+0x28**n*)

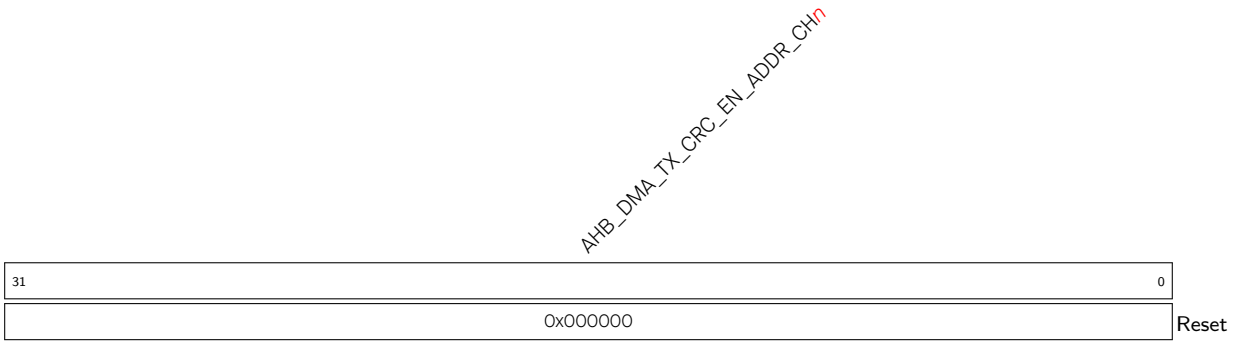


AHB_DMA_OUT_CRC_CLEAR_CH*n*_REG Reserved. (R/W)

Register 6.22. AHB_DMA_OUT_CRC_FINAL_RESULT_CH*n*_REG (*n*: 0-2) (0x02C8+0x28*n)

AHB_DMA_OUT_CRC_FINAL_RESULT_CH*n* Represents the CRC result for TX channel *n*. (RO)

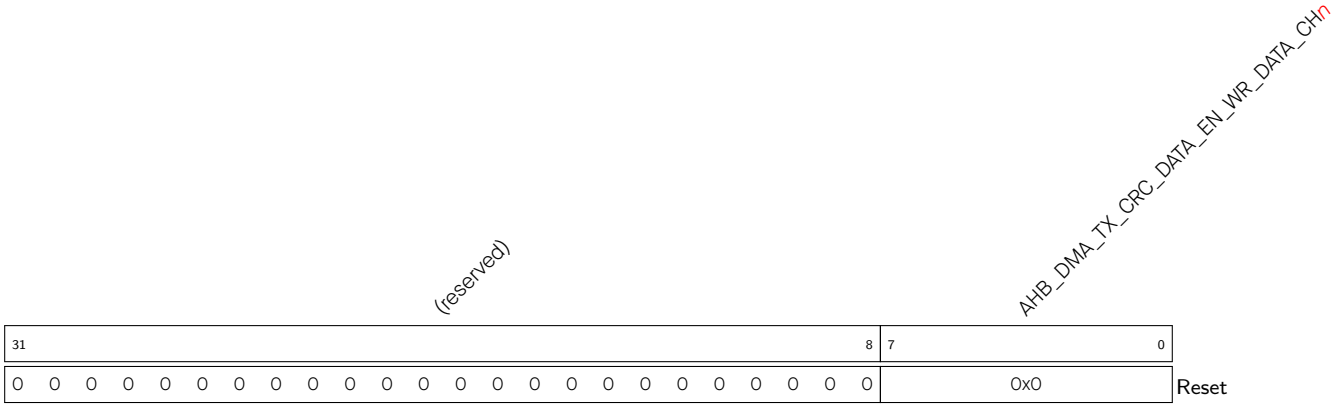
Register 6.23. AHB_DMA_TX_CRC_EN_WR_DATA_CH*n*_REG (*n*: 0-2) (0x02CC+0x28*n)



AHB_DMA_TX_CRC_EN_WR_DATA_CH*n* Configures whether to include each bit of the intermediate result in the CRC calculation matrix for TX channel *n*.

0: Not include

1: Include

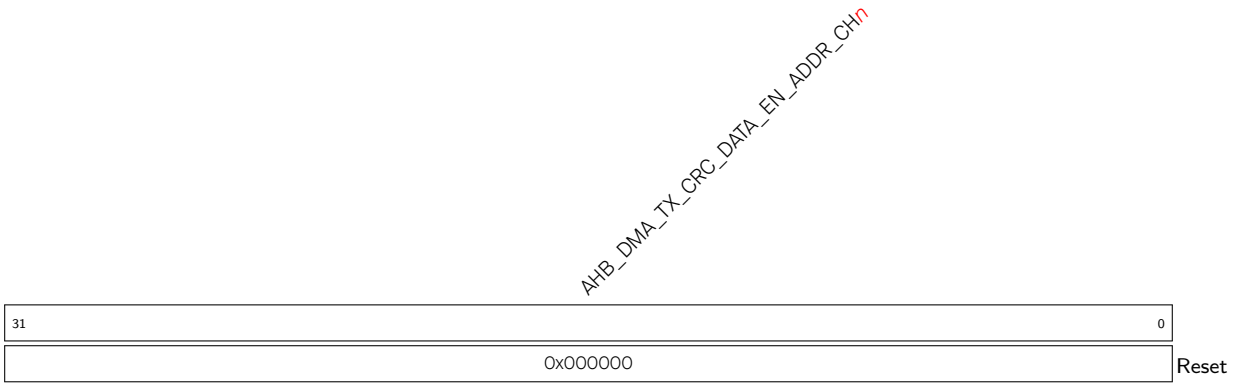


(R/W)

Register 6.24. AHB_DMA_TX_CRC_EN_ADDR_CH*n*_REG (*n*: 0-2) (0x02D0+0x28n*)**

AHB_DMA_TX_CRC_EN_ADDR_CH*n* Configures at which bit of the CRC result the AHB_DMA_TX_CRC_EN_WR_DATA_CH*n*_REG register targets for TX channel *n*. (R/W)

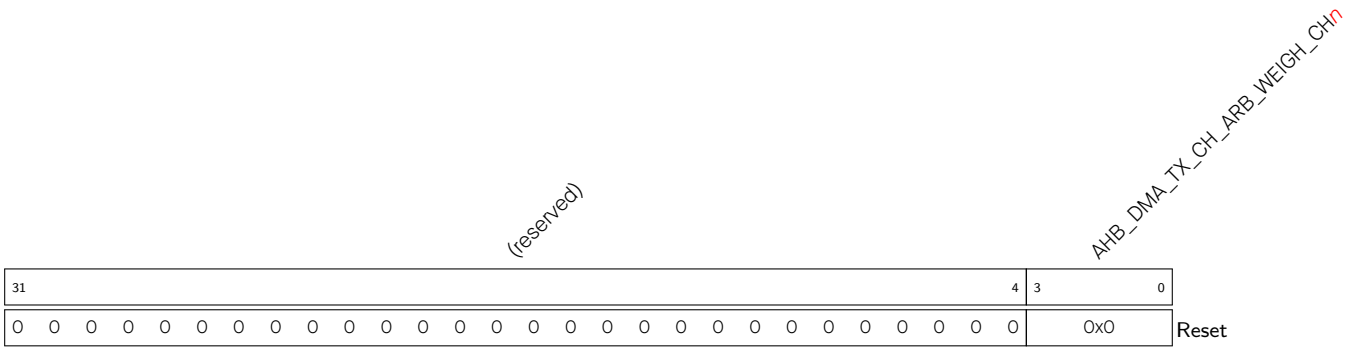
Register 6.25. AHB_DMA_TX_CRC_DATA_EN_WR_DATA_CH*n*_REG (*n*: 0-2) (0x02D4+0x28n*)**



AHB_DMA_TX_CRC_DATA_EN_WR_DATA_CH*n* Configures whether to include each bit of the data in the CRC calculation matrix for TX channel *n*.

0: Not include

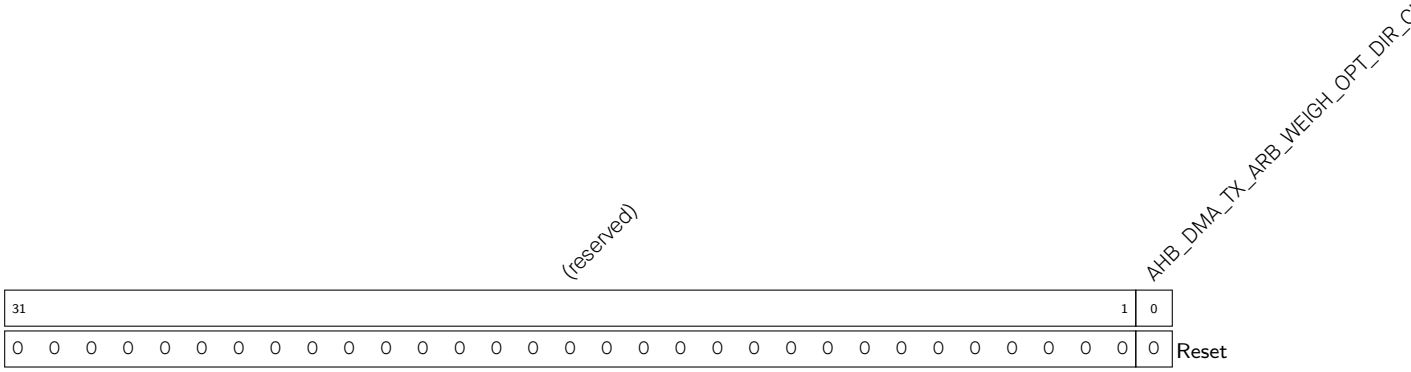
1: Include



(R/W)

Register 6.26. AHB_DMA_TX_CRC_DATA_EN_ADDR_CH*n*_REG (*n*: 0-2) (0x02D8+0x28*n)

AHB_DMA_TX_CRC_DATA_EN_ADDR_CH*n* Configures at which bit of the CRC result the AHB_DMA_TX_CRC_DATA_EN_WR_DATA_CH*n*_REG register targets for TX channel *n*. (R/W)



Register 6.27. AHB_DMA_TX_CH_ARB_WEIGH_CH*n*_REG (*n*: 0-2) (0x02DC+0x28*n)

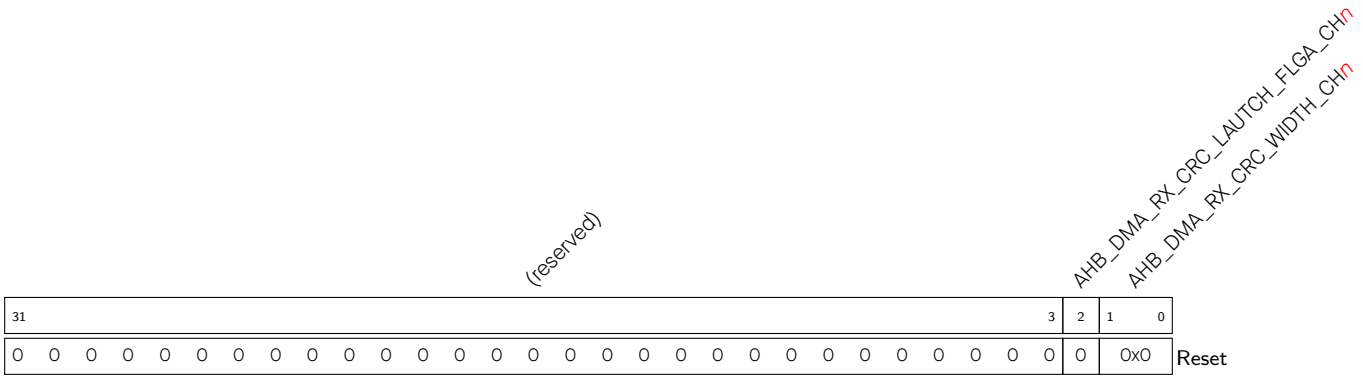
AHB_DMA_TX_CH_ARB_WEIGH_CH*n* Configures the weight (i.e the number of tokens) of TX channel *n*.

Value range: 0 ~ 15. (R/W)

Register 6.28. AHB_DMA_TX_ARB_WEIGH_OPT_DIR_CH*n*_REG (*n*: 0-2) (0x02E0+0x28**n*)

AHB_DMA_TX_ARB_WEIGH_OPT_DIR_CH*n* Configures whether to enable weight optimization for TX channel *n*.

0: Enable



1: Disable (R/W)

Register 6.29. AHB_DMA_IN_CRC_INIT_DATA_CH*n*_REG (*n*: 0-2) (0x0334+0x28**n*)

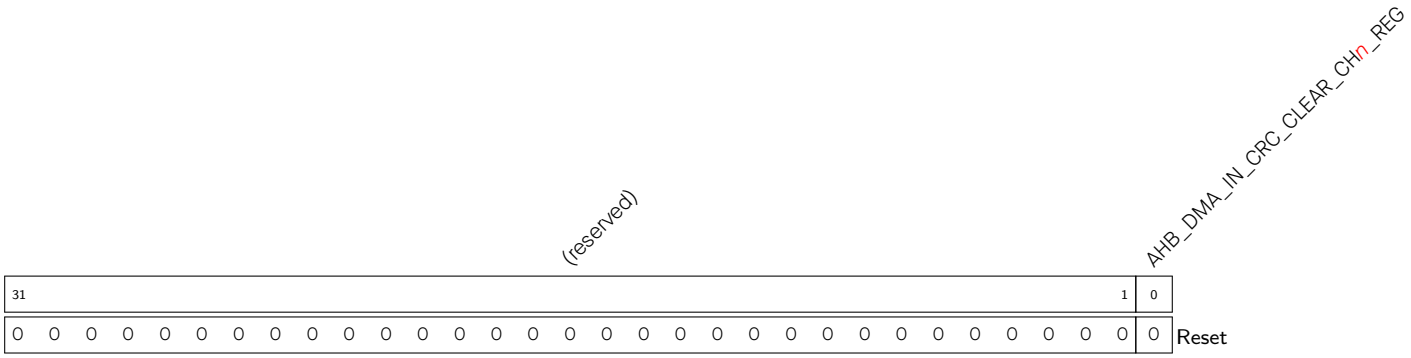
AHB_DMA_IN_CRC_INIT_DATA_CH*n* Configures the CRC initial value for RX channel *n*. (R/W)

Register 6.30. AHB_DMA_RX_CRC_WIDTH_CH*n*_REG (*n*: 0-2) (0x0338+0x28**n*)

AHB_DMA_RX_CRC_WIDTH_CH*n* Configures the CRC result width for RX channel *n*.

0: $\leq$ 8 bits

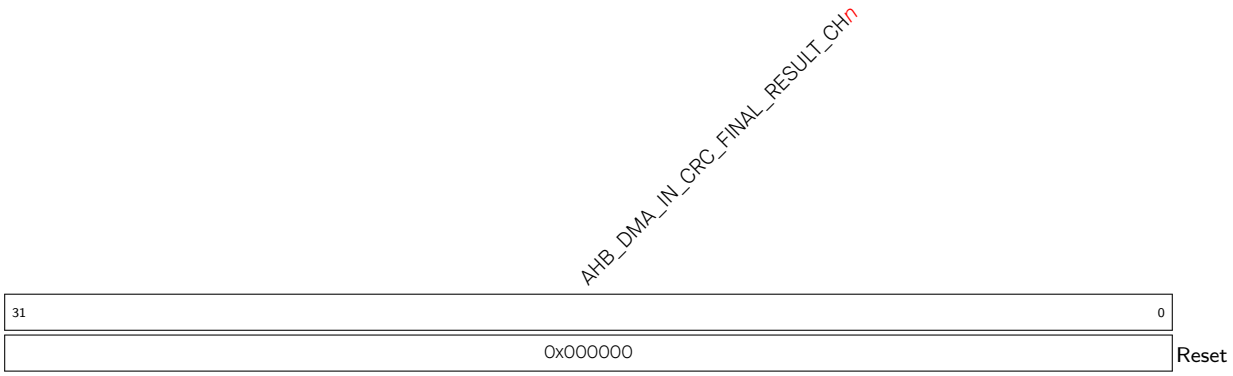
1: $\leq$ 16 bits



2: $\leq$ 24 bits

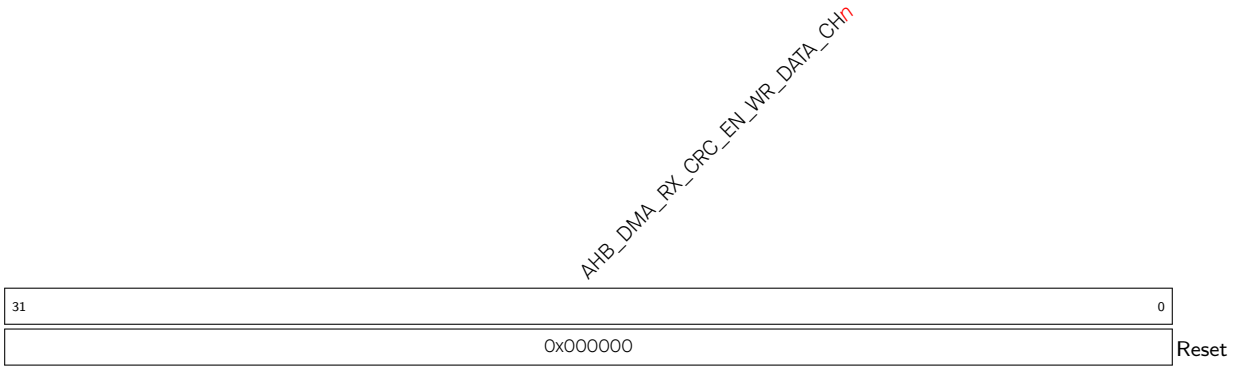
3: $\leq$ 32 bits

(R/W)



AHB_DMA_RX_CRC_LAUTCH_FLGA_CH*n* Write 1 and then 0 to latch the values of AHB_DMA_RX_CRC_EN_ADDR_CH*n*, AHB_DMA_RX_CRC_DATA_EN_ADDR_CH*n*, AHB_DMA_RX_CRC_EN_WR_DATA_CH*n*, and AHB_DMA_RX_CRC_DATA_EN_WR_DATA_CH*n*. (R/W)

Register 6.31. AHB_DMA_IN_CRC_CLEAR_CH*n*_REG (*n*: 0-2) (0x033C+0x28**n*)

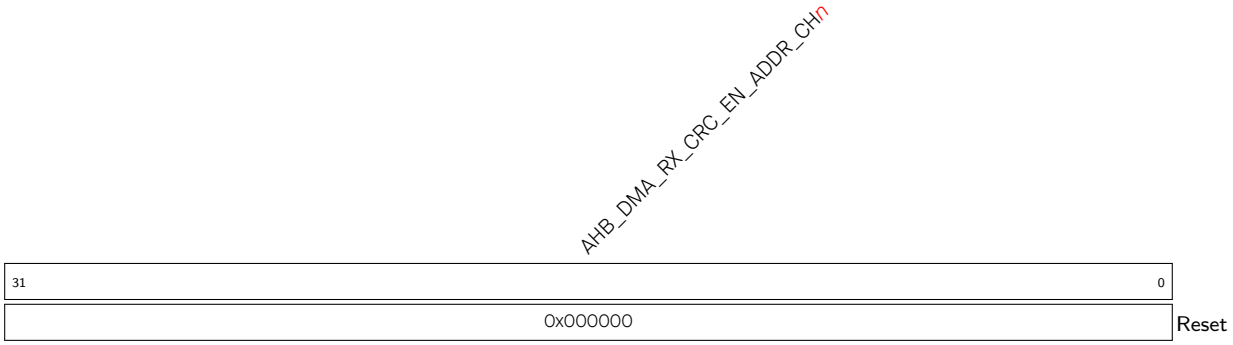


AHB_DMA_IN_CRC_CLEAR_CH*n*_REG Reserved. (R/W)

Register 6.32. AHB_DMA_IN_CRC_FINAL_RESULT_CH*n*_REG (*n*: 0-2) (0x0340+0x28**n*)

AHB_DMA_IN_CRC_FINAL_RESULT_CH*n* Represents the CRC result for RX channel *n*. (RO)

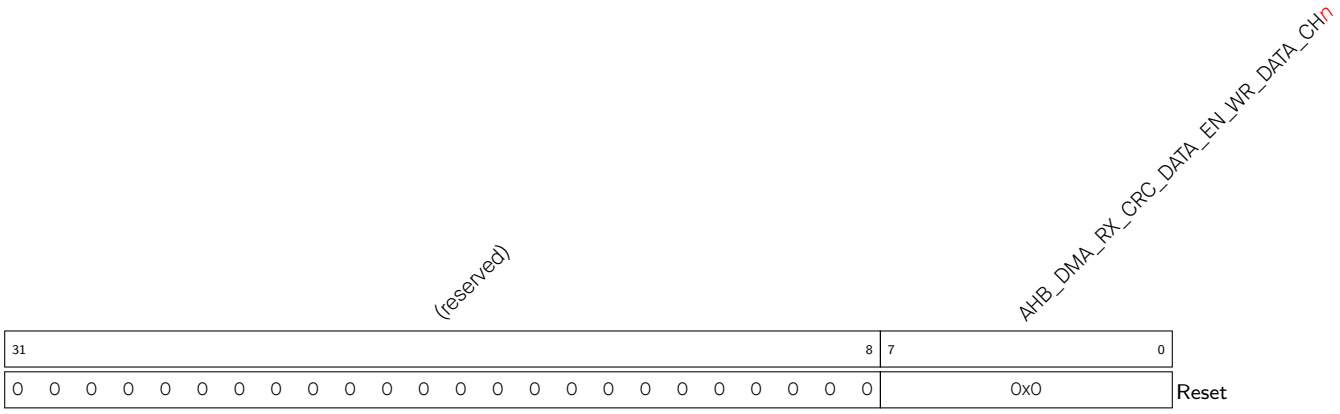
Register 6.33. AHB_DMA_RX_CRC_EN_WR_DATA_CH*n*_REG (*n*: 0-2) (0x0344+0x28**n*)



AHB_DMA_RX_CRC_EN_WR_DATA_CH*n* Configures whether to include each bit of the intermediate result in the CRC calculation matrix for RX channel *n*.

0: Not include

1: Include

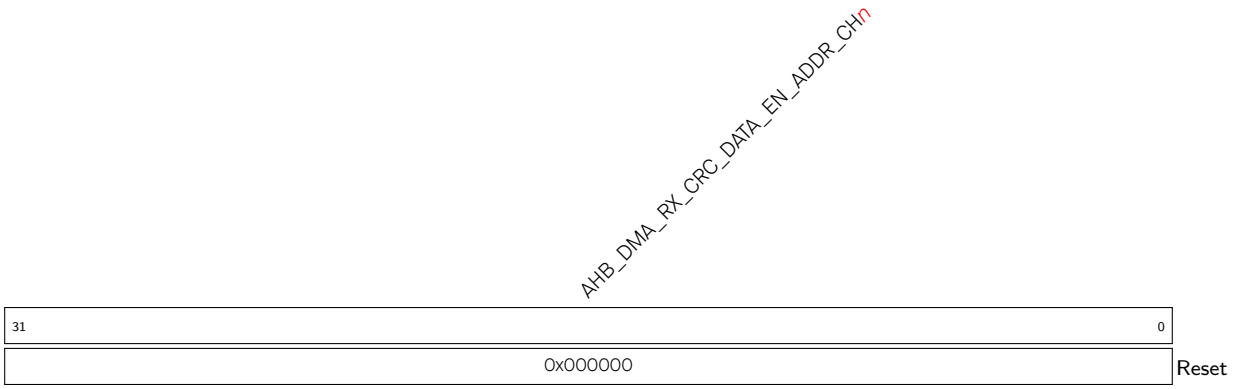


(R/W)

Register 6.34. AHB_DMA_RX_CRC_EN_ADDR_CH*n*_REG (*n*: 0-2) (0x0348+0x28n*)**

AHB_DMA_RX_CRC_EN_ADDR_CH*n* Configures at which bit of the CRC result the AHB_DMA_RX_CRC_EN_WR_DATA_CH*n*_REG register targets for RX channel *n*. (R/W)

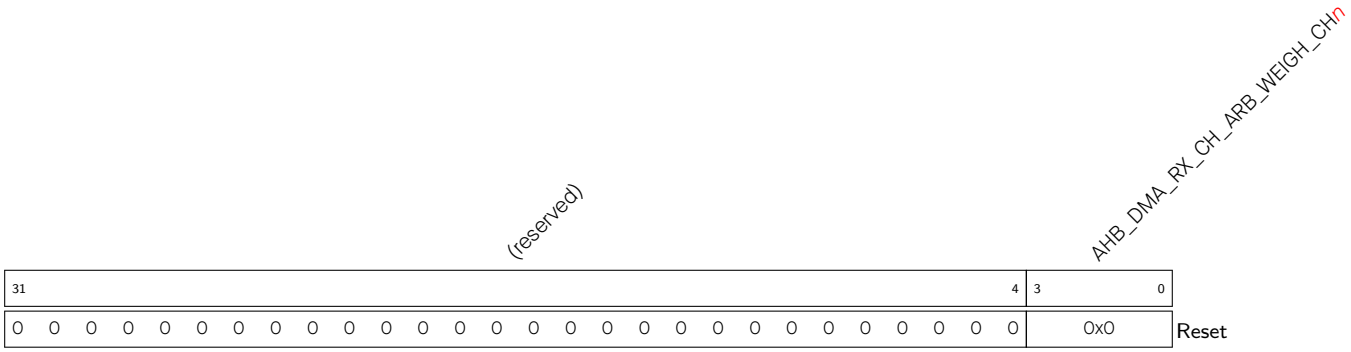
Register 6.35. AHB_DMA_RX_CRC_DATA_EN_WR_DATA_CH*n*_REG (*n*: 0-2) (0x034C+0x28n*)**



AHB_DMA_RX_CRC_DATA_EN_WR_DATA_CH*n* Configures whether to include each bit of the data in the CRC calculation matrix for RX channel *n*.

0: Not include

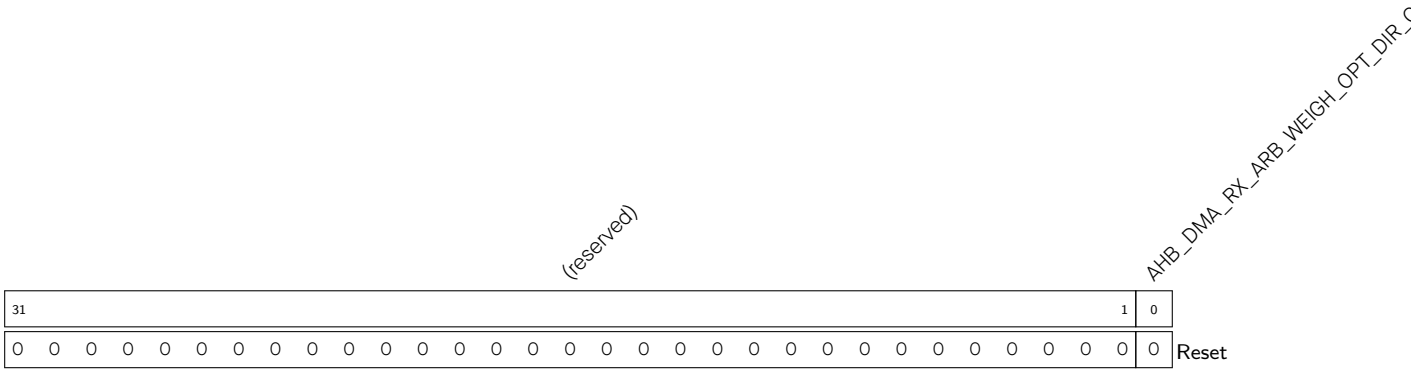
1: Include



(R/W)

Register 6.36. AHB_DMA_RX_CRC_DATA_EN_ADDR_CH*n*_REG (*n*: 0-2) (0x0350+0x28**n*)

AHB_DMA_RX_CRC_DATA_EN_ADDR_CH*n* Configures at which bit of the CRC result the AHB_DMA_RX_CRC_DATA_EN_WR_DATA_CH*n*_REG register targets for RX channel *n*. (R/W)

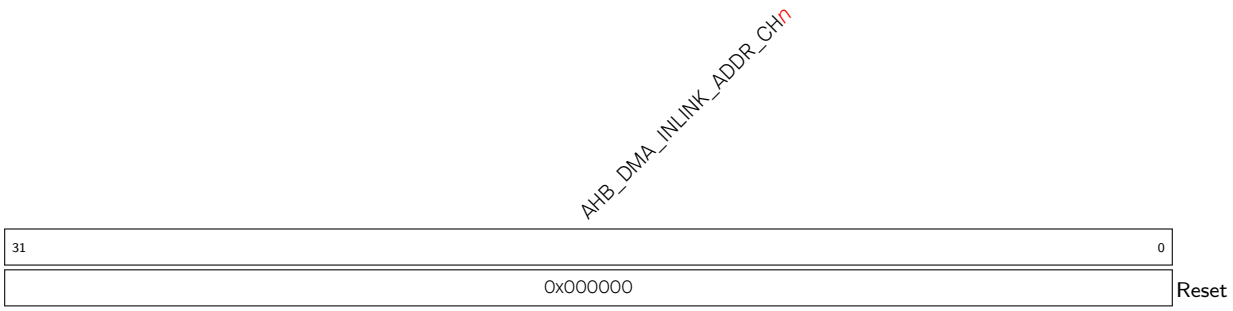


Register 6.37. AHB_DMA_RX_CH_ARB_WEIGH_CH*n*_REG (*n*: 0-2) (0x0354+0x28**n*)

AHB_DMA_RX_CH_ARB_WEIGH_CH*n* Configures the weight (i.e the number of tokens) of RX channel *n*.

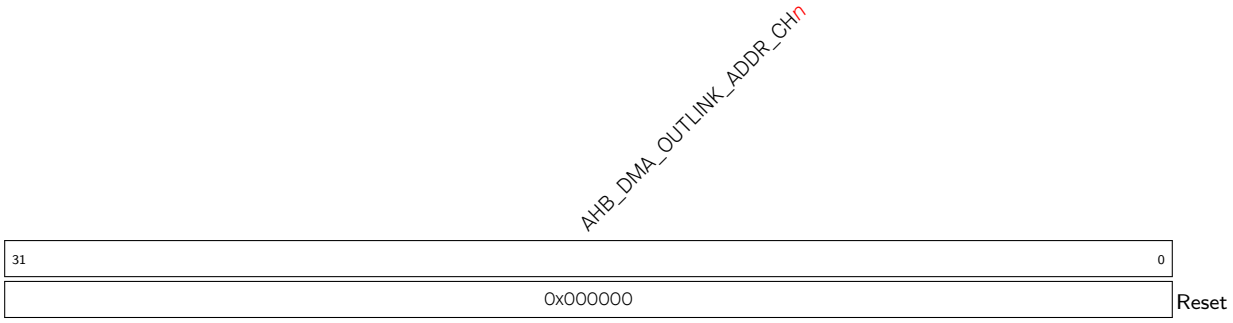
Value range: 0 ~ 15. (R/W)

Register 6.38. AHB_DMA_RX_ARB_WEIGH_OPT_DIR_CH*n*_REG (*n*: 0-2) (0x0358+0x28**n*)



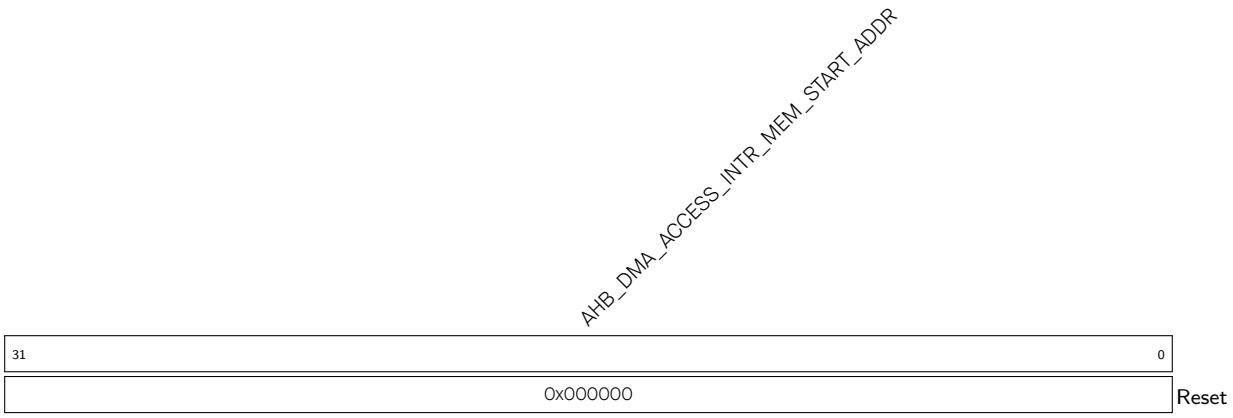
AHB_DMA_RX_ARB_WEIGH_OPT_DIR_CH*n* Configures whether to enable weight optimization for RX channel *n*.

0: Enable



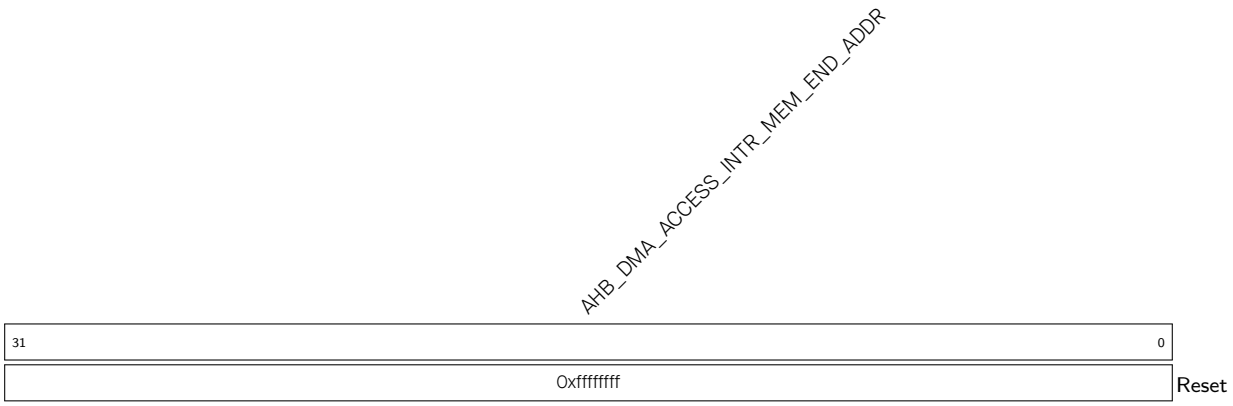
1: Disable (R/W)

Register 6.39. AHB_DMA_IN_LINK_ADDR_CH*n*_REG (*n*: 0-2) (0x03AC+0x4**n*)



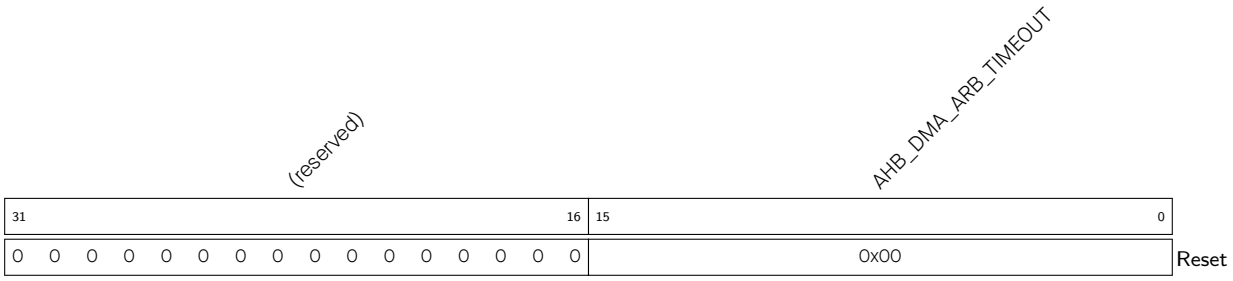
AHB_DMA_INLINK_ADDR_CH*n* Represents the first receive descriptor's address. (R/W)

Register 6.40. AHB_DMA_OUT_LINK_ADDR_CH*n*_REG (*n*: 0-2) (0x03B8+0x4**n*)



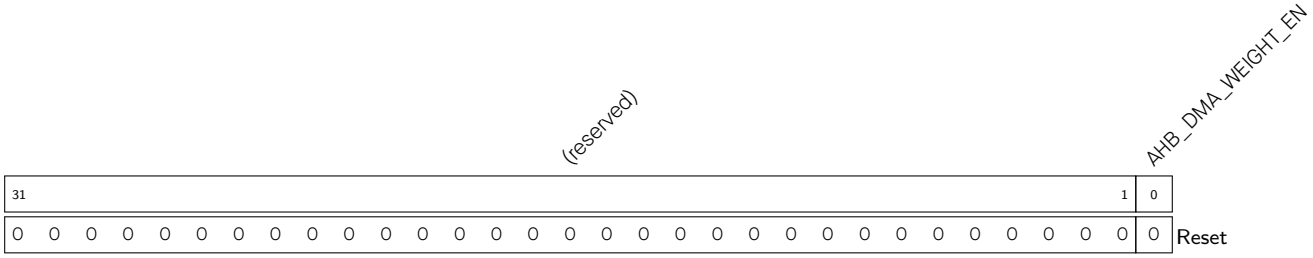
AHB_DMA_OUTLINK_ADDR_CH*n* Represents the first transmit descriptor's address. (R/W)

Register 6.41. AHB_DMA_INTR_MEM_START_ADDR_REG (0x03C4)



AHB_DMA_ACCESS_INTR_MEM_START_ADDR Configures the start address of accessible address space. (R/W)

Register 6.42. AHB_DMA_INTR_MEM_END_ADDR_REG (0x03C8)

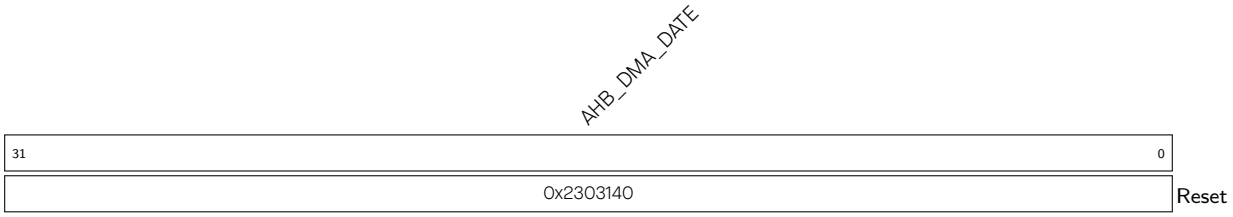


AHB_DMA_ACCESS_INTR_MEM_END_ADDR Configures the end address of accessible address space. (R/W)

Register 6.43. AHB_DMA_ARB_TIMEOUT_REG (0x03DC)

AHB_DMA_ARB_TIMEOUT Configures the time slot of weight arbitration. Measurement unit: AHB bus clock cycle. (R/W)

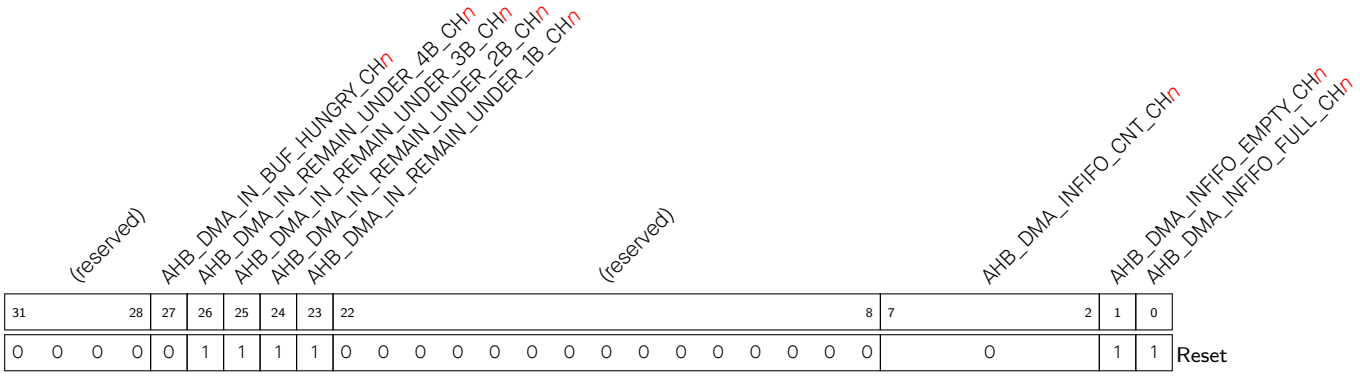
Register 6.44. AHB_DMA_WEIGHT_EN_REG (0x0400)



AHB_DMA_WEIGHT_EN Configures whether to enable weight arbitration.

0: Disable

1: Enable



(R/W)

Register 6.45. AHB_DMA_DATE_REG (0x0068)

AHB_DMA_DATE Version control register. (R/W)

Register 6.46. AHB_DMA_INFIFO_STATUS_CH*n*_REG (*n*: 0-2) (0x0078+0xC0n*)**

AHB_DMA_INFIFO_FULL_CH*n* Represents whether L1 RX FIFO is full.

0: Not Full

1: Full

(RO)

AHB_DMA_INFIFO_EMPTY_CH*n* Represents whether L1 RX FIFO is empty.

0: Not empty

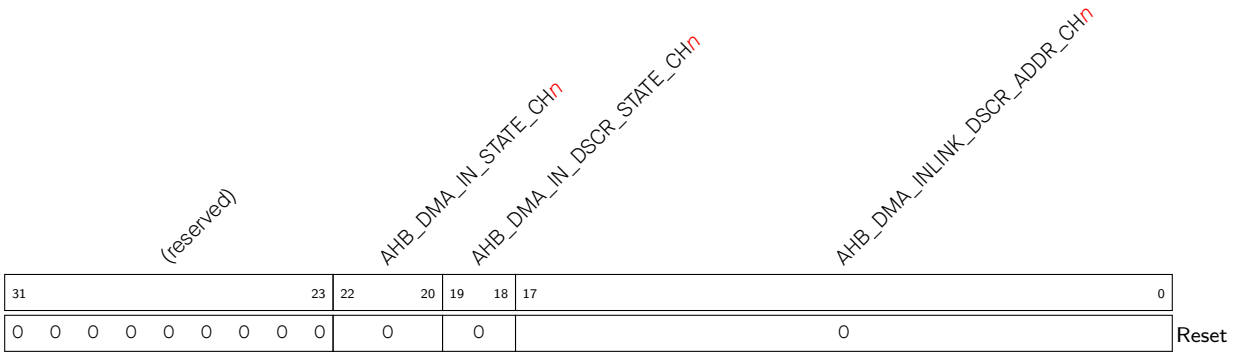
1: Empty

(RO)

AHB_DMA_INFIFO_CNT_CH*n* Represents the number of data bytes in L1 RX FIFO for RX channel *n*.

(RO)

AHB_DMA_IN_REMAIN_UNDER_1B_CH*n* Reserved. (RO)



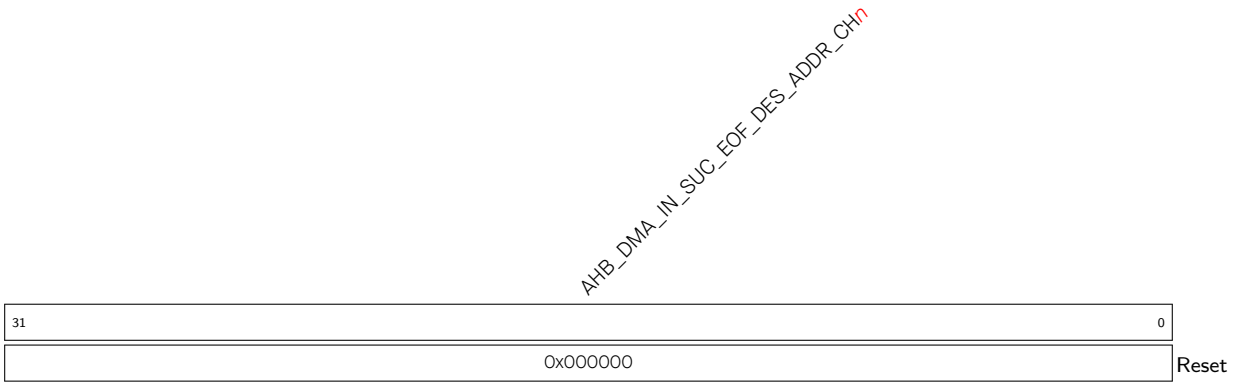
AHB_DMA_IN_REMAIN_UNDER_2B_CH*n* Reserved. (RO)

AHB_DMA_IN_REMAIN_UNDER_3B_CH*n* Reserved. (RO)

AHB_DMA_IN_REMAIN_UNDER_4B_CH*n* Reserved. (RO)

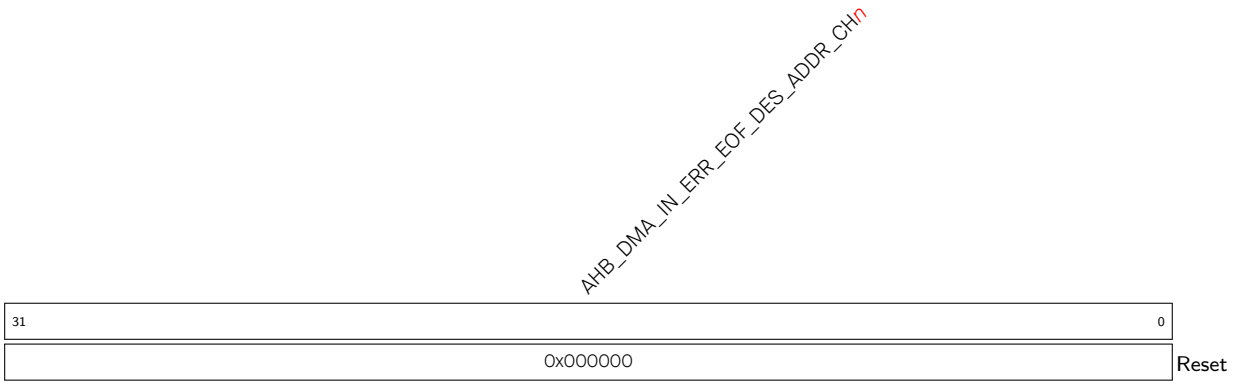
AHB_DMA_IN_BUF_HUNGRY_CH*n* Reserved. (RO)

Register 6.47. AHB_DMA_IN_STATE_CH*n*_REG (*n*: 0-2) (0x0084+0xC0*n)



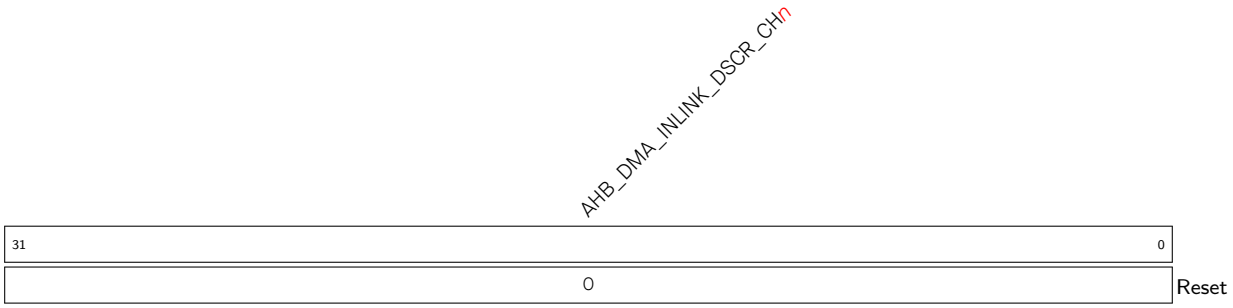
AHB_DMA_INLINK_DSCR_ADDR_CH*n* Represents the lower 18 bits of the next receive descriptor address that is pre-read (but not processed yet). If the current receive descriptor is the last descriptor, then this field represents the address of the current receive descriptor. (RO)

AHB_DMA_IN_DSCR_STATE_CH*n* Reserved. (RO)



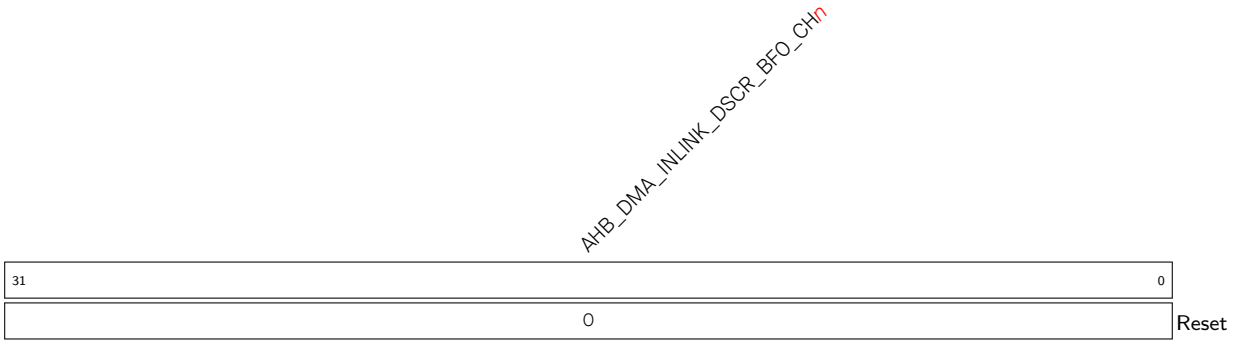
AHB_DMA_IN_STATE_CH*n* Reserved. (RO)

Register 6.48. AHB_DMA_IN_SUC_EOF_DES_ADDR_CH*n*_REG (*n*: 0-2) (0x0088+0xC0*n)



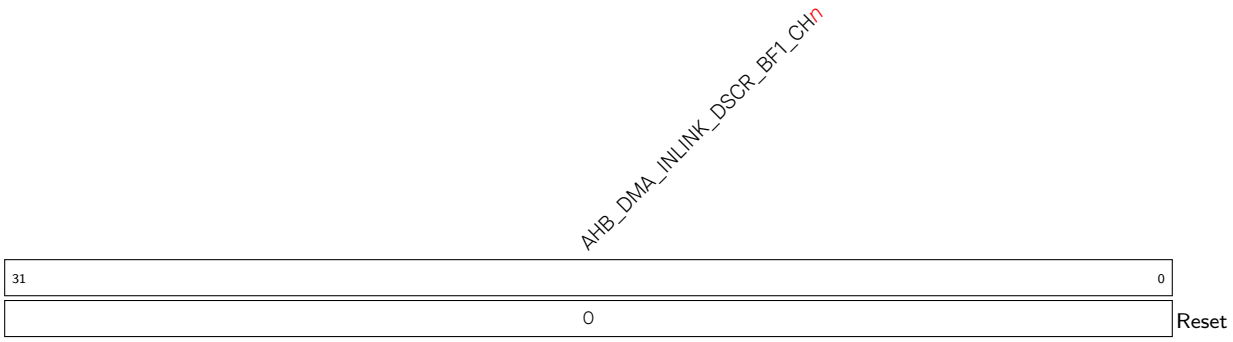
AHB_DMA_IN_SUC_EOF_DES_ADDR_CH*n* Represents the address of the receive descriptor when the EOF bit in this descriptor is 1. (RO)

Register 6.49. AHB_DMA_IN_ERR_EOF_DES_ADDR_CH*n*_REG (*n*: 0-2) (0x008C+0xC0*n*)



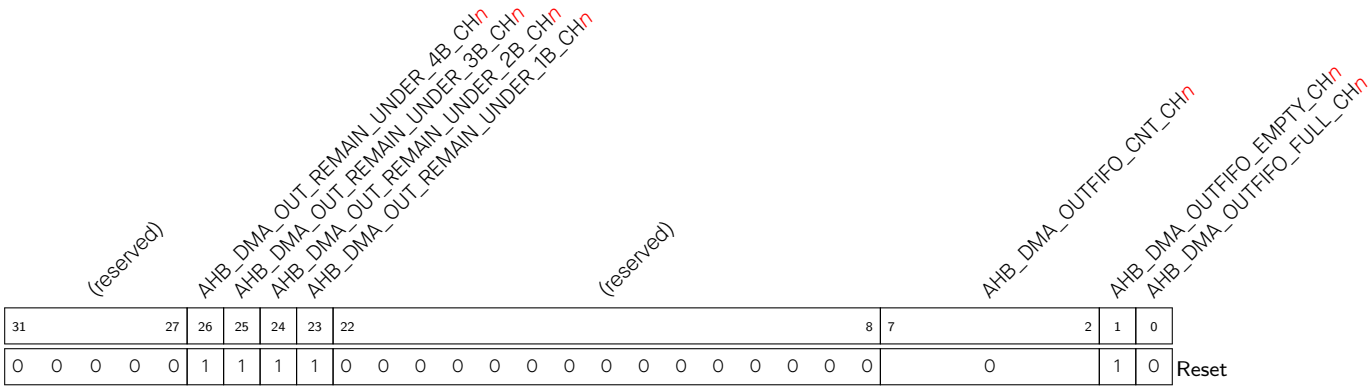
AHB_DMA_IN_ERR_EOF_DES_ADDR_CH*n* Represents the address of the receive descriptor when there are some errors in the currently received data. Valid only for UHCI. (RO)

Register 6.50. AHB_DMA_IN_DSCR_CH*n*_REG (*n*: 0-2) (0x0090+0xC0*n*)



AHB_DMA_INLINK_DSCR_CH*n* Represents the address of the next receive descriptor x+1 pointed by the current receive descriptor that is pre-read. (RO)

Register 6.51. AHB_DMA_IN_DSCR_BF0_CH*n*_REG (*n*: 0-2) (0x0094+0xC0*n*)



AHB_DMA_INLINK_DSCR_BF0_CH*n* Represents the address of the current receive descriptor x that is pre-read. (RO)

Register 6.52. AHB_DMA_IN_DSCR_BF1_CH*n*_REG (*n*: 0-2) (0x0098+0xC0*n*)

AHB_DMA_INLINK_DSCR_BF1_CH*n* Represents the address of the previous receive descriptor x-1 that is pre-read. (RO)

Register 6.53. AHB_DMA_OUTFIFO_STATUS_CH*n*_REG (*n*: 0-2) (0x00D8+0xC0*n*)

AHB_DMA_OUTFIFO_FULL_CH*n* Represents whether L1 TX FIFO is full.

0: Not Full

1: Full

(RO)

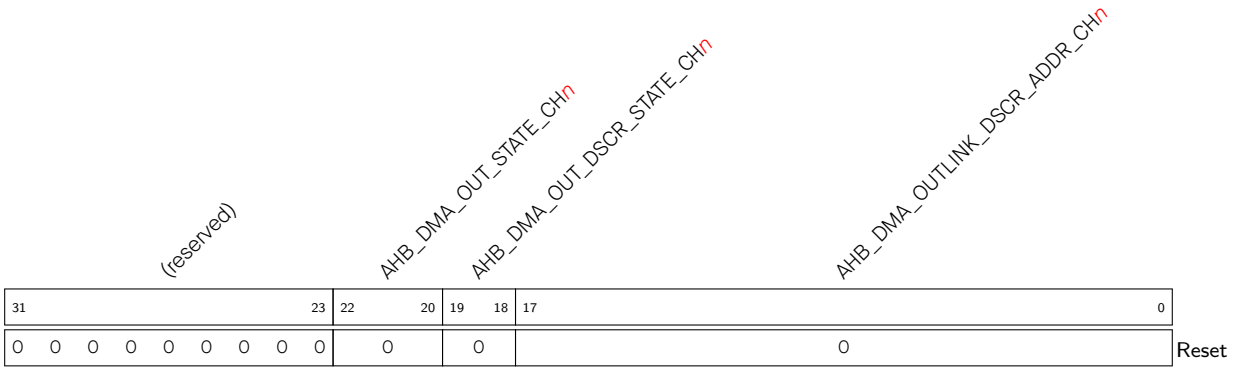
AHB_DMA_OUTFIFO_EMPTY_CH*n* Represents whether L1 TX FIFO is empty.

0: Not empty

1: Empty

(RO)

AHB_DMA_OUTFIFO_CNT_CH*n* Represents the number of data bytes in L1 TX FIFO for TX channel *n*. (RO)



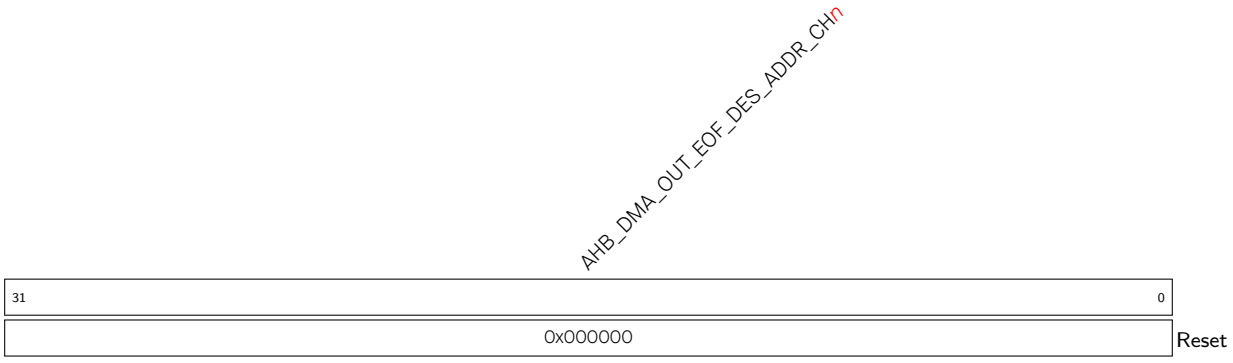
AHB_DMA_OUT_REMAIN_UNDER_1B_CH*n* Reserved. (RO)

AHB_DMA_OUT_REMAIN_UNDER_2B_CH*n* Reserved. (RO)

AHB_DMA_OUT_REMAIN_UNDER_3B_CH*n* Reserved. (RO)

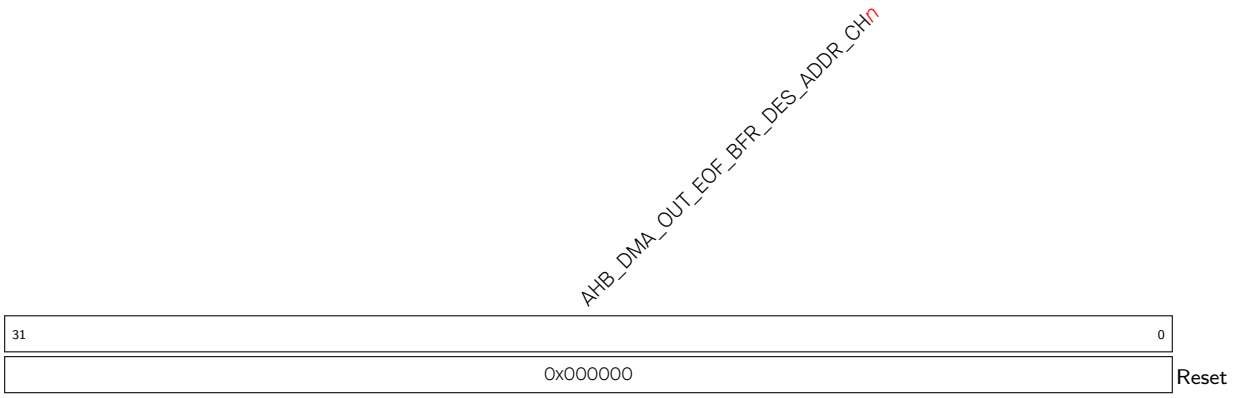
AHB_DMA_OUT_REMAIN_UNDER_4B_CH*n* Reserved. (RO)

Register 6.54. AHB_DMA_OUT_STATE_CH*n*_REG (*n*: 0-2) (0x00E4+0xC0*n*)



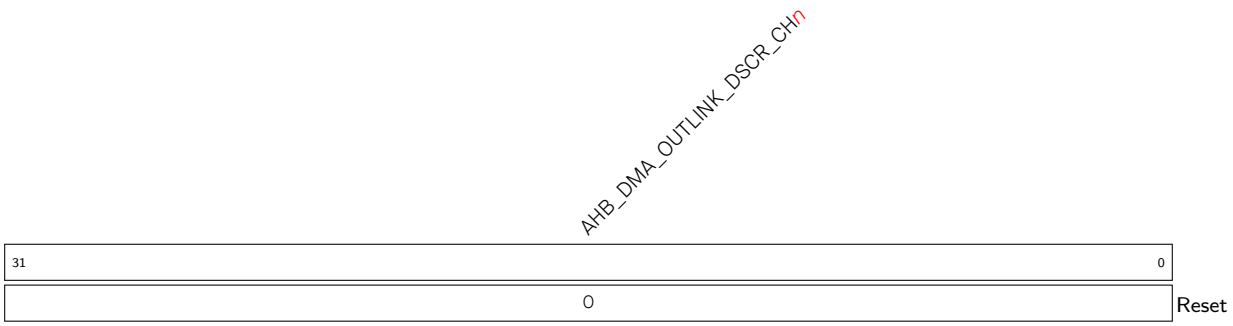
AHB_DMA_OUTLINK_DSCR_ADDR_CH*n* Represents the lower 18 bits of the next transmit descriptor address that is pre-read (but not processed yet). If the current transmit descriptor is the last descriptor, then this field represents the address of the current transmit descriptor. (RO)

AHB_DMA_OUT_DSCR_STATE_CH*n* Reserved. (RO)



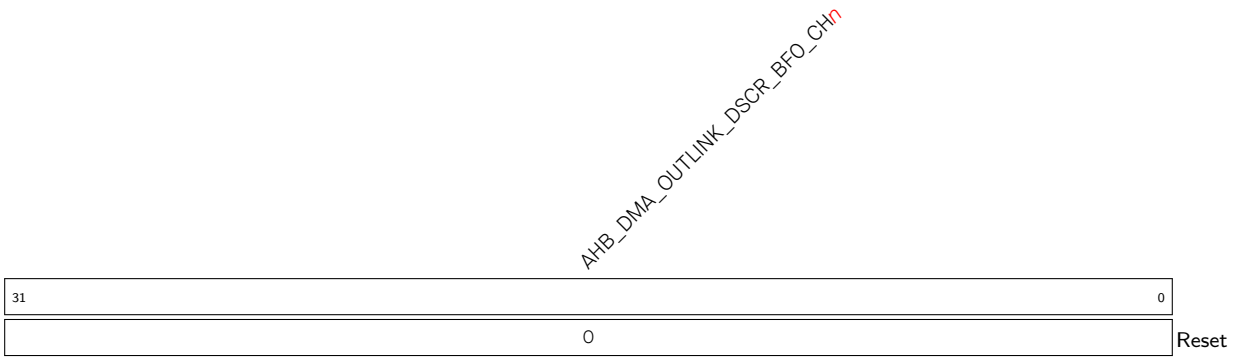
AHB_DMA_OUT_STATE_CH*n* Reserved. (RO)

Register 6.55. AHB_DMA_OUT_EOF_DES_ADDR_CH*n*_REG (*n*: 0-2) (0x00E8+0xC0*n*)



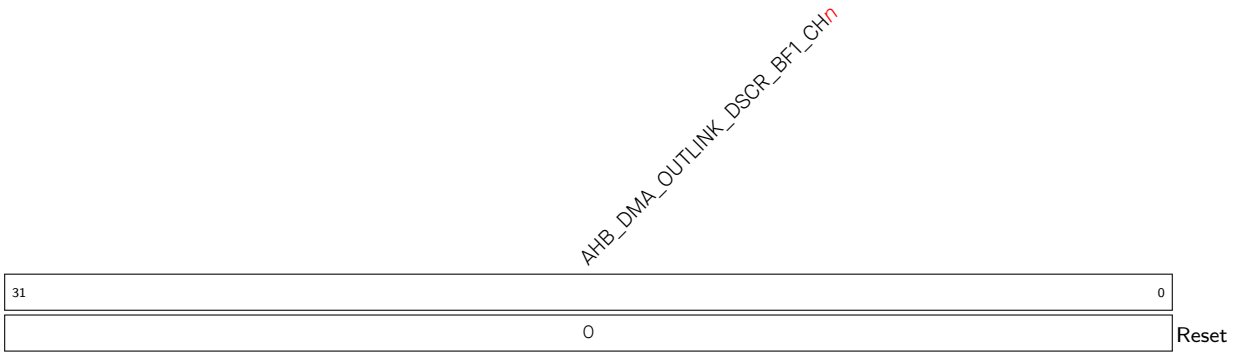
AHB_DMA_OUT_EOF_DES_ADDR_CH*n* Represents the address of the transmit descriptor when the EOF bit in this descriptor is 1. (RO)

Register 6.56. AHB_DMA_OUT_EOF_BFR_DES_ADDR_CH*n*_REG (*n*: 0-2) (0x00EC+0xC0*n*)



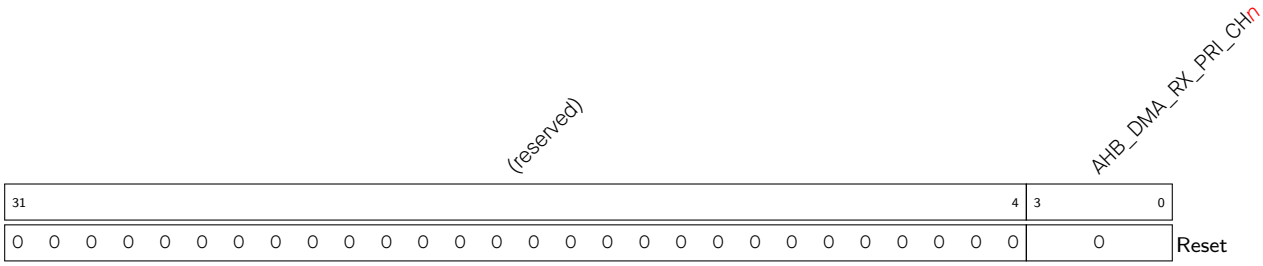
AHB_DMA_OUT_EOF_BFR_DES_ADDR_CH*n* Represents the address of the transmit descriptor before the last transmit descriptor. (RO)

Register 6.57. AHB_DMA_OUT_DSCR_CH*n*_REG (*n*: 0-2) (0x00F0+0xC0*n*)



AHB_DMA_OUTLINK_DSCR_CH*n* Represents the address of the next transmit descriptor y+1 pointed by the current transmit descriptor that is pre-read. (RO)

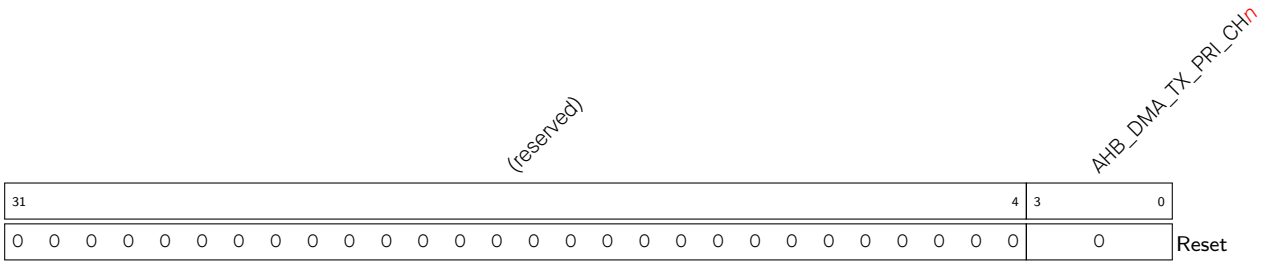
Register 6.58. AHB_DMA_OUT_DSCR_BF0_CH*n*_REG (*n*: 0-2) (0x00F4+0xC0*n*)



AHB_DMA_OUTLINK_DSCR_BF0_CH*n* Represents the address of the current transmit descriptor y that is pre-read. (RO)

Register 6.59. AHB_DMA_OUT_DSCR_BF1_CH*n*_REG (*n*: 0-2) (0x00F8+0xC0*n*)

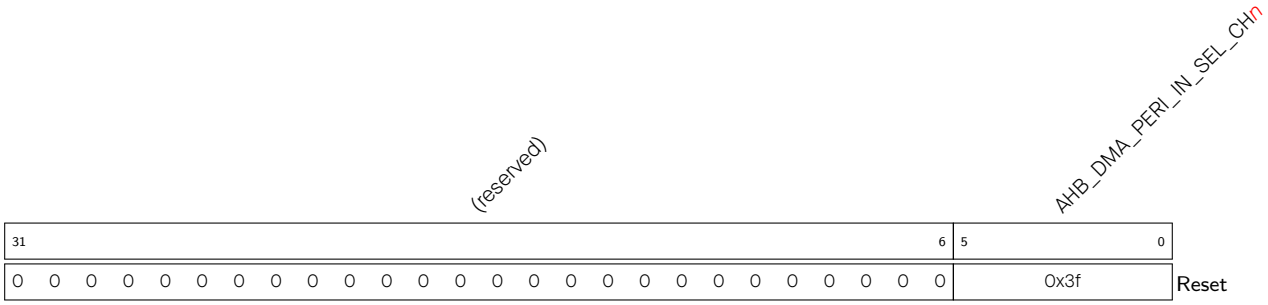
AHB_DMA_OUTLINK_DSCR_BF1_CH*n* Represents the address of the previous transmit descriptor y-1 that is pre-read. (RO)



Register 6.60. AHB_DMA_IN_PRI_CH*n*_REG (*n*: 0-2) (0x009C+0xC0*n*)

AHB_DMA_RX_PRI_CH*n* Configures the priority of RX channel *n*. The larger the value, the higher the priority.

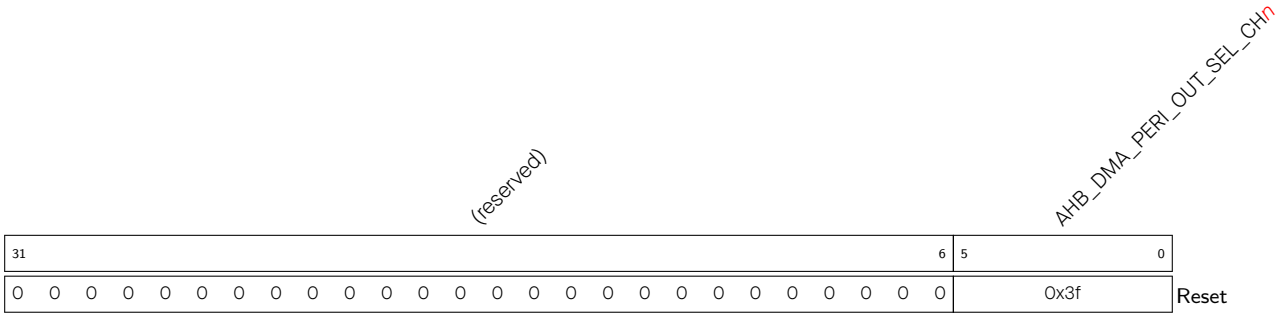
Value range: 0 ~ 5 (R/W)



Register 6.61. AHB_DMA_OUT_PRI_CH*n*_REG (*n*: 0-2) (0x00FC+0xC0*n*)

AHB_DMA_TX_PRI_CH*n* Configures the priority of TX channel *n*. The larger the value, the higher the priority.

Value range: 0 ~ 5 (R/W)



Register 6.62. AHB_DMA_IN_PERI_SEL_CH*n*_REG (*n*: 0-2) (0x00A0+0xC0n*)**

AHB_DMA_PERI_IN_SEL_CH*n* Configures the peripheral connected to RX channel *n*.

Register 6.64. AHB_DMA_MODULE_CLK_EN_REG (0x0404)

AHB_DMA_AHB_APB_SYNC_CLK_EN Configures whether to forcibly enable the clock for the AHB DMA register configuration synchronization module.

Bit 0 corresponds to TX and RX channel 0, bit 1 corresponds to channel TX and RX 1, and so on.

0: Not forcibly enable

1: Forcibly enable

(R/W)

AHB_DMA_OUT_DSCR_CLK_EN Configures whether to forcibly enable the clock for the AHB DMA TX descriptor processing module.

Bit 0 corresponds to TX channel 0, bit 1 corresponds to TX channel 1, and so on.

0: Not forcibly enable

1: Forcibly enable

(R/W)

AHB_DMA_OUT_CTRL_CLK_EN Configures whether to forcibly enable the clock for the AHB DMA TX data processing module.

Bit 0 corresponds to TX channel 0, bit 1 corresponds to TX channel 1, and so on.

0: Not forcibly enable

1: Forcibly enable

(R/W)

AHB_DMA_IN_DSCR_CLK_EN Configures whether to forcibly enable the clock for the AHB DMA RX descriptor processing module.

Bit 0 corresponds to RX channel 0, bit 1 corresponds to RX channel 1, and so on.

0: Not forcibly enable

1: Forcibly enable

(R/W)

AHB_DMA_IN_CTRL_CLK_EN Configures whether to forcibly enable the clock for the AHB DMA RX data processing module.

Bit 0 corresponds to RX channel 0, bit 1 corresponds to RX channel 1, and so on.

0: Not forcibly enable

1: Forcibly enable

(R/W)

Register 6.65. AHB_DMA_AHBINF_RESP_ERR_STATUS0_REG (0x0408)

AHB_DMA_AHBINF_RESP_ERR_ADDR Represents the address of the current AHB bus transfer that triggers an error response. (RO)

Register 6.66. AHB_DMA_AHBINF_RESP_ERR_STATUS1_REG (0x040C)

AHB_DMA_AHBINF_RESP_ERR_CH_ID Represents the channel ID of the transfer that triggers the AHB bus error response.

Bits[0:1]: Channel number. Value range: 0 ~2

Bit[2]: Channel direction. 0: RX

1: TX

(RO)

AHB_DMA_AHBINF_RESP_ERR_ID Represents the ID of the transfer that triggers the AHB bus error response.

0: Transfer between I3C and memory

2: Transfer between UHCI and memory

3: Transfer between I2S0 and memory

4: Transfer between I2S1 and memory

5: Transfer between I2S2 and memory

6: Transfer between ADC and memory

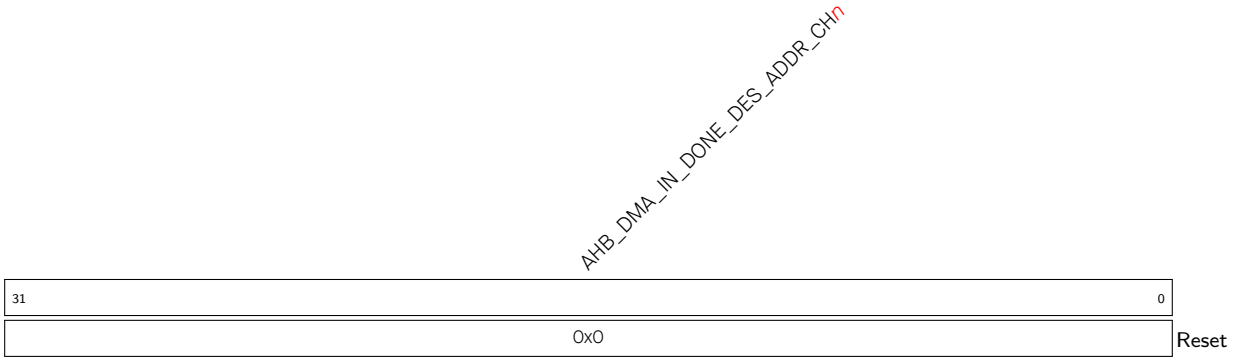
10: Transfer between RMT and memory

11 + 15: Dummy-11 + Dummy-15

16 + 63: Invalid

Other values are invalid

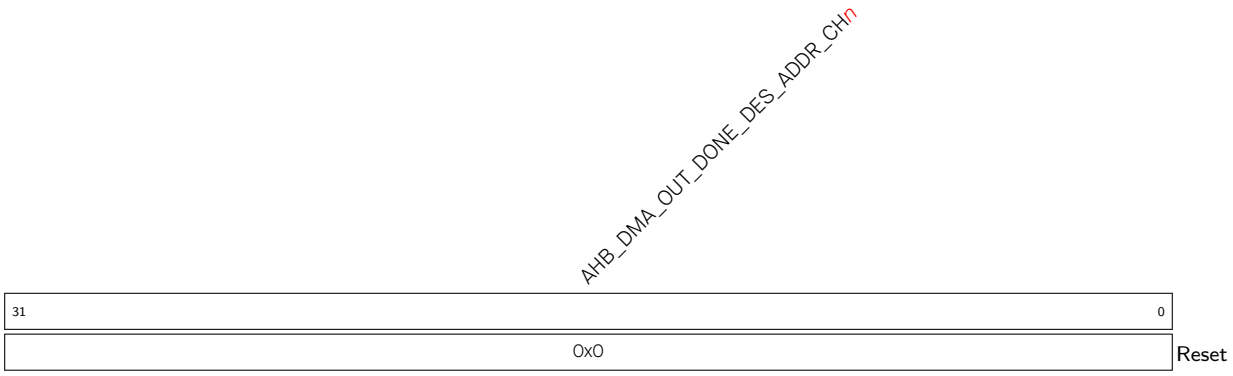
(RO)



AHB_DMA_AHBINF_RESP_ERR_WR Represents the type of the transfer that triggered the AHB bus error response received by the AHB DMA.

0: Read

1: Write

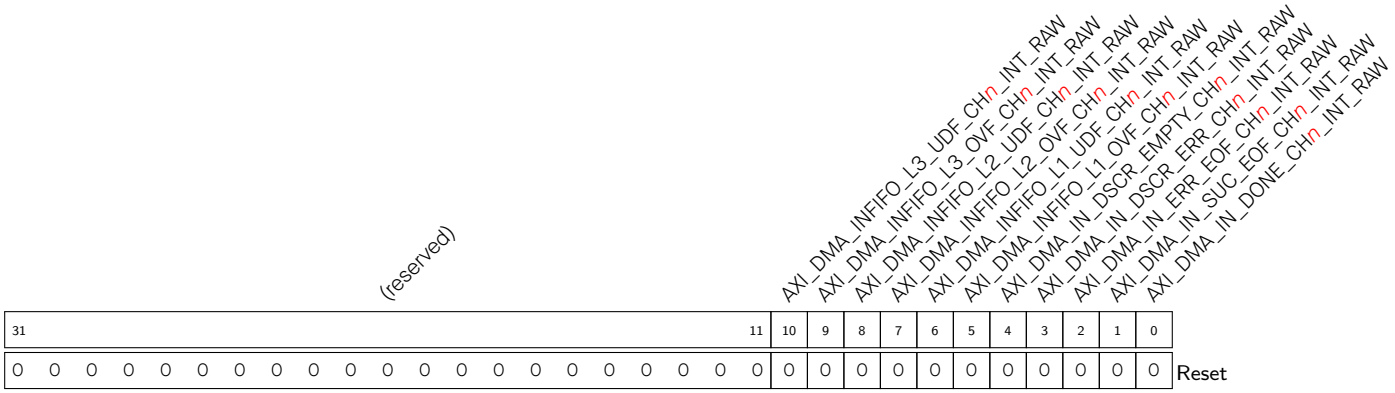


(RO)

Register 6.67. AHB_DMA_IN_DONE_DES_ADDR_CH*n*_REG(*n*: 0-2) (0x0410+0x08n*)**

AHB_DMA_IN_DONE_DES_ADDR_CH*n* Represents the address of the descriptor corresponding to the completed RX transfer. (RO)

Register 6.68. AHB_DMA_OUT_DONE_DES_ADDR_CH*n*_REG(*n*: 0-2) (0x0414+0x08n*)**



AHB_DMA_OUT_DONE_DES_ADDR_CH*n* Represents the address of the descriptor corresponding to the completed TX transfer. (RO)

6.9.2 GDMA-AXI Registers

The addresses in this section are relative to GDMA-AXI base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

For how to program reserved fields, please refer to Section Programming Reserved Register Field.

Register 6.69. AXI_DMA_IN_INT_RAW_CH*n*_REG (*n*: 0-2) (0x0000+0x68**n*)

AXI_DMA_IN_DONE_CH*n*_INT_RAW The raw interrupt status of AXI_DMA_IN_DONE_CH*n*_INT. (R/WTC/SS)

AXI_DMA_IN_SUC_EOF_CH*n*_INT_RAW The raw interrupt status of AXI_DMA_IN_SUC_EOF_CH*n*_INT. For UHCI this bit turns to 1 when the last data byte pointed by one receive descriptor has been received and no data error is detected for RX channel 0. (R/WTC/SS)

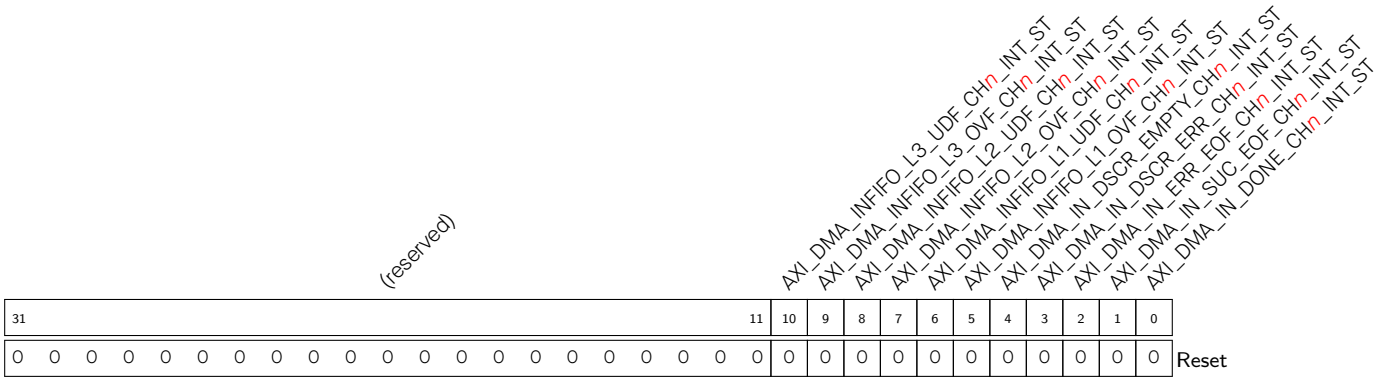
AXI_DMA_IN_ERR_EOF_CH*n*_INT_RAW The raw interrupt status of AXI_DMA_IN_ERR_EOF_CH*n*_INT. Valid only for UHCI. (R/WTC/SS)

AXI_DMA_IN_DSCR_ERR_CH*n*_INT_RAW The raw interrupt status of AXI_DMA_IN_DSCR_ERR_CH*n*_INT. (R/WTC/SS)

AXI_DMA_IN_DSCR_EMPTY_CH*n*_INT_RAW The raw interrupt status of AXI_DMA_IN_DSCR_EMPTY_CH*n*_INT. (R/WTC/SS)

AXI_DMA_INFIFO_L1_OVF_CH*n*_INT_RAW The raw interrupt status of AXI_DMA_INFIFO_L1_OVF_CH*n*_INT. (R/WTC/SS)

AXI_DMA_INFIFO_L1_UDF_CH*n*_INT_RAW The raw interrupt status of AXI_DMA_INFIFO_L1_UDF_CH*n*_INT. (R/WTC/SS)



AXI_DMA_INFIFO_L2_OVF_CH*n*_INT_RAW The raw interrupt status of AXI_DMA_INFIFO_L2_OVF_CH*n*_INT. (R/WTC/SS)

AXI_DMA_INFIFO_L2_UDF_CH*n*_INT_RAW The raw interrupt status of AXI_DMA_INFIFO_L2_UDF_CH*n*_INT. (R/WTC/SS)

AXI_DMA_INFIFO_L3_OVF_CH*n*_INT_RAW The raw interrupt status of AXI_DMA_INFIFO_L3_OVF_CH*n*_INT. (R/WTC/SS)

AXI_DMA_INFIFO_L3_UDF_CH*n*_INT_RAW The raw interrupt status of AXI_DMA_INFIFO_L3_UDF_CH*n*_INT. (R/WTC/SS)

Register 6.70. AXI_DMA_IN_INT_ST_CH*n*_REG (*n*: 0-2) (0x0004+0x68**n*)

AXI_DMA_IN_DONE_CH*n*_INT_ST The masked interrupt status of AXI_DMA_IN_DONE_CH*n*_INT. (RO)

AXI_DMA_IN_SUC_EOF_CH*n*_INT_ST The masked interrupt status of AXI_DMA_IN_SUC_EOF_CH*n*_INT. (RO)

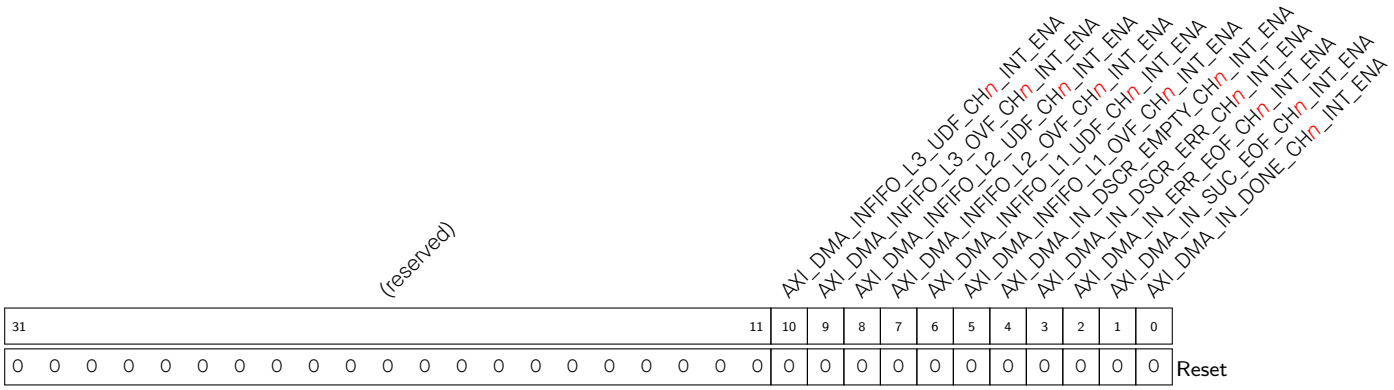
AXI_DMA_IN_ERR_EOF_CH*n*_INT_ST The masked interrupt status of AXI_DMA_IN_ERR_EOF_CH*n*_INT. (RO)

AXI_DMA_IN_DSCR_ERR_CH*n*_INT_ST The masked interrupt status of AXI_DMA_IN_DSCR_ERR_CH*n*_INT. (RO)

AXI_DMA_IN_DSCR_EMPTY_CH*n*_INT_ST The masked interrupt status of AXI_DMA_IN_DSCR_EMPTY_CH*n*_INT. (RO)

AXI_DMA_INFIFO_L2_OVF_CH*n*_INT_ST The masked interrupt status of AXI_DMA_INFIFO_L2_OVF_CH*n*_INT. (RO)

AXI_DMA_INFIFO_L2_UDF_CH*n*_INT_ST The masked interrupt status of AXI_DMA_INFIFO_L2_UDF_CH*n*_INT. (RO)



AXI_DMA_INFIFO_L1_OVF_CH*n*_INT_ST The masked interrupt status of AXI_DMA_INFIFO_L1_OVF_CH*n*_INT. (RO)

AXI_DMA_INFIFO_L1_UDF_CH*n*_INT_ST The masked interrupt status of AXI_DMA_INFIFO_L1_UDF_CH*n*_INT. (RO)

AXI_DMA_INFIFO_L3_OVF_CH*n*_INT_ST The masked interrupt status of AXI_DMA_INFIFO_L3_OVF_CH*n*_INT. (RO)

AXI_DMA_INFIFO_L3_UDF_CH*n*_INT_ST The masked interrupt status of AXI_DMA_INFIFO_L3_UDF_CH*n*_INT. (RO)

Register 6.71. AXI_DMA_IN_INT_ENA_CH*n*_REG (*n*: 0-2) (0x0008+0x68**n*)

AXI_DMA_IN_DONE_CH*n*_INT_ENA Write 1 to enable AXI_DMA_IN_DONE_CH*n*_INT. (R/W)

AXI_DMA_IN_SUC_EOF_CH*n*_INT_ENA Write 1 to enable AXI_DMA_IN_SUC_EOF_CH*n*_INT. (R/W)

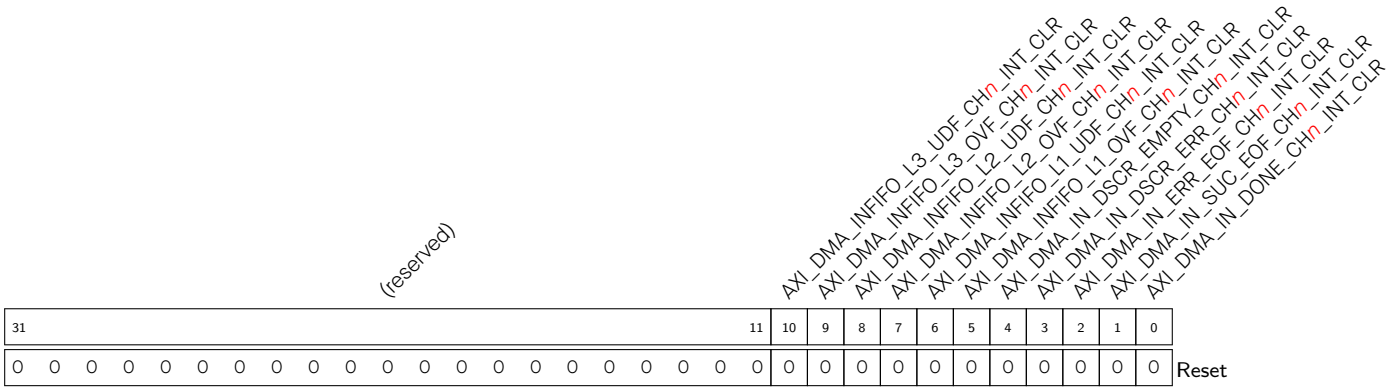
AXI_DMA_IN_ERR_EOF_CH*n*_INT_ENA Write 1 to enable AXI_DMA_IN_ERR_EOF_CH*n*_INT. (R/W)

AXI_DMA_IN_DSCR_ERR_CH*n*_INT_ENA Write 1 to enable AXI_DMA_IN_DSCR_ERR_CH*n*_INT. (R/W)

AXI_DMA_IN_DSCR_EMPTY_CH*n*_INT_ENA Write 1 to enable AXI_DMA_IN_DSCR_EMPTY_CH*n*_INT. (R/W)

AXI_DMA_INFIFO_L1_OVF_CH*n*_INT_ENA Write 1 to enable AXI_DMA_INFIFO_L1_OVF_CH*n*_INT. (R/W)

AXI_DMA_INFIFO_L1_UDF_CH*n*_INT_ENA Write 1 to enable AXI_DMA_INFIFO_L1_UDF_CH*n*_INT. (R/W)



AXI_DMA_INFIFO_L2_OVF_CH*n*_INT_ENA Write 1 to enable AXI_DMA_INFIFO_L2_OVF_CH*n*_INT. (R/W)

AXI_DMA_INFIFO_L2_UDF_CH*n*_INT_ENA Write 1 to enable AXI_DMA_INFIFO_L2_UDF_CH*n*_INT. (R/W)

AXI_DMA_INFIFO_L3_OVF_CH*n*_INT_ENA Write 1 to enable AXI_DMA_INFIFO_L3_OVF_CH*n*_INT. (R/W)

AXI_DMA_INFIFO_L3_UDF_CH*n*_INT_ENA Write 1 to enable AXI_DMA_INFIFO_L3_UDF_CH*n*_INT. (R/W)

Register 6.72. AXI_DMA_IN_INT_CLR_CH*n*_REG (*n*: 0-2) (0x000C+0x68**n*)

AXI_DMA_IN_DONE_CH*n*_INT_CLR Write 1 to clear AXI_DMA_IN_DONE_CH*n*_INT. (WT)

AXI_DMA_IN_SUC_EOF_CH*n*_INT_CLR Write 1 to clear AXI_DMA_IN_SUC_EOF_CH*n*_INT. (WT)

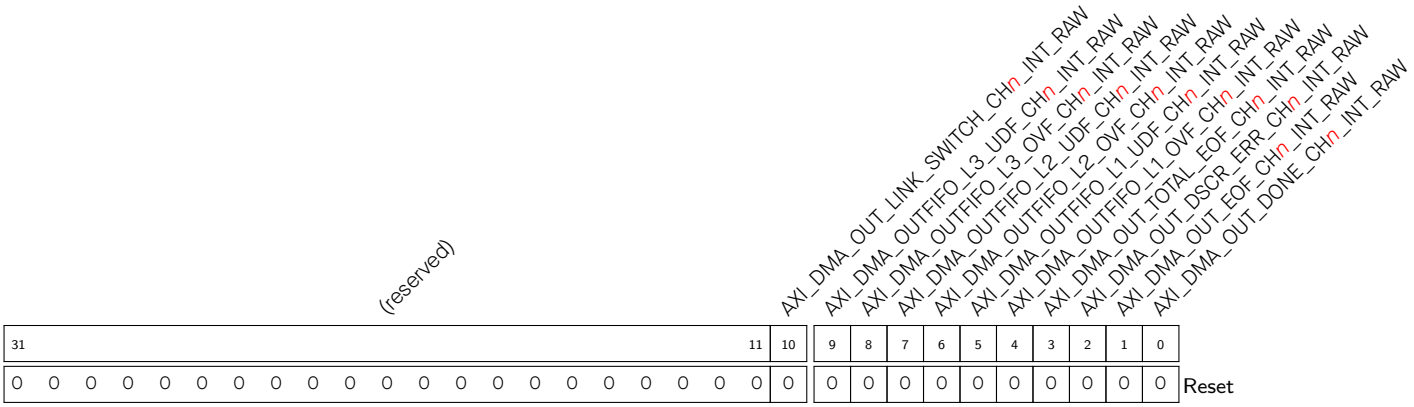
AXI_DMA_IN_ERR_EOF_CH*n*_INT_CLR Write 1 to clear AXI_DMA_IN_ERR_EOF_CH*n*_INT. (WT)

AXI_DMA_IN_DSCR_ERR_CH*n*_INT_CLR Write 1 to clear AXI_DMA_IN_DSCR_ERR_CH*n*_INT. (WT)

AXI_DMA_IN_DSCR_EMPTY_CH*n*_INT_CLR Write 1 to clear AXI_DMA_IN_DSCR_EMPTY_CH*n*_INT. (WT)

AXI_DMA_INFIFO_L1_OVF_CH*n*_INT_CLR Write 1 to clear AXI_DMA_INFIFO_L1_OVF_CH*n*_INT. (WT)

AXI_DMA_INFIFO_L1_UDF_CH*n*_INT_CLR Write 1 to clear AXI_DMA_INFIFO_L1_UDF_CH*n*_INT. (WT)



AXI_DMA_INFIFO_L2_OVF_CH*n*_INT_CLR Write 1 to clear AXI_DMA_INFIFO_L2_OVF_CH*n*_INT. (WT)

AXI_DMA_INFIFO_L2_UDF_CH*n*_INT_CLR Write 1 to clear AXI_DMA_INFIFO_L2_UDF_CH*n*_INT. (WT)

AXI_DMA_INFIFO_L3_OVF_CH*n*_INT_CLR Write 1 to clear AXI_DMA_INFIFO_L3_OVF_CH*n*_INT. (WT)

AXI_DMA_INFIFO_L3_UDF_CH*n*_INT_CLR Write 1 to clear AXI_DMA_INFIFO_L3_UDF_CH*n*_INT. (WT)

Register 6.73. AXI_DMA_OUT_INT_RAW_CH*n*_REG (*n*: 0-2) (0x0138+0x68n*)**

AXI_DMA_OUT_DONE_CH*n*_INT_RAW The raw interrupt status of AXI_DMA_OUT_DONE_CH*n*_INT. (R/WTC/SS)

AXI_DMA_OUT_EOF_CH*n*_INT_RAW The raw interrupt status of AXI_DMA_OUT_EOF_CH*n*_INT. (R/WTC/SS)

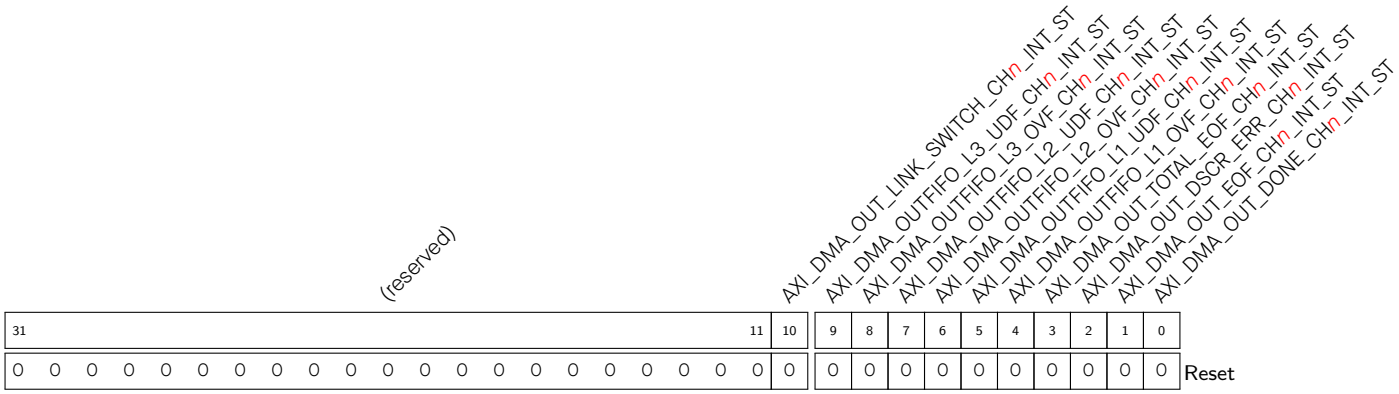
AXI_DMA_OUT_DSCR_ERR_CH*n*_INT_RAW The raw interrupt status of AXI_DMA_OUT_DSCR_ERR_CH*n*_INT. (R/WTC/SS)

AXI_DMA_OUT_TOTAL_EOF_CH*n*_INT_RAW The raw interrupt status of AXI_DMA_OUT_TOTAL_EOF_CH*n*_INT. (R/WTC/SS)

AXI_DMA_OUTFIFO_L1_OVF_CH*n*_INT_RAW The raw interrupt status of AXI_DMA_OUTFIFO_L1_OVF_CH*n*_INT. (R/WTC/SS)

AXI_DMA_OUTFIFO_L1_UDF_CH*n*_INT_RAW The raw interrupt status of AXI_DMA_OUTFIFO_L1_UDF_CH*n*_INT. (R/WTC/SS)

AXI_DMA_OUTFIFO_L2_OVF_CH*n*_INT_RAW The raw interrupt status of AXI_DMA_OUTFIFO_L2_OVF_CH*n*_INT. (R/WTC/SS)



AXI_DMA_OUTFIFO_L2_UDF_CH*n*_INT_RAW The raw interrupt status of AXI_DMA_OUTFIFO_L2_UDF_CH*n*_INT. (R/WTC/SS)

AXI_DMA_OUTFIFO_L3_OVF_CH*n*_INT_RAW The raw interrupt status of AXI_DMA_OUTFIFO_L3_OVF_CH*n*_INT. (R/WTC/SS)

AXI_DMA_OUTFIFO_L3_UDF_CH*n*_INT_RAW The raw interrupt status of AXI_DMA_OUTFIFO_L3_UDF_CH*n*_INT. (R/WTC/SS)

AXI_DMA_OUT_LINK_SWITCH_CH*n*_INT_RAW The raw interrupt status of AXI_DMA_OUT_LINK_SWITCH_CH*n*_INT. (R/WTC/SS)

Register 6.74. AXI_DMA_OUT_INT_ST_CH*n*_REG (*n*: 0-2) (0x013C+0x68n*)**

AXI_DMA_OUT_DONE_CH*n*_INT_ST The masked interrupt status of AXI_DMA_OUT_DONE_CH*n*_INT. (RO)

AXI_DMA_OUT_EOF_CH*n*_INT_ST The masked interrupt status of AXI_DMA_OUT_EOF_CH*n*_INT. (RO)

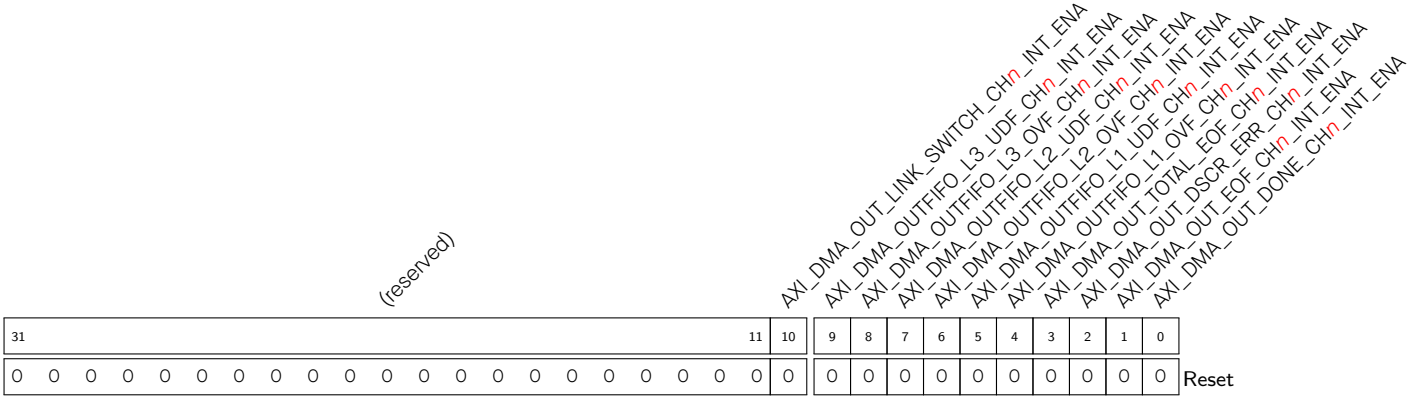
AXI_DMA_OUT_DSCR_ERR_CH*n*_INT_ST The masked interrupt status of AXI_DMA_OUT_DSCR_ERR_CH*n*_INT. (RO)

AXI_DMA_OUT_TOTAL_EOF_CH*n*_INT_ST The masked interrupt status of AXI_DMA_OUT_TOTAL_EOF_CH*n*_INT. (RO)

AXI_DMA_OUTFIFO_L1_OVF_CH*n*_INT_ST The masked interrupt status of AXI_DMA_OUTFIFO_L1_OVF_CH*n*_INT. (RO)

AXI_DMA_OUTFIFO_L1_UDF_CH*n*_INT_ST The masked interrupt status of AXI_DMA_OUTFIFO_L1_UDF_CH*n*_INT. (RO)

AXI_DMA_OUTFIFO_L2_OVF_CH*n*_INT_ST The masked interrupt status of AXI_DMA_OUTFIFO_L2_OVF_CH*n*_INT. (RO)



AXI_DMA_OUTFIFO_L2_UDF_CH*n*_INT_ST The masked interrupt status of AXI_DMA_OUTFIFO_L2_UDF_CH*n*_INT. (RO)

AXI_DMA_OUTFIFO_L3_OVF_CH*n*_INT_ST The masked interrupt status of AXI_DMA_OUTFIFO_L3_OVF_CH*n*_INT. (RO)

AXI_DMA_OUTFIFO_L3_UDF_CH*n*_INT_ST The masked interrupt status of AXI_DMA_OUTFIFO_L3_UDF_CH*n*_INT. (RO)

AXI_DMA_OUT_LINK_SWITCH_CH*n*_INT_ST The masked interrupt status of AXI_DMA_OUT_LINK_SWITCH_CH*n*_INT. (RO)

Register 6.75. AXI_DMA_OUT_INT_ENA_CH*n*_REG (*n*: 0-2) (0x0140+0x68**n*)

AXI_DMA_OUT_DONE_CH*n*_INT_ENA Write 1 to enable AXI_DMA_OUT_DONE_CH*n*_INT. (R/W)

AXI_DMA_OUT_EOF_CH*n*_INT_ENA Write 1 to enable AXI_DMA_OUT_EOF_CH*n*_INT. (R/W)

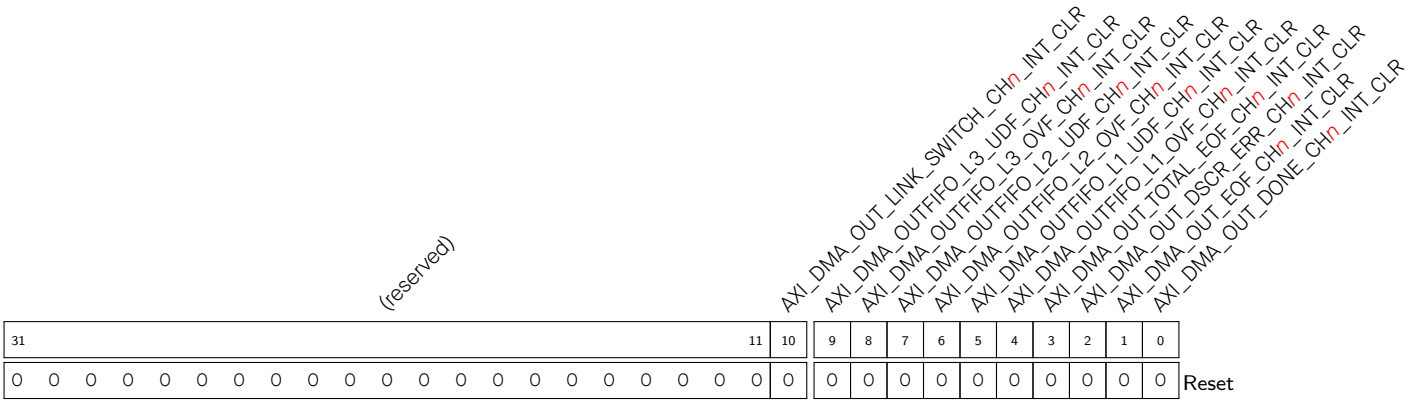
AXI_DMA_OUT_DSCR_ERR_CH*n*_INT_ENA Write 1 to enable AXI_DMA_OUT_DSCR_ERR_CH*n*_INT. (R/W)

AXI_DMA_OUT_TOTAL_EOF_CH*n*_INT_ENA Write 1 to enable AXI_DMA_OUT_TOTAL_EOF_CH*n*_INT. (R/W)

AXI_DMA_OUTFIFO_L1_OVF_CH*n*_INT_ENA Write 1 to enable AXI_DMA_OUTFIFO_L1_OVF_CH*n*_INT. (R/W)

AXI_DMA_OUTFIFO_L1_UDF_CH*n*_INT_ENA Write 1 to enable AXI_DMA_OUTFIFO_L1_UDF_CH*n*_INT. (R/W)

AXI_DMA_OUTFIFO_L2_OVF_CH*n*_INT_ENA Write 1 to enable AXI_DMA_OUTFIFO_L2_OVF_CH*n*_INT. (R/W)



AXI_DMA_OUTFIFO_L2_UDF_CH*n*_INT_ENA Write 1 to enable AXI_DMA_OUTFIFO_L2_UDF_CH*n*_INT. (R/W)

AXI_DMA_OUTFIFO_L3_OVF_CH*n*_INT_ENA Write 1 to enable AXI_DMA_OUTFIFO_L3_OVF_CH*n*_INT. (R/W)

AXI_DMA_OUTFIFO_L3_UDF_CH*n*_INT_ENA Write 1 to enable AXI_DMA_OUTFIFO_L3_UDF_CH*n*_INT. (R/W)

AXI_DMA_OUT_LINK_SWITCH_CH*n*_INT_ENA Write 1 to enable AXI_DMA_OUT_LINK_SWITCH_CH*n*_INT. (RO)

Register 6.76. AXI_DMA_OUT_INT_CLR_CH*n*_REG (*n*: 0-2) (0x0144+0x68***n*)

AXI_DMA_OUT_DONE_CH*n*_INT_CLR Write 1 to clear AXI_DMA_OUT_DONE_CH*n*_INT. (WT)

AXI_DMA_OUT_EOF_CH*n*_INT_CLR Write 1 to clear AXI_DMA_OUT_EOF_CH*n*_INT. (WT)

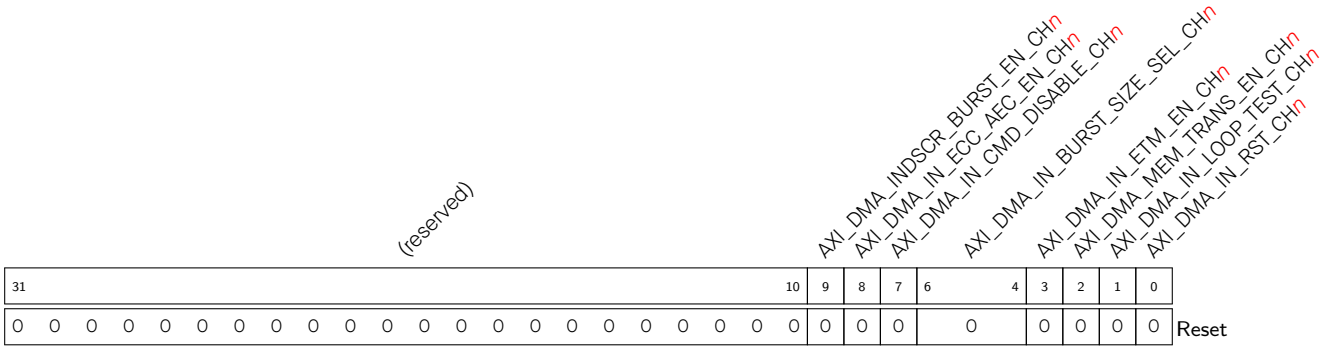
AXI_DMA_OUT_DSCR_ERR_CH*n*_INT_CLR Write 1 to clear AXI_DMA_OUT_DSCR_ERR_CH*n*_INT. (WT)

AXI_DMA_OUT_TOTAL_EOF_CH*n*_INT_CLR Write 1 to clear AXI_DMA_OUT_TOTAL_EOF_CH*n*_INT. (WT)

AXI_DMA_OUTFIFO_L1_OVF_CH*n*_INT_CLR Write 1 to clear AXI_DMA_OUTFIFO_L1_OVF_CH*n*_INT. (WT)

AXI_DMA_OUTFIFO_L1_UDF_CH*n*_INT_CLR Write 1 to clear AXI_DMA_OUTFIFO_L1_UDF_CH*n*_INT. (WT)

AXI_DMA_OUTFIFO_L2_OVF_CH*n*_INT_CLR Write 1 to clear AXI_DMA_OUTFIFO_L2_OVF_CH*n*_INT. (WT)



AXI_DMA_OUTFIFO_L2_UDF_CH*n*_INT_CLR Write 1 to clear AXI_DMA_OUTFIFO_L2_UDF_CH*n*_INT. (WT)

AXI_DMA_OUTFIFO_L3_OVF_CH*n*_INT_CLR Write 1 to clear AXI_DMA_OUTFIFO_L3_OVF_CH*n*_INT. (WT)

AXI_DMA_OUTFIFO_L3_UDF_CH*n*_INT_CLR Write 1 to clear AXI_DMA_OUTFIFO_L3_UDF_CH*n*_INT. (WT)

AXI_DMA_OUT_LINK_SWITCH_CH*n*_INT_CLR Write 1 to clear AXI_DMA_OUT_LINK_SWITCH_CH*n*_INT. (RO)

Register 6.77. AXI_DMA_IN_CONF0_CH*n*_REG (*n*: 0-2) (0x0010+0x68n*)**

AXI_DMA_IN_RST_CH*n* Write 1 and then 0 to reset RX channel *n* FSM and RX FIFO pointer.(R/W)

AXI_DMA_IN_LOOP_TEST_CH*n* Reserved. (R/W)

AXI_DMA_MEM_TRANS_EN_CH*n* Configures whether to enable memory-to-memory data transfer.

0: Disable

1: Enable

(R/W)

AXI_DMA_IN_ETM_EN_CH*n* Configures whether to enable ETM control for RX channel *n*.

0: Disable

1: Enable

(R/W)

AXI_DMA_IN_BURST_SIZE_SEL_CH*n* Configures the burst length for RX channel *n*.

0: 8 bytes

1: 16 bytes

2: 32 bytes

3: 64 bytes

4: 128 bytes

5 ~ 7: Invalid

(R/W)

AXI_DMA_IN_CMD_DISABLE_CH*n* Configures whether to disable command on RX channel *n*.

0: Enable

1: Disable

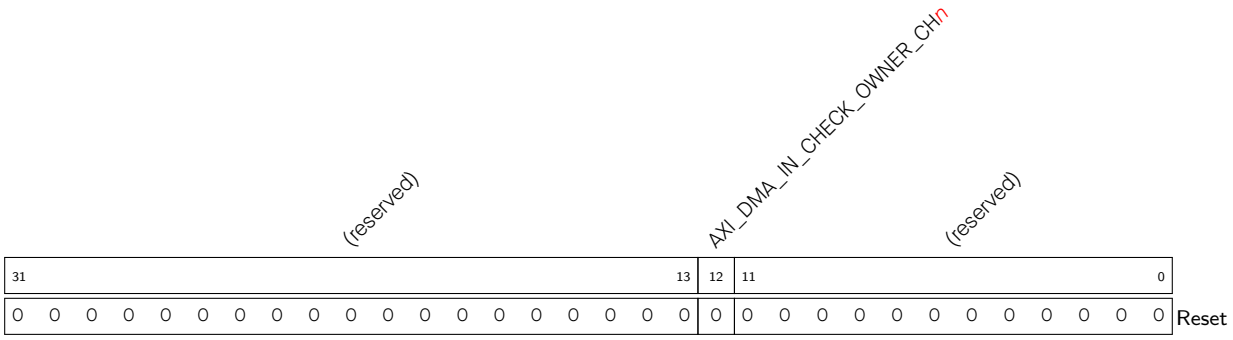
(R/W)

AXI_DMA_IN_ECC_AEC_EN_CH*n* Configures whether AXI DMA can access external memory space for ECC and AES via RX channel *n*.

0: Not access

1: Access

(R/W)



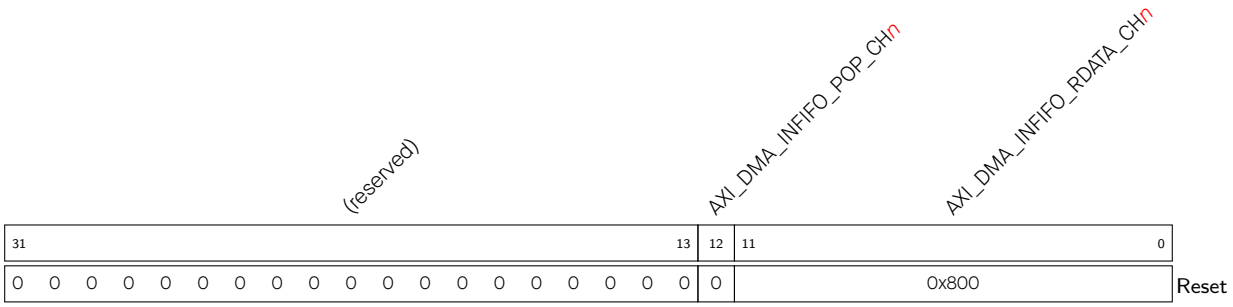
AXI_DMA_INDSCR_BURST_EN_CH*n* Configures whether to enable INCR burst transfer for RX channel *n* to read descriptors when accessing internal memory.

0: Disable

1: Enable

(R/W)

Register 6.78. AXI_DMA_IN_CONF1_CH*n*_REG (*n*: 0-2) (0x0014+0x68**n*)



AXI_DMA_IN_CHECK_OWNER_CH*n* Configures whether to enable owner bit check for RX channel *n*.

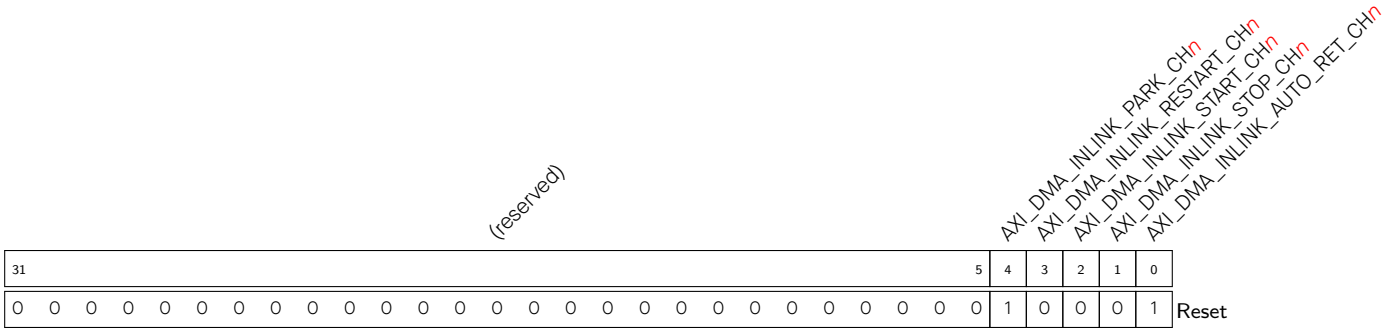
0: Disable

1: Enable

(R/W)

Register 6.79. AXI_DMA_IN_POP_CH*n*_REG (*n*: 0-2) (0x001C+0x68**n*)

AXI_DMA_INFIFO_RDATA_CH*n* Represents the data popped from AXI DMA RX FIFO. (RO)



AXI_DMA_INFIFO_POP_CH*n* Configures whether to pop data from AXI DMA RX FIFO.

0: Invalid. No effect

1: Pop

(WT)

Register 6.80. AXI_DMA_IN_LINK1_CH*n*_REG (*n*: 0-2) (0x0020+0x68*n*)**

AXI_DMA_INLINK_AUTO_RET_CH*n* Configures whether to return to the current receive descriptor's address when there are some errors in current receiving data.

0: Not return

1: Return

(R/W)

AXI_DMA_INLINK_STOP_CH*n* Configures whether to stop RX channel *n* from receiving data.

0: Invalid. No effect

1: Stop

(WT)

AXI_DMA_INLINK_START_CH*n* Configures whether to enable RX channel *n* for data transfer.

0: Disable

1: Enable

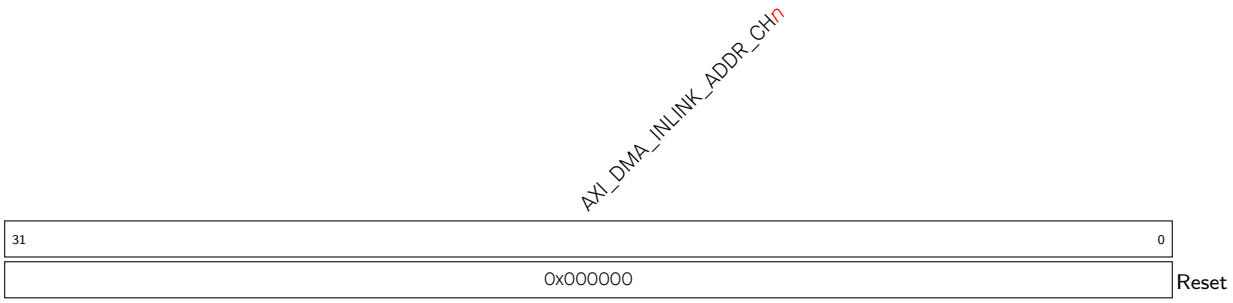
(WT)

AXI_DMA_INLINK_RESTART_CH*n* Configures whether to restart RX channel *n* for AXI DMA transfer.

0: Invalid. No effect

1: Restart

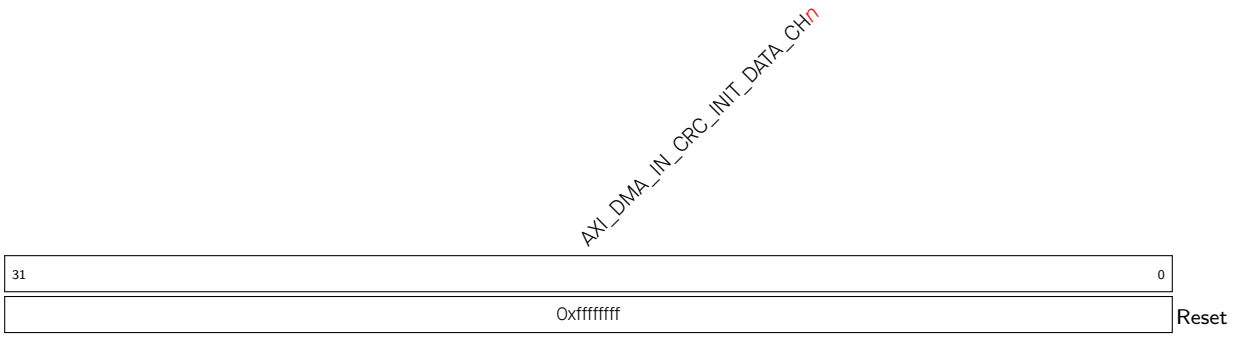
(WT)



AXI_DMA_INLINK_PARK_CH*n* Represents the status of the receive descriptor's FSM.

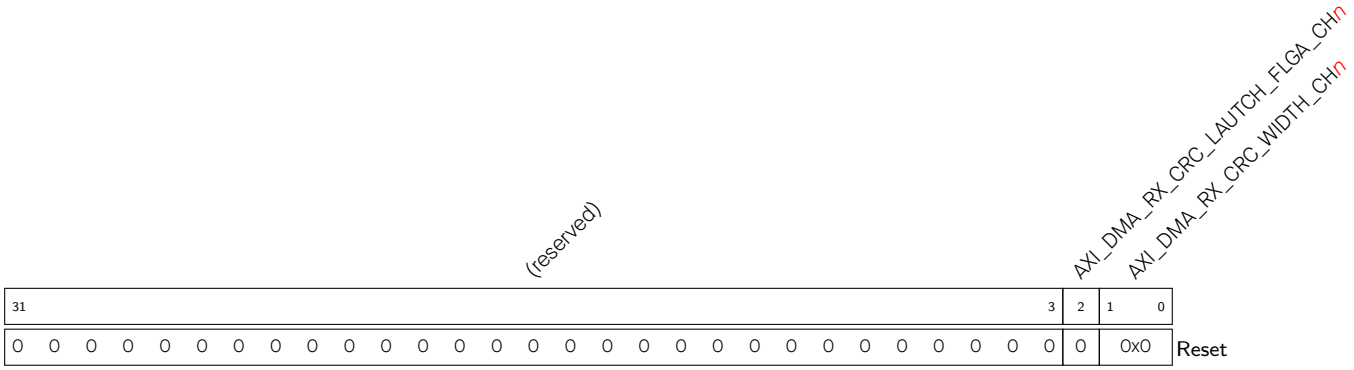
0: Running

1: Idle



(RO)

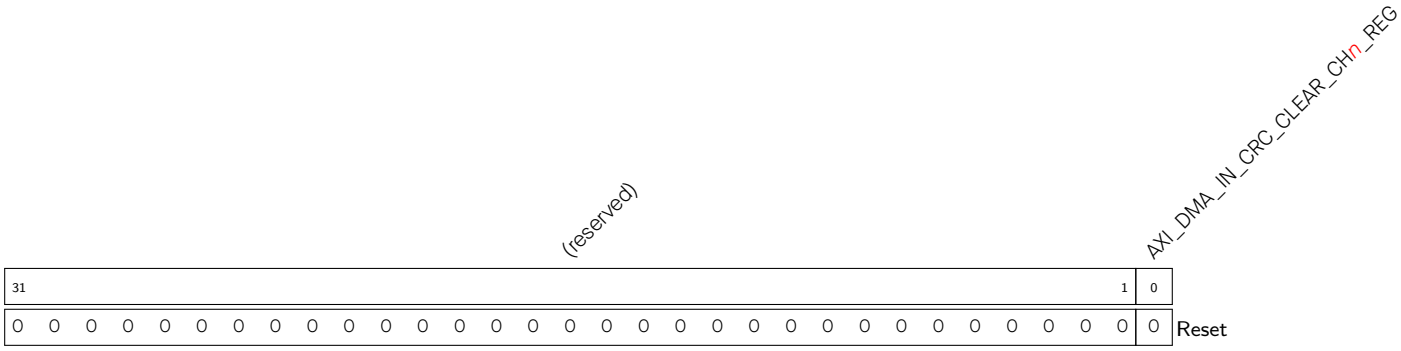
Register 6.81. AXI_DMA_IN_LINK2_CH*n*_REG (*n*: 0-2) (0x0024+0x68**n*)



AXI_DMA_INLINK_ADDR_CH*n* Represents the first receive descriptor's address. (R/W)

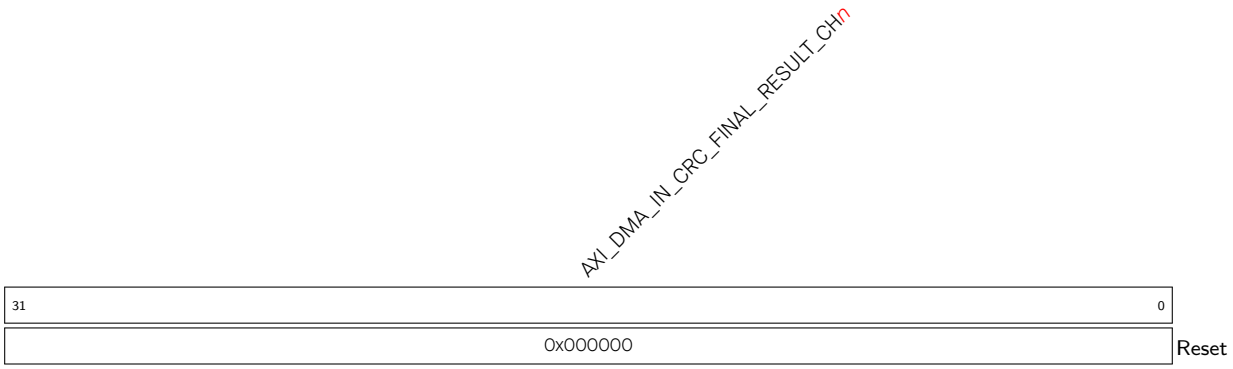
Register 6.82. AXI_DMA_IN_CRC_INIT_DATA_CH*n*_REG (*n*: 0-2) (0x0048+0x68**n*)

AXI_DMA_IN_CRC_INIT_DATA_CH*n* Configures the CRC initial value for RX channel *n*. (R/W)



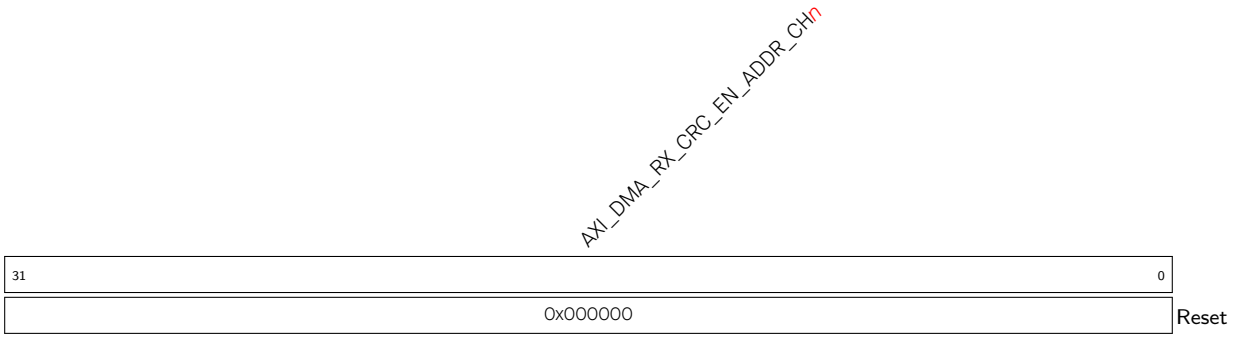
Register 6.83. AXI_DMA_RX_CRC_WIDTH_CH*n*_REG (*n*: 0-2) (0x004C+0x68n*)**

AXI_DMA_RX_CRC_WIDTH_CH*n* Configures the CRC result width for RX channel *n*. 0: $\leq$ 8 bits
1: $\leq$ 16 bits
2: $\leq$ 24 bits
3: $\leq$ 32 bits
(R/W)



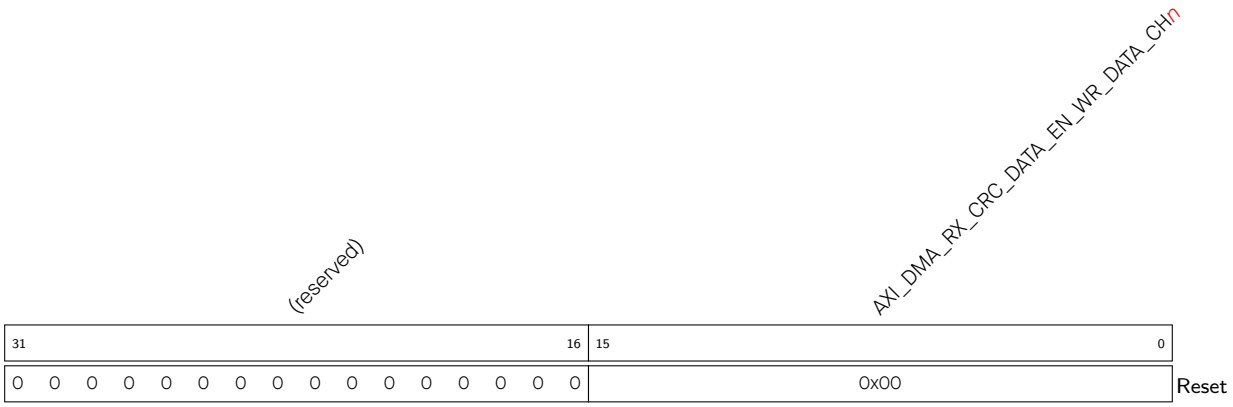
AXI_DMA_RX_CRC_LAUTCH_FLGA_CH*n* Write 1 and then 0 to latch the values of AXI_DMA_RX_CRC_EN_ADDR_CH*n*, AXI_DMA_RX_CRC_DATA_EN_ADDR_CH*n*, AXI_DMA_RX_CRC_EN_WR_DATA_CH*n*, and AXI_DMA_RX_CRC_DATA_EN_WR_DATA_CH*n*. (R/W)

Register 6.84. AXI_DMA_IN_CRC_CLEAR_CH*n*_REG (*n*: 0-2) (0x0050+0x68n*)**



AXI_DMA_IN_CRC_CLEAR_CH*n*_REG Configures whether to clear the CRC result for RX channel *n*.
0: Not clear
1: Clear
(R/W)

Register 6.85. AXI_DMA_IN_CRC_FINAL_RESULT_CH*n*_REG (*n*: 0-2) (0x0054+0x68n*)**

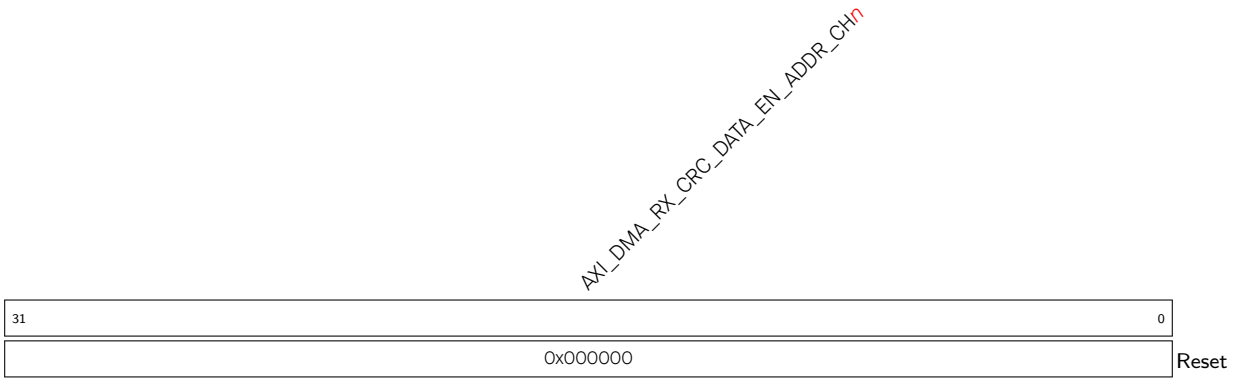


AXI_DMA_IN_CRC_FINAL_RESULT_CH*n* Represents the CRC result for RX channel *n*. (RO)

Register 6.86. AXI_DMA_RX_CRC_EN_ADDR_CH*n*_REG (*n*: 0-2) (0x005C+0x68n*)**

AXI_DMA_RX_CRC_EN_ADDR_CH*n* Configures at which bit of the CRC result the AXI_DMA_RX_CRC_EN_WR_DATA_CH*n*_REG register targets for TX channel *n*. (R/W)

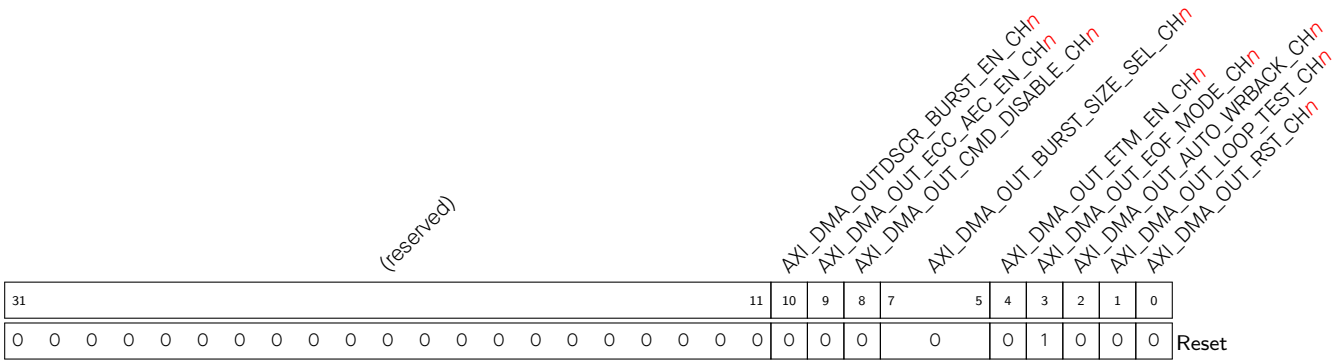
Register 6.87. AXI_DMA_RX_CRC_DATA_EN_WR_DATA_CH*n*_REG (*n*: 0-2) (0x0060+0x68n*)**



AXI_DMA_RX_CRC_DATA_EN_WR_DATA_CH*n* Configures whether to include each bit of the data in the CRC calculation matrix for TX channel *n*.

0: Not include

1: Include



(R/W)

Register 6.88. AXI_DMA_RX_CRC_DATA_EN_ADDR_CH*n*_REG (*n*: 0-2) (0x0064+0x68n*)**

AXI_DMA_RX_CRC_DATA_EN_ADDR_CH*n* Configures at which bit of the CRC result the AXI_DMA_RX_CRC_DATA_EN_WR_DATA_CH*n*_REG register targets for TX channel *n*. (R/W)

Register 6.89. AXI_DMA_OUT_CONFO_CHn_REG(n: 0-2) (0x0148+0x68*n)

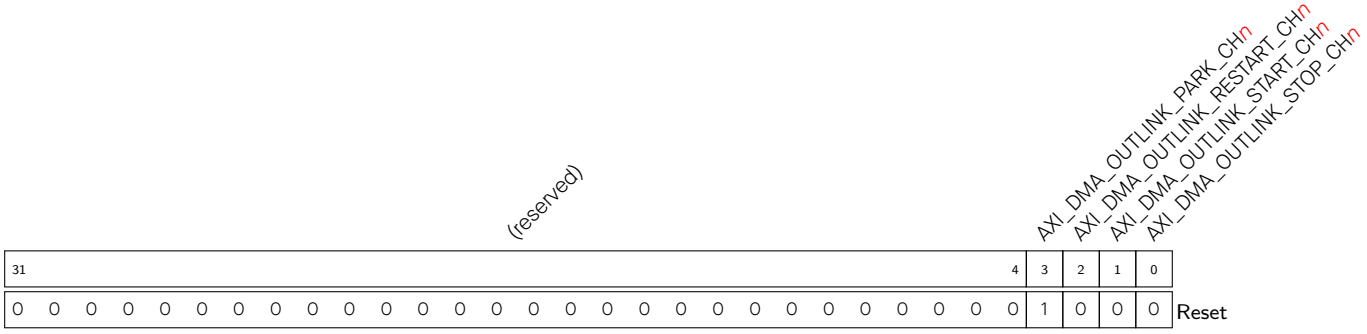
Register 6.91. AXI_DMA_OUT_PUSH_CH*n*_REG (*n*: 0-2) (0x0154+0x68*n*)**

AXI_DMA_OUTFIFO_WDATA_CH*n* Represents the data that need to be pushed into AXI DMA TX FIFO. (R/W)



AXI_DMA_OUTFIFO_PUSH_CH*n* Configures whether to push data into AXI DMA TX FIFO.

0: Invalid. No effect

1: Push

(WT)

Register 6.92. AXI_DMA_OUT_LINK1_CH*n*_REG (*n*: 0-2) (0x0158+0x68n*)**

AXI_DMA_OUTLINK_STOP_CH*n* Configures whether to stop TX channel *n* from transmitting data.

0: Invalid. No effect

1: Stop

(WT)

AXI_DMA_OUTLINK_START_CH*n* Configures whether to enable TX channel *n* for data transfer.

0: Disable

1: Enable

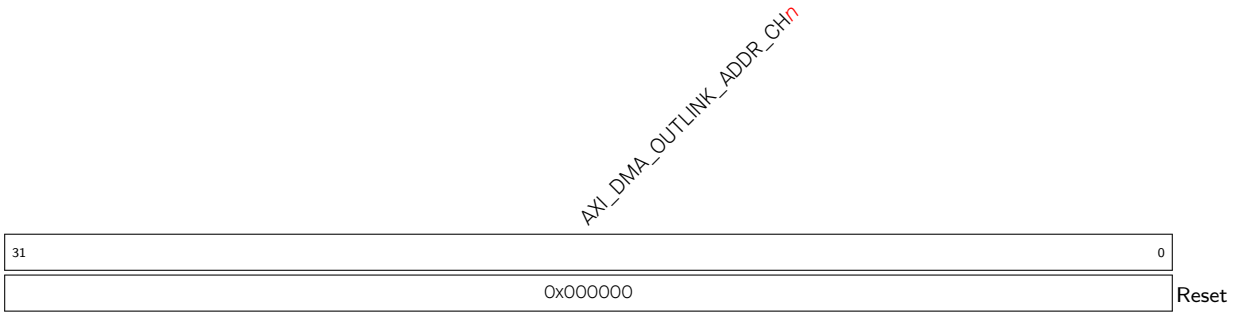
(WT)

AXI_DMA_OUTLINK_RESTART_CH*n* Configures whether to restart TX channel *n* for AXI DMA transfer.

0: Invalid. No effect

1: Restart

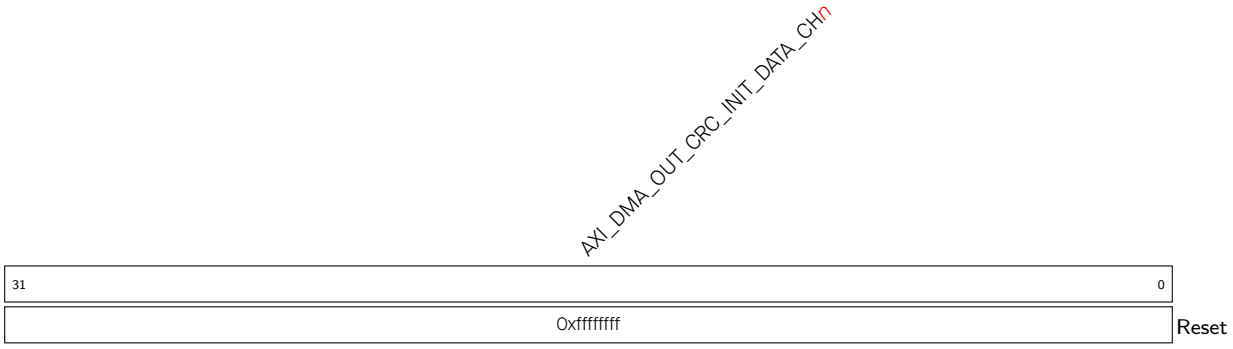
(WT)



AXI_DMA_OUTLINK_PARK_CH*n* Represents the status of the transmit descriptor's FSM.

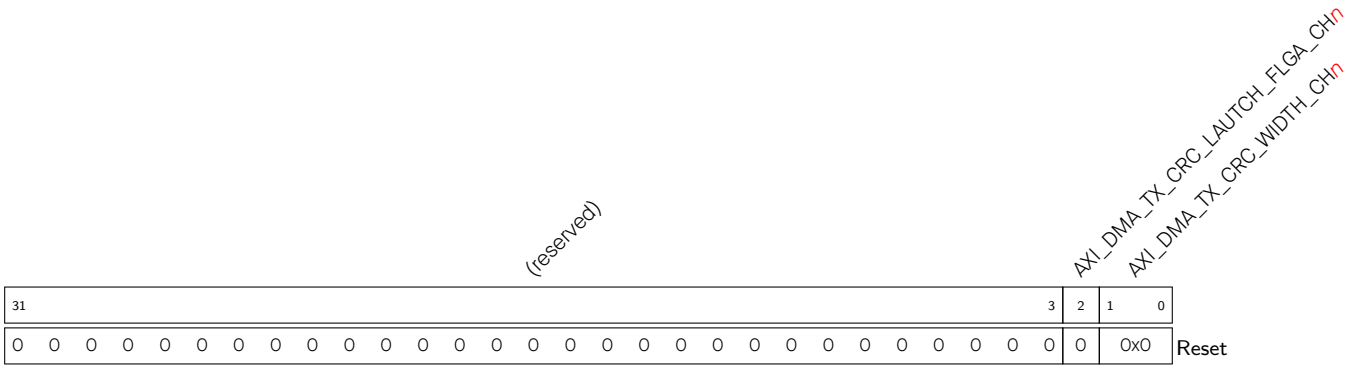
0: Running

1: Idle



(RO)

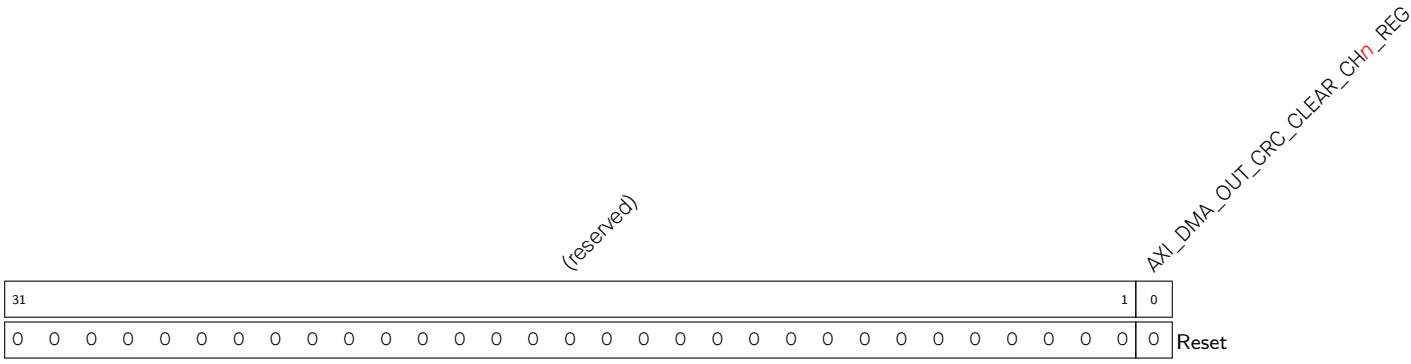
Register 6.93. AXI_DMA_OUT_LINK2_CH*n*_REG (*n*: 0-2) (0x015C+0x68n*)**



AXI_DMA_OUTLINK_ADDR_CH*n* Represents the first transmit descriptor's address. (R/W)

Register 6.94. AXI_DMA_OUT_CRC_INIT_DATA_CH*n*_REG (*n*: 0-2) (0x0180+0x68n*)**

AXI_DMA_OUT_CRC_INIT_DATA_CH*n* Configures the CRC initial value for TX channel *n*. (R/W)

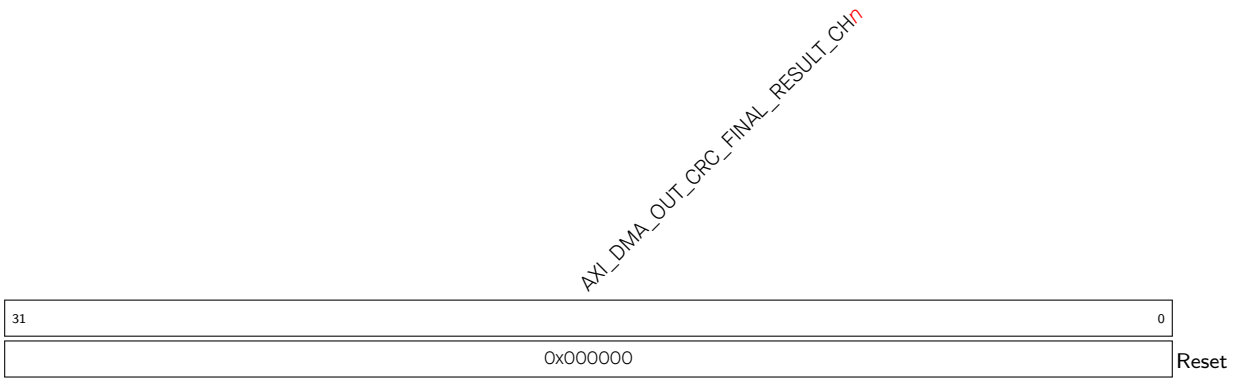


Register 6.95. AXI_DMA_TX_CRC_WIDTH_CH*n*_REG (*n*: 0-2) (0x0184+0x68n*)**

AXI_DMA_TX_CRC_WIDTH_CH*n* Configures the CRC result width for TX channel *n*. 0: $\leq$ 8 bits
1: $\leq$ 16 bits
2: $\leq$ 24 bits
3: $\leq$ 32 bits
(R/W)

AXI_DMA_TX_CRC_LAUTCH_FLGA_CH*n* Write 1 and then 0 to latch the values of AXI_DMA_TX_CRC_EN_ADDR_CH*n*, AXI_DMA_TX_CRC_DATA_EN_ADDR_CH*n*, AXI_DMA_TX_CRC_EN_WR_DATA_CH*n*, and AXI_DMA_TX_CRC_DATA_EN_WR_DATA_CH*n*. (R/W)

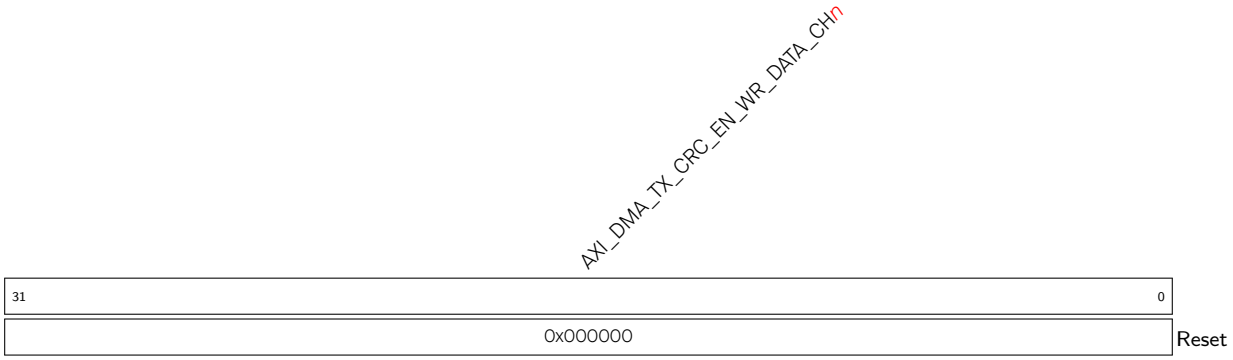
Register 6.96. AXI_DMA_OUT_CRC_CLEAR_CH*n*_REG (*n*: 0-2) (0x0188+0x68n*)**



AXI_DMA_OUT_CRC_CLEAR_CH*n*_REG Configures whether to clear the CRC result for TX channel *n*.

0: Not clear

1: Clear

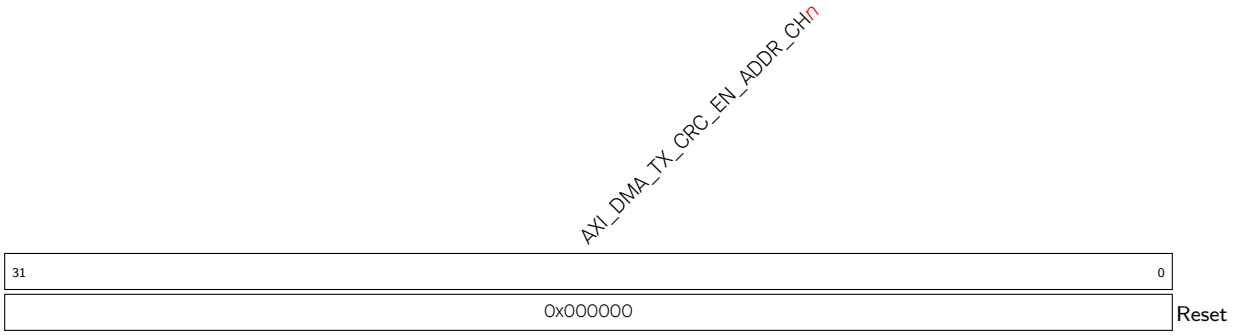


(R/W)

Register 6.97. AXI_DMA_OUT_CRC_FINAL_RESULT_CH*n*_REG (*n*: 0-2) (0x018C+0x68n*)**

AXI_DMA_OUT_CRC_FINAL_RESULT_CH*n* Represents the CRC result for TX channel *n*. (RO)

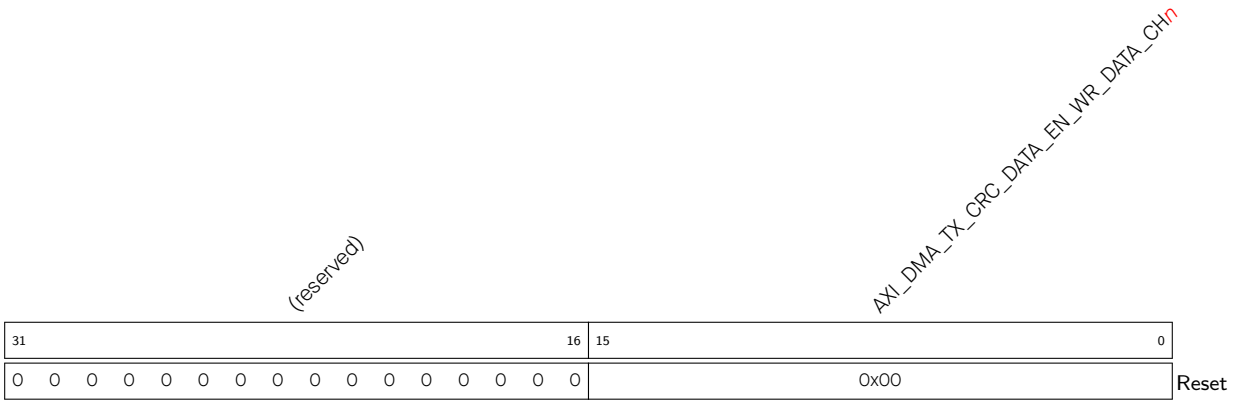
Register 6.98. AXI_DMA_TX_CRC_EN_WR_DATA_CH*n*_REG (*n*: 0-2) (0x0190+0x68**n*)



AXI_DMA_TX_CRC_EN_WR_DATA_CH*n* Configures whether to include each bit of the intermediate result in the CRC calculation matrix for TX channel *n*.

0: Not include

1: Include

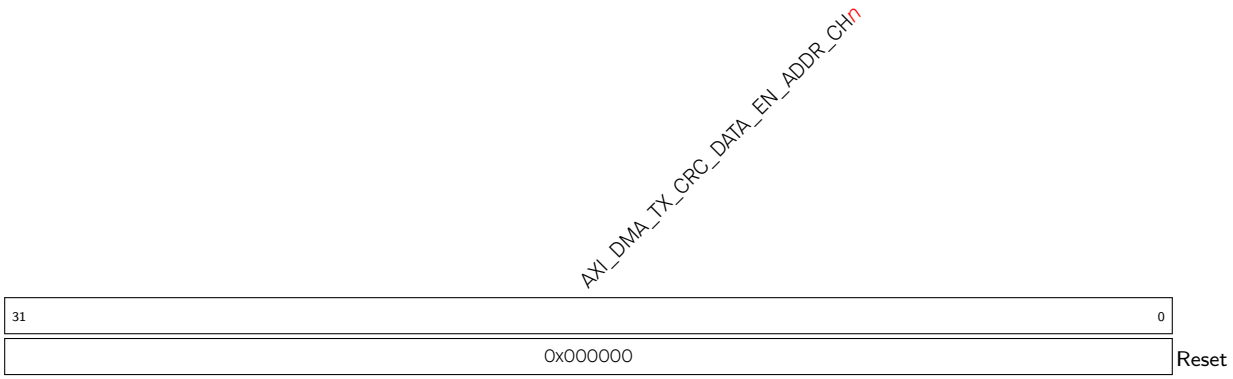


(R/W)

Register 6.99. AXI_DMA_TX_CRC_EN_ADDR_CH*n*_REG (*n*: 0-2) (0x0194+0x68**n*)

AXI_DMA_TX_CRC_EN_ADDR_CH*n* Configures at which bit of the CRC result the AXI_DMA_TX_CRC_EN_WR_DATA_CH*n*_REG register targets for TX channel *n*. (R/W)

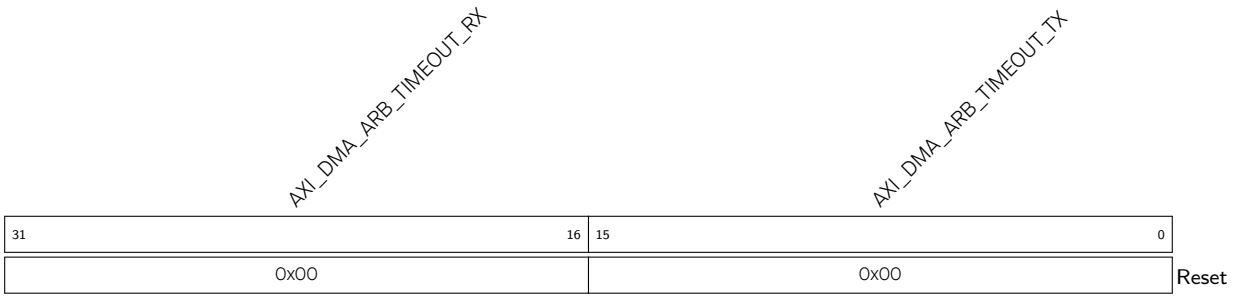
Register 6.100. AXI_DMA_TX_CRC_DATA_EN_WR_DATA_CH*n*_REG (*n*: 0-2) (0x0198+0x68**n*)



AXI_DMA_TX_CRC_DATA_EN_WR_DATA_CH*n* Configures whether to include each bit of the input data in the CRC calculation matrix for TX channel *n*.

0: Not include

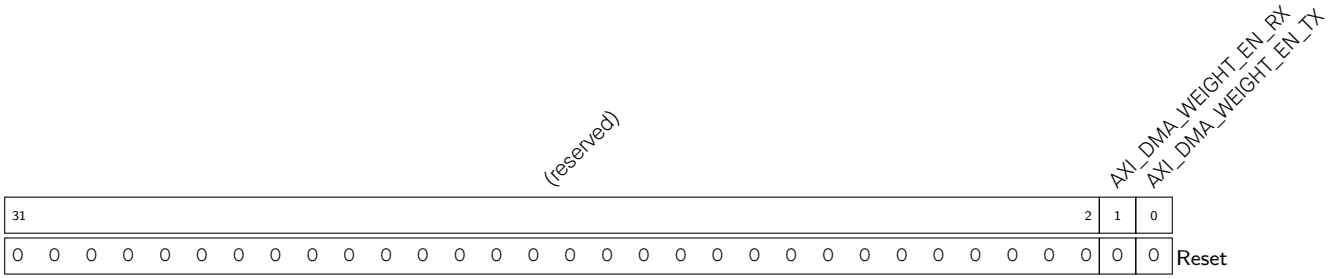
1: Include



(R/W)

Register 6.101. AXI_DMA_TX_CRC_DATA_EN_ADDR_CH*n*_REG (*n*: 0-2) (0x019C+0x68**n*)

AXI_DMA_TX_CRC_DATA_EN_ADDR_CH*n* Configures at which bit of the CRC result the AAXI_DMA_TX_CRC_DATA_EN_WR_DATA_CH*n*_REG register targets for TX channel *n*.(R/W)



Register 6.102. AXI_DMA_ARB_TIMEOUT_REG (0x0270)

AXI_DMA_ARB_TIMEOUT_TX Configures the time slot for TX. Measurement unit: AXI bus clock cycle. (R/W)

AXI_DMA_ARB_TIMEOUT_RX Configures the time slot for RX. Measurement unit: AXI bus clock cycle. (R/W)

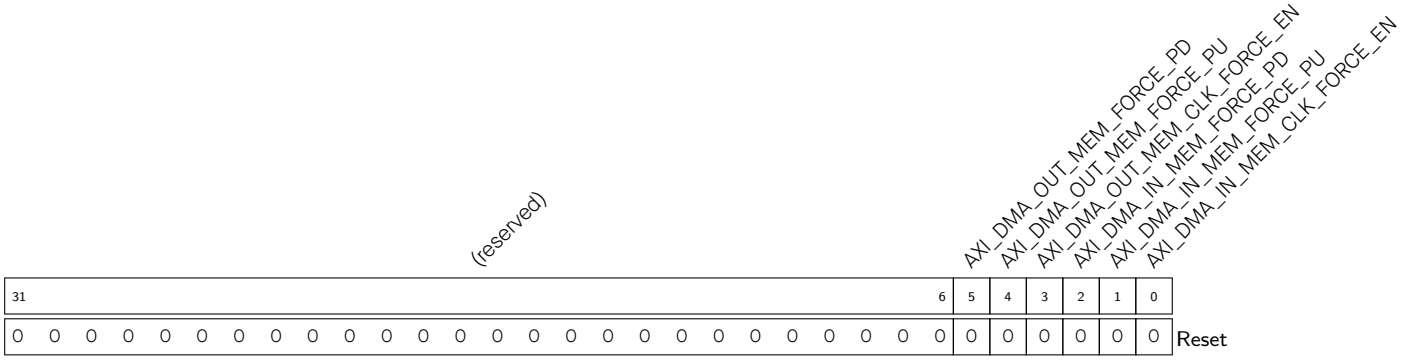
Register 6.103. AXI_DMA_WEIGHT_EN_REG (0x0274)

AXI_DMA_WEIGHT_EN_TX Configures whether to enable weight arbitration for TX.

0: Disable

1: Enable

(R/W)



AXI_DMA_WEIGHT_EN_RX Configures whether to enable weight arbitration for RX.

0: Disable

1: Enable

(R/W)

Register 6.104. AXI_DMA_IN_MEM_CONF_REG (0x0278)

AXI_DMA_IN_MEM_CLK_FORCE_EN Configures memory clock gating for RX.

0: Support clock only when AXI DMA accesses memory

1: Always force the clock on

(R/W)

AXI_DMA_IN_MEM_FORCE_PU Configures whether to force power up memory for RX.

0: Not force power up

1: Force power up

(R/W)

AXI_DMA_IN_MEM_FORCE_PD Configures whether to force power down memory for RX.

0: Not force power down

1: Force power down

(R/W)

AXI_DMA_OUT_MEM_CLK_FORCE_EN Configures memory clock gating for TX.

0: Support clock only when AXI DMA accesses memory

1: Always force the clock on

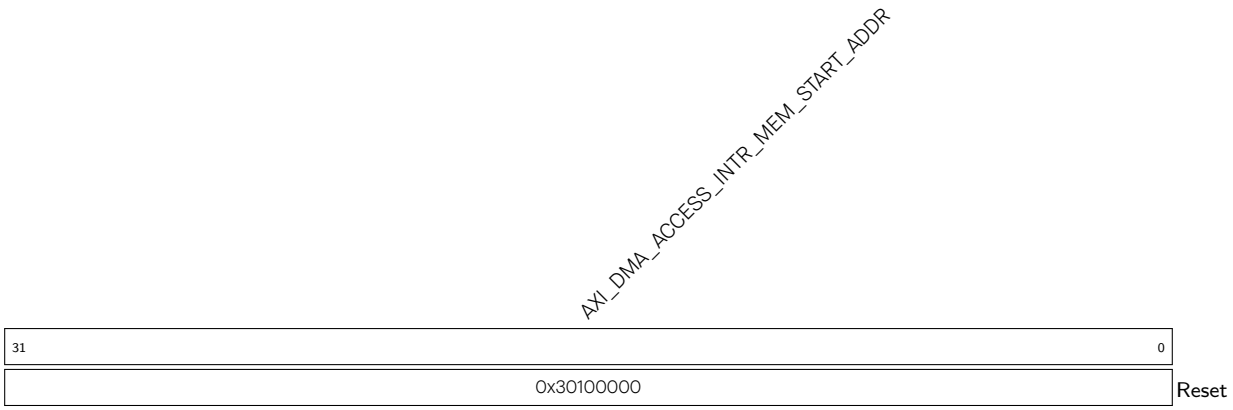
(R/W)

AXI_DMA_OUT_MEM_FORCE_PU Configures whether to force power up memory for TX.

0: Not force power up

1: Force power up

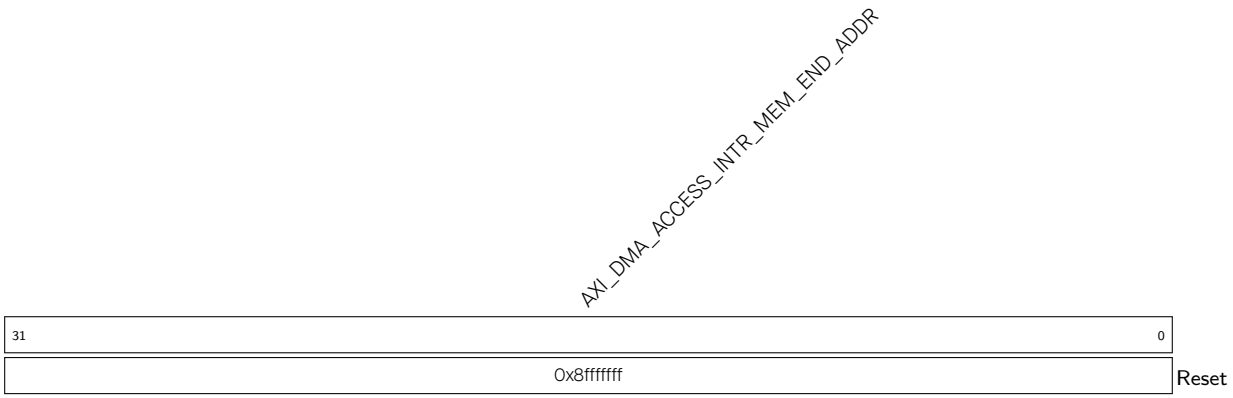
(R/W)



AXI_DMA_OUT_MEM_FORCE_PD Configures whether to force power down memory for TX.

0: Not force power down

1: Force power down



(R/W)

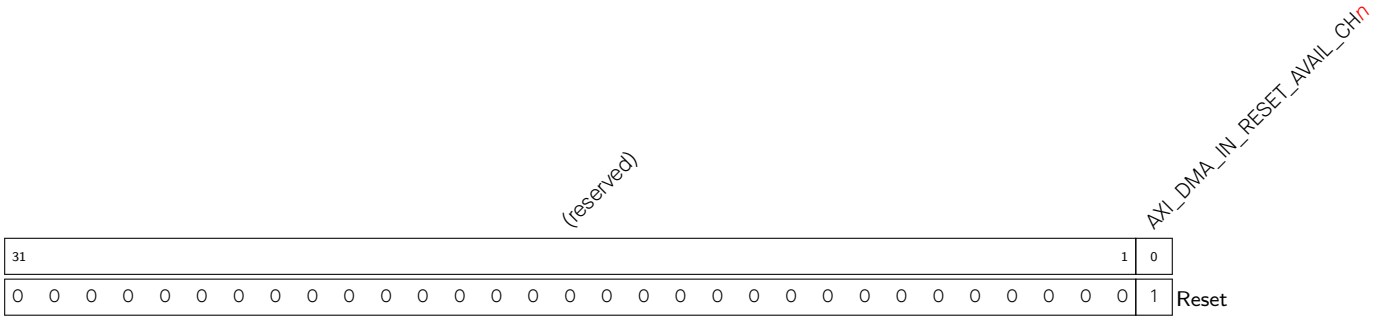
Register 6.105. AXI_DMA_INTR_MEM_START_ADDR_REG (0x027C)

AXI_DMA_ACCESS_INTR_MEM_START_ADDR Configures the start address of the accessible internal memory address space. (R/W)

Register 6.106. AXI_DMA_INTR_MEM_END_ADDR_REG (0x0280)

AXI_DMA_ACCESS_INTR_MEM_END_ADDR Configures the end address of the accessible internal memory address space. (R/W)

Register 6.107. AXI_DMA_EXTR_MEM_START_ADDR_REG (0x0284)

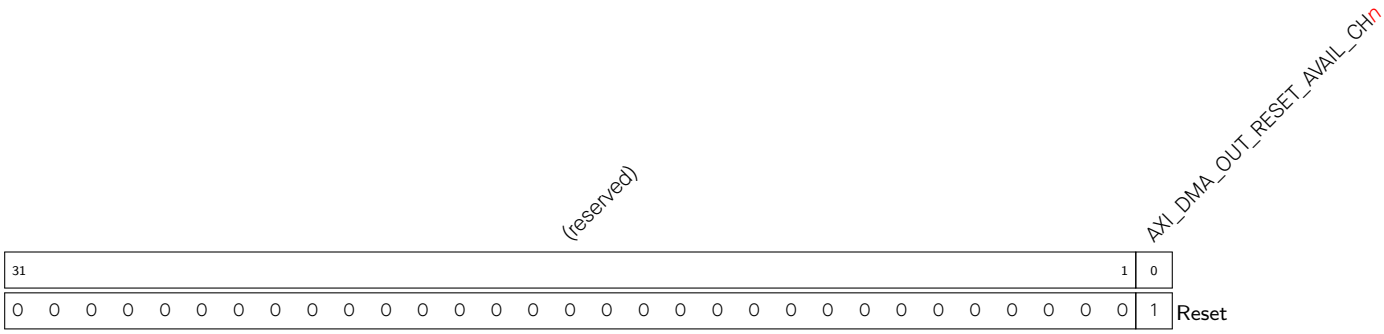


AXI_DMA_ACCESS_EXTR_MEM_START_ADDR Configures the start address of the accessible external memory address space. (R/W)

Register 6.108. AXI_DMA_EXTR_MEM_END_ADDR_REG (0x0288)

AXI_DMA_ACCESS_EXTR_MEM_END_ADDR Configures the end address of the accessible external memory address space. (R/W)

Register 6.109. AXI_DMA_IN_RESET_AVAIL_CH*n*_REG (*n*: 0-2) (0x028C+0x4n*)**



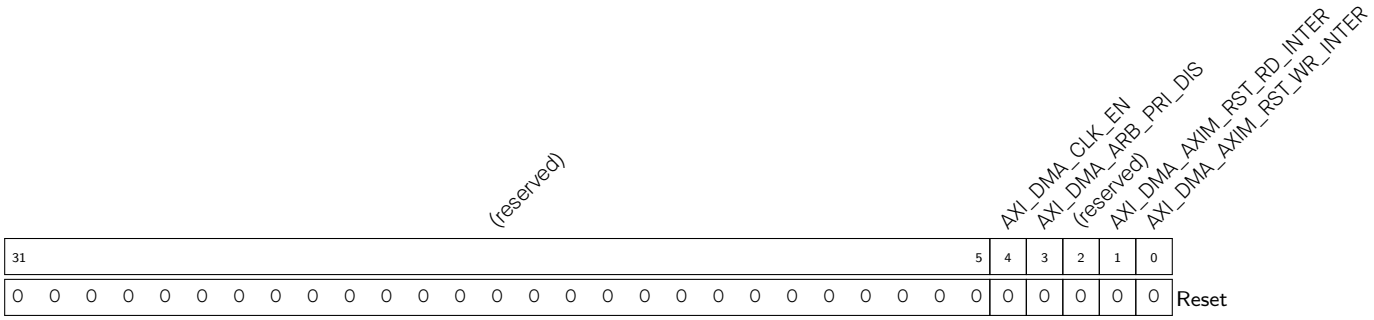
AXI_DMA_IN_RESET_AVAIL_CH*n* Represents whether RX channel *n* can be reset.

0: Cannot be reset by software

1: Can be reset

(RO)

Register 6.110. AXI_DMA_OUT_RESET_AVAIL_CH*n*_REG (*n*: 0-2) (0x0298+0x4n*)**



AXI_DMA_OUT_RESET_AVAIL_CH*n* Represents whether TX channel *n* can be reset.

0: Cannot be reset by software

1: Can be reset

. (RO)

Register 6.111. AXI_DMA_MISC_CONF_REG (0x02A8)

AXI_DMA_AXIM_RST_WR_INTER Write 1 and then 0 to reset the internal AXI write FSM. (R/W)

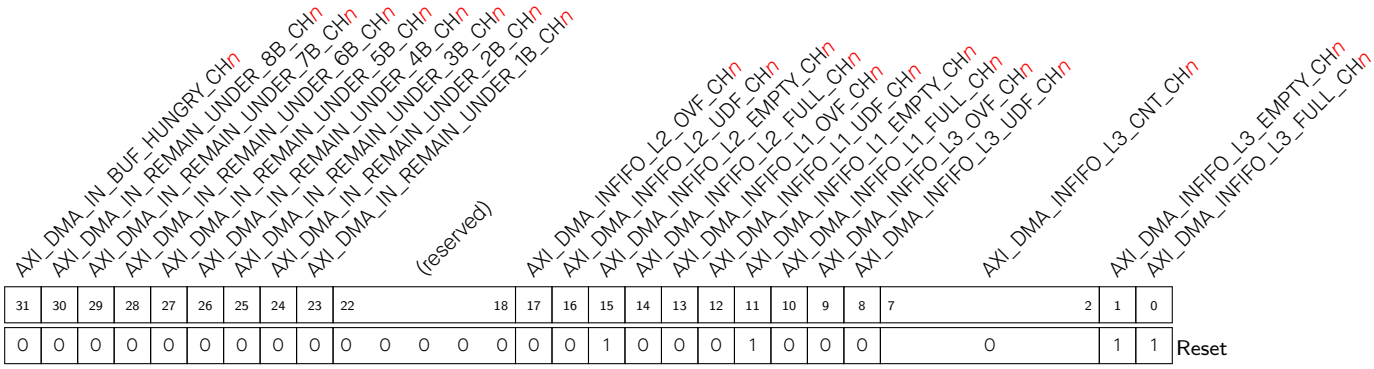
AXI_DMA_AXIM_RST_RD_INTER Write 1 and then 0 to reset the internal AXI read FSM. (R/W)

AXI_DMA_ARB_PRI_DIS Configures whether to disable the priority arbitration.

0: Enable

1: Disable

(R/W)



AXI_DMA_CLK_EN Configures AXI DMA clock gating.

0: Support clock only when the application writes registers.

1: Always force the clock on for registers.

(R/W)

Register 6.112. AXI_DMA_INFIFO_STATUS_CH*n*_REG (*n*: 0-2) (0x0018+0x68**n*)

AXI_DMA_INFIFO_L3_FULL_CH*n* Represents whether L3 RX FIFO is full.

0: Not Full

1: Full

(RO)

AXI_DMA_INFIFO_L3_EMPTY_CH*n* Represents whether L3 RX FIFO is empty.

0: Not empty

1: Empty

(RO)

AXI_DMA_INFIFO_L3_CNT_CH*n* Represents the number of data bytes in L3 RX FIFO for RX channel *n*. (RO)

AXI_DMA_INFIFO_L3_UDF_CH*n* Represents whether L3 RX FIFO underflows.

0: No underflow

1: Underflow

(RO)

AXI_DMA_INFIFO_L3_OVF_CH*n* Represents whether L3 RX FIFO overflows.

0: No overflow

1: Overflow

(RO)

AXI_DMA_INFIFO_L1_FULL_CH*n* Represents whether L1 RX FIFO is full.

0: Not Full

1: Full

(RO)

AXI_DMA_INFIFO_L1_EMPTY_CH*n* Represents whether L1 RX FIFO is empty.

0: Not empty

1: Empty

(RO)

AXI_DMA_INFIFO_L1_UDF_CH*n* Represents whether L1 RX FIFO underflows.

0: No underflow

1: Underflow

(RO)

Register 6.132. AXI_DMA_DATE_REG (0x02D8)

AXI_DMA_DATE Version control register. (R/W)

Chapter 7

VDMA Controller (VDMA)

7.1 Overview

DMA (Direct Memory Access) enables direct access to system memory or peripherals without CPU involvement. The VDMA controller on ESP32-P4 is a general-purpose DMA that performs high-speed data transfer from memory to memory, from memory to peripheral, and from peripheral to memory. The VDMA complies with the AXI3 protocol and includes two AXI master interfaces. This design allows users to select between the two interfaces for data transfer dynamically.

7.2 Terminology

The following terms are defined in the context of the VDMA controller on ESP32-P4:

- **AXI**: Advanced eXtensible Interface, a part of AMBA 3 (Advanced Microcontroller Bus Architecture) specification, designed to facilitate high bandwidth and low latency communication between memory and peripheral, and between memory and memory.
- **Peripheral**: A system component that has a handshake interface with VDMA, as listed in Table 7.4-1.
- **Memory**: A system component that is always ready for DMA transfer, which means there is no handshaking interface between VDMA and memory. The memory that supports VDMA data transfer includes HP L2MEM, external flash, and external RAM.
- **Source**: Source memory or peripheral from which VDMA reads data via the AXI interface. VDMA then stores data in channel FIFO.
- **Source transfer**: Transfer from the source to VDMA.
- **Destination**: Destination peripheral or memory to which VDMA writes the data stored in channel FIFO.
- **Destination transfer**: Transfer from VDMA to the destination.
- **Channel**: Data path between source and destination.
- **Master interface**: Refers to the two AXI master interfaces of VDMA.
- **Slave interface**: The APB3 slave interface for programming registers.
- **Handshaking interface**: The handshaking interface performs a handshake between VDMA and the source or destination peripheral. The handshaking interface requests, acknowledges, and controls an VDMA transfer.
- **Flow controller**: The flow controller defines the length of a DMA block transfer and terminates the transfer. The flow controller can be VDMA, a source peripheral, or a destination peripheral, but it cannot be memory.

7.3 Features

VDMA supports the following features:

- Four channels for unidirectional data transfer from source to destination
- Two AXI master interfaces
- Handshake with MIPI DSI (Display Serial Interface) and ISP (Image Signal Processor)
- Memory-to-memory, ISP-to-memory, and MIPI DSI-to-memory transfer types
- Multiple levels of DMA transfer hierarchy
- Configurable transfer type, transfer length, and transfer size for each channel
- Single-block transfer
- Multi-block transfer based on contiguous address, automatic reloading register configuration, shadow registers, and linked lists
- Independent configuration of multi-block transfer type for source transfer and destination transfer
- Channel disabling without data loss
- Channel suspension, resume, and abortion
- Configurable priorities among arbitration channels
- Flow control using VDMA or peripherals
- Programmable mapping between peripherals and channels

7.4 Architectural Overview

Figure 7.4-1 shows the architecture of VDMA and its connection with other system components.

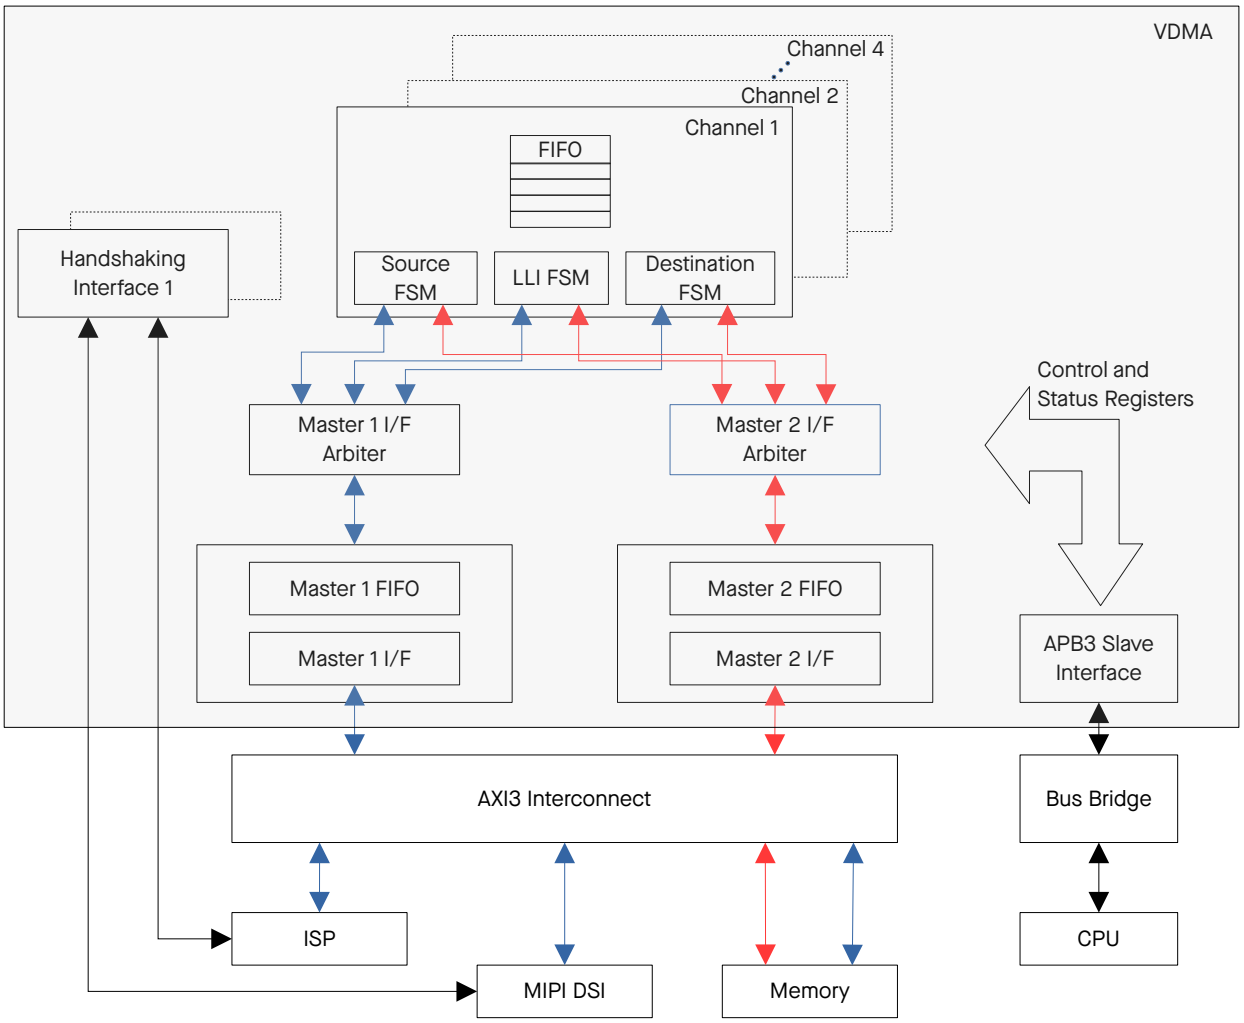

Figure 7.4-1. VDMA Architecture

It can be seen from the figure that:

- The CPU accesses VDMA registers via the APB3 slave interface.
- VDMA has four channels (Channel 1 to Channel 4). Each channel has a data FIFO with a depth of 64 and a width of 64 bits.
- VDMA has two AXI master interfaces (Master 1 and Master 2).
  - Master 1 can access ISP, MIPI DSI, and memory, as blue arrows indicate.
  - Master 2 can only access memory, as red arrows indicate.
  - Master 1 and Master 2 each have an arbiter that arbitrates read and write requests on all channels.
- VDMA has three hardware handshaking interfaces. Table 7.4-1 shows the mapping between the handshaking interfaces and peripherals.

Table 7.4-1. Hardware Handshaking Interface and Peripherals Mapping Table

Handshaking Interface Number	Peripheral
0	MIPI DSI

1	ISP (ISP-to-memory)
2	ISP (memory-to-ISP)

For more information about ISP and MIPI DSI, please refer to Chapter 38 *Image Signal Processor (ISP)* and Chapter 43 *MIPI DSI*.

7.5 Functional Description

This section provides a detailed description of the key features and operations of the module.

7.5.1 Transfer Hierarchy

Transfers are organized into a maximum of four levels: DMA transfer level, block transfer level, transaction level, and AXI transfer level.

Figure 7.5-1 shows four transfer levels between VDMA and peripherals.

Figure 7.5-2 shows three transfer levels between VDMA and memory. There is no transaction level because memory is assumed to be always ready for data transfer.

The following descriptions of DMA, block, and AXI transfers apply to the transfer between VDMA and memory, VDMA and peripherals. **The description of the transaction level applies only to transfers between VDMA and peripherals.**

- **DMA transfer**: Software defines the number of blocks in a DMA transfer. Once a DMA transfer has finished, VDMA disables the channel and generates an interrupt. The channel can then be reprogrammed for a new DMA transfer. A DMA transfer can consist of either a single-block or a multi-block transfer.
- **Block transfer**: A block transfer moves a specified data block through the VDMA. The flow controller controls the block length. There are two types of block transfer: single-block transfer and multi-block transfer. As shown in Figure 7.5-1, a block transfer may consist of multiple transactions.
- **Transaction**: A peripheral request may trigger either a single or burst transaction, corresponding to an AXI single transfer or multiple AXI burst transfers, respectively.
  - Single transaction: The length of a single transaction is always 1, in the unit of DMAC_CH*n*_SRC_TR_WIDTH.
  - Burst transaction: The length of a burst transaction is programmed into the VDMA through DMAC_CH*n*_SRC_MSIZE for the source or DMAC_CH*n*_DST_MSIZE for the destination. The burst length typically relates to the FIFO sizes in the source or destination peripherals. For more information, please refer to the chapter on each peripheral.
- **AXI transfer**: Refers to the AXI protocol transfer, which is divided into AXI single transfer and AXI burst transfer.

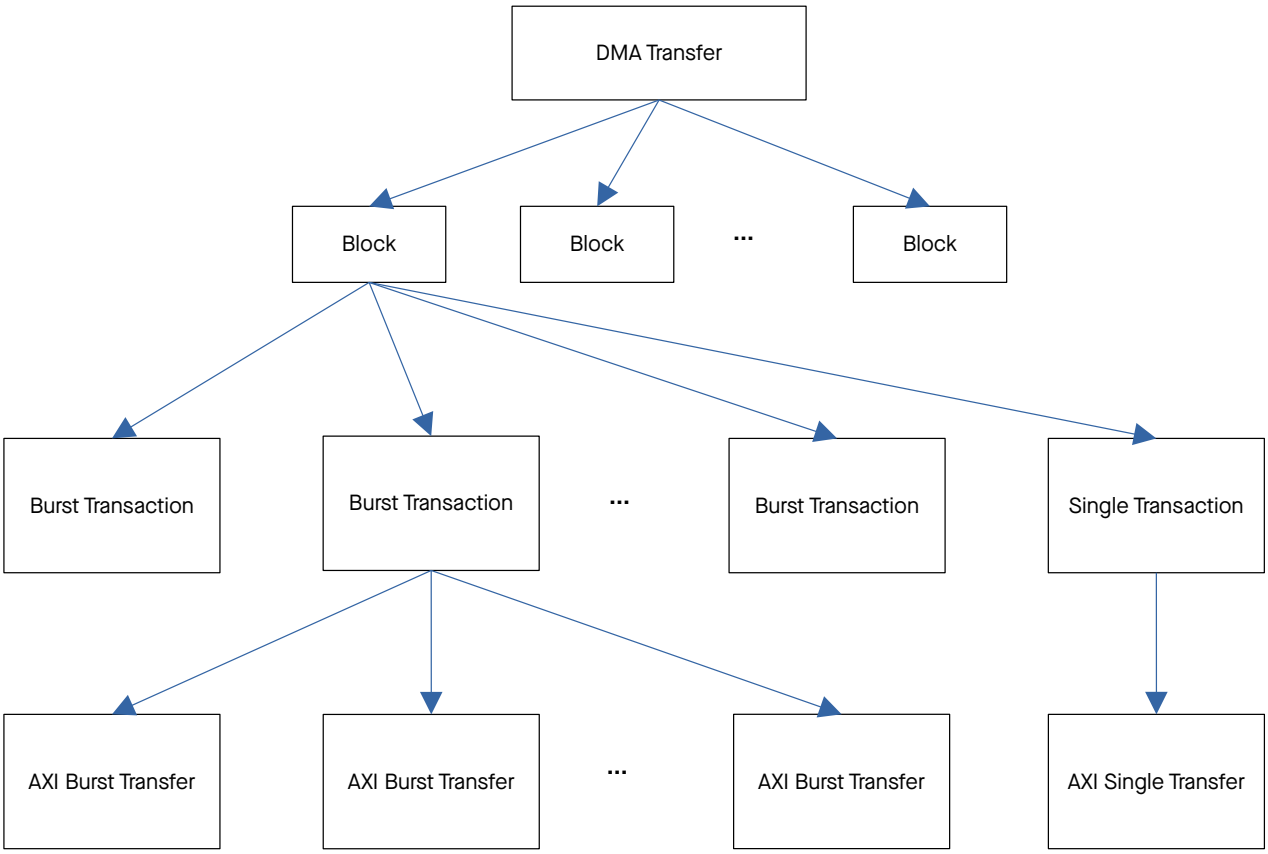

Figure 7.5-1. VDMA Transfer Hierarchy for Peripherals

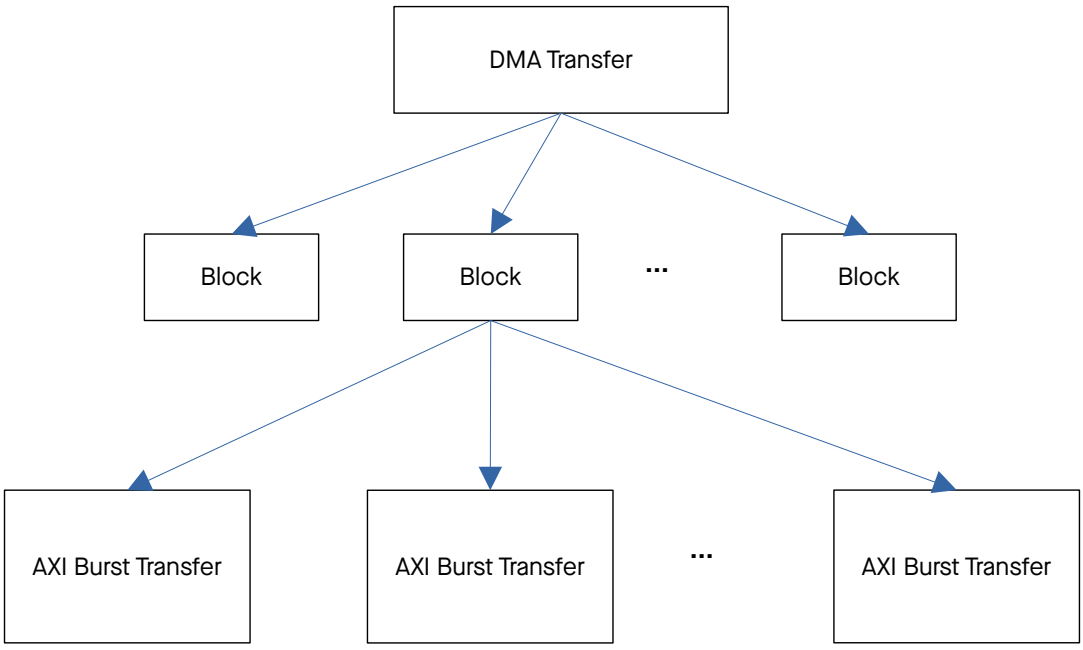

Figure 7.5-2. VDMA Transfer Hierarchy for Memory

7.5.2 Arbitration Scheme

The arbitration mechanism arbitrates read and write requests for all channels.

VDMA uses a priority and fair-among-equals arbitration mechanism. The priority for each channel is defined in the channel configuration register DMAC_CH*n*_CFG1_REG.

A priority of 3 is the highest, while 0 is the lowest. Multiple channels can share the same priority level.

The arbitration mechanism works as follows:

- The arbitration mechanism determines which request client to grant the authorization signal based on the priority of the request. The request with the highest priority will be granted access to the channel.
- When two or more requests have the same priority, request clients will gain access randomly.

7.5.2.1 Read Arbiter

The read arbiter arbitrates read requests, including:

- VDMA's read requests to obtain data or status from the source
- VDMA's read requests to obtain status from the destination
- VDMA's read requests to obtain LLI descriptors

The block diagram of the read arbiter is shown in Figure 7.5-3:

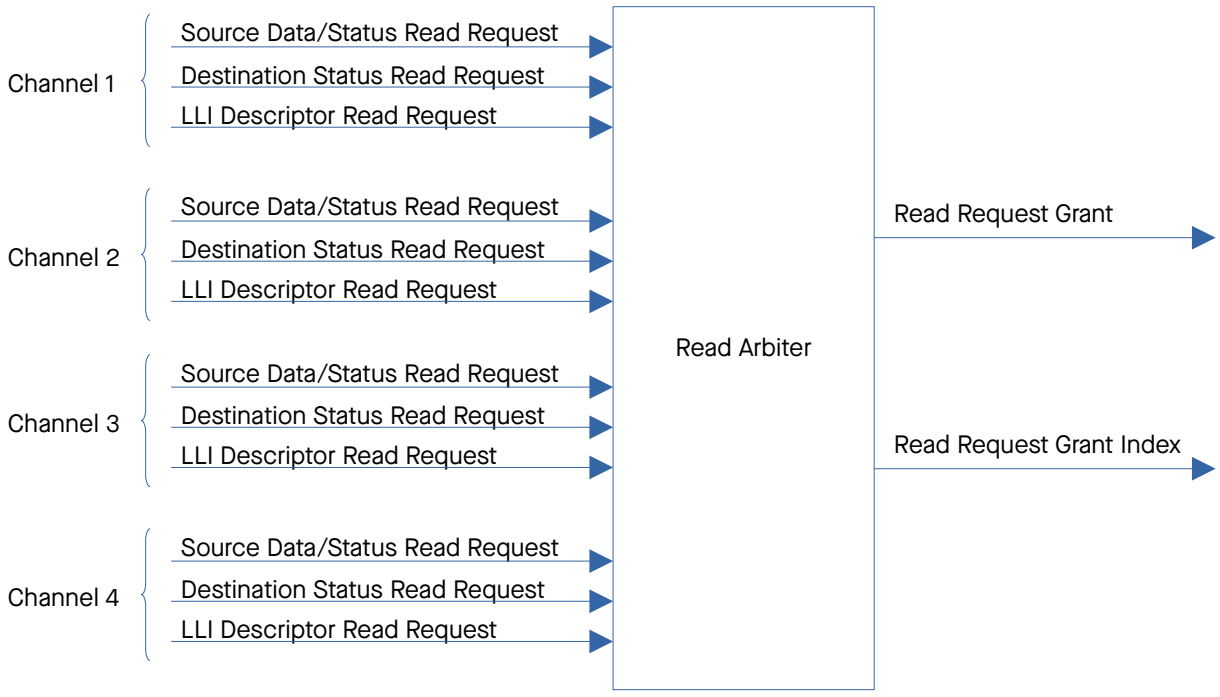

Figure 7.5-3. VDMA Read Arbiter

Read requests to obtain linked list descriptors will be granted the highest priority, regardless of the channels' priority settings.

7.5.2.2 Write Arbiter

The write arbiter arbitrates write requests, including:

- Destination Data Write Request
- LLI Descriptor Write-Back Request

The block diagram of the write arbiter is shown in Figure 7.5-4:

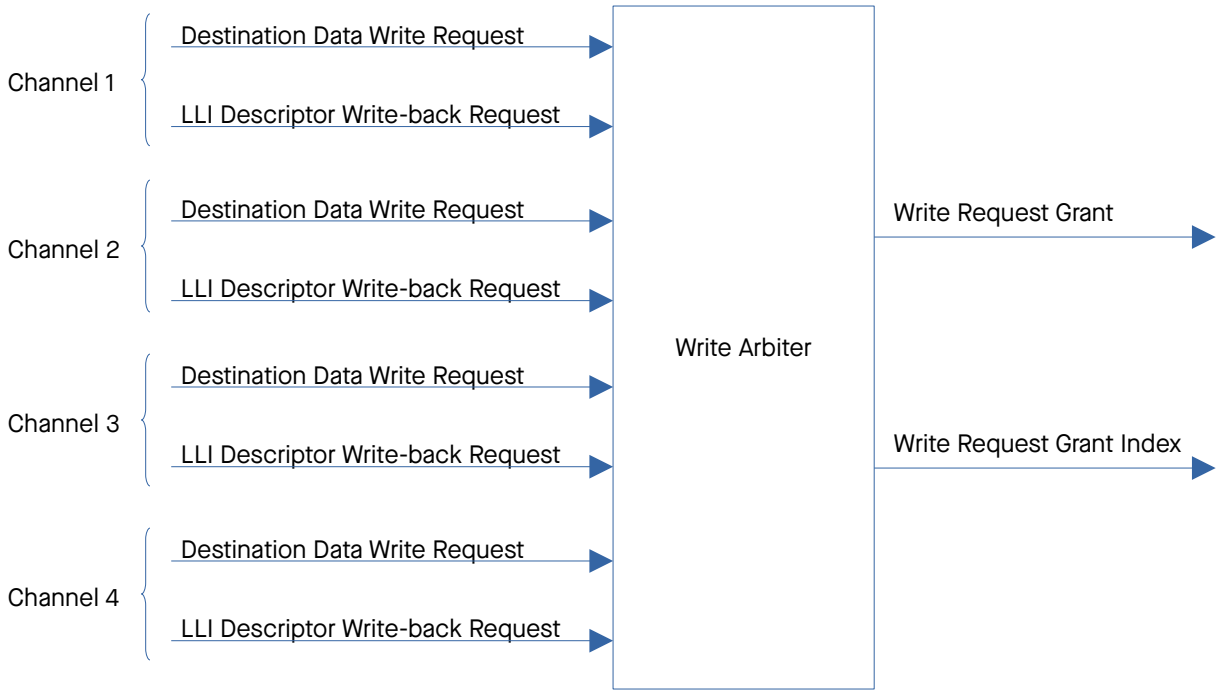

Figure 7.5-4. VDMA Write Arbiter

Within the same channel, Destination Data Write Request has higher priority than LLI Descriptor Write-Back Request. If different channels have the same priority, then Data Write Requests have the highest priority.

7.5.3 Handshaking Interface

A peripheral uses a handshaking interface to inform VDMA that it is ready to transmit or receive data via AXI bus. The operation of the handshaking interface depends on whether the flow controller is the peripheral or VDMA.

VDMA performs a single transaction or a burst transaction per handshake. In some cases, a block transfer cannot be completed using only burst transactions. This situation typically occurs when the block size is not a multiple of the burst transaction length. In this case, the block transfer uses burst transactions until the remaining size of the block is less than the amount of data in the burst transaction. At this point, a single transaction is used to complete the block transfer.

A source's burst transaction size is determined by DMAC_CH*n*_SRC_MSIZE. A destination's burst transaction size is determined by DMAC_CH*n*_DST_MSIZE. The transaction size also corresponds to the burst transaction size used for handshaking. The value of DMAC_CH*n*_SRC_MSIZE or DMAC_CH*n*_DST_MSIZE should match the peripheral configuration. For detailed information, please refer to the chapter on related peripherals.

VDMA has three hardware handshaking interfaces with MIPI DSI, ISP (ISP-to-memory), and ISP (memory-to-ISP). For the mapping relationship please see Table 7.4-1.

7.5.4 Transfer Control

Transfer control logic facilitates the data transfer from a source to a destination. Data from the source is temporarily stored in the channel FIFO before being sent to the destination. If source and destination peripherals use different transfer sizes, VDMA will pack and unpack the data to fit the FIFO configuration.

For a specific DMA transfer, the transfer type and flow control configurations are determined by DMAC_CH*n*_TT_FC.

7.5.4.1 Single-Block Transfer

If a DMA transfer consists of a single block, the software can set DMAC_CH*n*_SRC_MULTBLK_TYPE and DMAC_CH*n*_DST_MULTBLK_TYPE to 0 to enable contiguous-address-based single-block transfer. In this case, VDMA disables the channel once the block transfer of size DMAC_CH*n*_BLOCK_TS is completed.

> **Note:**
> Single-block transfer is a special case of multi-block transfer, and there is no strict distinction between the two. In this chapter, single-block transfer refers to the transfer consisting of only one block, while multi-block transfer refers to the transfer consisting of at least two blocks.

7.5.4.2 Multi-Block Transfer

If a DMA transfer consists of multiple blocks, the software can configure DMAC_CH*n*_SRC_MULTBLK_TYPE and DMAC_CH*n*_DST_MULTBLK_TYPE to choose a multi-block transfer type. There are four types of multi-block transfers, depending on how the transfer control registers (DMAC_CH*n*_SARO_REG, DMAC_CH*n*_DARO_REG, DMAC_CH*n*_BLOCK_TS, DMAC_CH*n*_CTLO/1_REG) are updated:

1. **Contiguous address**
2. **Auto reloading**: Register values reload from initial values
3. **Shadow register**: Register values load from shadow registers
4. **Linked list** Register values load from the next linked list (LLI)

Table 7.5-1 lists all the cases of register update methods for multi-block transfer.

Table 7.5-1. Register Update Methods for Multi-Block Transfer

DMAC_CH*n*_CFG0_REG		Registers Update Method				Comment
DMAC_CH*n*_SRC_MULTBLK_TYPE	DMAC_CH*n*_DST_MULTBLK_TYPE	DMAC_CH*n*_SARO_REG	DMAC_CH*n*_DARO_REG	DMAC_CH*n*_CTLO_REG /CTL1_REG	DMAC_CH*n*_BLOCK_TS	
00	00	Contiguous address	Contiguous address	No update	No update	Single block or last block of multi-block
00	01	Contiguous address	Reload from initial value	Reload from initial value	Reload from initial value	-
00	10	Contiguous address	Load from shadow register	Load from shadow register	Load from shadow register	-
01	00	Reload from initial value	Contiguous address	Reload from initial value	Reload from initial value	-
01	01	Reload from initial value	Reload from initial value	Reload from initial value	Reload from initial value	-
01	10	Reload from initial value	Load from shadow register	Load from shadow register	Load from shadow register	-
10	00	Load from shadow register	Contiguous address	Load from shadow register	Load from shadow register	-
10	01	Load from shadow register	Reload from initial value	Load from shadow register	Load from shadow register	-
10	10	Load from shadow register	Load from shadow register	Load from shadow register	Load from shadow register	-
00	11	Contiguous address	Load from next LLI	Load from next LLI	Load from next LLI	-
01	11	Reload from initial value	Load from next LLI	Load from next LLI	Load from next LLI	-
11	00	Load from next LLI	Contiguous address	Load from next LLI	Load from next LLI	-
11	01	Load from next LLI	Reload from initial value	Load from next LLI	Load from next LLI	-
11	11	Load from next LLI	Load from next LLI	Load from next LLI	Load from next LLI	-
10	11	-	-	-	-	Invalid. Interrupt* is generated.
11	10	-	-	-	-	Invalid. Interrupt* is generated.

*Note: The interrupt is DMAC_CH*n*_SLVIF_MULTIBLKTYPE_ERR_INT.

Contiguous Address

In this scenario, the address for each subsequent block continues from the end of the preceding block. To achieve this contiguity, configure DMAC_CH*n*_SRC_MULTBLK_TYPE or DMAC_CH*n*_DST_MULTBLK_TYPE to 0 for the source address or destination address to remain continuous across the blocks.

In the case of multi-block transfer, the values of DMAC_CH*n*_SRC_MULTBLK_TYPE and DMAC_CH*n*_DST_MULTBLK_TYPE cannot both be selected as contiguous addresses, meaning they cannot both be configured to 0 at the same time. If both are configured to 0 during a multi-block transfer, then the current block will be considered as the last block.

During a multi-block transfer, if DMAC_CH*n*_SARO_REG and DMAC_CH*n*_DARO_REG need to have contiguous addresses between blocks, you can indirectly achieve this functionality using linked-list or shadow-register-based multi-block transfer.

Note:
If you have enabled contiguous-address-based multi-block transfer (i.e., DMAC_CH*n*_SRC_MULTBLK_TYPE or DMAC_CH*n*_DST_MULTBLK_TYPE is 0), ensure there are at least two blocks in the DMA transfer. Otherwise, it will result in unpredictable behavior.

Auto Reloading

In this scenario, DMAC_CH*n*_SARO_REG and DMAC_CH*n*_DARO_REG are reloaded with their initial values at the end of each block. VDMA does not proceed to the next block transfer until software clears the corresponding channel's block transfer complete interrupt by writing 1 to DMAC_CH*n*_CLEAR_SRC_TRANSCOMP_INTSTAT and DMAC_CH*n*_CLEAR_DST_TRANSCOMP_INTSTAT.

Note:
If you have enabled auto-reloading-based multi-block transfer, please ensure there are at least two blocks in the DMA transfer. Otherwise, it will result in unpredictable behavior.

Shadow Register

In this scenario, DMAC_CH*n*_SARO_REG, DMAC_CH*n*_DARO_REG, DMAC_CH*n*_BLOCK_TS, DMAC_CH*n*_CTLO_REG, and DMAC_CH*n*_CTL1_REG synchronize with their corresponding shadow registers when each block finishes. The values of the shadow registers are then used for the subsequent block.

Software writes the block configurations to the corresponding shadow registers. VDMA copies the shadow register contents to DMAC_CH*n*_SARO_REG, DMAC_CH*n*_DARO_REG, DMAC_CH*n*_BLOCK_TS, DMAC_CH*n*_CTLO_REG, and DMAC_CH*n*_CTL1_REG before starting the subsequent block transfer.

Read operations to the DMAC_CH*n*_SARO_REG, DMAC_CH*n*_DARO_REG, DMAC_CH*n*_BLOCK_TS, DMAC_CH*n*_CTLO_REG, and DMAC_CH*n*_CTL1_REG always return the data corresponding to the current block transfer, not the shadow register contents that correspond to the next block.

DMAC_CH*n*_SHADOWREG_OR_LLI_VALID indicates whether the shadow register contents are valid (1) or not (0). If this bit reads as 0 during a shadow register fetch phase, VDMA discards the shadow register contents and generates a DMAC_CH*n*_SHADOWREG_OR_LLI_INVALID_ERR_INT interrupt. VDMA waits until the software

writes 1 to DMAC_CH*n*_BLK_TFR_RESUMEREQ, indicating that the shadow registers are available. After this, VDMA attempts to read the shadow registers again and continues with the next block transfer.

Note:
In a shadow-register-based multi-block transfer, the values in DMAC_CH*n*_SARO_REG, DMAC_CH*n*_DARO_REG, DMAC_CH*n*_BLOCK_TS, DMAC_CH*n*_CTLO_REG, and DMAC_CH*n*_CTL1_REG correspond to the current transfer configurations. When software writes to these registers, it is actually writing to the corresponding shadow registers.

Linked List

In this scenario, VDMA retrieves a block descriptor for a specific block from memory to update DMAC_CH*n*_SARO_REG, DMAC_CH*n*_DARO_REG, DMAC_CH*n*_BLOCK_TS, DMAC_CH*n*_CTLO_REG, and DMAC_CH*n*_CTL1_REG, and then initiates the block transfer. This process is called LLI (Linked List Item) update. The block chaining feature of VDMA uses the linked list pointer register DMAC_CH*n*_LOCO to store the address of the next linked list item in memory, thereby achieving seamless continuity of data transfer.

Figure 7.5-5 shows the VDMA linked list item:

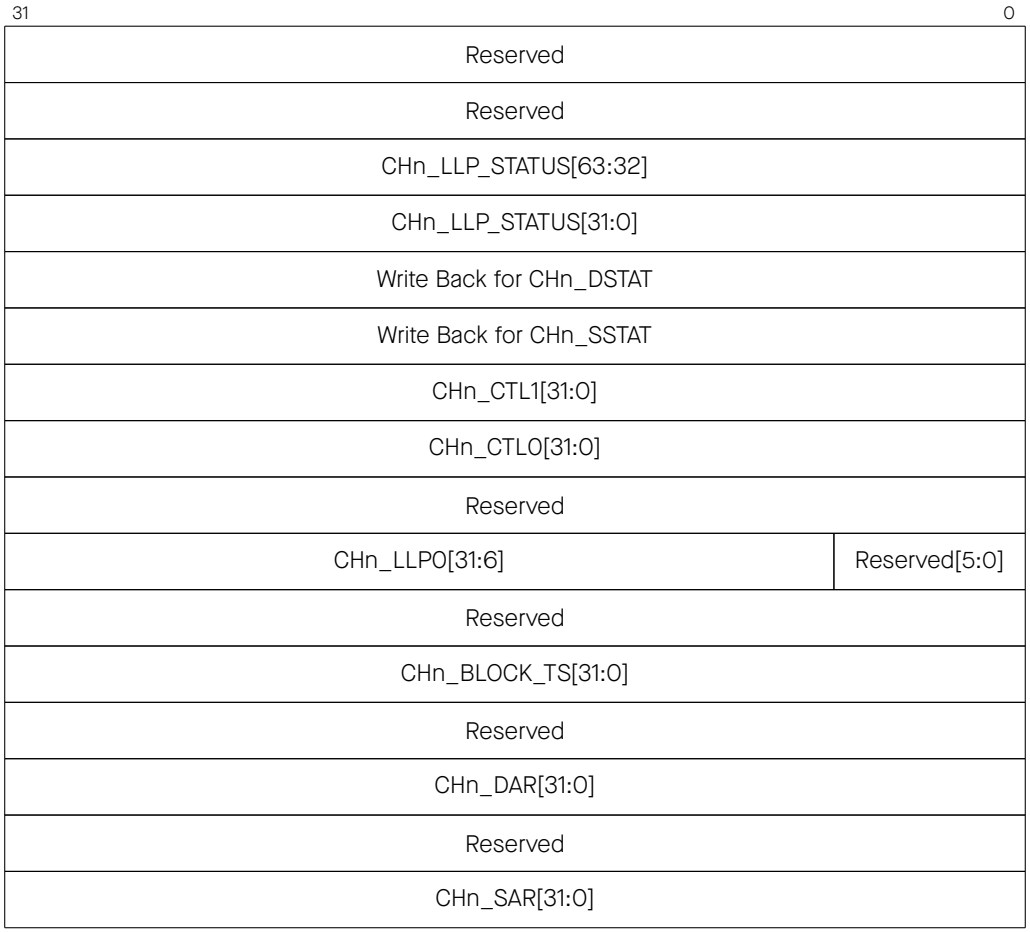

Figure 7.5-5. VDMA Linked List Item (Descriptor)

VDMA can dynamically extend linked lists, which means you do not need to pre-create the entire linked list in system memory. To enable this feature, set DMAC_CH*n*_SHADOWREG_OR_LLI_VALID to 1. If the linked list item is the last one, then also configure DMAC_CH*n*_SHADOWREG_OR_LLI_LAST to 1.

DMAC_CH*n*_SHADOWREG_OR_LLI_VALID indicates whether the linked list item fetched from memory is valid (1) or not (0). If the LLI is invalid, VDMA discards the LLI and generates a DMAC_CH*n*_SHADOWREG_OR_LLI_INVALID_ERR_INT interrupt. This interrupt causes VDMA to halt the corresponding channel and wait until the software writes 1 to DMAC_CH*n*_BLK_TFR_RESUMEREQ to indicate that the LLI is available. After this, VDMA will attempt to read the LLI again.

Note:
For pre-fetched LLIs, if DMAC_CH*n*_SHADOWREG_OR_LLI_VALID is 0, then the DMAC_CH*n*_SHADOWREG_OR_LLI_INVALID_ERR_INTSTAT interrupt will not be generated. VDMA re-attempts to fetch the LLI again after completing the current block transfer and generates a DMAC_CH*n*_SHADOWREG_OR_LLI_INVALID_ERR_INTSTAT interrupt only if DMAC_CH*n*_SHADOWREG_OR_LLI_VALID still reads as 0.

The following fields in LLI are prepared by software:

- CH*n*_SAR: The field definition is the same as DMAC_CH*n*_SARO_REG
- CH*n*_DAR: The field definition is the same as DMAC_CH*n*_DARO_REG
- CH*n*_BLOCK_TS: The field definition is the same as DMAC_CH*n*_BLOCK_TS
- CH*n*_LLPO[31:6]: The field definition is the same as DMAC_CH*n*_LLPO_REG[31:6]
- CH*n*_CTLO: The field definition is the same as DMAC_CH*n*_CTLO_REG
- CH*n*_CTL1: The field definition is the same as DMAC_CH*n*_CTL1_REG

If the status write-back option is enabled, VDMA writes back CH*n*_CTLO, CH*n*_CTL1, CH*n*_LLP_STATUS, CH*n*_SSTAT, and CH*n*_DSTAT information to the location defined for this field, which is from address [CH*n*_LLP] + 0x20 to [CH*n*_LLP] + 0x34. The write-back of CH*n*_SSTAT and CH*n*_DSTAT can be independently enabled or disabled by programming DMAC_CH*n*_SRC_STAT_EN and DMAC_CH*n*_DST_STAT_EN.

Note:
- If CH*n*_SSTAT and CH*n*_DSTAT write-back is not enabled, do not use PSRAM to store LLI.
- DMAC_CH*n*_SHADOWREG_OR_LLI_VALID will be 0 after the LLI write-back operation.

Figure 7.5-6 shows CH*n*_LLP_STATUS write-back field of LLI:

Note: * denotes Status Indication (CHn_IntStatus[1:0])

Figure 7.5-6. CH*n*_LLP_STATUS Write-Back Field of LLI

CH*n*_LLP_STATUS[63] and CH*n*_LLP_STATUS[62] indicate DMA_TFR_DONE and BLOCK_TFR_DONE status respectively. These two fields are the last to be updated during LLI write-back. Software should ensure that BLOCK_TFR_DONE bit is set to 1 before using CH*n*_SSTAT and CH*n*_DSTAT information. DMA_TFR_DONE and BLOCK_TFR_DONE bits will be set to 1 after transferring the last block.

CH*n*_STATUS[21:0] corresponds to DMAC_CH*n*_CMPLTD_BLK_TFR_SIZE, and CH*n*_STATUS[46:32] corresponds to DMAC_CH*n*_DATA_LEFT_IN_FIFO[14:0].

Suspension of Transfers Between Blocks

At the end of every block transfer, a block transfer completion interrupt DMAC_CH*n*_BLOCK_TFR_DONE_INT is generated if:

- Global interrupt is enabled (DMAC_INT_EN = 1)
- The channel block transfer completion interrupt is enabled (DMAC_CH*n*_ENABLE_BLOCK_TFR_DONE_INTSTAT = 1, DMAC_CH*n*_ENABLE_BLOCK_TFR_DONE_INTSIGNAL = 1, DMAC_CH*n*_IOC_BLKTFR = 1)

For contiguous-address and auto-reloading-based multi-block transfers (neither source nor destination peripheral uses shadow-register or linked-list-based multi-block transfers), the DMA transfer automatically stalls after the DMAC_CH*n*_BLOCK_TFR_DONE_INT interrupt is generated. VDMA does not proceed to the next block transfer until software writes 1 to DMAC_CH*n*_CLEAR_BLOCK_TFR_DONE_INTSTAT to clear the interrupt.

Channel suspension between blocks ensures that the block transfer done ISR (Interrupt Service Routine) of the next-to-last block is serviced before the final block transfer starts. This ensures that the ISR has cleared DMAC_CH*n*_SRC_MULTBLK_TYPE and DMAC_CH*n*_DST_MULTBLK_TYPE before the final block transfer is completed.

End of Multi-Block Transfers

If either source or destination peripheral uses shadow-register or linked-list-based multi-block transfers, then DMAC_CH*n*_SHADOWREG_OR_LLI_LAST indicates whether the current block is the last in the transfer. If this bit is 1, VDMA recognizes that the current block is the final block in the transfer and completes the DMA transfer operation at the end of the current block transfer.

For contiguous-address and auto-reloading-based multi-block transfers (when neither source nor destination peripheral uses shadow-register or linked-list-based multi-block transfers), if the corresponding multi-block type selection fields DMAC_CH*n*_SRC_MULTBLK_TYPE and/or DMAC_CH*n*_DST_MULTBLK_TYPE are 0 at the end of a block transfer, VDMA understands that the previous block was the final block in the transfer and completes the DMA transfer operation.

7.5.5 Flow Controller

The flow controller determines the length of the DMA block transfer. The flow controller can be VDMA, the source peripheral, or the destination peripheral; memory cannot serve as a flow controller.

If the block length is known before enabling the channel, configure VDMA as the flow controller. If the block length is unknown before enabling the channel, use the source or destination peripheral as the flow controller to determine when to terminate the DMA block transfer.

7.5.6 Channel Suspend and Resume

Software can suspend and resume a channel during DMA transfer. To suspend a channel during DMA transfer:

1. Software writes 1 to DMAC_CH*n*_SUSP.
2. VDMA halts all transfers from the source, after completing all AXI transfers initiated from the source.
3. VDMA sets DMAC_CH*n*_CH_SRC_SUSPENDED_INT to 1 to indicate that source transfer is suspended.
4. VDMA transfers all the data in channel FIFO to the destination. If DMAC_CH*n*_SRC_TR_WIDTH < DMAC_CH*n*_DST_TR_WIDTH and DMAC_CH*n*_SUSP is 1, there may still be data in the channel FIFO, but not enough to form a single transfer of DMAC_CH*n*_DST_TR_WIDTH. The remaining data in the channel FIFO will be transferred to the destination if the channel is resumed.
5. VDMA sets DMAC_CH*n*_CH_SUSPENDED_INT to 1 to indicate that the channel is suspended.

After a channel suspend, software can resume the channel by setting DMAC_CH*n*_SUSP to 0. Then, VDMA resumes the DMA transfer from the point where it was suspended.

7.5.7 Channel Disable

Under normal operation, software enables a channel by writing 1 to DMAC_CH*n*_EN, and VDMA clears DMAC_CH*n*_EN after channel transfer completion. Software can disable a channel before a transfer completes.

7.5.7.1 Disabling a Suspended Channel Before Transfer Completion

To disable a suspended channel before transfer completion:

- Write 0 to DMAC_CH*n*_EN after DMAC_CH*n*_CH_SUSPENDED_INTSTAT is set to 1. If DMAC_CH*n*_SRC_TR_WIDTH < DMAC_CH*n*_DST_TR_WIDTH and DMAC_CH*n*_SUSP is 1, there may still be data in the channel FIFO, but not enough to form a single transfer of DMAC_CH*n*_DST_TR_WIDTH. In this case, once the channel is disabled, the remaining data in the channel FIFO is not transferred to the destination peripheral and is lost.
- VDMA sets DMAC_CH*n*_CH_DISABLED_INTSTAT to 1 to indicate that the channel is disabled and generates an interrupt.

7.5.7.2 Disabling a Non-suspended Channel Before Transfer Completion

To disable a non-suspended channel before transfer completion:

- Software writes 0 to DMAC_CH*n*_EN during DMA transfer.
- VDMA halts all transfers from the source, after completing all AXI transfers initiated on the source.
- VDMA transfers all the data in the channel FIFO to the destination. When DMAC_CH*n*_SRC_TR_WIDTH < DMAC_CH*n*_DST_TR_WIDTH and DMAC_CH*n*_EN is 0, there may still be data in the channel FIFO, but not enough to form a single transfer of DMAC_CH*n*_DST_TR_WIDTH. In this scenario, once the channel is disabled, the remaining data in the channel FIFO is not transferred to the destination peripheral and is lost.
- VDMA sets DMAC_CH*n*_CH_DISABLED_INTSTAT to 1 to indicate that the channel is disabled and generates an interrupt.

Note:

Once software initiates a channel disable procedure by writing 0 to DMAC_CH*n*_EN, before DMAC_CH*n*_CH_DISABLED_INT is set to 1, you cannot re-enable the channel by writing 1 to DMAC_CH*n*_EN. VDMA will ignore this write operation.

7.5.8 Low-Power Technique

VDMA implements a low-power technique that intelligently monitors idle periods across multiple DMA channels, the slave bus interface, and AXI master interface channels in various scenarios. By detecting inactivity, this feature can turn off the clock for these modules, significantly reducing overall power consumption.

When activity is detected, the logic quickly restores the clocks to these modules, ensuring that performance remains uncompromised.

Configure DMAC_LOWPOWER_CFG0_REG to enable the low-power feature and manage the low-power counters.

7.5.8.1 Low-Power Technique for DMA Channels

DMA channels occupy a significant portion of the chip area in the VDMA module, resulting in higher power consumption compared to other components. Therefore, optimizing power usage in this module is essential.

The low-power technique for DMA channels employs a **DMA channel low-power state machine** to monitor activities. When the state machine detects a low-power condition, it activates a **DMA channel low-power delay counter**. This counter runs until it expires. Once the counter expires, the DMA channels enter a low-power state by gating the AXI_DMAC_CORE_CLK.

The DMA channels will remain in this low-power state until any activity is detected. If activity is detected while the delay counter is still running, the counter is reset and paused until the low-power condition is detected again.

7.5.8.2 Low-Power Technique for Slave Bus Interface

The slave bus interface unit (SBIU) accesses the internal registers of VDMA via the APB3 slave interface. The low-power technique can optimize the power consumption in SBIU.

The low-power technique for the slave bus interface employs a **SBIU state machine** to monitor activities. When a low-power condition is detected (i.e., when there are no ongoing APB reads or writes and the SBIU state machine is idle), the **SBIU low power delay counter** is activated. Once the delay counter expires, SBIU enters the low-power state by gating PCLK or AXI_DMAC_CORE_CLK (based on the clock mode configuration).

SBIU remains in the low-power state until an active read or write transaction is detected on the slave bus interface. If an active transaction is detected while the SBIU low-power delay counter running, the delay counter is reset and paused until the low-power condition is detected again.

If a read or write transaction occurs while SBIU is in a low-power state, the low-power logic immediately exits the low-power state by un-gating PCLK or AXI_DMAC_CORE_CLK.

7.5.8.3 Low-Power Technique for AXI Master Interface Channels

The AXI master interface module implements the AXI bus to transfer data between memory and peripheral.

Whenever a low-power condition is detected on the AXI master interface channels, the **AXI master interface channel low-power delay counter** starts. The AXI low-power logic waits until the delay counter expires. After the delay counter expires, the AXI master interface channel enters the low-power state by gating the clock of AXI master interface and AXI_DMAC_CORE_CLK. It remains in this state until any activity is detected. If an activity is detected while the AXI master interface channel low-power delay counter is running, the delay counter is reset and paused until the low-power condition is detected again.

7.5.8.4 Global Low-Power Technique

The global low-power technique implements the low-power option based on the idle condition of the DMA channel, slave bus interface, and AXI master interface channels. If all the mentioned modules indicate that the VDMA is idle, the **global low-power delay counter** is activated.

The global low-power logic waits until the low-power delay counter expires. After the counter expires, VDMA enters the low-power state by gating the clocks of all modules. It remains in the low-power state until any activity is detected on any of the modules. If an activity is detected while the global low-power delay counter is running, the global delay counter is reset and paused until the low-power condition is again detected.

7.6 Interrupts

ESP32-P4's VDMA can generate the interrupt signal AXI_DMAC_INTR that will be sent to the Interrupt Matrix.

The interrupt signal is generated by the internal interrupt sources from VDMA.

- Common interrupts:
  - DMAC_SLVIF_UNDEFINEDREG_DEC_ERR_INT: Slave interface undefined register decode error interrupt
  - DMAC_SLVIF_COMMONREG_RD2WO_ERR_INT: Slave interface common register read to write-only error interrupt
  - DMAC_SLVIF_COMMONREG_WR2RO_ERR_INT: Slave interface common register write to read-only error Interrupt
  - DMAC_SLVIF_COMMONREG_DEC_ERR_INT: Slave interface common register decode error interrupt
- Channel interrupts (n = 1 ~ 4):
  - DMAC_CHn_CH_ABORTED_INT: Channel aborted interrupt
  - DMAC_CHn_CH_DISABLED_INT: Channel disabled interrupt
  - DMAC_CHn_CH_SUSPENDED_INT: Channel suspended interrupt
  - DMAC_CHn_CH_SRC_SUSPENDED_INT: Channel source suspended interrupt
  - DMAC_CHn_SLVIF_SHADOWREG_WRON_VALID_ERR_INT: Shadow register write on valid error interrupt

- DMAC_CH*n*_SLVIF_WRONCHEN_ERR_INT: Slave interface write on enabled channel error interrupt
- DMAC_CH*n*_SLVIF_RD2RWO_ERR_INT: Slave interface read to write-only error interrupt
- DMAC_CH*n*_SLVIF_WR2RO_ERR_INT: Slave interface write to read-only error interrupt
- DMAC_CH*n*_SLVIF_DEC_ERR_INT: Slave interface decode error interrupt
- DMAC_CH*n*_SLVIF_MULTIBLKTYPE_ERR_INT: Slave interface multi-block type error interrupt
- DMAC_CH*n*_SHADOWREG_OR_LLI_INVALID_ERR_INT: Shadow register or LLI invalid error interrupt
- DMAC_CH*n*_LLI_WR_SLV_ERR_INT: LLI write slave error interrupt
- DMAC_CH*n*_LLI_RD_SLV_ERR_INT: LLI read slave error interrupt
- DMAC_CH*n*_LLI_WR_DEC_ERR_INT: LLI write decode error interrupt
- DMAC_CH*n*_LLI_RD_DEC_ERR_INT: LLI read decode error interrupt
- DMAC_CH*n*_DST_SLV_ERR_INT: Destination slave error interrupt
- DMAC_CH*n*_SRC_SLV_ERR_INT: Source slave error interrupt
- DMAC_CH*n*_DST_DEC_ERR_INT: Destination decode error interrupt
- DMAC_CH*n*_SRC_DEC_ERR_INT: Source decode error interrupt
- DMAC_CH*n*_DST_TRANSCOMP_INT: Destination transfer completed interrupt
- DMAC_CH*n*_SRC_TRANSCOMP_INT: Source transfer completed interrupt
- DMAC_CH*n*_DMA_TFR_DONE_INT: DMA transfer done interrupt
- DMAC_CH*n*_BLOCK_TFR_DONE_INT: Block transfer done interrupt

7.7 Programming Procedures

This section outlines the programming steps for different types of transfers.

7.7.1 Common Programming Procedures

The following two steps are common and should be performed before other programming procedures.

1. Set HP_SYS_CLKRST_GDMA_SYS_CLK_EN to 1 to enable VDMA bus clock.
2. Configure TEE_DMA_GDMA_CH*n*_W_PMS and TEE_DMA_GDMA_CH*n*_R_PMS to define the access permission of VDMA. For more details please refer to Chapter 20 *Permission Control (PMS)*.

7.7.2 Programming Procedures for Shadow-Register-Based Multi-Block Transfer

1. Read DMAC_CH*n*_EN to select an available (unused) channel.
2. Configure DMAC_CH*n*_SRC_MULTBLK_TYPE and/or DMAC_CH*n*_DST_MULTBLK_TYPE to 2 to enable shadow-register-based multi-block transfer for source transfer and/or destination transfer.

3. Configure DMAC_CH*n*_SARO_REG and/or DMAC_CH*n*_DARO_REG, DMAC_CH*n*_BLOCK_TS, DMAC_CH*n*_CTLO_REG, and DMAC_CH*n*_CTL1_REG for the first block. VDMA loads the configured values to the corresponding shadow registers.

   Notice: The DMAC_CH*n*_SHADOWREG_OR_LLI_VALID field in DMAC_CH*n*_CTL1_REG must be the last one to be set to 1.

4. Set DMAC_CH*n*_EN to 1 to enable the corresponding channel.
5. VDMA initiates the DMA block transfer operation based on the configurations.
   - The block transfer might start immediately or after the handshaking request, depending on DMAC_CH*n*_TT_FC. Specifically,
     - When the source is memory, the source transfer starts immediately; when the destination is memory, the destination transfer starts immediately.
     - When the source is a peripheral, obtaining data from the source requires waiting for a handshake with the source. When the destination is a peripheral, writing data to the destination requires waiting for a handshake with the destination.
   - VDMA checks DMAC_CH*n*_SHADOWREG_OR_LLI_VALID and if it is seen as 0, VDMA waits until software writes 1 to DMAC_CH*n*_BLK_TFR_RESUMEREQ to indicate valid shadow registers availability. Then VDMA re-attempts shadow register fetch operation. In this case, VDMA may generate a DMAC_CH*n*_SHADOWREG_OR_LLI_INVALID_ERR_INT interrupt.
   - VDMA checks DMAC_CH*n*_SHADOWREG_OR_LLI_VALID and if it is seen as 1, VDMA copies the shadow register contents to the registers used for executing the DMA block transfer (i.e., DMAC_CH*n*_SARO_REG and/or DMAC_CH*n*_DARO_REG, DMAC_CH*n*_BLOCK_TS, DMAC_CH*n*_CTLO_REG, and DMAC_CH*n*_CTL1_REG) and clears DMAC_CH*n*_SHADOWREG_OR_LLI_VALID.
     - If VDMA sees DMAC_CH*n*_SHADOWREG_OR_LLI_LAST as 1, it understands that the current block is the final block in the transfer and completes the DMA transfer operation at the end of current block transfer.
     - If VDMA sees DMAC_CH*n*_SHADOWREG_OR_LLI_LAST as 0, it understands that there are one or more blocks to be transferred and checks DMAC_CH*n*_SHADOWREG_OR_LLI_VALID again at the end of current block transfer.
6. Software waits DMAC_CH*n*_SHADOWREG_OR_LLI_VALID to be cleared to 0.
7. Configure DMAC_CH*n*_SARO_REG and/or DMAC_CH*n*_DARO_REG, DMAC_CH*n*_BLOCK_TS, DMAC_CH*n*_CTLO_REG, and DMAC_CH*n*_CTL1_REG for the next block. If the next block is the last block, set DMAC_CH*n*_SHADOWREG_OR_LLI_LAST to 1.

   Notice: DMAC_CH*n*_SHADOWREG_OR_LLI_VALID must be the lase to be set to 1.

8. Software waits for a DMAC_CH*n*_BLOCK_TFR_DONE_INT interrupt or polls DMAC_CH*n*_BLOCK_TFR_DONE_INTSTAT until it reads as 1 and goes back to Step 6.

Note:
In cases where a DMAC_CH*n*_SHADOWREG_OR_LLI_INVALID_ERR_INT interrupt is generated, follow the recommended flow to resume transfer:

- Configure DMAC_CH*n*_SARO_REG and/or DMAC_CH*n*_DARO_REG, DMAC_CH*n*_BLOCK_TS, DMAC_CH*n*_CTLO_REG, and DMAC_CH*n*_CTL1_REG for the next block.
- Set DMAC_CH*n*_CLEAR_SHADOWREG_OR_LLI_INVALID_ERR_INTSTAT to 1 to clear the interrupt.
- Set DMAC_CH*n*_BLK_TFR_RESUMEREQ to 1 to request for resuming block transfer.

7.7.3 Programming Procedures for Linked-List-Based Multi-Block Transfer

1. Reads DMAC_CH*n*_EN to select an available (unused) channel.
2. Configure DMAC_CH*n*_SRC_MULTBLK_TYPE and/or DMAC_CH*n*_DST_MULTBLK_TYPE to 3 to enable linked-list-based transfer for source transfer and/or destination transfer.
3. Configure DMAC_CH*n*_LLPO_REG to define the base address of the first linked list item and the master interface on which the linked list item is available.
4. Create one or more linked list items in the system memory. You can create the entire linked list item in advance or dynamically extend it using DMAC_CH*n*_SHADOWREG_OR_LLI_VALID and DMAC_CH*n*_SHADOWREG_OR_LLI_LAST fields of the LLI. Follow the steps below to dynamically extend the linked list.
   - During the DMA transfer process, when the linked list is not ready, configure DMAC_CH*n*_SHADOWREG_OR_LLI_VALID in the linked list to 0 and wait until the linked list is prepared. Then set DMAC_CH*n*_SHADOWREG_OR_LLI_VALID to 1 to extend the linked list.
   - When it is time to end the DMA transfer, set DMAC_CH*n*_SHADOWREG_OR_LLI_LAST of the last linked list to 1 to indicate the end of the transfer.
5. Set DMAC_CH*n*_EN to 1 to enable the channel.

   Note:
   You can swap the sequence of Step 4 and Step 5. However, if Step 5 is performed before Step 4, or if the linked list item for the next block transfer is not available in system memory during the multi-block transfer (i.e., DMAC_CH*n*_SHADOWREG_OR_LLI_VALID of the fetched LLI is 0), VDMA may generate a DMAC_CH*n*_SHADOWREG_OR_LLI_INVALID_ERR_INT interrupt.

6. VDMA initiates the DMA block transfer operation based on the configurations. The block transfer might start immediately or after the handshaking request, depending on DMAC_CH*n*_TT_FC. VDMA copies the linked list contents to the registers used for executing the DMA block transfer (i.e., DMAC_CH*n*_SARO_REG and/or DMAC_CH*n*_DARO_REG, DMAC_CH*n*_BLOCK_TS, DMAC_CH*n*_CTLO_REG, and DMAC_CH*n*_CTL1_REG) and initiates the DMA block transfer.
7. During the linked list fetch phase:
   - If VDMA reads DMAC_CH*n*_SHADOWREG_OR_LLI_LAST as 1, it understands that the current block is the final block in the transfer and completes the DMA transfer operation at the end of the current block transfer.
   - If VDMA reads DMAC_CH*n*_SHADOWREG_OR_LLI_LAST as 0, it understands that there are one or more blocks to be transferred and goes to Step 6.

- If VDMA reads DMAC_CH*n*_SHADOWREG_OR_LLI_VALID as 0, it may generate a DMAC_CH*n*_SHADOWREG_OR_LLI_INVALID_ERR_INT interrupt. VDMA waits until software writes 1 to DMAC_CH*n*_BLK_TFR_RESUMEREQ to indicate valid LLI availability before re-attempting the LLI read operation.

7.7.4 Programming Procedures for Single-Block Transfer

1. Read DMAC_CH*n*_EN to choose a free (unused) channel.
2. Configure DMAC_CH*n*_SRC_MULTBLK_TYPE and DMAC_CH*n*_DST_MULTBLK_TYPE to 0 to enable contiguous-address-based single-block transfer.
3. Configure DMAC_CH*n*_SARO_REG and/or DMAC_CH*n*_DARO_REG, DMAC_CH*n*_BLOCK_TS, DMAC_CH*n*_CTLO_REG, and DMAC_CH*n*_CTL1_REG for the block.
4. Set DMAC_CH*n*_EN to 1 to enable the channel.
5. Software waits for the DMAC_CH*n*_BLOCK_TFR_DONE_INT interrupt or polls DMAC_CH*n*_BLOCK_TFR_DONE_INTSTAT until it is 1.

7.8 Register Summary

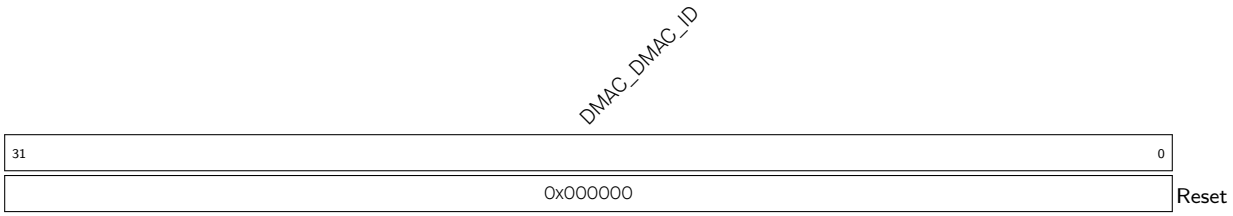
The addresses in this section are relative to the VDMA base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Version Control Registers			
DMAC_IDO_REG	VDMA ID number	0x0000	RO
DMAC_COMPVERO_REG	VDMA version number	0x0008	RO
Configuration Registers			
DMAC_CFGO_REG	VDMA Configuration register	0x0010	R/W
DMAC_CHENO_REG	VDMA channel enable register	0x0018	varies
DMAC_RESETO_REG	VDMA reset control register	0x0058	R/W
DMAC_LOWPOWER_CFGO_REG	VDMA low power configuration register 0	0x0060	R/W
DMAC_LOWPOWER_CFG1_REG	VDMA low power configuration register 1	0x0064	R/W
DMAC_CH1_SARO_REG	VDMA channel 1 source address register	0x0100	R/W
DMAC_CH1_DARO_REG	VDMA channel 1 destination address register	0x0108	R/W
DMAC_CH1_BLOCK_TSO_REG	VDMA channel 1 block transfer size register	0x0110	R/W
DMAC_CH1_CTLO_REG	VDMA channel 1 control register 0	0x0118	R/W
DMAC_CH1_CTL1_REG	VDMA channel 1 control register 1	0x011C	R/W
DMAC_CH1_CFGO_REG	VDMA channel 1 configuration register 0	0x0120	varies
DMAC_CH1_CFG1_REG	VDMA channel 1 configuration register 1	0x0124	varies
DMAC_CH1_LLPO_REG	VDMA channel 1 linked list pointer register	0x0128	R/W
DMAC_CH1_BLK_TFR_RESUMEREQO_REG	VDMA channel 1 block transfer resume request register	0x0148	WO
DMAC_CH1_AXI_IDO_REG	VDMA channel 1 AXI ID register	0x0150	R/W
DMAC_CH2_SARO_REG	VDMA channel 2 source address register	0x0200	R/W
DMAC_CH2_DARO_REG	VDMA channel 2 destination address register	0x0208	R/W
DMAC_CH2_BLOCK_TSO_REG	VDMA channel 2 block transfer size register	0x0210	R/W
DMAC_CH2_CTLO_REG	VDMA channel 2 control register 0	0x0218	R/W
DMAC_CH2_CTL1_REG	VDMA channel 2 control register 1	0x021C	R/W

Name	Description	Address	Access
DMAC_CH2_CFG0_REG	VDMA channel 2 configuration register 0	0x0220	varies
DMAC_CH2_CFG1_REG	VDMA channel 2 configuration register 1	0x0224	varies
DMAC_CH2_LLP0_REG	VDMA channel 2 linked list pointer register	0x0228	R/W
DMAC_CH2_BLK_TFR_RESUMEREQ0_REG	VDMA channel 2 block transfer resume request register	0x0248	WO
DMAC_CH2_AXI_ID0_REG	VDMA channel 2 AXI ID register	0x0250	R/W
DMAC_CH3_SAR0_REG	VDMA channel 3 source address register	0x0300	R/W
DMAC_CH3_DAR0_REG	VDMA channel 3 destination address register	0x0308	R/W
DMAC_CH3_BLOCK_TS0_REG	VDMA channel 3 block transfer size register	0x0310	R/W
DMAC_CH3_CTL0_REG	VDMA channel 3 control register 0	0x0318	R/W
DMAC_CH3_CTL1_REG	VDMA channel 3 control register 1	0x031C	R/W
DMAC_CH3_CFG0_REG	VDMA channel 3 configuration register 0	0x0320	varies
DMAC_CH3_CFG1_REG	VDMA channel 3 configuration register 1	0x0324	varies
DMAC_CH3_LLP0_REG	VDMA channel 3 linked list pointer register	0x0328	R/W
DMAC_CH3_BLK_TFR_RESUMEREQ0_REG	VDMA channel 3 block transfer resume request register	0x0348	WO
DMAC_CH3_AXI_ID0_REG	VDMA channel 3 AXI ID register	0x0350	R/W
DMAC_CH4_SAR0_REG	VDMA channel 4 source address register	0x0400	R/W
DMAC_CH4_DAR0_REG	VDMA channel 4 destination address register	0x0408	R/W
DMAC_CH4_BLOCK_TS0_REG	VDMA channel 4 block transfer size register	0x0410	R/W
DMAC_CH4_CTL0_REG	VDMA channel 4 control register 0	0x0418	R/W
DMAC_CH4_CTL1_REG	VDMA channel 4 control register 1	0x041C	R/W
DMAC_CH4_CFG0_REG	VDMA channel 4 configuration register 0	0x0420	varies
DMAC_CH4_CFG1_REG	VDMA channel 4 configuration register 1	0x0424	varies
DMAC_CH4_LLP0_REG	VDMA channel 4 linked list pointer register	0x0428	R/W
DMAC_CH4_BLK_TFR_RESUMEREQ0_REG	VDMA channel 4 block transfer resume request register	0x0448	WO
DMAC_CH4_AXI_ID0_REG	VDMA channel 4 AXI ID register	0x0450	R/W
Interrupt Registers			

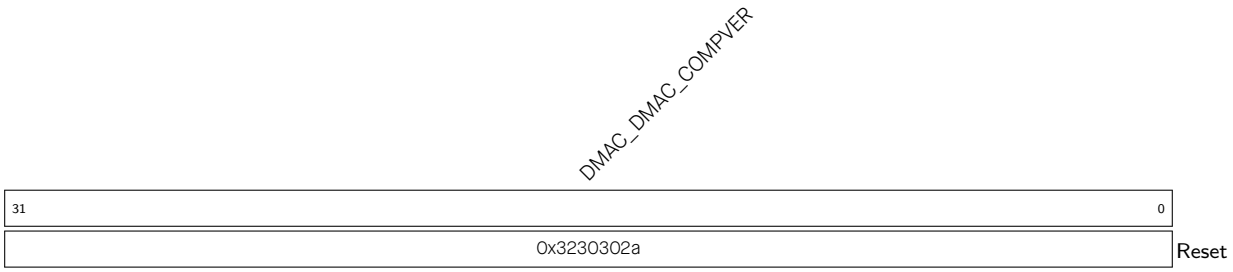
Name	Description	Address	Access
DMAC_INTSTATUSO_REG	VDMA interrupt status register	0x0030	RO
DMAC_COMMONREG_INTCLEARO_REG	VDMA common interrupt clear register	0x0038	WO
DMAC_COMMONREG_INTSTATUS_ENABLEO_REG	VDMA common interrupt status enable register	0x0040	varies
DMAC_COMMONREG_INTSIGNAL_ENABLEO_REG	VDMA common interrupt signal enable register	0x0048	varies
DMAC_COMMONREG_INTSTATUSO_REG	VDMA common interrupt status register	0x0050	RO
DMAC_CH1_INTSTATUS_ENABLEO_REG	VDMA channel 1 interrupt status enable register	0x0180	varies
DMAC_CH1_INTSTATUSO_REG	VDMA channel 1 interrupt status register	0x0188	RO
DMAC_CH1_INTSIGNAL_ENABLEO_REG	VDMA channel 1 interrupt signal enable register	0x0190	varies
DMAC_CH1_INTCLEARO_REG	VDMA channel 1 interrupt clear register	0x0198	WO
DMAC_CH2_INTSTATUS_ENABLEO_REG	VDMA channel 2 interrupt status enable register	0x0280	varies
DMAC_CH2_INTSTATUSO_REG	VDMA channel 2 interrupt status register	0x0288	RO
DMAC_CH2_INTSIGNAL_ENABLEO_REG	VDMA channel 2 interrupt signal enable register	0x0290	varies
DMAC_CH2_INTCLEARO_REG	VDMA channel 2 interrupt clear register	0x0298	WO
DMAC_CH3_INTSTATUS_ENABLEO_REG	VDMA channel 3 interrupt status enable register	0x0380	varies
DMAC_CH3_INTSTATUSO_REG	VDMA channel 3 interrupt status register	0x0388	RO
DMAC_CH3_INTSIGNAL_ENABLEO_REG	VDMA channel 3 interrupt signal enable register	0x0390	varies
DMAC_CH3_INTCLEARO_REG	VDMA channel 3 interrupt clear register	0x0398	WO
DMAC_CH4_INTSTATUS_ENABLEO_REG	VDMA channel 4 interrupt status enable register	0x0480	varies
DMAC_CH4_INTSTATUSO_REG	VDMA channel 4 interrupt status register	0x0488	RO
DMAC_CH4_INTSIGNAL_ENABLEO_REG	VDMA channel 4 interrupt signal enable register	0x0490	varies
DMAC_CH4_INTCLEARO_REG	VDMA channel 4 interrupt clear register	0x0498	WO
status registers			
DMAC_CH1_STATUSO_REG	VDMA channel 1 status register 0	0x0130	RO
DMAC_CH1_STATUS1_REG	VDMA channel 1 status register 1	0x0134	RO
DMAC_CH1_SSTATO_REG	VDMA channel 1 source status register	0x0160	RO
DMAC_CH1_DSTATO_REG	VDMA channel 1 destination status register	0x0168	RO
DMAC_CH1_SSTATARO_REG	VDMA channel 1 source status address register	0x0170	R/W



Name	Description	Address	Access
DMAC_CH1_DSTATARO_REG	VDMA channel 1 destination status address register	0x0178	R/W
DMAC_CH2_STATUSO_REG	VDMA channel 2 status register 0	0x0230	RO
DMAC_CH2_STATUS1_REG	VDMA channel 2 status register 1	0x0234	RO
DMAC_CH2_SSTATO_REG	VDMA channel 2 source status register	0x0260	RO
DMAC_CH2_DSTATO_REG	VDMA channel 2 destination status register	0x0268	RO
DMAC_CH2_SSTATARO_REG	VDMA channel 2 source status address register	0x0270	R/W
DMAC_CH2_DSTATARO_REG	VDMA channel 2 destination status address register	0x0278	R/W
DMAC_CH3_STATUSO_REG	VDMA channel 3 status register 0	0x0330	RO
DMAC_CH3_STATUS1_REG	VDMA channel 3 status register 1	0x0334	RO
DMAC_CH3_SSTATO_REG	VDMA channel 3 source status register	0x0360	RO
DMAC_CH3_DSTATO_REG	VDMA channel 3 destination status register	0x0368	RO
DMAC_CH3_SSTATARO_REG	VDMA channel 3 source status address register	0x0370	R/W
DMAC_CH3_DSTATARO_REG	VDMA channel 3 destination status address register	0x0378	R/W
DMAC_CH4_STATUSO_REG	VDMA channel 4 status register 0	0x0430	RO
DMAC_CH4_STATUS1_REG	VDMA channel 4 status register 1	0x0434	RO
DMAC_CH4_SSTATO_REG	VDMA channel 4 source status register	0x0460	RO
DMAC_CH4_DSTATO_REG	VDMA channel 4 destination status register	0x0468	RO
DMAC_CH4_SSTATARO_REG	VDMA channel 4 source status address register	0x0470	R/W
DMAC_CH4_DSTATARO_REG	VDMA channel 4 destination status address register	0x0478	R/W

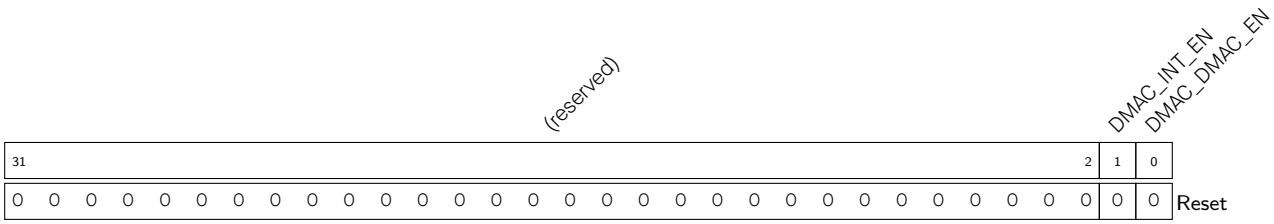
7.9 Registers

The addresses in this section are relative to the VDMA base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.



For how to program reserved fields, please refer to Section Programming Reserved Register Field.

Register 7.1. DMAC_IDO_REG (0x0000)



DMAC_DMAC_ID Represents VDMA ID number. (RO)

Register 7.2. DMAC_COMPVER0_REG (0x0008)

DMAC_DMAC_COMPVER Represents VDMA version number. (RO)

Register 7.3. DMAC_CFG0_REG (0x0010)

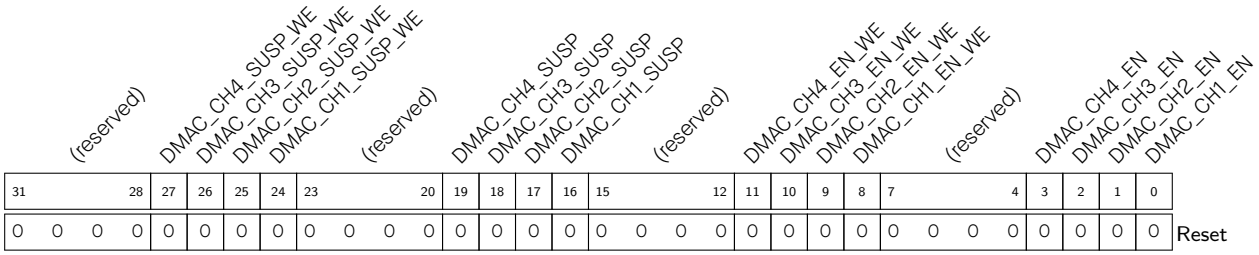
DMAC_DMAC_EN Configures whether to enable VDMA.

0: Disable

1: Enable

Note: If this field is cleared but a channel is still active, this field will still return 1. When hardware has terminated activity on all channels, this field will return 0.

(R/W)



DMAC_INT_EN Configures whether to enable global interrupt.

0: Disable

1: Enable

(R/W)

Register 7.4. DMAC_CHENO_REG (0x0018)

DMAC_CH*n*_EN (*n*: 1-4) Configures whether to enable VDMA channel *n*. Hardware automatically clears this bit after the last AXI transfer of the DMA transfer has been completed. Software can poll this field to determine when this channel is free for a new DMA transfer.

0: Disable channel *n*

1: Enable channel *n*

(R/W)

DMAC_CH*n*_EN_WE (*n*: 1-4) Configures whether to enable write to DMAC_CH*n*_EN. This field always reads as 0.

0: Disable write to DMAC_CH*n*_EN

1: Enable write to DMAC_CH*n*_EN

(WO)

DMAC_CH*n*_SUSP (*n*: 1-4) Configures whether to suspend channel *n*.

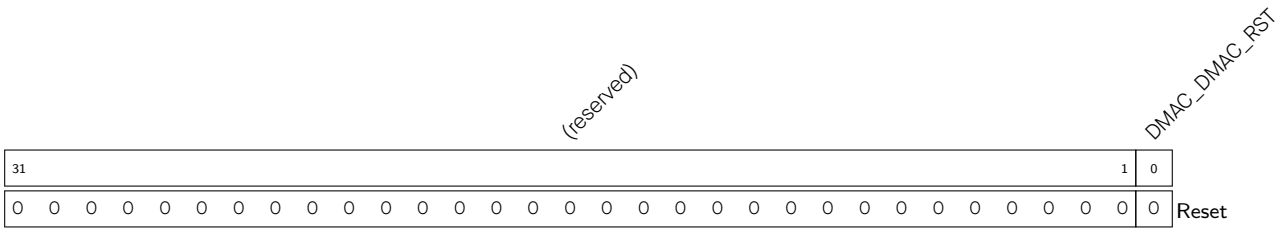
0: Do not suspend channel *n*

1: Suspend channel *n*

Software can clear this field to 0 after VDMA sets DMAC_CH*n*_CH_SUSPENDED_INTSTAT to 1, to exit the channel suspend mode.

Note: This field is cleared when channel *n* is disabled.

(R/W)



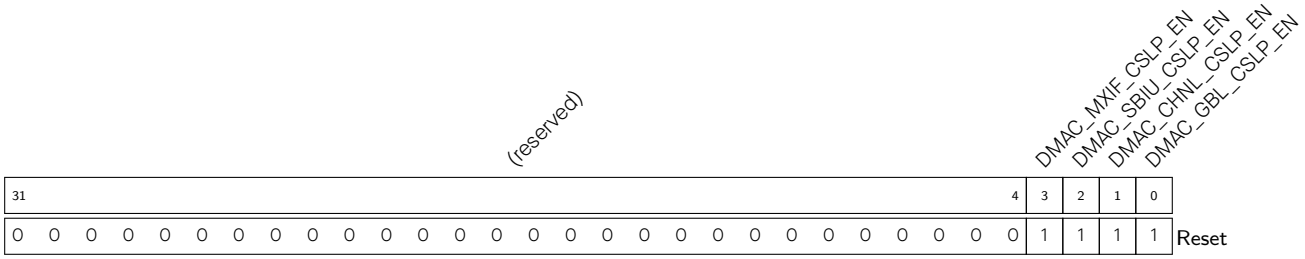
DMAC_CH*n*_SUSP_WE (*n*: 1-4) Configures whether to enable write to DMAC_CH*n*_SUSP. This field always reads as 0.

0: Disable write to DMAC_CH*n*_SUSP

1: Enable write to DMAC_CH*n*_SUSP

(WO)

Register 7.5. DMAC_RESET0_REG (0x0058)



DMAC_DMAC_RST Configures whether to reset VDMA. Software writes 1 to this field to reset VDMA and polls this field to see if it is 0. VDMA resets all the modules except the APB slave interface module and clears this field to 0.

Note: Software is not allowed to write 0 to this field.

(R/W)

Register 7.6. DMAC_LOWPOWER_CFG0_REG (0x0060)

DMAC_GBL_CSLP_EN Configures whether to enable global low-power feature.

0: Disable

1: Enable

(R/W)

DMAC_CHNL_CSLP_EN Configures whether to enable low-power feature for DMA channels.

0: Disable

1: Enable

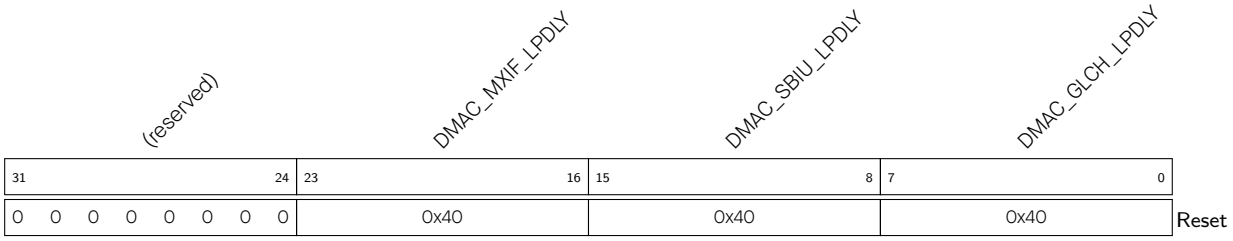
(R/W)

DMAC_SBIU_CSLP_EN SBIU Configures whether to enable low-power feature for slave bus interface.

0: Disable

1: Enable

(R/W)



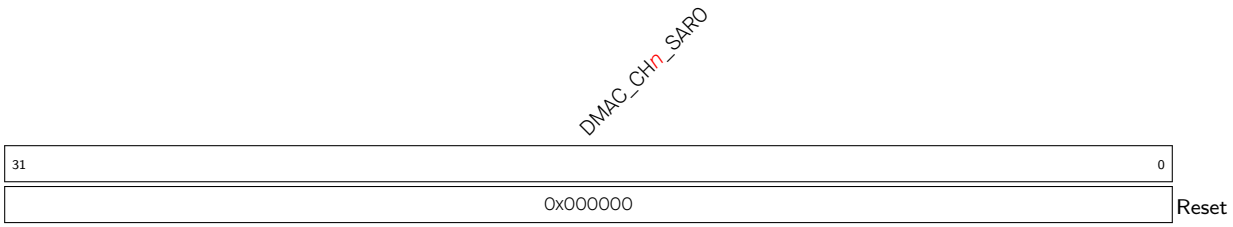
DMAC_MXIF_CSLP_EN Configures whether to enable low-power feature for AXI master interface.

0: Disable

1: Enable

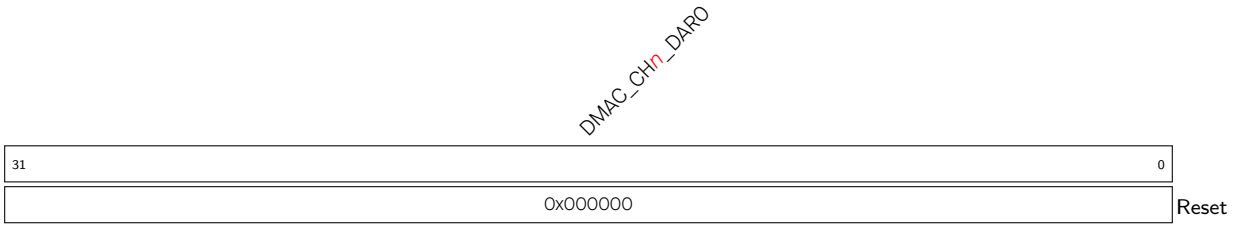
(R/W)

Register 7.7. DMAC_LOWPOWER_CFG1_REG (0x0064)



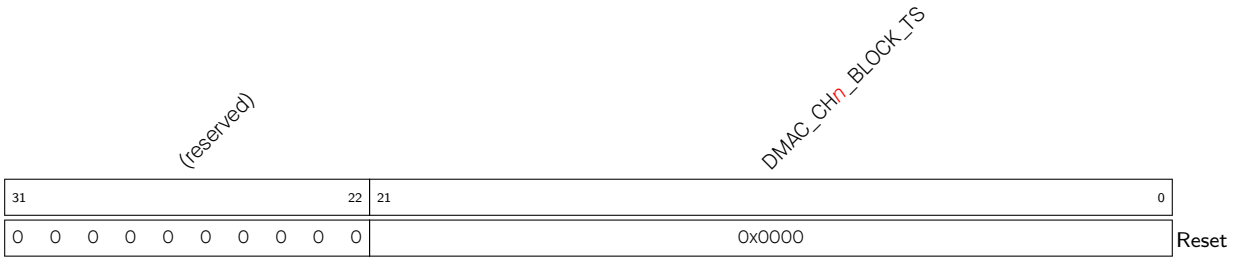
DMAC_GLCH_LPDLY Configures the value of the AXI master interface low-power delay counter. The programmed value must be greater than or equal to 0x4. If it is less than 0x4, the field will reset to 0x40. (R/W)

DMAC_SBIU_LPDLY Configures the value of the SBIU low-power delay counter. The programmed value must be greater than or equal to 0x4. If it is less than 0x4, the field will reset to 0x40. (R/W)



DMAC_MXIF_LPDLY Configures the value of the global low-power delay counter and the DMA channel low-power delay counter. The programmed value must be greater than or equal to 0x4. If it is less than 0x4, the field will reset to 0x40. (R/W)

Register 7.8. DMAC_CH*n*_SARO_REG (*n*: 1-4) (0x0100*n*)

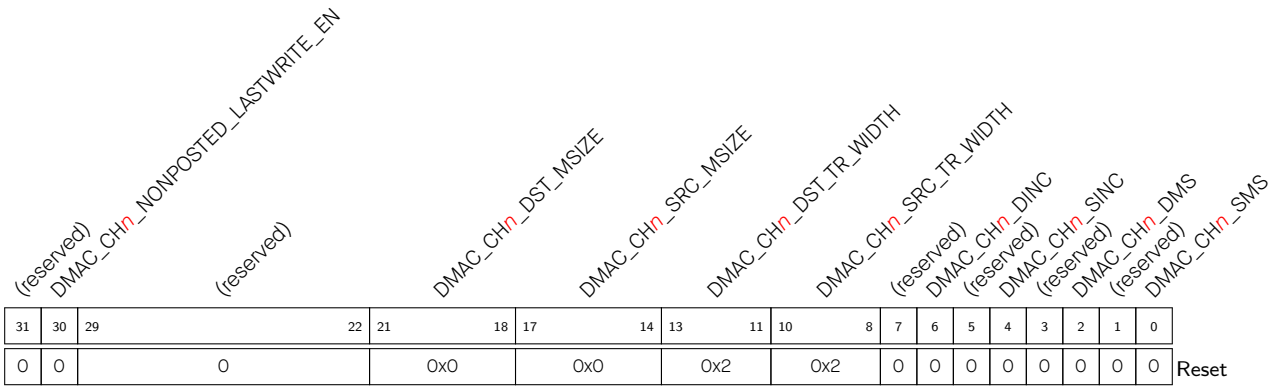


DMAC_CH*n*_SARO Configures the source address of DMA transfer. This field is updated after each source transfer. DMAC_CH*n*_SINC determines whether the address increments or remains unchanged on every source transfer throughout the block transfer. (R/W)

Register 7.9. DMAC_CH*n*_DARO_REG (*n*: 1-4) (0x0100*n* + 0x0008)

DMAC_CH*n*_DARO Configures the destination address of DMA transfer. This field is updated after each source transfer. DMAC_CH*n*_DINC determines whether the address increments or remains unchanged on every destination transfer throughout the block transfer. (R/W)

Register 7.10. DMAC_CH*n*_BLOCK_TSO_REG (*n*: 1-4) (0x0100*n* + 0x0010)



DMAC_CH*n*_BLOCK_TS Configures the total number of DMAC_CH*n*_SRC_TR_WIDTH in a DMA transfer. The programming range of this field is 0 ~ 4,194,303.

Block transfer size = Programmed value + 1

(R/W)

Register 7.11. DMAC_CH*n*_CTL0_REG (*n*: 1-4) (0x0100*n* + 0x0018)

DMAC_CH*n*_SMS Configures which AXI master to access the source.

0: AXI Master 1

1: AXI Master 2

(R/W)

DMAC_CH*n*_DMS Configures which AXI master to access the destination.

0: AXI Master 1

1: AXI Master 2

(R/W)

DMAC_CH*n*_SINC Configures whether to increment the source address on every source transfer. If VDMA is fetching data from a source peripheral's FIFO at a fixed address, then set this field to 1.

0: Increment

1: No change

(R/W)

DMAC_CH*n*_DINC Configures whether to increment the destination address on every destination transfer. If VDMA is writing data to a source peripheral's FIFO at a fixed address, then set this field to 1.

0: Increment

1: No change

(R/W)

DMAC_CH*n*_SRC_TR_WIDTH Configures source transfer width.

0x0: 8 bits

0x1: 16 bits

0x2: 32 bits

0x3: 64 bits

(R/W)

Continued on the next page...

Register 7.11. DMAC_CH*n*_CTL0_REG (*n*: 1-4) (0x0100**n* + 0x0018)

Continued from the previous page...

DMAC_CH*n*_DST_TR_WIDTH Configures destination transfer width.

0x0: 8 bits
0x1: 16 bits
0x2: 32 bits
0x3: 64 bits
(R/W)

DMAC_CH*n*_SRC_MSIZE Configures the length of the source burst transaction. Every time the handshaking interface requests for a source burst transaction, the read value of this field from the source is the number of data items, each of width DMAC_CH*n*_SRC_TR_WIDTH.

0x0: 1 data item
0x1: 4 data items
0x2: 8 data items
0x3: 16 data items
0x4: 32 data items
0x5: 64 data items
0x6: 128 data items
0x7: 256 data items
0x8: 512 data items
0x9: 1024 data items
(R/W)

DMAC_CH*n*_DST_MSIZE Configures the length of the destination burst transaction. Every time the handshaking interface requests for a destination burst transaction, the read value of this field from the destination is the number of data items, each of width DMAC_CH*n*_SRC_TR_WIDTH.

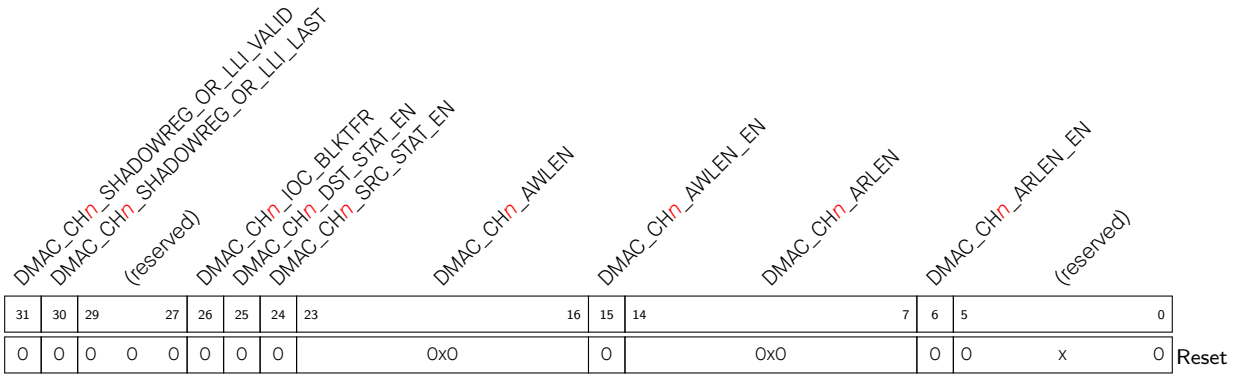
0x0: 1 data item
0x1: 4 data items
0x2: 8 data items
0x3: 16 data items
0x4: 32 data items
0x5: 64 data items
0x6: 128 data items
0x7: 256 data items
0x8: 512 data items
0x9: 1024 data items
(R/W)

Continued on the next page...

Register 7.11. DMAC_CH*n*_CTL0_REG (*n*: 1-4) (0x0100**n* + 0x0018)

Continued from the previous page...

DMAC_CH*n*_NONPOSTED_LASTWRITE_EN Configures whether to enable non-posted writes throughout the block transfer.



Posted writes refers to sending data without the need to write the data into the destination (the data may still be in transit); VDMA can consider this write request to be complete. Non-posted writes refers to sending data that needs to be written into the destination and requires a response, only then can VDMA consider this write request to be complete.

0: Posted writes can be used throughout the block transfer.

1: Posted writes can be used at the end of the block transfer (within the block). The last write must be non-posted to ensure synchronization between the generation of the block completion interrupt and the final written data reaching the destination.

(R/W)

Register 7.12. DMAC_CH*n*_CTL1_REG (*n*: 1-4) (0x0100*n* + 0x001C)

DMAC_CH*n*_ARLEN_EN Configures whether to enable the length of the source burst transfer.

0: VDMA uses any possible value that is less than or equal to 16 as the length of the source burst transfer.

1: VDMA uses the value of DMAC_CH*n*_ARLEN as the length of the source burst transfer till the extent possible. The remaining transfers use the maximum possible burst transfer length. For example, if the data size is 192 bytes and the source burst transfer length DMAC_CH*n*_ARLEN is set to 128 bytes, then after transmitting 128 bytes, the remaining 64 bytes is the maximum possible burst transfer length.

(R/W)

DMAC_CH*n*_ARLEN Configures the length of the source burst transfer. The specified burst length is used for source data transfer till the extent possible. The remaining transfers use the maximum possible value that is less than or equal to 16.

(R/W)

DMAC_CH*n*_AWLEN_EN Configures whether to enable the length of the destination burst transfer.

0: VDMA uses any possible value that is less than or equal to 16 as the length of the destination burst transfer.

1: VDMA uses the value of DMAC_CH*n*_AWLEN as the length of the destination burst transfer till the extent possible. The remaining transfers use the maximum possible burst transfer length.

(R/W)

DMAC_CH*n*_AWLEN Configures the length of the destination burst transfer. The specified burst length is used for destination data transfer till the extent possible. The remaining transfers use the maximum possible value that is less than or equal to 16.

(R/W)

DMAC_CH*n*_SRC_STAT_EN Configures whether to enable fetch of source status.

This logic enables the fetch of the status from the source peripheral of channel *n* pointed to by DMAC_CH*n*_SSTATARO. The value is subsequently stored in DMAC_CH*n*_SSTAT. At the end of each block transfer, the status value is written back to the DMAC_CH*n*_SSTAT register of the linked list, if either source or destination peripheral uses linked-list-based multi-block transfer.

0: Do not fetch source status

1: Fetch source status and store the value in DMAC_CH*n*_SSTAT

(R/W)

Continued on the next page...

Register 7.12. DMAC_CH*n*_CTL1_REG (*n*: 1-4) (0x0100**n* + 0x001C)

Continued from the previous page...

DMAC_CH*n*_DST_STAT_EN Configures whether to enable fetch of destination status.

This logic enables the fetch of the status from the destination peripheral of channel *n* pointed to by DMAC_CH*n*_DSTATARO. The value is subsequently stored in DMAC_CH*n*_DSTAT. At the end of each block transfer, the status value is written back to the DMAC_CH*n*_DSTAT register of the linked list, if either source or destination peripheral uses linked-list-based multi-block transfer.

0: Do not fetch destination status

1: Fetch destination status and store the value in DMAC_CH*n*_DSTAT

(R/W)

DMAC_CH*n*_IOC_BLKTFR Configures whether to enable the interrupt on completion of multi-block transfer based on shadow register or linked list.

Note: If the source and destination uses contiguous-address or auto-reloading-based multi-block transfer, this field cannot be modified on a block by block basis. In addition, the programmed value before enabling the channel will be used for all the blocks in DMA transfer.

0: Disable DMAC_CH*n*_BLOCK_TFR_DONE_INTSTAT

1: Enable DMAC_CH*n*_BLOCK_TFR_DONE_INTSTAT, valid when DMAC_CH*n*_ENABLE_BLOCK_TFR_DONE_INTSTAT is 1. To output a DMAC_CH*n*_BLOCK_TFR_DONE_INT interrupt, set DMAC_CH*n*_ENABLE_BLOCK_TFR_DONE_INTSIGNAL to 1.

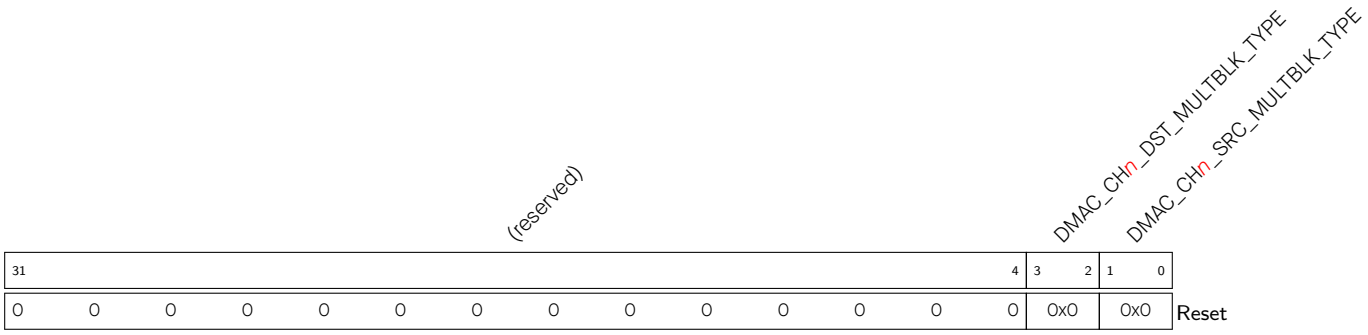
(R/W)

DMAC_CH*n*_SHADOWREG_OR_LLI_LAST Configures whether the shadow register or linked list item is the last one.

0: Not the last one

1: The last one

(R/W)



DMAC_CH*n*_SHADOWREG_OR_LLI_VALID Configures whether the contents of shadow register or the linked list item are valid.

0: Invalid

1: Valid

(R/W)

Register 7.13. DMAC_CH*n*_CFG0_REG (*n*: 1-4) (0x0100*n* + 0x0120)

DMAC_CH*n*_SRC_MULTBLK_TYPE Configures the source multi-block transfer type.

0: Contiguous address

1: Auto reloading

2: Shadow register

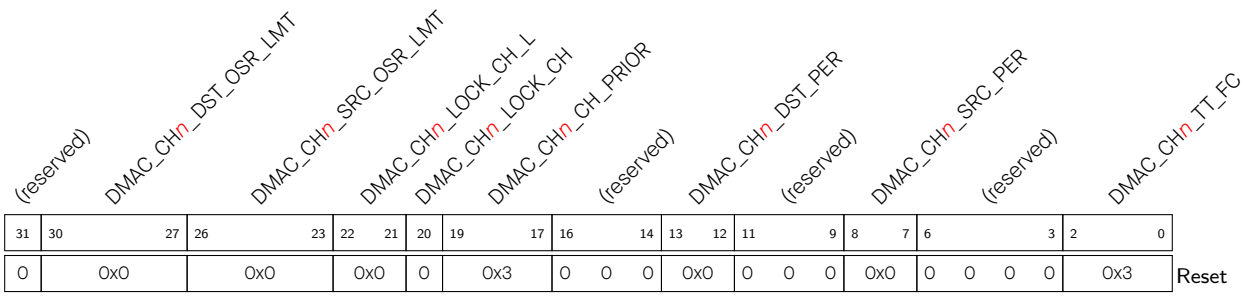
3: Linked list

(R/W)

DMAC_CH*n*_DST_MULTBLK_TYPE Configures the destination multi-block transfer type.

0: Contiguous address

1: Auto reloading



2: Shadow register

3: Linked list

If both DMAC_CH*n*_SRC_MULTBLK_TYPE and DMAC_CH*n*_DST_MULTBLK_TYPE are 0, then the transfer type is single-block transfer based on contiguous address.

(R/W)

Register 7.14. DMAC_CH*n*_CFG1_REG (*n*: 1-4) (0x0100*n* + 0x0124)

DMAC_CH*n*_TT_FC Configures transfer type and flow controller.

0x0: Transfer type is memory to memory and flow controller is VDMA

0x1: Transfer type is memory to peripheral and flow controller is VDMA

0x2: Transfer type is peripheral to memory and flow controller is VDMA

0x3: Invalid

0x4: Transfer type is peripheral to memory and flow controller is source peripheral

0x5: Invalid

0x6: Transfer type is memory to peripheral and flow controller is destination peripheral

0x7: Invalid

(R/W)

DMAC_CH*n*_SRC_PER Assigns a handshaking interface (0 ~ 2) to the source of channel *n*. (R/W)

DMAC_CH*n*_DST_PER Assigns a handshaking interface (0 ~ 2) to the destination of channel *n*. (R/W)

DMAC_CH*n*_CH_PRIOR Assigns channel priority (0 ~ 3). A priority of 3 is the highest priority, and 0 is the lowest. A programmed value outside this range will cause erroneous behavior. (R/W)

DMAC_CH*n*_LOCK_CH VDMA does not support lock feature. Reads of this field always return 0. (RO)

DMAC_CH*n*_LOCK_CH_L VDMA does not support lock feature. Reads of this field always return 0. (RO)

DMAC_CH*n*_SRC_OSR_LMT Configures the limit of the source AXI Outstanding request. The maximum number of AXI Outstanding request is 16.

Source AXI Outstanding request limit = Programmed value + 1.

AXI Outstanding is a feature in the AXI protocol that allows to send request before the previous request response is received, thereby increasing the bandwidth of the bus interface.

(R/W)

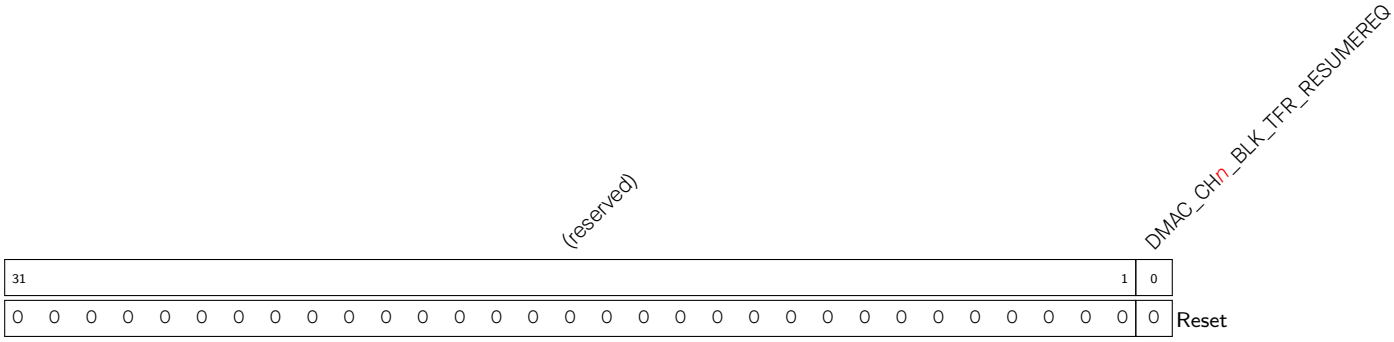
DMAC_CH*n*_DST_OSR_LMT Configures the limit of the destination AXI Outstanding request. The maximum number of AXI Outstanding request is 16.

Destination AXI Outstanding request limit = Programmed value + 1.

(R/W)

Register 7.15. DMAC_CH*n*_LLP0_REG (*n*: 1-4) (0x0100*n* + 0x0128)

DMAC_CH*n*_LMS Selects the AXI master for accessing LLI.



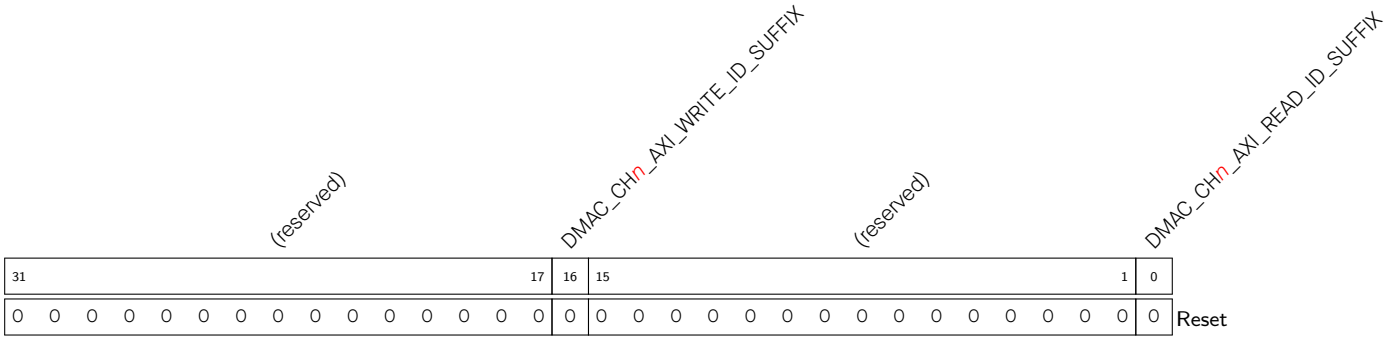
0: AXI Master 1

1: AXI Master 2

(R/W)

DMAC_CH*n*_LOC0 Configures the starting address of the first linked list item in memory. The six least significant bits (LSB) of the starting address are not stored because it is assumed that the address is 64-byte aligned. (R/W)

Register 7.16. DMAC_CH*n*_BLK_TFR_RESUMEREQ0_REG (*n*: 1-4) (0x0100*n* + 0x0148)

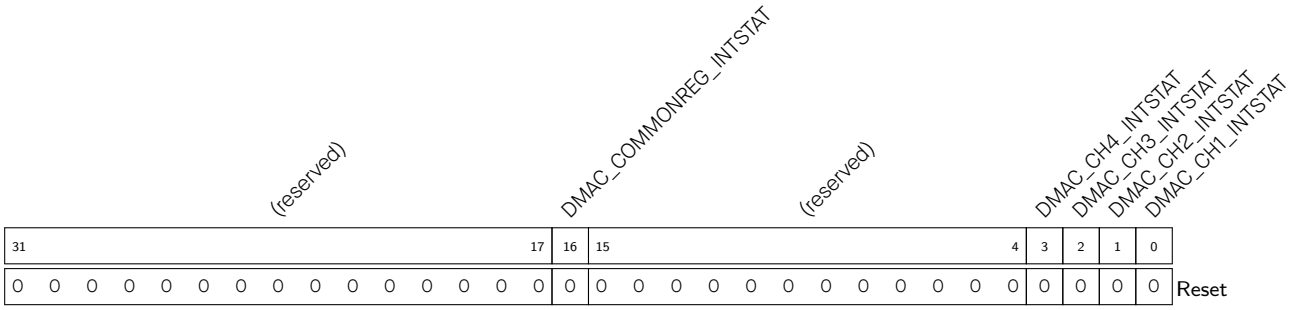


DMAC_CH*n*_BLK_TFR_RESUMEREQ Configures whether to request to resume block transfer during linked-list or shadow-register-based multi-block transfer.

0: Do not request to resume block transfer

1: Request to resume block transfer

(WO)



Register 7.17. DMAC_CH*n*_AXI_IDO_REG (0x0150)

DMAC_CH*n*_AXI_READ_ID_SUFFIX Configure the least significant bit of AXI read ID. (R/W)

DMAC_CH*n*_AXI_WRITE_ID_SUFFIX Configure the least significant bit of AXI write ID. (R/W)

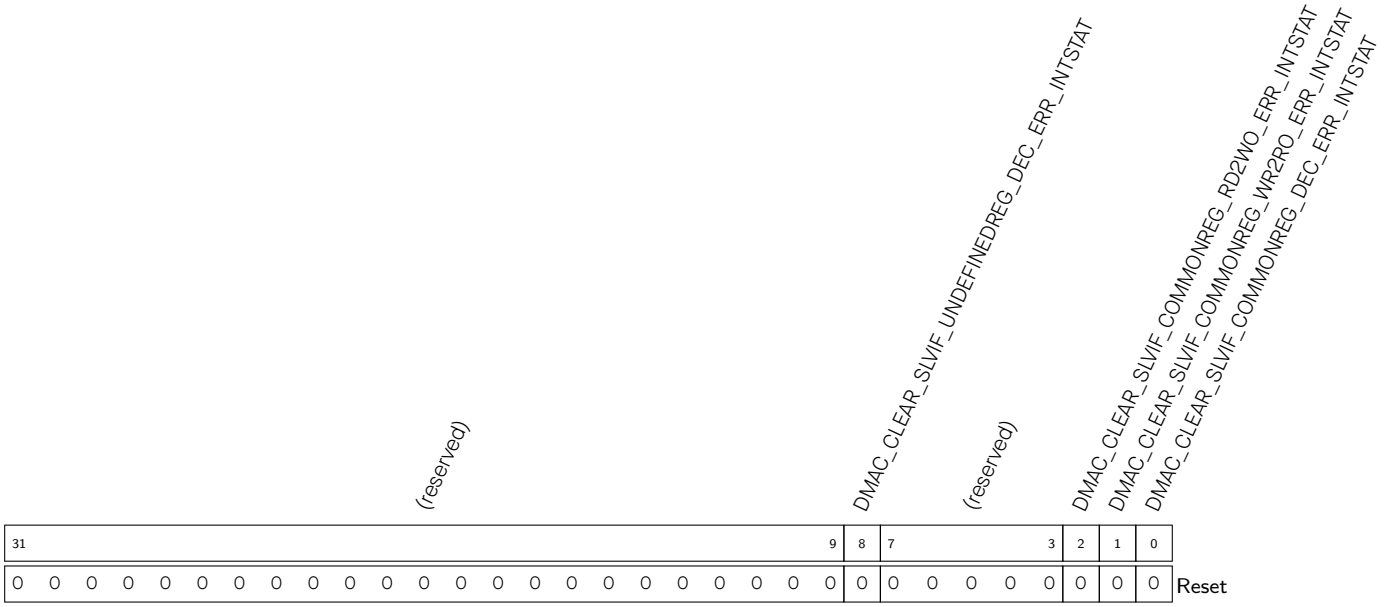
Register 7.18. DMAC_INTSTATUSO_REG (0x0030)

DMAC_CH*n*_INTSTAT (*n*: 1-4) Indicates the interrupt status for channel *n*.

1: Interrupt is active

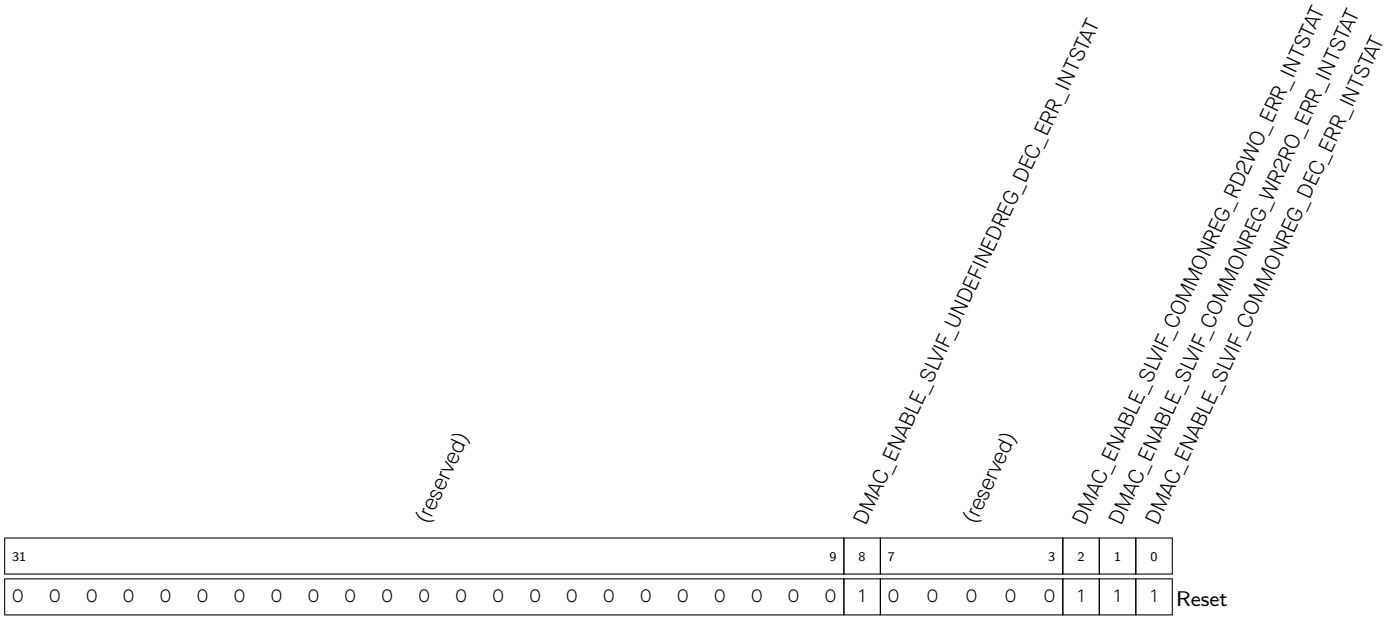
0: Interrupt is inactive

(RO)



DMAC_COMMONREG_INTSTAT Indicates the common register interrupt status.

1: Interrupt is active



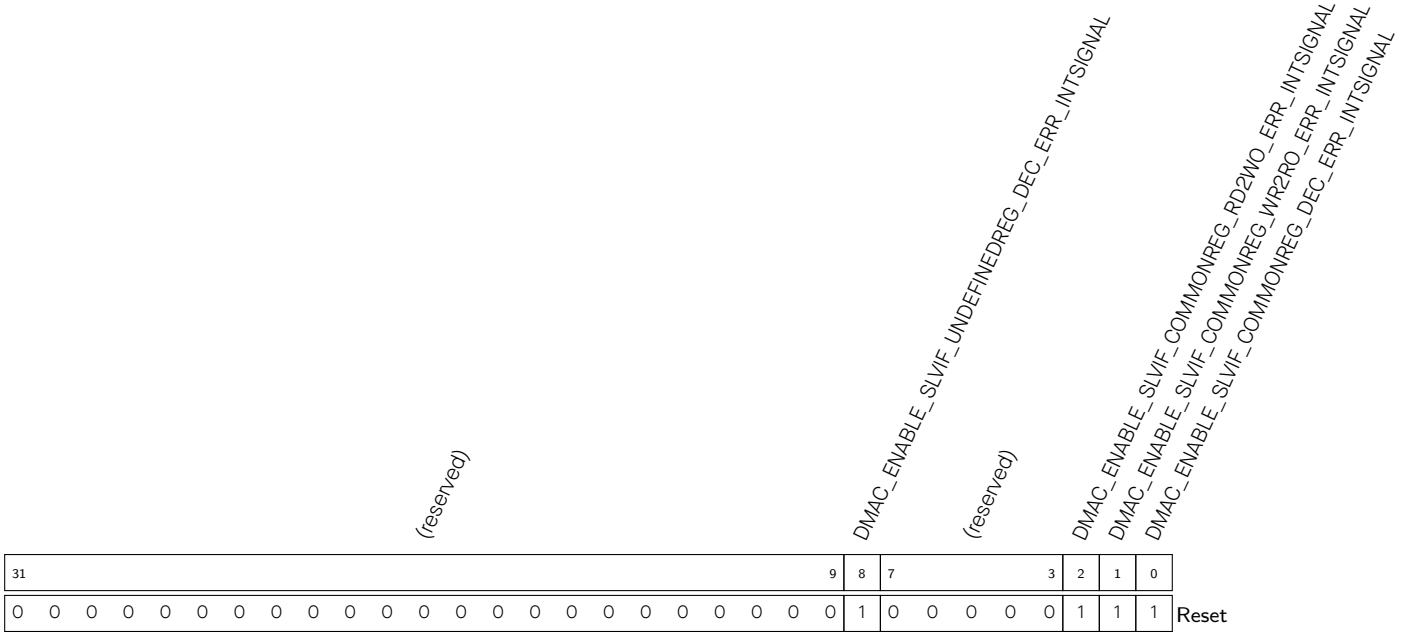
0: Interrupt is inactive

(RO)

Register 7.19. DMAC_COMMONREG_INTCLEAR0_REG (0x0038)

(reserved)
DMAC_CLEAR_SLVIF_UNDEFINEDREG_DEC_ERR_INTSTAT
(reserved)
DMAC_CLEAR_SLVIF_COMMONREG_RD2WO_ERR_INTSTAT
DMAC_CLEAR_SLVIF_COMMONREG_WR2RO_ERR_INTSTAT
DMAC_CLEAR_SLVIF_COMMONREG_DEC_ERR_INTSTAT
31 9 8 7 3 2 1 0
0 0 0

Register 7.20. DMAC_COMMONREG_INTSTATUS_ENABLEO_REG (0x0040)



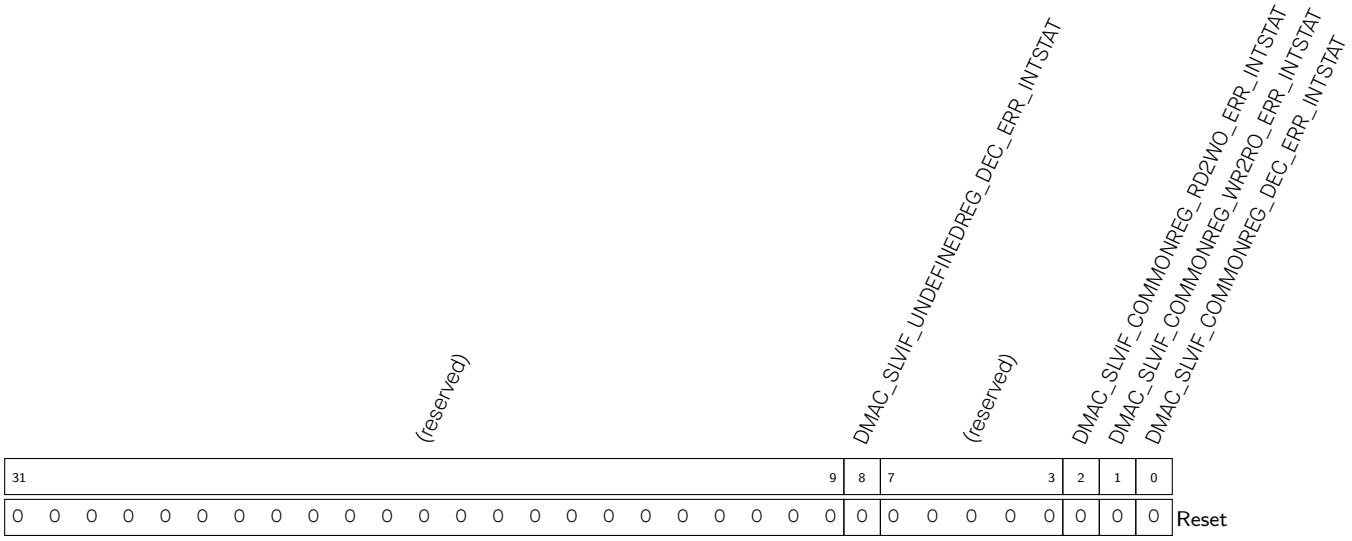
DMAC_ENABLE_SLVIF_COMMONREG_DEC_ERR_INTSTAT Write 1 to enable DMAC_SLVIF_COMMONREG_DEC_ERR_INTSTAT. (R/W)

DMAC_ENABLE_SLVIF_COMMONREG_WR2RO_ERR_INTSTAT Write 1 to enable DMAC_SLVIF_COMMONREG_WR2RO_ERR_INTSTAT. (R/W)

DMAC_ENABLE_SLVIF_COMMONREG_RD2WO_ERR_INTSTAT Write 1 to enable DMAC_SLVIF_COMMONREG_RD2WO_ERR_INTSTAT. (R/W)

DMAC_ENABLE_SLVIF_UNDEFINEDREG_DEC_ERR_INTSTAT Write 1 to enable DMAC_SLVIF_UNDEFINEDREG_DEC_ERR_INTSTAT. (R/W)

Register 7.21. DMAC_COMMONREG_INTSIGNAL_ENABLEO_REG (0x0048)



DMAC_ENABLE_SLVIF_COMMONREG_DEC_ERR_INTSIGNAL Write 1 to enable DMAC_SLVIF_COMMONREG_DEC_ERR_INT at port level. (R/W)

DMAC_ENABLE_SLVIF_COMMONREG_WR2RO_ERR_INTSIGNAL Write 1 to enable DMAC_SLVIF_COMMONREG_WR2RO_ERR_INT at port level. (R/W)

DMAC_ENABLE_SLVIF_COMMONREG_RD2WO_ERR_INTSIGNAL Write 1 to enable DMAC_SLVIF_COMMONREG_RD2WO_ERR_INT at port level. (R/W)

DMAC_ENABLE_SLVIF_UNDEFINEDREG_DEC_ERR_INTSIGNAL Write 1 to enable DMAC_SLVIF_UNDEFINEDREG_DEC_ERR_INT at port level. (R/W)

Register 7.22. DMAC_COMMONREG_INTSTATUS0_REG (0x0050)

DMAC_SLVIF_COMMONREG_DEC_ERR_INTSTAT Slave interface common register decode error interrupt status bit. This error occurs when VDMA accesses an invalid address in the common register space (0x000 to 0x0FF).

0: No error occurs

1: Error occurs

(RO)

DMAC_SLVIF_COMMONREG_WR2RO_ERR_INTSTAT Slave interface common register write to read-only error interrupt status bit. This error occurs when a write operation is performed to a read-only register in the common register space (0x000 to 0x0FF).

0: No error occurs

1: Error occurs

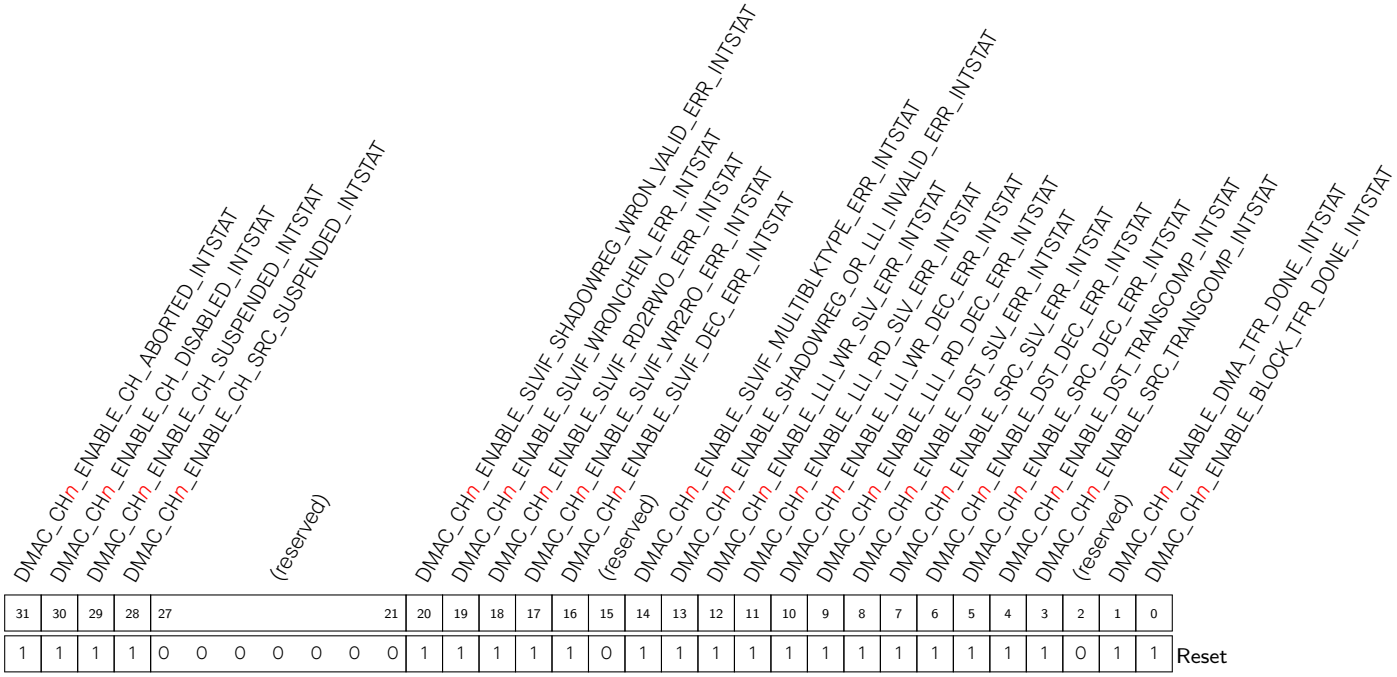
(RO)

DMAC_SLVIF_COMMONREG_RD2WO_ERR_INTSTAT Slave interface common register read to write-only error interrupt status bit. This error occurs when a read operation is performed to a write-only register in the common register space (0x000 to 0x0FF).

0: No error occurs

1: Error occurs

(RO)



DMAC_SLVIF_UNDEFINEDREG_DEC_ERR_INTSTAT Slave interface undefined register decode error interrupt signal enable bit. This error occurs when the register access is to undefined address range (>0x4FF).

0: No error occurs

1: Error occurs

(RO)

Register 7.23. DMAC_CH*n*_INTSTATUS_ENABLEO_REG (*n*: 1-4) (0x0100*n* + 0x0180)

DMAC_CH*n*_ENABLE_BLOCK_TFR_DONE_INTSTAT Write 1 to enable DMAC_CH*n*_BLOCK_TFR_DONE_INTSTAT. (R/W)

DMAC_CH*n*_ENABLE_DMA_TFR_DONE_INTSTAT Write 1 to enable DMAC_CH*n*_DMA_TFR_DONE_INTSTAT. (R/W)

DMAC_CH*n*_ENABLE_SRC_TRANSCOMP_INTSTAT Write 1 to enable DMAC_CH*n*_SRC_TRANSCOMP_INTSTAT. (R/W)

DMAC_CH*n*_ENABLE_DST_TRANSCOMP_INTSTAT Write 1 to enable DMAC_CH*n*_DST_TRANSCOMP_INTSTAT. (R/W)

DMAC_CH*n*_ENABLE_SRC_DEC_ERR_INTSTAT Write 1 to enable DMAC_CH*n*_SRC_DEC_ERR_INTSTAT. (R/W)

DMAC_CH*n*_ENABLE_DST_DEC_ERR_INTSTAT Write 1 to enable DMAC_CH*n*_DST_DEC_ERR_INTSTAT. (R/W)

DMAC_CH*n*_ENABLE_SRC_SLV_ERR_INTSTAT Write 1 to enable DMAC_CH*n*_SRC_SLV_ERR_INTSTAT. (R/W)

DMAC_CH*n*_ENABLE_DST_SLV_ERR_INTSTAT Write 1 to enable DMAC_CH*n*_DST_SLV_ERR_INTSTAT. (R/W)

DMAC_CH*n*_ENABLE_LLI_RD_DEC_ERR_INTSTAT Write 1 to enable DMAC_CH*n*_LLI_RD_DEC_ERR_INTSTAT. (R/W)

DMAC_CH*n*_ENABLE_LLI_WR_DEC_ERR_INTSTAT Write 1 to enable DMAC_CH*n*_LLI_WR_DEC_ERR_INTSTAT. (R/W)

Continued on the next page...

Register 7.23. DMAC_CH*n*_INTSTATUS_ENABLEO_REG (*n*: 1-4) (0x0100*n* + 0x0180)

Continued from the previous page...

DMAC_CH*n*_ENABLE_LLI_RD_SLV_ERR_INTSTAT Write 1 to enable DMAC_CH*n*_LLI_RD_SLV_ERR_INTSTAT. (R/W)

DMAC_CH*n*_ENABLE_LLI_WR_SLV_ERR_INTSTAT Write 1 to enable DMAC_CH*n*_LLI_WR_SLV_ERR_INTSTAT. (R/W)

DMAC_CH*n*_ENABLE_SHADOWREG_OR_LLI_INVALID_ERR_INTSTAT Write 1 to enable DMAC_CH*n*_SHADOWREG_OR_LLI_INVALID_ERR_INTSTAT. (R/W)

DMAC_CH*n*_ENABLE_SLVIF_MULTIBLKTYPE_ERR_INTSTAT Write 1 to enable DMAC_CH*n*_SLVIF_MULTIBLKTYPE_ERR_INTSTAT. (R/W)

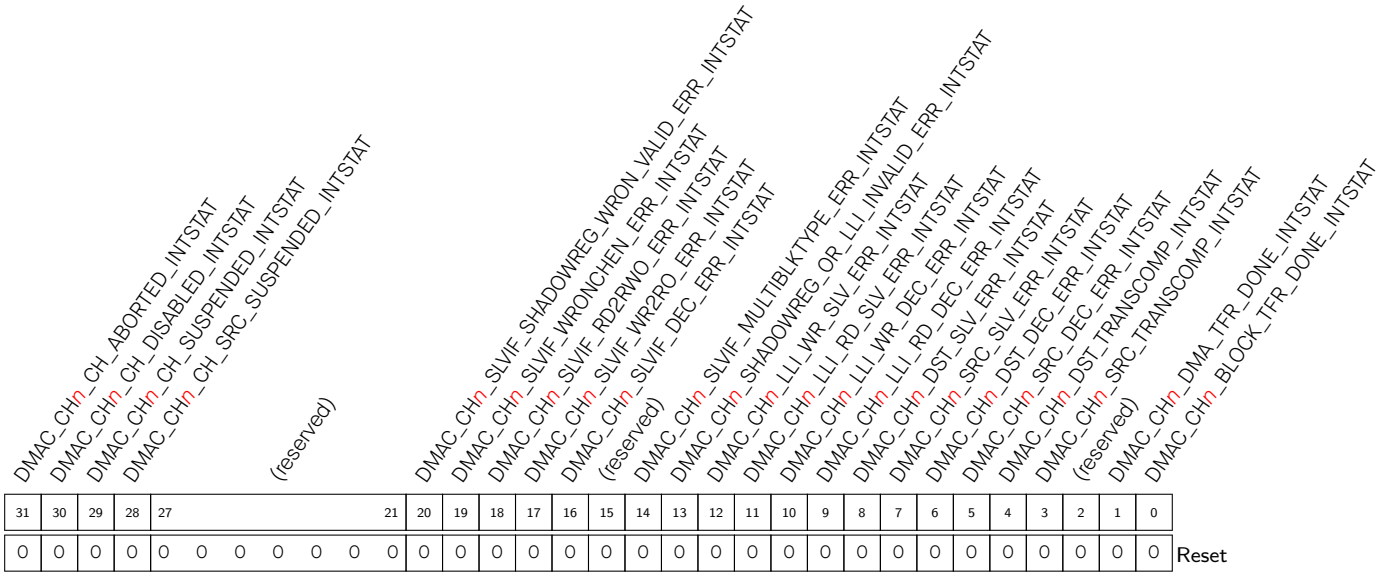
DMAC_CH*n*_ENABLE_SLVIF_DEC_ERR_INTSTAT Write 1 to enable DMAC_CH*n*_SLVIF_DEC_ERR_INTSTAT. (R/W)

DMAC_CH*n*_ENABLE_SLVIF_WR2RO_ERR_INTSTAT Write 1 to enable DMAC_CH*n*_SLVIF_WR2RO_ERR_INTSTAT. (R/W)

DMAC_CH*n*_ENABLE_SLVIF_RD2RWO_ERR_INTSTAT Write 1 to enable DMAC_CH*n*_SLVIF_RD2RWO_ERR_INTSTAT. (R/W)

DMAC_CH*n*_ENABLE_SLVIF_WRONCHEN_ERR_INTSTAT Write 1 to enable DMAC_CH*n*_SLVIF_WRONCHEN_ERR_INTSTAT. (R/W)

DMAC_CH*n*_ENABLE_SLVIF_SHADOWREG_WRON_VALID_ERR_INTSTAT Write 1 to enable DMAC_CH*n*_SLVIF_SHADOWREG_WRON_VALID_ERR_INTSTAT. (R/W)



DMAC_CH*n*_ENABLE_CH_SRC_SUSPENDED_INTSTAT Write 1 to enable DMAC_CH*n*_CH_SRC_SUSPENDED_INTSTAT. (R/W)

DMAC_CH*n*_ENABLE_CH_SUSPENDED_INTSTAT Write 1 to enable DMAC_CH*n*_CH_SUSPENDED_INTSTAT. (R/W)

DMAC_CH*n*_ENABLE_CH_DISABLED_INTSTAT Write 1 to enable DMAC_CH*n*_CH_DISABLED_INTSTAT. (R/W)

DMAC_CH*n*_ENABLE_CH_ABORTED_INTSTAT Write 1 to enable DMAC_CH*n*_CH_ABORTED_INTSTAT. (R/W)

Register 7.24. DMAC_CH*n*_INTSTATUSO_REG (*n*: 1-4) (0x0100*n* + 0x0188)

DMAC_CH*n*_BLOCK_TFR_DONE_INTSTAT Block transfer done status bit. (RO)

DMAC_CH*n*_DMA_TFR_DONE_INTSTAT DMA transfer done status bit. (RO)

DMAC_CH*n*_SRC_TRANSCOMP_INTSTAT Source DMA transfer completed status bit. (RO)

DMAC_CH*n*_DST_TRANSCOMP_INTSTAT Destination DMA transfer completed status bit. (RO)

DMAC_CH*n*_SRC_DEC_ERR_INTSTAT Source decode error status bit. The decode error is detected by the master interface during source transfer. (RO)

DMAC_CH*n*_DST_DEC_ERR_INTSTAT Destination decode error status bit. The decode error is detected by the master interface during destination transfer. (RO)

DMAC_CH*n*_SRC_SLV_ERR_INTSTAT Source slave error status bit. The slave error is detected by the master interface during source transfer. This error occurs if the slave interface that reads data issues a slave error. (RO)

DMAC_CH*n*_DST_SLV_ERR_INTSTAT Destination slave error status bit. The slave error is detected by the master interface during source transfer. This error occurs if the slave interface that writes data issues a slave error. (RO)

DMAC_CH*n*_LLI_RD_DEC_ERR_INTSTAT LLI read decode error status bit. The decode error is detected by the master interface during LLI read operation. (RO)

DMAC_CH*n*_LLI_WR_DEC_ERR_INTSTAT LLI write decode error status bit. The decode error is detected by the master interface during LLI write-back operation. (RO)

DMAC_CH*n*_LLI_RD_SLV_ERR_INTSTAT LLI read slave error status bit. The slave error is detected by the master interface during LLI read operation. (RO)

DMAC_CH*n*_LLI_WR_SLV_ERR_INTSTAT LLI write slave error status bit. The slave error is detected by the master interface during LLI write-back operation. (RO)

Continued on the next page...

Register 7.24. DMAC_CH*n*_INTSTATUSO_REG (*n*: 1-4) (0x0100*n* + 0x0188)

Continued from the previous page...

DMAC_CH*n*_SHADOWREG_OR_LLI_INVALID_ERR_INTSTAT Shadow register or LLI invalid error status bit. This error occurs if DMAC_CH*n*_SHADOWREG_OR_LLI_VALID is 0 during VDMA shadow register/LLI fetch phase. (RO)

DMAC_CH*n*_SLVIF_MULTIBLKTYPE_ERR_INTSTAT Slave interface multi-block type error status bit. This error occurs if multi-block transfer type programmed in DMAC_CH*n*_SRC_MULTBLK_TYPE and DMAC_CH*n*_DST_MULTBLK_TYPE is invalid. (RO)

DMAC_CH*n*_SLVIF_DEC_ERR_INTSTAT Slave interface decode error status bit. The decode error is generated by VDMA during register access. This error occurs if the register access is to invalid address in channel *n*. (RO)

DMAC_CH*n*_SLVIF_WR2RO_ERR_INTSTAT Slave interface write to read-only error status bit. This error occurs if write operation is performed to a read-only register. (RO)

DMAC_CH*n*_SLVIF_RD2RWO_ERR_INTSTAT Slave interface read to write-only error status bit. This error occurs if read operation is performed to a write-only register. (RO)

DMAC_CH*n*_SLVIF_WRONCHEN_ERR_INTSTAT Slave interface write to enable channel error status bit. This error occurs if an illegal write operation is performed on a register as per the VDMA specification. (RO)

DMAC_CH*n*_SLVIF_SHADOWREG_WRON_VALID_ERR_INTSTAT Shadow register write on valid error status bit. This error occurs if shadow register based multi-block transfer is enabled and software tries to write to the shadow register when DMAC_CH*n*_SHADOWREG_OR_LLI_VALID bit is 1. (RO)

DMAC_CH*n*_CH_SRC_SUSPENDED_INTSTAT Channel source suspended status bit.

0: Channel source is not suspended.

1: Channel Source is suspended.

(RO)

DMAC_CH*n*_CH_SUSPENDED_INTSTAT Channel suspended status bit.

0: Channel is not suspended.

1: Channel is suspended.

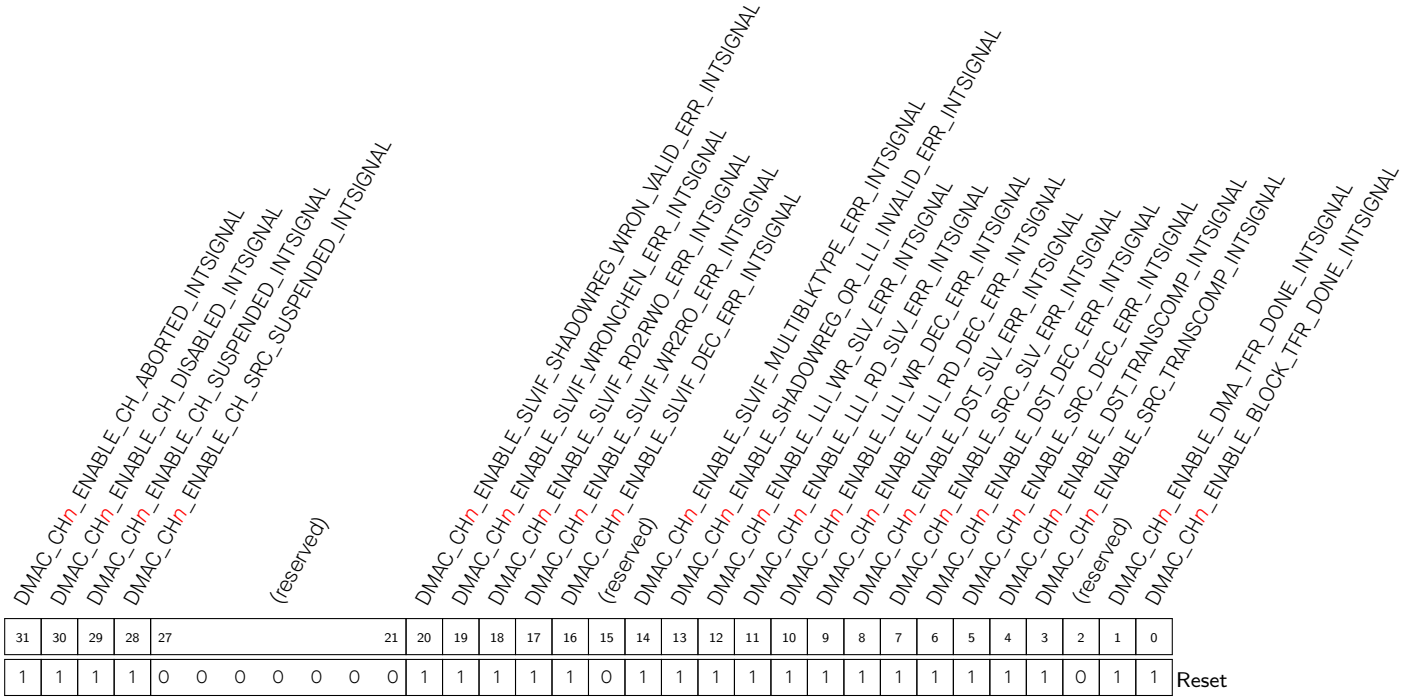
(RO)

DMAC_CH*n*_CH_DISABLED_INTSTAT Channel disabled status bit.

0: Channel is not disabled.

1: Channel is disabled.

(RO)



DMAC_CH*n*_CH_ABORTED_INTSTAT Channel aborted status bit.

0: Channel is not aborted.

1: Channel is aborted.

(RO)

Register 7.25. DMAC_CH*n*_INTSIGNAL_ENABLEO_REG (*n*: 1-4) (0x0100*n* + 0x0190)

DMAC_CH*n*_ENABLE_BLOCK_TFR_DONE_INTSIGNAL Write 1 to enable DMAC_CH*n*_BLOCK_TFR_DONE_INT at port level. (R/W)

DMAC_CH*n*_ENABLE_DMA_TFR_DONE_INTSIGNAL Write 1 to enable DMAC_CH*n*_DMA_TFR_DONE_INT at port level. (R/W)

DMAC_CH*n*_ENABLE_SRC_TRANSCOMP_INTSIGNAL Write 1 to enable DMAC_CH*n*_SRC_TRANSCOMP_INT at port level. (R/W)

DMAC_CH*n*_ENABLE_DST_TRANSCOMP_INTSIGNAL Write 1 to enable DMAC_CH*n*_DST_TRANSCOMP_INT at port level. (R/W)

DMAC_CH*n*_ENABLE_SRC_DEC_ERR_INTSIGNAL Write 1 to enable DMAC_CH*n*_SRC_DEC_ERR_INT at port level. (R/W)

DMAC_CH*n*_ENABLE_DST_DEC_ERR_INTSIGNAL Write 1 to enable DMAC_CH*n*_DST_DEC_ERR_INT at port level. (R/W)

DMAC_CH*n*_ENABLE_SRC_SLV_ERR_INTSIGNAL Write 1 to enable DMAC_CH*n*_SRC_SLV_ERR_INT at port level. (R/W)

DMAC_CH*n*_ENABLE_DST_SLV_ERR_INTSIGNAL Write 1 to enable DMAC_CH*n*_DST_SLV_ERR_INT at port level. (R/W)

DMAC_CH*n*_ENABLE_LLI_RD_DEC_ERR_INTSIGNAL Write 1 to enable DMAC_CH*n*_LLI_RD_DEC_ERR_INT at port level. (R/W)

DMAC_CH*n*_ENABLE_LLI_WR_DEC_ERR_INTSIGNAL Write 1 to enable DMAC_CH*n*_LLI_WR_DEC_ERR_INT at port level. (R/W)

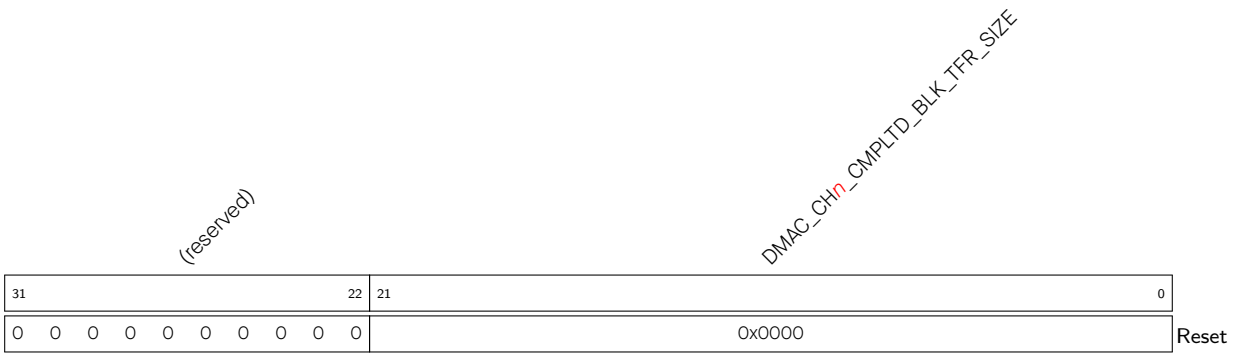
DMAC_CH*n*_CLEAR_SLVIF_DEC_ERR_INTSTAT Write 1 to clear DMAC_CH*n*_SLVIF_DEC_ERR_INTSTAT. (WO)

DMAC_CH*n*_CLEAR_SLVIF_WR2RO_ERR_INTSTAT Write 1 to clear DMAC_CH*n*_SLVIF_WR2RO_ERR_INTSTAT. (WO)

DMAC_CH*n*_CLEAR_SLVIF_RD2RWO_ERR_INTSTAT Write 1 to clear DMAC_CH*n*_SLVIF_RD2RWO_ERR_INTSTAT. (WO)

DMAC_CH*n*_CLEAR_SLVIF_WRONCHEN_ERR_INTSTAT Write 1 to clear DMAC_CH*n*_SLVIF_WRONCHEN_ERR_INTSTAT. (WO)

DMAC_CH*n*_CLEAR_SLVIF_SHADOWREG_WRON_VALID_ERR_INTSTAT Write 1 to clear DMAC_CH*n*_SLVIF_SHADOWREG_WRON_VALID_ERR_INTSTAT. (WO)



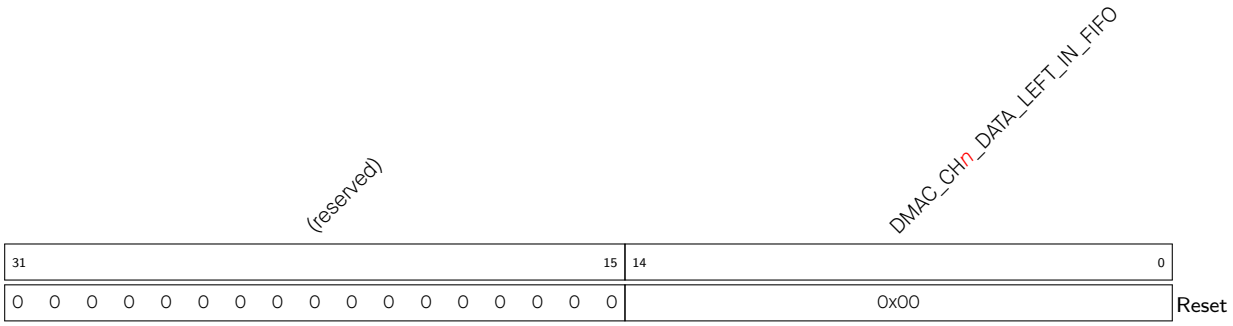
DMAC_CH*n*_CLEAR_CH_SRC_SUSPENDED_INTSTAT Write 1 to clear DMAC_CH*n*_CH_SRC_SUSPENDED_INTSTAT. (WO)

DMAC_CH*n*_CLEAR_CH_SUSPENDED_INTSTAT Write 1 to clear DMAC_CH*n*_CH_SUSPENDED_INTSTAT. (WO)

DMAC_CH*n*_CLEAR_CH_DISABLED_INTSTAT Write 1 to clear DMAC_CH*n*_CH_DISABLED_INTSTAT. (WO)

DMAC_CH*n*_CLEAR_CH_ABORTED_INTSTAT Write 1 to clear DMAC_CH*n*_CH_ABORTED_INTSTAT. (WO)

Register 7.27. DMAC_CH*n*_STATUS0_REG (*n*: 1-4) (0x0100*n* + 0x0130)



DMAC_CH*n*_CMPLTD_BLK_TFR_SIZE Indicates the total number of data of width DMAC_CH*n*_SRC_TR_WIDTH transferred during the previous block transfer.

If any error occurs during DMA transfer, the block transfer might be terminated early. In such case, the value of this field indicates the actual data transferred without error in the current block.

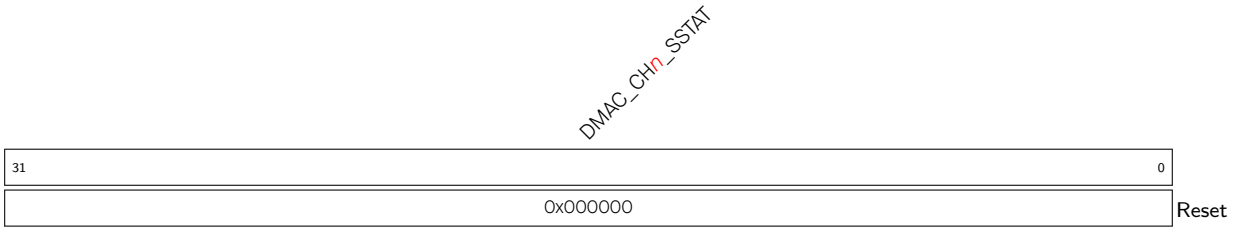
This field is cleared to 0 when the channel is enabled.

(RO)

Register 7.28. DMAC_CH*n*_STATUS1_REG (*n*: 1-4) (0x0100*n* + 0x0134)

DMAC_CH*n*_DATA_LEFT_IN_FIFO Indicates the total number of remaining data in the VDMA channel FIFO after completing the current block transfer.

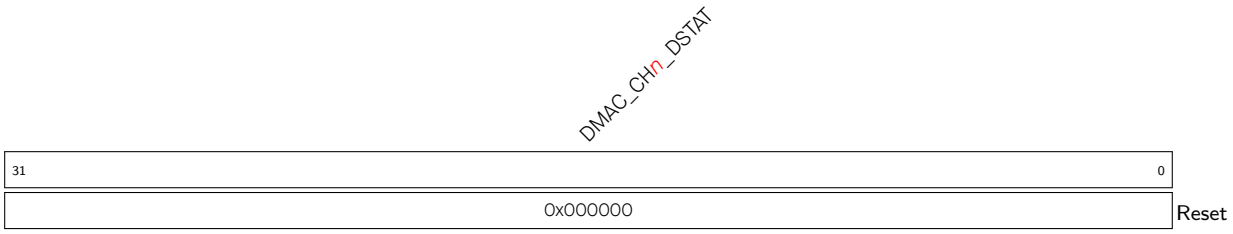
The data width in the channel FIFO is DMAC_CH*n*_SRC_TR_WIDTH.



For a normal block transfer completion without errors, the value of this field is 0. If any errors occur during DMA transfer, the block transfer may be terminated early; in this case, this field indicates the remaining data in the channel FIFO that cannot be transferred to the target peripheral.

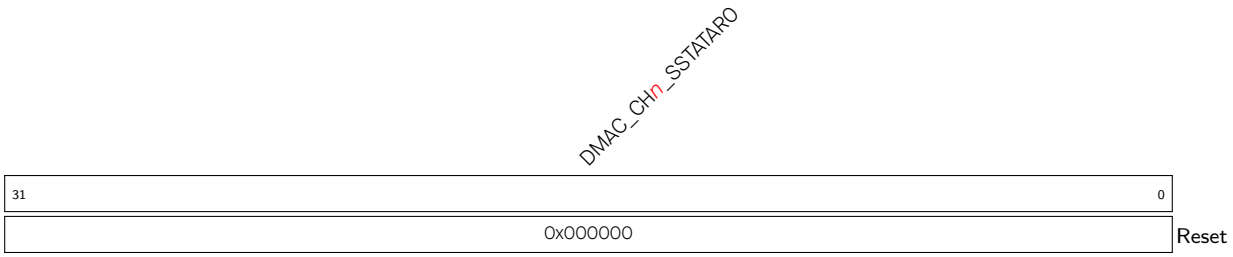
This field will be cleared when the channel is enabled.

If DMAC_CH*n*_DST_TR_WIDTH > DMAC_CH*n*_SRC_TR_WIDTH, there may be remaining data in the FIFO that is not enough to form a single transfer of DMAC_CH*n*_SRC_TR_WIDTH width; in this case, this field will return 0.



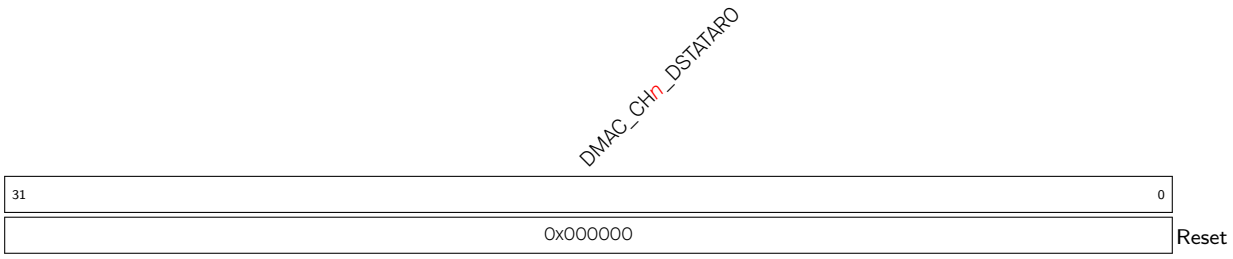
(RO)

Register 7.29. DMAC_CH*n*_SSTAT0_REG (*n*: 1-4) (0x0100**n* + 0x0160)



DMAC_CH*n*_SSTAT Indicates the source status information retrieved by hardware from the address pointed to by DMAC_CH*n*_SSTATARO_REG. (RO)

Register 7.30. DMAC_CH*n*_DSTAT0_REG (*n*: 1-4) (0x0100**n* + 0x0168)



DMAC_CH*n*_DSTAT Indicates the destination status information retrieved by hardware from the address pointed to by DMAC_CH*n*_DSTATARO_REG.
(RO)

Register 7.31. DMAC_CH*n*_SSTATARO_REG (*n*: 1-4) (0x0100**n* + 0x0170)

DMAC_CH*n*_SSTATARO Configures the address from where the hardware obtains the source status information. (R/W)

Register 7.32. DMAC_CH*n*_DSTATARO_REG (*n*: 1-4) (0x0100*n* + 0x0178)

DMAC_CH*n*_DSTATARO Configures the address from where the hardware obtains the destination status information. (R/W)

Chapter 8

2D-DMA Controller (2D-DMA)

8.1 Overview

The 2D-DMA controller is a DMA (Direct Memory Access) dedicated to two-dimensional image processing. In addition to all the features of GDMA-AXI, it includes support for macroblock reordering and color space conversion (CSC) to better meet the data transfer requirements from JPEG and PPA. Notably, the 2D-DMA facilitates memory-to-memory transfers, enabling the movement of macroblocks between different segments of memory address space while concurrently performing color space conversion.

8.2 Features

- One AXI master interface
- Data transfer with unaligned starting addresses
- Memory-to-memory, peripheral-to-memory (RX), and memory-to-peripheral (TX) data transfer
- Four memory-to-peripheral channels, and three peripheral-to-memory channels
- Support for PPA and JPEG Codec
- Macroblock reordering
- Color space conversion
- Configurable channel priority and weight

8.3 Architecture

In ESP32-P4, only JPEG Codec and PPA support 2D-DMA. The 2D-DMA controller and CPU data bus have access to the same address space in memory. Figure 8.3-1 shows the basic architecture of the 2D-DMA controller.

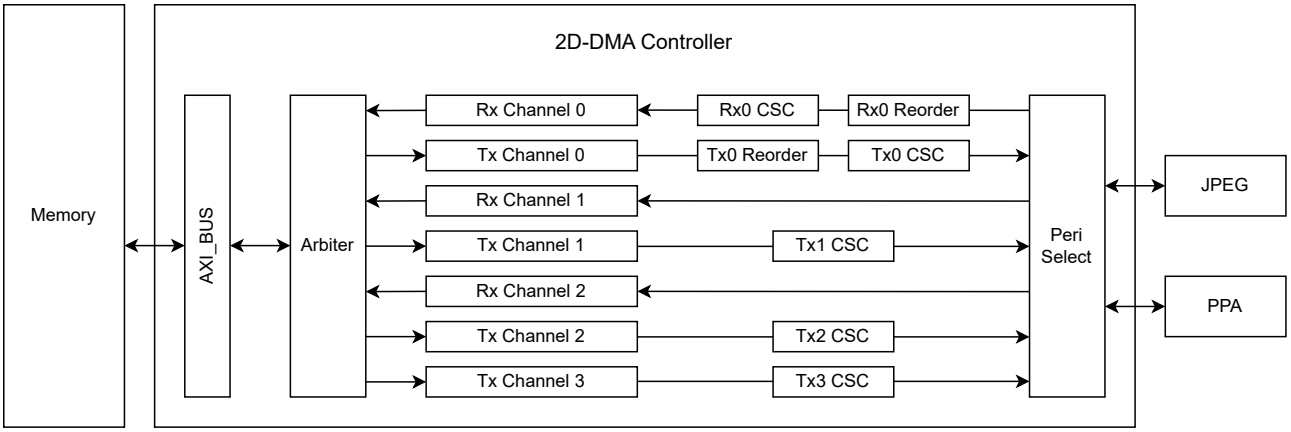


Figure 8.3-1. 2D-DMA Architecture

The 2D-DMA has seven independent channels: four transmit channels and three receive channels. Every channel can be connected to different peripherals, or in other words shared by peripherals.

The macroblock reordering and color space conversion features of the 2D-DMA are not supported by all channels. Among the channels, transmit channel 0 and receive channel 0 support macroblock reordering, while transmit channel 0 ~ 3 and receive channel 0 support color space conversion.

The 2D-DMA reads data from or writes data to the internal or external memory via AXI_BUS. Before the data transfer, the 2D-DMA uses configurable arbitration schemes for channels requesting read or write access. For the available address range of internal and external memory, please see Chapter 9 *System and Memory*.

The software can use the 2D-DMA through linked lists stored in internal or external memory. These linked lists consist of outlink*n* and inlink*n*, where *n* indicates the channel number. For outlink*n*, *n* ranges from 0 to 3; for inlink*n*, *n* ranges from 0 to 2. The 2D-DMA reads an outlink*n* (i.e., a linked list of transmit descriptors) from memory and transmit data in corresponding memory according to the outlink*n*, or read an inlink*n* (i.e., a linked list of receive descriptors) and store received data into specific address space in memory according to the inlink*n*.

8.4 Functional Description

8.4.1 Transfer Mode

The 2D-DMA supports four transfer modes:

- 1D mode: enabled by setting the 2DEN field of DW0 and the mod field of DW2 to 0. In this mode, the 2D-DMA has the same functionalities as GDMA-AXI: it performs memory read/write operations based on the data length and memory space configured in the linked list, and the operation addresses are contiguous.
- 2D-MOD0 mode: enabled by setting the 2DEN field of DW0 to 1 and the mod field of DW2 to 0. In this mode, the 2D-DMA reads or writes a hb*vb macroblock starting from the (X, Y) coordinates of the HA*VA image. After the last data in each row has been read or written, the address jumps to the address of the first data in the next row to be read or written.

- 2D-MOD1 mode: enabled by setting the 2DEN field of DW0 to 1 and the mod field of DW2 to 1. In this mode, the 2D-DMA reads or writes multiple macroblocks from the starting address of the HA*VA image until the HA*VA image has been fully read or written. For JPEG, it is necessary to configure DMA2D_IN_MACRO_BLOCK_SIZE_CH*n* or DMA2D_OUT_MACRO_BLOCK_SIZE_CH*n* to choose a macroblock size out of the three available options (horizontal × vertical): 8 pixels × 8 pixels, 8 pixels × 16 pixels, and 16 pixels × 16 pixels. For more information about macroblock size, see Chapter 37 *JPEG Codec*. For correspondence between macroblock size, hb, and vb of descriptors, see Table 8.4-4 and Table 8.4-5.
- DSCR-PORT mode: enabled by setting the 2DEN field of DW0 to 1, the mod field of DW2 to 0, and the DMA2D_OUT_DSCR_PORT_EN_CH*n* bit or the DMA2D_IN_DSCR_PORT_EN_CH*n* bit to 1. This mode is specifically designed for PPA. For details, see Chapter 39 *Pixel-Processing Accelerator (PPA)*.

1D Mode, 2D-MOD0 Mode, 2D-MOD1 Mode, and DSCR-PORT support both peripheral-to-memory and memory-to-peripheral data transfers. Only 1D Mode and 2D-MOD0 Mode support memory-to-memory data transfers.

8.4.2 Linked List

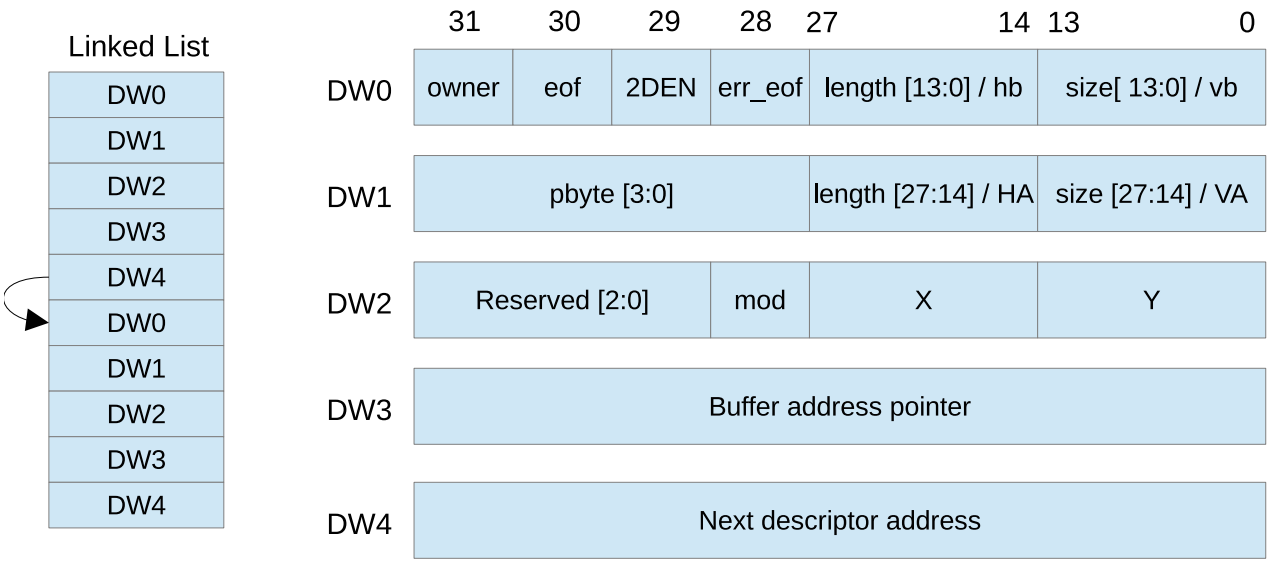

Figure 8.4-1. Structure of a Linked List

Figure 8.4-1 shows the structure of a linked list. An outlink and an inlink have the same structure. A linked list is formed by one or more descriptors, and each descriptor consists of five words. Linked lists should be stored in the memory for the 2D-DMA to be able to use them. The meanings of a descriptor's fields are shown in Table 8.4-1.

Note: DMA2D_OUT is the prefix of transmit channel registers, and DMA2D_IN is the prefix of receive channel registers.

Table 8.4-1. Descriptor Field Description

Bits	Name	Description
DW0[31]	owner	Specifies who is allowed to access the buffer that this descriptor points to. • 0: CPU can access the buffer • 1: The 2D-DMA controller can access the buffer When the 2D-DMA controller stops using the buffer, this bit in a receive descriptor is automatically cleared by hardware, while this bit in a transmit descriptor can only be automatically cleared by hardware if DMA2D_OUT_AUTO_WRBACK_CH*n* is set to 1. When software loads a linked list, this bit should be set to 1.
DW0[30]	eof	Specifies the end of frame. • 0: The current descriptor is not the last descriptor of an image • 1: The current descriptor is the last descriptor of an image For receive descriptors, software needs to write 0 to this bit first, and hardware would set this bit to 1 after receiving a complete image. For transmit descriptors, software should set this bit in the last descriptor of an image to 1.
DW0[29]	2DEN	Specifies whether to enable 2D functions. • 0: 2D-DMA operates in 1D mode • 1: 2D-DMA operates in 2D mode
DW0[28]	err_eof	Specifies whether the received data has errors (JPEG only). • 0: The received data does not have errors • 1: The received data has errors For receive descriptors, the hardware sets this bit to 1 after receiving a complete image and detecting errors in the received data.
DW0[27:14]	length[13:0]/hb	**hb** in 2D mode – Specifies the horizontal width of the macroblocks to be moved in the unit of pixels. **length[13:0]** in 1D mode – Specifies the lower 14 bits of length, which is the number of valid bytes in the buffer that this descriptor points to. This field in a transmit descriptor is written by software and indicates how many bytes can be read from the buffer; this field in a receive descriptor is written by hardware automatically and indicates how many valid bytes have been stored in the buffer.
DW0[13:0]	size[13:0]/vb	**vb** in 2D mode – Specifies the vertical height of the macroblocks to be moved in the unit of pixels. **size[13:0]** in 1D mode – Specifies the lower 14 bits of size, which is the capacity of the buffer that this descriptor points to in the unit of bytes.

Bits	Name	Description
DW1[31:28]	pbyte	In 2D mode, specifies the number of bytes per pixel of the image to be transferred to/from the memory. (If color space conversion is applied, this field represents the number of bytes per pixel of the image stored in the memory.) • 0: 0.5 byte/pixel • 1: 1 byte/pixel • 2: 1.5 bytes/pixel • 3: 2 bytes/pixel • 4: 3 bytes/pixel • 5: 4 bytes/pixel In 1D mode, this field is not used and can be any value.
DW1[27:14]	length[27:14]/HA	**HA** in 2D mode – Specifies the horizontal width of the original image corresponding to the macroblocks to be moved in the unit of pixels. **length[27:14]** in 1D mode – Specifies the higher 14 bits of length.
DW1[13:0]	size[27:14]/VA	**VA** in 2D mode – Specifies the vertical height of the original image corresponding to the macroblocks to be moved in the unit of pixels. **size[27:14]** in 1D mode – Specifies the higher 14 bits of size.
DW2[31:29]	Reserved	Reserved. Irrelevant.
DW2[28]	mod	Specifies the macroblock read mode. • 0: 2D-DMA reads or writes a single macroblock with horizontal width hb and vertical height vb only once • 1: 2D-DMA reads or writes multiple macroblocks with horizontal width hb and vertical height vb until the image data with horizontal width HA and vertical height VA is fully read or written In 1D mode, this bit must be 0. **Note:** hb/vb/HA/VA are in the unit of pixels.
DW2[27:14]	X	In 2D mode, specifies the X coordinate of the hb*vb image block within the HA*VA image in the unit of pixels. In 1D mode, this field is not used and can be any value.
DW2[13:0]	Y	In 2D mode, specifies the Y coordinate of the hb*vb image block within the HA*VA image in the unit of pixels. In 1D mode, this field is not used and can be any value.
DW3	Buffer address pointer	In 2D mode, specifies the address of the HA*VA image block origin in the buffer (the address of the original image's first byte in the memory). In 1D mode, specifies the starting address of the buffer.

Bits	Name	Description
DW4	Next descriptor address	Address of the next descriptor. If the current descriptor is the last descriptor in the linked list, this value can be 0. This address can point to the address space of internal or external memory. **Note:** The starting address for storing 2D-DMA descriptors must be 8-byte aligned.

8.4.3 Padding in 2D-MOD1 Mode and DSCR-PORT Mode

This section only applies to the TX direction of 2D-DMA transfers in 2D-MOD1 and DSCR-PORT mode.

For JPEG decoding, the basic unit of image data input is a block of 8 × 8, 8 × 16, or 16 × 16 (pixels). In 2D-MOD1 mode, when the length and width of the image are not integer multiples of the basic unit, the image needs to pad out to integer multiples of the basic unit based on the previous or the current macroblock.

For PPA, the basic unit for transmit channels in DSCR-PORT mode is 36 × 36 (YUV420), 36 × 34 (YUV422) and 34 × 34 (horizontal × vertical). The width and height of a basic unit for different transmit channels are configured using DMA2D_OUT_DSCR_PORT_BLK_H_CH*n* and DMA2D_OUT_DSCR_PORT_BLK_V_CH*n*. When the length and width of the image are not integer multiples of the basic unit, the image needs to pad out.

Below are the padding rules rules:

- Horizontally, the padding depends on the pbyte field of DW1.
  - When pbyte is 0 (0.5 byte/pixel), the remaining pixels must be even, and the padding is the last 0.5 byte.
  - When pbyte is 1 (1 byte/pixel), the padding is the last 1 byte.
  - When pbyte is 2 (1.5 bytes/pixel), the remaining pixels must be even, and the padding is the last 3 bytes.
  - When pbyte is 3 (2 bytes/pixel), the padding is the last 2 bytes.
  - When pbyte is 4 (3 bytes/pixel), the padding is the last 3 bytes.
  - When pbyte is 5 (4 bytes/pixel), the padding is the last 4 bytes.
- Vertically, the padding is the last row.

Figure 8.4-2 and Figure 8.4-3 illustrate the padding method.

In Figure 8.4-2, a blue grid represents a basic unit (a block of 8 × 8, 8 × 16, or 16 × 16 pixels), and a yellow box (incomplete basic unit) along with a green box (padding) forms a basic unit.

In Figure 8.4-3, a grid represents one pixel, and the numbers inside each grid represent pixel values.

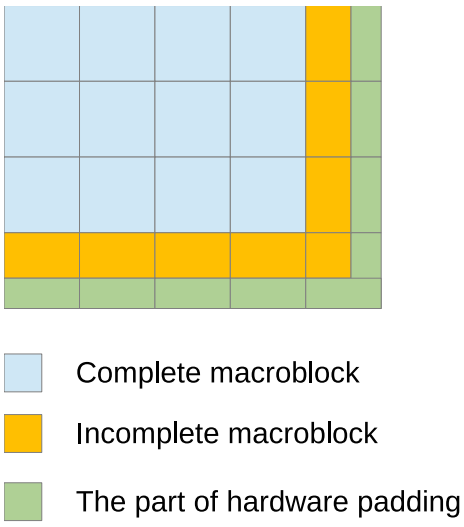

Figure 8.4-2. Padding Illustration (Overall)

1	2	3	3	3	3	3	3
4	5	6	6	6	6	6	6
7	8	9	9	9	9	9	9

7	8	9	9	9	9	9	9

Figure 8.4-3. Padding Illustration (Detail)

8.4.4 Peripheral-to-Memory and Memory-to-Peripheral Data Transfer

When DMA2D_MEM_TRANS_EN_CH*n* is 0, the 2D-DMA controller enters peripheral transfer mode. The transmit channel reads data from the memory and transmits it to peripherals, while the receive channel receives data from peripherals and stores it into the memory.

The transmit direction refers to data transfer from memory to peripheral, and the receive direction refers data transfer from peripheral to memory. A transmit channel transfers data in the specified memory location to a peripheral's transmitter via an outlink*n*, whereas a receive channel transfers data received by a peripheral to the specified memory location via an inlink*n*.

Every transmit and receive channel can be connected to any peripheral that supports 2D-DMA. Table 8.4-2 and Table 8.4-3 illustrate how to select the peripheral to be connected via registers. "Dummy-*n*" corresponds to register values for memory-to-memory data transfer. When a channel is connected to a peripheral, the rest

of the channels cannot be connected to that peripheral.

Table 8.4-2. Selecting Peripherals via Register Configuration in TX Direction

DMA2D_PERI_OUT_SEL_CH*n*	Peripheral
0	JPEG
1	PPA's SRM module
2	PPA's BLEND0 module
3	PPA's BLEND1 module
4 ~ 7	Dummy-4 ~ 7

Table 8.4-3. Selecting Peripherals via Register Configuration in RX Direction

DMA2D_PERI_IN_SEL_CH*n*	Peripheral
0	JPEG
1	PPA's SRM module
2	PPA's BLEND channel
3 ~ 7	Dummy-3 ~ 7

8.4.5 Memory-to-Memory Data Transfer

The 2D-DMA controller allows memory-to-memory data transfer only in 1D mode and 2D-MOD0 mode. Such data transfer can be enabled by setting DMA2D_IN_MEM_TRANS_EN_CH*n*, which connects the output of transmit channel *n* to the input of receive channel *n*. Note that a transmit channel can only be connected to the receive channel with the same number (*n*), and DMA2D_IN_PERI_SEL_CH*n* and DMA2D_OUT_PERI_SEL_CH*n* should be configured to any value corresponding to "Dummy".

Memory-to-memory data transfer can be used in combination with color space conversion so that a macroblock can be moved from one segment of memory address space to another with its color space converted.

8.4.6 Macroblock Reordering

8.4.6.1 Macroblock Reordering in TX Direction

When the 2D-DMA accesses external memory via SPI, in order to improve the bandwidth utilization of SPI, it is necessary to initiate AXI transfers with a larger burst length. In 2D-MOD1 mode, the 2D-DMA can increase the burst length of AXI transfers by fetching multiple macroblocks at once. For example, the 2D-DMA can fetch five macroblocks of 8x8 pixels in one operation, and in this case, the hb field in the descriptor should be 40 and vb should be 8. However, the JPEG requires the 2D-DMA to send data in the order of macroblocks. This means that the 2D-DMA needs to reorder the fetched macroblocks to meet the requirements of JPEG.

Recommended configurations for macroblock reordering are listed in Table 8.4-4.

Table 8.4-4. Recommended Configurations for Macroblock Reordering in TX Direction

Byte/Pixel	Macroblock Size (Pixel)	Optimal Macroblock Count	hb	vb
3	8× 8	5	40	8
3	16 × 8	2	32	8
3	16 × 16	2	32	16
2	8 × 8	8	64	8
2	16 × 8	4	64	8
2	16 × 16	3	48	16
1	8 × 8	16	128	8

The macroblock size in TX direction should be configured via the DMA2D_OUT_MACRO_BLOCK_SIZE_CH*n* field.

8.4.6.2 Macroblock Reordering in RX Direction

Currently, in RX direction the 2D-DMA can only reorder the data decoded by JPEG (the bitstream is 1 scan, see Chapter 37 *JPEG Codec*). The 2D-DMA breaks down color component data decoded by JPEG into pixels, assembles them into larger macroblocks, and writes these blocks into the memory.

The data formats decoded by JPEG include GRAY, YUV444, YUV422, and YUV420. Recommended configurations for macroblock reordering are listed in Table 8.4-5.

Table 8.4-5. Recommended Configuration Table for Macroblock Reordering in 2D-DMA Receive Direction (Without Color Format Conversion)

Format	Macroblock Size (pixels)	Optimal Macroblock Count	hb	vb
GRAY	8 × 8	12	96	8
YUV444	8 × 8	5	40	8
YUV422	16 × 8	4	64	8
YUV420	16 × 16	3	48	16

The macroblock size in TX direction should be configured via the DMA2D_IN_MACRO_BLOCK_SIZE_CH*n* field.

Figure 8.4-4 shows the layout of macroblocks outputted by the JPEG decoder. Each blue grid in this figure represents 8x8 bytes of continuous data, and for each color format the figure displays four macroblocks of 8 × 8 pixels.

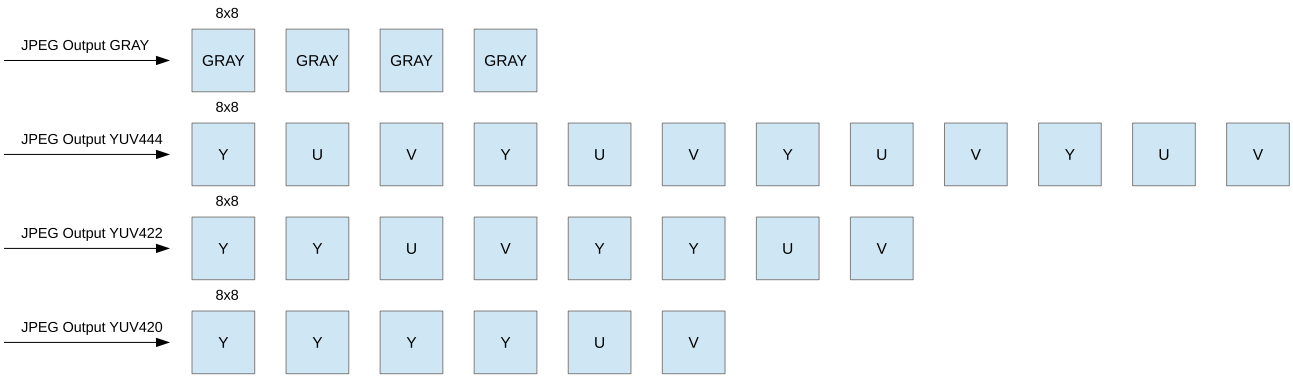

Figure 8.4-4. Macroblock Layout of JPEG Decoder Output Data

8.4.7 Color Space Conversion

On the transmit side, the 2D-DMA converts the color space after assembling the data read from memory into pixels. The 2D-DMA supports the following conversion except YUV420:

- RGB888 to RGB565
- RGB565 to RGB888
- RGB888 to YUV444
- RGB888 to YUV422 (the number of pixels per row in RGB format must be even)
- YUV444 to RGB888
- YUV422 to RGB888

On the receive side, only pixels received from JPEG requires color space conversion. The 2D-DMA supports the following conversion:

- YUV444 to RGB888/RGB565/YUV422/YUV420
- YUV422 to YUV444 to RGB888/RGB565/YUV420
- YUV420 to YUV444 to RGB888/RGB565

Note:

- For JPEG decoding, i.e., the receive side of 2D-DMA, the hardware will forcibly convert YUV422 and YUV420 to the YUV444 format. Software can optionally further convert the format to RGB888/RGB565 with the color space conversion feature.

Figure 8.4-5 shows the structure of the color space conversion module.

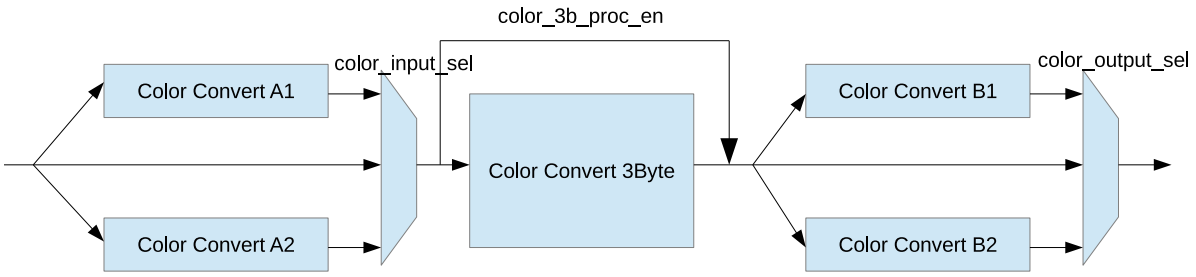

Figure 8.4-5. Color Space Conversion

Color space conversion is performed in 3 stages. The first stage converts a specific 16-bit color format (2 bytes/pixel) to a 24-bit color format (3 bytes/pixel). The source color formats can be configured via the DMA2D_OUT_COLOR_INPUT_SEL_CH*n* or DMA2D_IN_COLOR_INPUT_SEL_CH0 field. (See the supported color format conversion in the first stage by clicking the fields)

The second stage further converts the output data of the first stage using the following formula:

$$256 * Q = A[9:0] * x + B[10:0] * y + C[9:0] * z + D[17:0]$$

In this formula, Q is the output data; x, y, and z are the most significant, middle, and the least significant byte of the input data respectively; A, B, C, and D are the corresponding multiplication or addition coefficients, which are signed numbers. At most 3 bytes of data can be processed in one go, and therefore 3 * 4 = 12 coefficients need to be configured via the following fields:

- DMA2D_OUT_COLOR_PARAM_H0_CH*n*/DMA2D_IN_COLOR_PARAM_H0_CH0
- DMA2D_OUT_COLOR_PARAM_H1_CH*n*/DMA2D_IN_COLOR_PARAM_H1_CH0
- DMA2D_OUT_COLOR_PARAM_M0_CH*n*/DMA2D_IN_COLOR_PARAM_M0_CH0
- DMA2D_OUT_COLOR_PARAM_M1_CH*n*/DMA2D_IN_COLOR_PARAM_M1_CH0
- DMA2D_OUT_COLOR_PARAM_L0_CH*n*/DMA2D_IN_COLOR_PARAM_L0_CH0
- DMA2D_OUT_COLOR_PARAM_L1_CH*n*/DMA2D_IN_COLOR_PARAM_L1_CH0

PARAM_H*x*, PARAM_M*x*, and PARAM_L*x* (*x* is 0 or 1) in field names represent the parameters for the three bytes of data respectively. Take PARAM_H*x* as examples, the lower 10 bits of the 21-bit PARAM_H0 is coefficient A, the higher 11 bits of PARAM_H0 is coefficient B, the lower 10 bits of the 28-bit PARAM_H1 is coefficient C, and the higher 18 bits of PARAM_H1 is coefficient D.

The third stage, similar to the first stage, outputs the color format converted in the second stage directly, or further converts the 24-bit color format (3 bytes/pixel) to a 16-bit color format. This is configured using DMA2D_OUT_COLOR_OUTPUT_SEL_CH*n* or DMA2D_IN_COLOR_OUTPUT_SEL_CH0.

The following table lists the parameter configurations for commonly used color space conversions:

Table 8.4-6. Parameter Configuration for Color Space Conversion in TX Direction

Additionally, the color space conversion module can scramble the order of at most three bytes per pixel. This can be done before the color space conversion in TX direction, and before or after the color space conversion in RX direction. Table 8.4-8, Table 8.4-9, and Table 8.4-10 show the byte order per pixel required by the color space conversion module. For the JPEG decoder, if the byte order per pixel is not scrambled after the macroblock reordering in RX direction, it will conform to the requirements of color space conversion. Assuming that the order of an input pixel is represented from MSB to LSD as 2, 1, 0, the order can be scrambled and outputted as 210 (default), 201, 102, 120, 021, or 012. In RX direction, this feature can be configured before or after the color space conversion via DMA2D_IN_SCRAMBLE_SEL_PRE_CH0 orDMA2D_IN_SCRAMBLE_SEL_POST_CH0 respectively; in TX rection, this feature can be configured before the color space conversion via DMA2D_OUT_SCRAMBLE_SEL_PRE_CH*n*.

8.4.8 Enabling 2D-DMA

The software uses the 2D-DMA controller through linked lists. For receive channels, software loads an inlink, configures the DMA2D_INLINK_ADDR_CH*n* field with the address of the first receive descriptor, and sets the DMA2D_INLINK_START_CH*n* bit to enable the 2D-DMA. For transmit channels, software loads an outlink, prepares data to be transmitted, configures the DMA2D_OUTLINK_ADDR_CH*n* field with address of the first transmit descriptor, and sets the DMA2D_OUTLINK_START_CH*n* bit to enable the 2D-DMA. The DMA2D_INLINK_START_CH*n* bit and DMA2D_OUTLINK_START_CH*n* bit are cleared automatically by hardware.

In some cases, you may want to append more descriptors to a 2D-DMA transfer that is already started. Naively, it would seem to be possible to do this by clearing the eof bit of the final descriptor in the existing list and setting its next descriptor address pointer field (DW4) to the first descriptor of the to-be-added list. However, this strategy fails if the existing 2D-DMA transfer is almost or entirely finished. Instead, the 2D-DMA controller

has specialized logic to make sure a transfer can be continued or restarted: if the transfer is ongoing, the controller will make sure to take the appended descriptors into account; if the transfer has already finished, the controller will restart with the new descriptors. This is implemented by the Restart function.

When using the Restart function, software needs to

1. Set DMA2D_INLINK_STOP_CH*n* or DMA2D_OUTLINK_STOP_CH*n* to stop the 2D-DMA when it finishes processing the current descriptor
2. Rewrite the address of the first descriptor in the new list to DW4 of the last descriptor in the loaded list
3. Set DMA2D_INLINK_RESTART_CH*n* or DMA2D_OUTLINK_RESTART_CH*n* (these two bits are cleared automatically by hardware)

By doing so, hardware can obtain the address of the first descriptor in the new list when reading the last descriptor in the loaded list, and then read the new list.

8.4.9 Linked List Reading Process

Once configured and enabled by software, the 2D-DMA controller starts to read the linked list from the memory. The 2D-DMA performs checks on descriptors in the linked list. Only if descriptors pass the checks, the corresponding 2D-DMA channel will start data transfer. If the descriptors fail any of the checks, hardware will trigger descriptor error interrupt (either DMA2D_IN_DSCR_ERR_CH*n*_INT or DMA2D_OUT_DSCR_ERR_CH*n*_INT), and the channel will remain idle. This channel can be restarted by setting DMA2D_OUTLINK_START_CH*n* or DMA2D_INLINK_START_CH*n* again.

The checks performed on descriptors are:

- Owner bit check when DMA2D_IN_CHECK_OWNER_CH*n* or DMA2D_OUT_CHECK_OWNER_CH*n* is set to 1. If the owner bit is 0, the buffer is accessed by the CPU. In this case, the owner bit fails the check. The owner bit will not be checked if DMA2D_IN_CHECK_OWNER_CH*n* or DMA2D_OUT_CHECK_OWNER_CH*n* is 0.
- Descriptor address check, which checks if the descriptor address is located in configured memory space. If a 2D-DMA descriptor points to DMA2D_ACCESS_INTR_MEM_START_ADDR ~ DMA2D_ACCESS_INTR_MEM_END_ADDR (the value should be located in internal memory) or DMA2D_ACCESS_EXTR_MEM_START_ADDR ~ DMA2D_ACCESS_EXTR_MEM_END_ADDR (the value should be located in external memory), it passes the check. For details, please refer to Section 8.4.11).
- HA/VA/hb/vb/SIZE check, which checks if any of these fields is 0. If any field is 0, it fails the check. HA/VA/hb/vb fields are not checked in 1D mode, while SIZE is checked only in 1D mode.

After the software detects a descriptor error interrupt, it must reset the corresponding channel, and restart the 2D-DMA DMA by setting the DMA2D_OUTLINK_START_CH*n* or DMA2D_INLINK_START_CH*n* bit.

To quickly obtain receive or transmit descriptors from the memory, AXI burst transfers for 2D-DMA can be enabled by setting DMA2D_INDSCR_BURST_EN_CH*n* or DMA2D_OUTDSCR_BURST_EN_CH*n*.

8.4.10 EOF

Note: In this chapter, EOF of transmit descriptors refers to eof (i.e., bit 30 of DW0), while EOF of receive descriptors refers to both eof and err_eof (i.e., bit 28 of DW0).

The 2D-DMA controller uses EOF (end of frame) flags to indicate the end of the image transmission.

For data transmission, the 2D-DMA generates two types of EOF interrupts:

- DMA2D_OUT_EOF_CH*n*_INT, generated when the eof bit of any descriptor in the linked list is set, and the data corresponding to this descriptor has been transmitted. Usually, the eof bit is set in the last descriptor for the transmission of an image. This interrupt is enabled by setting the DMA2D_OUT_EOF_CH*n*_INT_ENA bit.
- DMA2D_OUT_TOTAL_EOF_CH*n*_INT, generated when the eof bit of the last descriptor in the linked list is set, and the data corresponding to the last descriptor has been transmitted. This interrupt is enabled by setting the DMA2D_OUT_TOTAL_EOF_CH*n*_INT_ENA bit.

For data reception, the 2D-DMA also generates two types of EOF interrupts:

- DMA2D_IN_SUC_EOF_CH*n*_INT, generated when an image has been received. This interrupt is enabled by setting the DMA2D_IN_SUC_EOF_CH*n*_INT_ENA bit.
- (JPEG only) DMA2D_IN_ERR_CH*n*_EOF_INT, generated when an image has been received with errors. This interrupt is enabled by setting the DMA2D_IN_ERR_EOF_CH*n*_INT_ENA bit, and is valid only when the channel is connected to JPEG.

When detecting an DMA2D_OUT_TOTAL_EOF_CH*n*_INT or DMA2D_IN_SUC_EOF_CH*n*_INT interrupt, software can read the value of the DMA2D_OUT_EOF_DES_ADDR_CH*n* or DMA2D_IN_SUC_EOF_DES_ADDR_CH*n* field, which stores the address of the finished descriptor. Therefore, the software can tell which descriptors have been used and reclaim them as needed. In RX direction, the address of the descriptor can also be stored to the DMA2D_IN_ERR_EOF_DES_ADDR_CH*n* field when an DMA2D_IN_ERR_EOF_CH*n*_INT interrupt is triggered.

8.4.11 Accessing Memory

Any transmit and receive channels of the 2D-DMA can access the internal memory address space configured by DMA2D_ACCESS_INTR_MEM_START_ADDR and DMA2D_ACCESS_INTR_MEM_END_ADDR, and the external memory address space configured by DMA2D_ACCESS_EXTR_MEM_START_ADDR and DMA2D_ACCESS_EXTR_MEM_END_ADDR.

The 2D-DMA can send data in the internal memory in burst mode via the AXI bus. Burst transfer on the AXI bus is enabled by default, and cannot be disabled. Users can configure the number of data bytes in a single AXI burst (burst length) to 8, 16, 32, 64, or 128 bytes via DMA2D_IN_MEM_BURST_LENGTH_CH*n* and DMA2D_OUT_MEM_BURST_LENGTH_CH*n*.

When the 2D-DMA accesses the encrypted external memory space (see Chapter 34 *External Memory Encryption and Decryption (XTS_AES)*), buffer address pointer and corresponding data should be 16-byte aligned; when it accesses the configured internal memory and non-encrypted external memory space, there are no requirements for descriptor field alignment.

8.4.12 Arbitration

To ensure timely response to peripherals running at a high speed with low latency, the 2D-DMA controller implements two arbitration schemes, based on channel priority and channel weight respectively.

- Priority arbitration: Each channel can be assigned a priority from 0 ~15 (in total 16 levels). The larger the number, the higher the priority. When several channels perform data transfers at the same time, the

2D-DMA would respond to the transfer requests according to priority levels, and the channel with higher priority would get a response more timely.

- Weight arbitration:
  - Each channel is assigned a weight (i.e., the number of tokens) from 0 ~ 15. The 2D-DMA divides the AXI bus clock period into multiple time slots, and in each time slot, the number of transfers performed by a channel is determined by the number of its tokens. Every time a channel performs a data transfer, one of its tokens is spent. If all of its tokens have been spent in a time slot, then this channel's transfer request will no longer be responded to until the time slot expires, or until tokens of all channels have been spent and the new time slot starts.
  - If the number of tokens assigned to a channel is not zero, the 2D-DMA waits for this channel's tokens to be spent even if it does not have data transfer requests, and will not exit from this time slot ahead of expiration. This leads to a waste of bandwidth. Therefore, the 2D-DMA provides weight arbitration optimization. When this feature is enabled, a channel without data transfer requests will not be involved in the arbitration and its tokens will be ignored. When all channels no longer have transfer requests, the 2D-DMA arbiter exits from the current time slot before expiration. This way, the arbitration response is accelerated and the transfer efficiency is improved.

Note:

- If channels have the same weight but different priorities, on condition that the number of bytes to be transferred is the same and not large, channels with higher priorities would finish data transfers first.
- If channels have different priorities and weights, on condition that the number of bytes to be transferred is the same, channels with higher weights would be allocated more bandwidth and finish data transfers first.

8.5 Event Task Matrix Feature

The 2D-DMA controller on ESP32-P4 supports the Event Task Matrix (ETM) function, which allows 2D-DMA's ETM tasks to be triggered by any peripherals' ETM events, or 2D-DMA's ETM events to trigger any peripherals' ETM tasks. This section introduces the ETM tasks and events related to 2D-DMA. For more information, please refer to Chapter 14 Event Task Matrix (ETM).

2D-DMA can receive the following ETM tasks:

- DMA2D_TASK_IN_START_CH*n*: Enables the corresponding receive channel *n* for data transfer.
- DMA2D_TASK_OUT_START_CH*n*: Enables the corresponding transmit channel *n* for data transfer.

  Note:
  Above ETM tasks can achieve the same functions as CPU configuring DMA2D_INLINK_START_CH*n* and DMA2D_OUTLINK_START_CH*n*. When DMA2D_IN_ETM_EN_CH*n* or DMA2D_OUT_ETM_EN_CH*n* is 1, only ETM tasks can be used to configure the transfer direction and enable the corresponding 2D-DMA channel. When DMA2D_IN_ETM_EN_CH*n* or DMA2D_OUT_ETM_EN_CH*n* is 0, only CPU can be used to enable the corresponding 2D-DMA channel.

- DMA2D_TASK_IN_DSCR_READY_CH*n*: Allows receive channel *n* to process the next descriptor.

- DMA2D_TASK_OUT_DSCR_READY_CH*n*: Allows transmit channel *n* to process the next descriptor.

> **Note:**
> In normal conditions, after finishing with the current descriptor if the next descriptor is available (i.e., the next descriptor address field is not zero), the 2D-DMA would process the next descriptor directly and reads/writes to the memory according to the descriptor's configuration until all descriptors are processed. When DMA2D_IN_ETM_LOOP_EN_CH*n* or DMA2D_OUT_ETM_LOOP_EN_CH*n* is set, after finishing with the current descriptor, the 2D-DMA would not start processing the next descriptor until receiving the DMA2D_TASK_IN_DSCR_READY_CH*n* or
> DMA2D_TASK_OUT_DSCR_READY_CH*n* task.
> The DMA2D_TASK_IN_DSCR_READY_CH*n* or DMA2D_TASK_OUT_DSCR_READY_CH*n* task can be stored in the task buffer, which can cache at most four tasks. When the 2D-DMA receives this task but the current descriptor is not yet processed, it can cache the task. The depth of the task buffer is determined by DMA2D_IN_DSCR_TASK_MAX_CH*n* or DMA2D_OUT_DSCR_TASK_MAX_CH*n*.
> When the task buffer exceeds its maximum capacity, it will trigger an DMA2D_IN_DSCR_TASK_OVF_CH*n*_INT or DMA2D_OUT_DSCR_TASK_OVF_CH*n*_INT interrupt.

2D-DMA can generate the following ETM events:

- DMA2D_EVT_IN_DONE_CH*n*: Indicates that the data has been received according to the receive descriptor via channel *n*.
- DMA2D_EVT_IN_SUC_EOF_CH*n*: Indicates that the data corresponding to a receive descriptor has been received via channel *n* and the Eof bit of this descriptor is 1.
- DMA2D_EVT_OUT_DONE_CH*n*: Indicates that the data has been transmitted according to the transmit descriptor via channel *n*.
- DMA2D_EVT_OUT_SUC_EOF_CH*n*: Indicates that the data corresponding to a transmit descriptor has been transmitted or received via channel *n* and the eof bit of this descriptor is 1.
- DMA2D_EVT_OUT_TOTAL_EOF_CH*n*: Indicates that the data corresponding to the last transmit descriptors has been sent via transmit channel *n* and the eof bit of this descriptor is 1.

In practical applications, 2D-DMA's ETM events can trigger its own ETM tasks. For example, the DMA2D_EVT_OUT_TOTAL_EOF_CH0 event can trigger the DMA2D_TASK_IN_START_CH1 task, and in this way trigger a new round of 2D-DMA operations.

8.6 Interrupts

ESP32-P4's 2D-DMA module can generate the following interrupt signals that will be sent to the Interrupt Matrix.

- DMA2D_IN_CH0_INTR
- DMA2D_IN_CH1_INTR
- DMA2D_IN_CH2_INTR
- DMA2D_OUT_CH0_INTR
- DMA2D_OUT_CH1_INTR

- DMA2D_OUT_CH2_INTR
- DMA2D_OUT_CH3_INTR

There are several internal interrupt sources from 2D-DMA that can generate the above interrupt signals.

The DMA2D_IN_CH*n*_INTR (*n* is 0 ~ 2) signals are generated by the following interrupt sources:

- DMA2D_IN_DONE_CH*n*_INT: Triggered when all data corresponding to a receive descriptor has been received via receive channel *n*.
- DMA2D_IN_SUC_EOF_CH*n*_INT: Triggered when the eof bit in a receive descriptor is 1 and the data corresponding to this receive descriptor has been received (i.e., when an image corresponding to an inlink has been received) via receive channel *n*.
- DMA2D_IN_ERR_EOF_CH*n*_INT: Triggered when an error is detected in the image received via receive channel *n*. This interrupt is used only for JPEG.
- DMA2D_IN_DSCR_EMPTY_CH*n*_INT: Triggered when the size of the buffer pointed by receive descriptors is smaller than the length of data to be received via receive channel *n*.
- DMA2D_IN_DSCR_ERR_CH*n*_INT: Triggered when a receive descriptor on receive channel *n* fails any of the two descriptor checks.
- DMA2D_INFIFO_OVF_CH*n*_INT: Triggered when the RX FIFO of 2D-DMA overflows.
- DMA2D_INFIFO_UDF_CH*n*_INT or AXI_DMA_INFIFO_L1/L2/L3_UDF_CH*n*_INT: Triggered when the RX FIFO of 2D-DMA underflows.
- DMA2D_IN_DSCR_TASK_OVF_CH*n*_INT: Triggered when the number of cached DMA2D_TASK_IN_DSCR_READY_CH*n* task exceeds the maximum capacity of the task buffer.
- DMA2D_INFIFO_RO_OVF_CH0_INT (only channel 0): Triggered when the buffer for macroblock reordering in RX direction overflows.
- DMA2D_INFIFO_RO_UDF_CH0_INT (only channel 0): Triggered when the buffer for macroblock reordering in RX direction underflows.

The DMA2D_OUT_CH*n*_INTR (*n* is 0 ~ 3) signals are generated by the following interrupt sources:

- DMA2D_OUT_DONE_CH*n*_INT: Triggered when all data corresponding to a transmit descriptor has been sent via transmit channel *n*.
- DMA2D_OUT_EOF_CH*n*_INT: Triggered when the eof bit in a transmit descriptor is 1 and data corresponding to this descriptor has been sent via transmit channel *n*. If DMA2D_OUT_EOF_MODE_CH*n* is 0, this interrupt will be triggered when the last byte of data corresponding to this descriptor enters 2D-DMA's transmit channel via the bus; if DMA2D_OUT_EOF_MODE_CH*n* is 1, this interrupt is triggered when the last byte of data is taken from 2D-DMA's transmit channel.
- DMA2D_OUT_DSCR_ERR_CH*n*_INT: Triggered when a transmit descriptor on transmit channel *n* fails any of the two descriptor checks.
- DMA2D_OUT_TOTAL_EOF_CH*n*_INT: Triggered when all data corresponding to a linked list (including multiple descriptors) has been sent via transmit channel *n*.
- DMA2D_OUTFIFO_L1/L2/L3_OVF_CH*n*_INT: Triggered when the TX FIFO of 2D-DMA overflows.
- DMA2D_OUTFIFO_L1/L2/L3_UDF_CH*n*_INT: Triggered when the TX FIFO of 2D-DMA underflows.

- DMA2D_OUT_DSCR_TASK_OVF_CH*n*_INT: Triggered when the number of cached DMA2D_TASK_OUT_DSCR_READY_CH*n* task exceeds the maximum capacity of the task buffer.
- DMA2D_OUTFIFO_RO_OVF_CH0_INT (only channel 0): Triggered when the buffer for macroblock reordering or color space conversion in TX direction overflows.
- DMA2D_OUTFIFO_RO_UDF_CH0_INT (only channel 0): Triggered when the buffer for macroblock reordering or color space conversion in TX direction underflows.

8.7 Programming Procedures

The clock gating for the 2D-DMA can be configured via HP_SYS_CLKRST_DMA2D_SYS_CLK_EN, and is enabled by default. The 2D-DMA can be reset globally by configuring HP_SYS_CLKRST_RST_EN_AHB/AXI_PDMA.

8.7.1 General Configurations for 2D-DMA

Configure the accessible address space of internal and external memory and burst length according to Section 8.4.11.

8.7.2 Mode-Specific Configurations for 2D-DMA

- 1D Mode: No specific configuration required.
- 2D-MOD0 Mode: No specific configuration required.
- 2D-MOD1 Mode: For JPEG, configure DMA2D_IN_MACRO_BLOCK_SIZE_CH*n* or DMA2D_OUT_MACRO_BLOCK_SIZE_CH*n* to choose a macroblock size out of the three available options (horizontal × vertical): 8 pixels × 8 pixels, 8 pixels × 16 pixels, and 16 pixels × 16 pixels. For more information about macroblock size, see Chapter 37 *JPEG Codec*. For correspondence between macroblock size, hb, and vb of descriptors, see Table 8.4-4 and Table 8.4-5.
- DSCR-PORT Mode: Set DMA2D_OUT_DSCR_PORT_EN_CH*n* to enter this mode. This mode is specifically designed for PPA. For details, see Chapter 39 *Pixel-Processing Accelerator (PPA)*.

8.7.3 Configurations for 2D-DMA's Transmit Channel

To transmit data, 2D-DMA's transmit channel should be configured by software as follows:

1. Set DMA2D_OUT_RST_CH*n* first to 1 and then to 0, to reset the state machine of 2D-DMA's transmit channel and FIFO pointer.
2. Load an outlink, and configure DMA2D_OUTLINK_ADDR_CH*n* with address of the first transmit descriptor.
3. Configure DMA2D_OUT_PERI_SEL_CH*n* with the value corresponding to the peripheral to be connected, as shown in Table 8.4-2.
4. Set DMA2D_OUTLINK_START_CH*n* to enable 2D-DMA's transmit channel for data transfer.
5. Configure and enable the corresponding peripheral. See details in individual chapters of these peripherals.
6. Wait for the DMA2D_OUT_EOF_CH*n*_INT interrupt, which indicates the completion of data transfer.

8.7.4 Configurations for 2D-DMA's Receive Channel

To receive data, 2D-DMA's receive channel should be configured by software as follows:

1. Set DMA2D_IN_RST_CH*n* first to 1 and then to 0, to reset the state machine of 2D-DMA's receive channel and FIFO pointer.
2. Load an inlink, and configure DMA2D_INLINK_ADDR_CH*n* with address of the first receive descriptor.
3. Configure DMA2D_IN_PERI_SEL_CH*n* with the value corresponding to the peripheral to be connected, as shown in Table 8.4-3.
4. Set DMA2D_INLINK_START_CH*n* to enable 2D-DMA's receive channel for data transfer.
5. Configure and enable the corresponding peripheral. See details in individual chapters of these peripherals.
6. Wait for DMA2D_IN_SUC_EOF_CH*n*_INT interrupt, which indicates that an image has been received.

8.7.5 Configurations for Memory-to-Memory Transfer

To transfer data from one memory location to another, 2D-DMA should be configured by software as follows:

1. Set DMA2D_OUT_RST_CH*n* first to 1 and then to 0, to reset the state machine of 2D-DMA's transmit channel and FIFO pointer.
2. Set DMA2D_IN_RST_CH*n* first to 1 and then to 0, to reset the state machine of 2D-DMA's receive channel and FIFO pointer.
3. Load an outlink, and configure DMA2D_OUTLINK_ADDR_CH*n* with address of the first transmit descriptor.
4. Load an inlink, and configure DMA2D_INLINK_ADDR_CH*n* with address of the first receive descriptor.
5. Configure DMA2D_PERI_OUT_SEL_CH*n* with any value corresponding to Dummy-*n* (see Table 8.4-2).
6. Configure DMA2D_PERI_IN_SEL_CH*n* with any value corresponding to Dummy-*n* (see Table 8.4-3).
7. Set DMA2D_IN_MEM_TRANS_EN_CH*n* to enable memory-to-memory transfer.
8. Set DMA2D_OUTLINK_START_CH*n* to enable 2D-DMA's transmit channel for data transfer.
9. Set DMA2D_INLINK_START_CH*n* to enable 2D-DMA's receive channel for data transfer.
10. Wait for DMA2D_IN_SUC_EOF_CH*n*_INT interrupt, which indicates that a data transaction has been completed.

8.7.6 Configurations for Channel Priority and Weight

The priority arbitration can be configured as follows:

1. Configure the channel priority for TX and RX respectively via DMA2D_OUT_ARB_PRIORITY_CH*n* and DMA2D_IN_ARB_PRIORITY_CH*n*.

The weight arbitration can be configured as follows:

1. Configure the time slot for TX and RX respectively via DMA2D_OUT_ARB_TIMEOUT_NUM and DMA2D_IN_ARB_TIMEOUT_NUM.

2. Configure the number of tokens for TX and RX respectively via DMA2D_OUT_ARB_TOKEN_NUM_CH*n* and DMA2D_IN_ARB_TOKEN_NUM_CH*n*.
3. Enable weight arbitration optimization for TX and RX respectively by clearing DMA2D_OUT_ARB_WEIGHT_OPT_DIS_CH_CH*n* and DMA2D_IN_ARB_WEIGHT_OPT_DIS_CH*n*.
4. Enable the arbitration for TX and RX respectively via DMA2D_OUT_WEIGHT_EN and DMA2D_IN_WEIGHT_EN.

8.7.7 Resetting 2D-DMA While it Runs

When the 2D-DMA is running, namely when it is still processing descriptors, it must be stopped first before being reset fully via HP_SYS_CLKRST_RST_EN_DMA2D or partially (only reset AXI functions) via DMA2D_AXIM_RD_RST and DMA2D_AXIM_WR_RST. The procedures are as follows:

1. Set DMA2D_IN_CMD_DISABLE_CH*n* and DMA2D_OUT_CMD_DISABLE_CH*n* to stop the 2D-DMA.
2. Reset the 2D-DMA when DMA2D_OUT_RESET_AVAIL_CH*n* and DMA2D_IN_RESET_AVAIL_CH*n* turn to 1.
3. Clear DMA2D_IN_CMD_DISABLE_CH*n* and DMA2D_OUT_CMD_DISABLE_CH*n* to 0 after the 2D-DMA is reset.

8.8 Register Summary

The addresses in this section are relative to 2D-DMA base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Configuration Registers			
DMA2D_OUT_CONF0_CH0_REG	Configures the TX channel 0	0x0000	R/W
DMA2D_OUT_PUSH_CH0_REG	Configures the FIFO of TX channel 0	0x0018	varies
DMA2D_OUT_LINK_CONF_CH0_REG	Configures the transmit descriptor operations of TX channel 0	0x001C	varies
DMA2D_OUT_LINK_ADDR_CH0_REG	Configures the transmit descriptor address of TX channel 0	0x0020	R/W
DMA2D_OUT_ARB_CH0_REG	Configures the arbitration of TX channel 0	0x003C	R/W
DMA2D_OUT_RO_PD_CONF_CH0_REG	Configures the macroblock reordering memory of TX channel 0	0x0044	R/W
DMA2D_OUT_COLOR_CONVERT_CH0_REG	Configures the color space conversion of TX channel 0	0x0048	R/W
DMA2D_OUT_SCRAMBLE_CH0_REG	Configures the byte scrambling of TX channel 0	0x004C	R/W
DMA2D_OUT_COLOR_PARAM0_CH0_REG	Configures the color space conversion parameter of TX channel 0	0x0050	R/W
DMA2D_OUT_COLOR_PARAM1_CH0_REG	Configures the color space conversion parameter of TX channel 0	0x0054	R/W
DMA2D_OUT_COLOR_PARAM2_CH0_REG	Configures the color space conversion parameter of TX channel 0	0x0058	R/W
DMA2D_OUT_COLOR_PARAM3_CH0_REG	Configures the color space conversion parameter of TX channel 0	0x005C	R/W
DMA2D_OUT_COLOR_PARAM4_CH0_REG	Configures the color space conversion parameter of TX channel 0	0x0060	R/W
DMA2D_OUT_COLOR_PARAM5_CH0_REG	Configures the color space conversion parameter of TX channel 0	0x0064	R/W
DMA2D_OUT_ETM_CONF_CH0_REG	Configures the ETM of TX channel 0	0x0068	R/W
DMA2D_OUT_DSCR_PORT_BLK_CH0_REG	Configures the block size for TX channel 0 in DSCR-PORT mode	0x006C	R/W
DMA2D_OUT_CONF0_CH1_REG	Configures the TX channel 1	0x0100	R/W
DMA2D_OUT_PUSH_CH1_REG	Configures the FIFO of TX channel 1	0x0118	varies
DMA2D_OUT_LINK_CONF_CH1_REG	Configures the transmit descriptor operations of TX channel 1	0x011C	varies
DMA2D_OUT_LINK_ADDR_CH1_REG	Configures the transmit descriptor address of TX channel 1	0x0120	R/W
DMA2D_OUT_ARB_CH1_REG	Configures the arbitration of TX channel 1	0x013C	R/W
DMA2D_OUT_COLOR_CONVERT_CH1_REG	Configures the color space conversion of TX channel 1	0x0148	R/W
DMA2D_OUT_SCRAMBLE_CH1_REG	Configures the byte scrambling of TX channel 1	0x014C	R/W

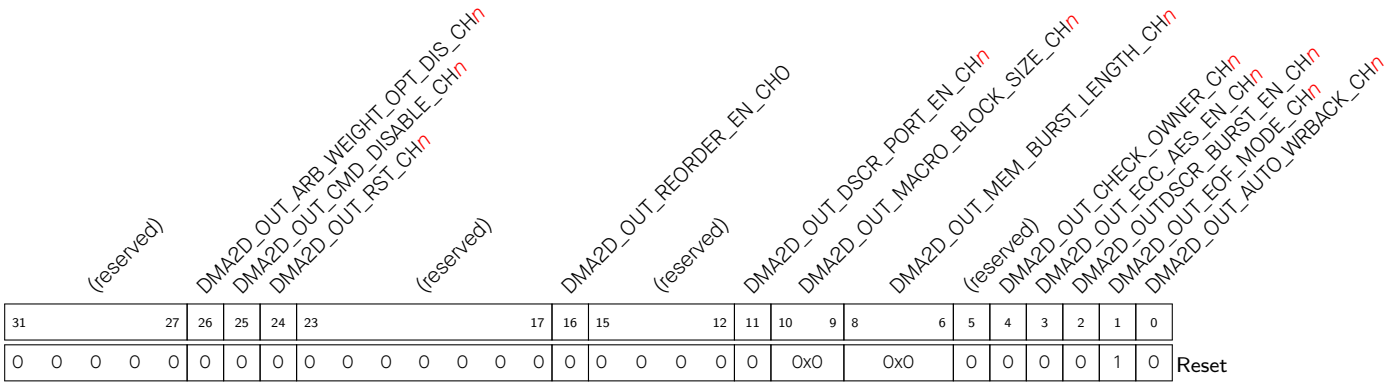
Name	Description	Address	Access
DMA2D_OUT_COLOR_PARAM0_CH1_REG	Configures the color space conversion parameter of TX channel 1	0x0150	R/W
DMA2D_OUT_COLOR_PARAM1_CH1_REG	Configures the color space conversion parameter of TX channel 1	0x0154	R/W
DMA2D_OUT_COLOR_PARAM2_CH1_REG	Configures the color space conversion parameter of TX channel 1	0x0158	R/W
DMA2D_OUT_COLOR_PARAM3_CH1_REG	Configures the color space conversion parameter of TX channel 1	0x015C	R/W
DMA2D_OUT_COLOR_PARAM4_CH1_REG	Configures the color space conversion parameter of TX channel 1	0x0160	R/W
DMA2D_OUT_COLOR_PARAM5_CH1_REG	Configures the color space conversion parameter of TX channel 1	0x0164	R/W
DMA2D_OUT_ETM_CONF_CH1_REG	Configures the ETM of TX channel 1	0x0168	R/W
DMA2D_OUT_DSCR_PORT_BLK_CH1_REG	Configures the block size for TX channel 1 in DSCR-PORT mode	0x016C	R/W
DMA2D_OUT_CONF0_CH2_REG	Configures the TX channel 2	0x0200	R/W
DMA2D_OUT_PUSH_CH2_REG	Configures the FIFO of TX channel 2	0x0218	varies
DMA2D_OUT_LINK_CONF_CH2_REG	Configures the transmit descriptor operations of TX channel 2	0x021C	varies
DMA2D_OUT_LINK_ADDR_CH2_REG	Configures the transmit descriptor address of TX channel 2	0x0220	R/W
DMA2D_OUT_ARB_CH2_REG	Configures the arbitration of TX channel 2	0x023C	R/W
DMA2D_OUT_COLOR_CONVERT_CH2_REG	Configures the color space conversion of TX channel 2	0x0248	R/W
DMA2D_OUT_SCRAMBLE_CH2_REG	Configures the byte scrambling of TX channel 2	0x024C	R/W
DMA2D_OUT_COLOR_PARAM0_CH2_REG	Configures the color space conversion parameter of TX channel 2	0x0250	R/W
DMA2D_OUT_COLOR_PARAM1_CH2_REG	Configures the color space conversion parameter of TX channel 2	0x0254	R/W
DMA2D_OUT_COLOR_PARAM2_CH2_REG	Configures the color space conversion parameter of TX channel 2	0x0258	R/W
DMA2D_OUT_COLOR_PARAM3_CH2_REG	Configures the color space conversion parameter of TX channel 2	0x025C	R/W
DMA2D_OUT_COLOR_PARAM4_CH2_REG	Configures the color space conversion parameter of TX channel 2	0x0260	R/W
DMA2D_OUT_COLOR_PARAM5_CH2_REG	Configures the color space conversion parameter of TX channel 2	0x0264	R/W
DMA2D_OUT_ETM_CONF_CH2_REG	Configures the ETM of TX channel 2	0x0268	R/W
DMA2D_OUT_DSCR_PORT_BLK_CH2_REG	Configures the block size for TX channel 2 in DSCR-PORT mode	0x026C	R/W
DMA2D_OUT_CONF0_CH3_REG	Configures the TX channel 3	0x0300	R/W
DMA2D_OUT_PUSH_CH3_REG	Configures the FIFO of TX channel 3	0x0318	varies
DMA2D_OUT_LINK_CONF_CH3_REG	Configures the transmit descriptor operations of TX channel 3	0x031C	varies
DMA2D_OUT_LINK_ADDR_CH3_REG	Configures the transmit descriptor address of TX channel 3	0x0320	R/W
DMA2D_OUT_ARB_CH3_REG	Configures the arbitration of TX channel 3	0x033C	R/W
DMA2D_OUT_COLOR_CONVERT_CH3_REG	Configures the color space conversion of TX channel 3	0x0348	R/W

Name	Description	Address	Access
DMA2D_OUT_SCRAMBLE_CH3_REG	Configures the byte scrambling of TX channel 3	0x034C	R/W
DMA2D_OUT_COLOR_PARAM0_CH3_REG	Configures the color space conversion parameter of TX channel 3	0x0350	R/W
DMA2D_OUT_COLOR_PARAM1_CH3_REG	Configures the color space conversion parameter of TX channel 3	0x0354	R/W
DMA2D_OUT_COLOR_PARAM2_CH3_REG	Configures the color space conversion parameter of TX channel 3	0x0358	R/W
DMA2D_OUT_COLOR_PARAM3_CH3_REG	Configures the color space conversion parameter of TX channel 3	0x035C	R/W
DMA2D_OUT_COLOR_PARAM4_CH3_REG	Configures the color space conversion parameter of TX channel 3	0x0360	R/W
DMA2D_OUT_COLOR_PARAM5_CH3_REG	Configures the color space conversion parameter of TX channel 3	0x0364	R/W
DMA2D_OUT_ETM_CONF_CH3_REG	Configures the ETM of TX channel 3	0x0368	R/W
DMA2D_OUT_DSCR_PORT_BLK_CH3_REG	Configures the block size for TX channel 3 in DSCR-PORT mode	0x036C	R/W
DMA2D_IN_CONF0_CH0_REG	Configures the RX channel 0	0x0500	R/W
DMA2D_IN_POP_CH0_REG	Configures the FIFO of RX channel 0	0x0518	varies
DMA2D_IN_LINK_CONF_CH0_REG	Configures the receive descriptor operations of RX channel 0	0x051C	varies
DMA2D_IN_LINK_ADDR_CH0_REG	Configures the receive descriptor address of RX channel 0	0x0520	R/W
DMA2D_IN_ARB_CH0_REG	Configures the arbitration of RX channel 0	0x0540	R/W
DMA2D_IN_RO_PD_CONF_CH0_REG	Configures the macroblock reordering memory of RX channel 0	0x0548	R/W
DMA2D_IN_COLOR_CONVERT_CH0_REG	Configures the color space conversion of RX channel 0	0x054C	R/W
DMA2D_IN_SCRAMBLE_CH0_REG	Configures the byte scrambling of RX channel 0	0x0550	R/W
DMA2D_IN_COLOR_PARAM0_CH0_REG	Configures the color space conversion parameter of RX channel 0	0x0554	R/W
DMA2D_IN_COLOR_PARAM1_CH0_REG	Configures the color space conversion parameter of RX channel 0	0x0558	R/W
DMA2D_IN_COLOR_PARAM2_CH0_REG	Configures the color space conversion parameter of RX channel 0	0x055C	R/W
DMA2D_IN_COLOR_PARAM3_CH0_REG	Configures the color space conversion parameter of RX channel 0	0x0560	R/W
DMA2D_IN_COLOR_PARAM4_CH0_REG	Configures the color space conversion parameter of RX channel 0	0x0564	R/W
DMA2D_IN_COLOR_PARAM5_CH0_REG	Configures the color space conversion parameter of RX channel 0	0x0568	R/W
DMA2D_IN_ETM_CONF_CH0_REG	Configures the ETM of RX channel 0	0x056C	R/W
DMA2D_IN_CONF0_CH1_REG	Configures the RX channel 1	0x0600	R/W
DMA2D_IN_POP_CH1_REG	Configures the FIFO of RX channel 1	0x0618	varies
DMA2D_IN_LINK_CONF_CH1_REG	Configures the receive descriptor operations of RX channel 1	0x061C	varies
DMA2D_IN_LINK_ADDR_CH1_REG	Configures the receive descriptor address of RX channel 1	0x0620	R/W
DMA2D_IN_ARB_CH1_REG	Configures the arbitration of RX channel 1	0x0640	R/W

Name	Description	Address	Access
DMA2D_IN_ETM_CONF_CH1_REG	Configures the ETM of RX channel 1	0x0648	R/W
DMA2D_IN_CONF0_CH2_REG	Configures the RX channel 2	0x0700	R/W
DMA2D_IN_POP_CH2_REG	Configures the FIFO of RX channel 2	0x0718	varies
DMA2D_IN_LINK_CONF_CH2_REG	Configures the receive descriptor operations of RX channel 2	0x071C	varies
DMA2D_IN_LINK_ADDR_CH2_REG	Configures the receive descriptor address of RX channel 2	0x0720	R/W
DMA2D_IN_ARB_CH2_REG	Configures the arbitration of RX channel 2	0x0740	R/W
DMA2D_IN_ETM_CONF_CH2_REG	Configures the ETM of RX channel 2	0x0748	R/W
DMA2D_RST_CONF_REG	Configures the reset of AXI	0x0A04	R/W
DMA2D_INTR_MEM_START_ADDR_REG	The start address of accessible internal memory address space	0x0A08	R/W
DMA2D_INTR_MEM_END_ADDR_REG	The end address of accessible internal memory address space	0x0A0C	R/W
DMA2D_EXTR_MEM_START_ADDR_REG	The start address of accessible external memory address space	0x0A10	R/W
DMA2D_EXTR_MEM_END_ADDR_REG	The end address of accessible external memory address space	0x0A14	R/W
DMA2D_OUT_ARB_CONFIG_REG	Configures the arbitration in TX direction	0x0A18	R/W
DMA2D_IN_ARB_CONFIG_REG	Configures the arbitration in RX direction	0x0A1C	R/W
Interrupt Registers			
DMA2D_OUT_INT_RAW_CH0_REG	Raw interrupt status of TX channel 0	0x0004	R/WTC/SS
DMA2D_OUT_INT_ENA_CH0_REG	Interrupt enable bits of TX channel 0	0x0008	R/W
DMA2D_OUT_INT_ST_CH0_REG	Masked interrupt status of TX channel 0	0x000C	RO
DMA2D_OUT_INT_CLR_CH0_REG	Interrupt clear bits of TX channel 0	0x0010	WT
DMA2D_OUT_INT_RAW_CH1_REG	Raw interrupt status of TX channel 1	0x0104	R/WTC/SS
DMA2D_OUT_INT_ENA_CH1_REG	Interrupt enable bits of TX channel 1	0x0108	R/W
DMA2D_OUT_INT_ST_CH1_REG	Masked interrupt status of TX channel 1	0x010C	RO
DMA2D_OUT_INT_CLR_CH1_REG	Interrupt clear bits of TX channel 1	0x0110	WT
DMA2D_OUT_INT_RAW_CH2_REG	Raw interrupt status of TX channel 2	0x0204	R/WTC/SS
DMA2D_OUT_INT_ENA_CH2_REG	Interrupt enable bits of TX channel 2	0x0208	R/W
DMA2D_OUT_INT_ST_CH2_REG	Masked interrupt status of TX channel 2	0x020C	RO
DMA2D_OUT_INT_CLR_CH2_REG	Interrupt clear bits of TX channel 2	0x0210	WT
DMA2D_OUT_INT_RAW_CH3_REG	Raw interrupt status of TX channel 3	0x0304	R/WTC/SS
DMA2D_OUT_INT_ENA_CH3_REG	Interrupt enable bits of TX channel 3	0x0308	R/W

Name	Description	Address	Access
DMA2D_OUT_INT_ST_CH3_REG	Masked interrupt status of TX channel 3	0x030C	RO
DMA2D_OUT_INT_CLR_CH3_REG	Interrupt clear bits of TX channel 3	0x0310	WT
DMA2D_IN_INT_RAW_CH0_REG	Raw interrupt status of RX channel 0	0x0504	R/WTC/SS
DMA2D_IN_INT_ENA_CH0_REG	Interrupt enable bits of RX channel 0	0x0508	R/W
DMA2D_IN_INT_ST_CH0_REG	Masked interrupt status of RX channel 0	0x050C	RO
DMA2D_IN_INT_CLR_CH0_REG	Interrupt clear bits of RX channel 0	0x0510	WT
DMA2D_IN_INT_RAW_CH1_REG	Raw interrupt status of RX channel 1	0x0604	R/WTC/SS
DMA2D_IN_INT_ENA_CH1_REG	Interrupt enable bits of RX channel 1	0x0608	R/W
DMA2D_IN_INT_ST_CH1_REG	Masked interrupt status of RX channel 1	0x060C	RO
DMA2D_IN_INT_CLR_CH1_REG	Interrupt clear bits of RX channel 1	0x0610	WT
DMA2D_IN_INT_RAW_CH2_REG	Raw interrupt status of RX channel 2	0x0704	R/WTC/SS
DMA2D_IN_INT_ENA_CH2_REG	Interrupt enable bits of RX channel 2	0x0708	R/W
DMA2D_IN_INT_ST_CH2_REG	Masked interrupt status of RX channel 2	0x070C	RO
DMA2D_IN_INT_CLR_CH2_REG	Interrupt clear bits of RX channel 2	0x0710	WT
Status Registers			
DMA2D_OUTFIFO_STATUS_CH0_REG	Represents the status of the FIFO of TX channel 0	0x0014	RO
DMA2D_OUT_STATE_CH0_REG	Represents the working status of the transmit descriptor of TX channel 0	0x0024	RO
DMA2D_OUT_EOF_DES_ADDR_CH0_REG	Represents the transmit descriptor address when EOF occurs on TX channel 0	0x0028	RO
DMA2D_OUT_DSCR_CH0_REG	Represents the address of the next transmit descriptor pointed by the current pre-read transmit descriptor on TX channel 0	0x002C	RO
DMA2D_OUT_DSCR_BF0_CH0_REG	Represents the address of the current pre-read transmit descriptor on TX channel 0	0x0030	RO
DMA2D_OUT_DSCR_BF1_CH0_REG	Represents the address of the previous pre-read transmit descriptor on TX channel 0	0x0034	RO
DMA2D_OUTFIFO_STATUS_CH1_REG	Represents the status of the FIFO of TX channel 1	0x0114	RO
DMA2D_OUT_STATE_CH1_REG	Represents the working status of the transmit descriptor of TX channel 1	0x0124	RO
DMA2D_OUT_EOF_DES_ADDR_CH1_REG	Represents the transmit descriptor address when EOF occurs on TX channel 1	0x0128	RO

Name	Description	Address	Access
DMA2D_OUT_DSCR_CH1_REG	Represents the address of the next transmit descriptor pointed by the current pre-read transmit descriptor on TX channel 1	0x012C	RO
DMA2D_OUT_DSCR_BF0_CH1_REG	Represents the address of the current pre-read transmit descriptor on TX channel 1	0x0130	RO
DMA2D_OUT_DSCR_BF1_CH1_REG	Represents the address of the previous pre-read transmit descriptor on TX channel 1	0x0134	RO
DMA2D_OUTFIFO_STATUS_CH2_REG	Represents the status of the FIFO of TX channel 2	0x0214	RO
DMA2D_OUT_STATE_CH2_REG	Represents the working status of the transmit descriptor of TX channel 2	0x0224	RO
DMA2D_OUT_EOF_DES_ADDR_CH2_REG	Represents the transmit descriptor address when EOF occurs on TX channel 2	0x0228	RO
DMA2D_OUT_DSCR_CH2_REG	Represents the address of the next transmit descriptor pointed by the current pre-read transmit descriptor on TX channel 2	0x022C	RO
DMA2D_OUT_DSCR_BF0_CH2_REG	Represents the address of the current pre-read transmit descriptor on TX channel 2	0x0230	RO
DMA2D_OUT_DSCR_BF1_CH2_REG	Represents the address of the previous pre-read transmit descriptor on TX channel 2	0x0234	RO
DMA2D_INFIFO_STATUS_CH0_REG	Represents the status of the FIFO of RX channel 0	0x0514	RO
DMA2D_IN_STATE_CH0_REG	Represents the working status of the receive descriptor of RX channel 0	0x0524	RO
DMA2D_IN_SUC_EOF_DES_ADDR_CH0_REG	Represents the eceive descriptor address when EOF occurs on RX channel 0	0x0528	RO
DMA2D_IN_ERR_EOF_DES_ADDR_CH0_REG	Represents the receive descriptor address when errors occur on RX channel 0	0x052C	RO
DMA2D_IN_DSCR_CH0_REG	Represents the address of the next receive descriptor pointed by the current pre-read receive descriptor on RX channel 0	0x0530	RO
DMA2D_IN_DSCR_BF0_CH0_REG	Represents address of the current pre-read receive descriptor on RX channel 0	0x0534	RO
DMA2D_IN_DSCR_BF1_CH0_REG	Represents the address of the previous pre-read receive descriptor on RX channel 0	0x0538	RO
DMA2D_INFIFO_STATUS_CH1_REG	Represents the status of the FIFO of RX channel 1	0x0614	RO



Name	Description	Address	Access
DMA2D_IN_STATE_CH1_REG	Represents the working status of the receive descriptor of RX channel 1	0x0624	RO
DMA2D_IN_SUC_EOF_DES_ADDR_CH1_REG	Represents the eceive descriptor address when EOF occurs on RX channel 1	0x0628	RO
DMA2D_IN_ERR_EOF_DES_ADDR_CH1_REG	Represents the receive descriptor address when errors occur on RX channel 1	0x062C	RO
DMA2D_IN_DSCR_CH1_REG	Represents the address of the next receive descriptor pointed by the current pre-read receive descriptor on RX channel 1	0x0630	RO
DMA2D_IN_DSCR_BF0_CH1_REG	Represents address of the current pre-read receive descriptor on RX channel 1	0x0634	RO
DMA2D_IN_DSCR_BF1_CH1_REG	Represents the address of the previous pre-read receive descriptor on RX channel 1	0x0638	RO
DMA2D_AXI_ERR_REG	Represents the status of the AXI bus	0x0A00	RO
DMA2D_DATE_REG	Version register	0x0A2C	R/W
Peripheral Select Registers			
DMA2D_OUT_PERI_SEL_CH0_REG	Configures the peripheral connected to TX channel 0	0x0038	R/W
DMA2D_OUT_PERI_SEL_CH1_REG	Configures the peripheral connected to TX channel 1	0x0138	R/W
DMA2D_OUT_PERI_SEL_CH2_REG	Configures the peripheral connected to TX channel 2	0x0238	R/W
DMA2D_OUT_PERI_SEL_CH3_REG	Configures the peripheral connected to TX channel 3	0x0338	R/W
DMA2D_IN_PERI_SEL_CH0_REG	Configures the peripheral connected to RX channel 0	0x053C	R/W
DMA2D_IN_PERI_SEL_CH1_REG	Configures the peripheral connected to RX channel 1	0x063C	R/W
DMA2D_IN_PERI_SEL_CH2_REG	Configures the peripheral connected to RX channel 2	0x073C	R/W

8.9 Registers

The addresses in this section are relative to 2D-DMA base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

For how to program reserved fields, please refer to Section *Programming Reserved Register Field*.

Register 8.1. DMA2D_OUT_CONF0_CH*n*_REG (*n*: 0-3) (0x0000+0x100n*)**

(reserved)
DMA2D_OUT_ARB_WEIGHT_OPT_DIS_CHn
DMA2D_OUT_CMD_DISABLE_CHn
DMA2D_OUT_RST_CHn
(reserved)
DMA2D_OUT_REORDER_EN_CH0
(reserved)
DMA2D_OUT_DSCR_PORT_EN_CHn
DMA2D_OUT_MACRO_BLOCK_SIZE_CHn
DMA2D_OUT_MEM_BURST_LENGTH_CHn
(reserved)
DMA2D_OUT_CHECK_OWNER_CHn
DMA2D_OUT_ECC_AES_EN_CHn
DMA2D_OUTDSCR_BURST_EN_CHn
DMA2D_OUT_EOF_MODE_CHn
DMA2D_OUT_AUTO_WRBACK_CHn
31 27 26 25 24 23 17 16 15 12 11 10 9 8 6 5 4 3 2 1 0
0 0 0

Register 8.1. DMA2D_OUT_CONF0_CH*n*_REG (*n*: 0-3) (0x0000+0x100**n*)

Continued from the previous page...

DMA2D_OUT_CHECK_OWNER_CH*n* Configures whether to enable the owner bit check for TX channel *n*.
0: Disable
1: Enable
(R/W)

DMA2D_OUT_MEM_BURST_LENGTH_CH*n* Configures the burst length for TX channel *n*.
0: 8 bytes
1: 16 bytes
2: 32 bytes
3: 64 bytes
4: 128 bytes
Others: Invalid
(R/W)

DMA2D_OUT_MACRO_BLOCK_SIZE_CH*n* Configures macroblock size for TX channel *n*. Used only in 2D-MOD1 mode.
0: 8 * 8 pixels
1: 8 * 16 pixels
2: 16 *16 pixels
3: No macroblock
(R/W)

DMA2D_OUT_DSCR_PORT_EN_CH*n* Configures whether to enable the DSCR-PORT mode for TX channel *n*.
0: Disable
1: Enable
(R/W)

DMA2D_OUT_REORDER_EN_CH0 Configures whether to enable macroblock reordering for TX channel 0.
0: Disable
1: Enable
(R/W)

DMA2D_OUT_RST_CH*n* Configures whether to reset TX channel *n*.
0: Reset release
1: Reset
(R/W)

Continued on the next page...

Register 8.1. DMA2D_OUT_CONFO_CH*n*_REG (*n*: 0-3) (0x0000+0x100**n*)

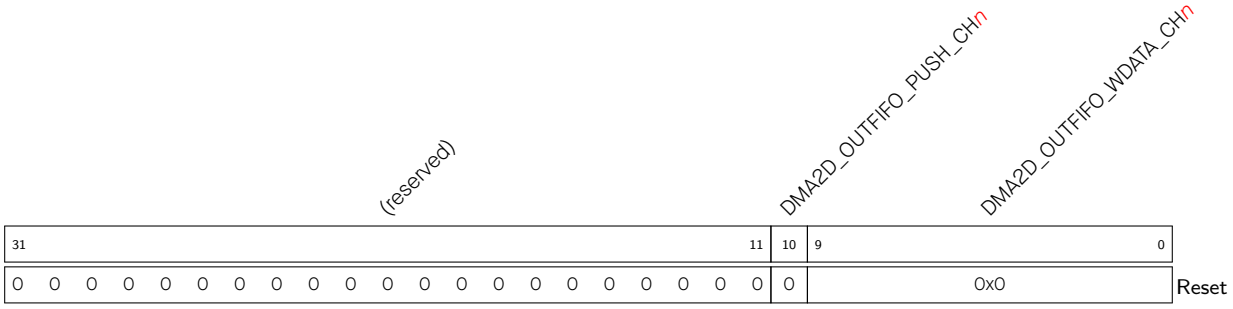
Continued from the previous page...

DMA2D_OUT_CMD_DISABLE_CH*n* Configures reset command for TX channel *n*.

0: Set 0 after reset release

1: Pause transfers before reset

(R/W)



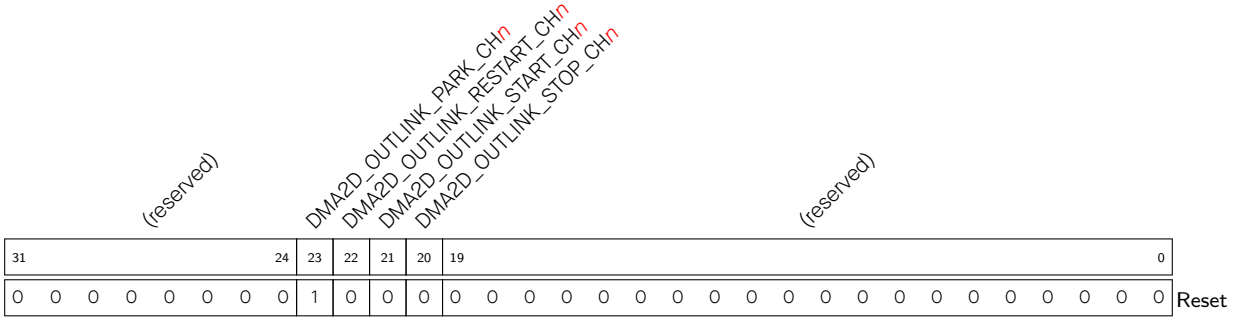
DMA2D_OUT_ARB_WEIGHT_OPT_DIS_CH*n* Configures whether to enable weight optimization for TX channel *n*.

0: Enable

1: Disable

(R/W)

Register 8.2. DMA2D_OUT_PUSH_CH*n*_REG (*n*: 0-3) (0x0018+0x100**n*)



DMA2D_OUTFIFO_WDATA_CH*n* Configures the data to be pushed into the 2D-DMA TX FIFO. (R/W)

DMA2D_OUTFIFO_PUSH_CH*n* Configures whether to push data into the 2D-DMA TX FIFO.

0: Not push 1: Push

(R/W/SC)

Register 8.3. DMA2D_OUT_LINK_CONF_CH*n*_REG (*n*: 0-3) (0x001C+0x100**n*)

DMA2D_OUTLINK_STOP_CH*n* Configures whether to stop TX channel *n* from transmitting data.

0: Invalid. No effect

1: Stop

(R/W/SC)

DMA2D_OUTLINK_START_CH*n* Configures whether to enable TX channel *n* for data transfer.

0: Disable

1: Enable

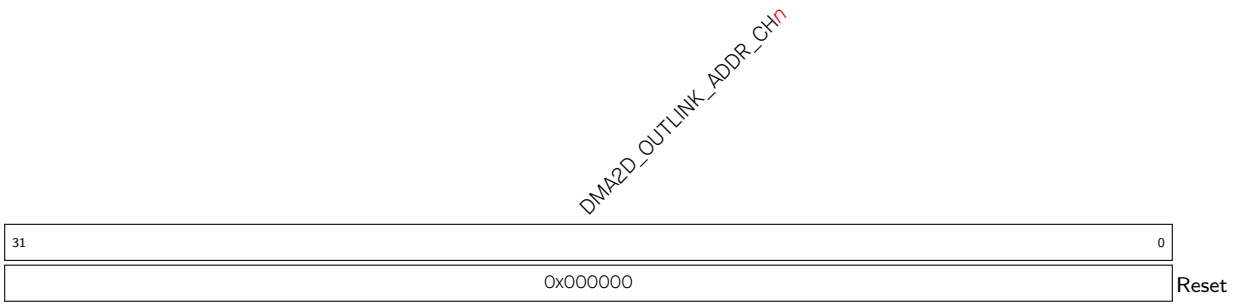
(R/W/SC)

DMA2D_OUTLINK_RESTART_CH*n* Configures whether to restart TX channel *n* for AXI DMA transfer.

0: Invalid. No effect

1: Restart

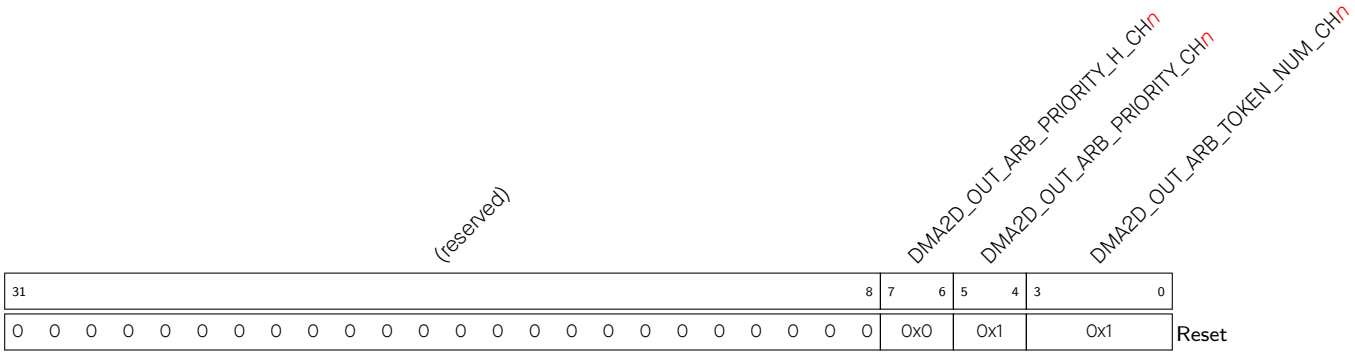
(R/W/SC)



DMA2D_OUTLINK_PARK_CH*n* Represents the status of the transmit descriptor's FSM.

0: Running

1: Idle



(RO)

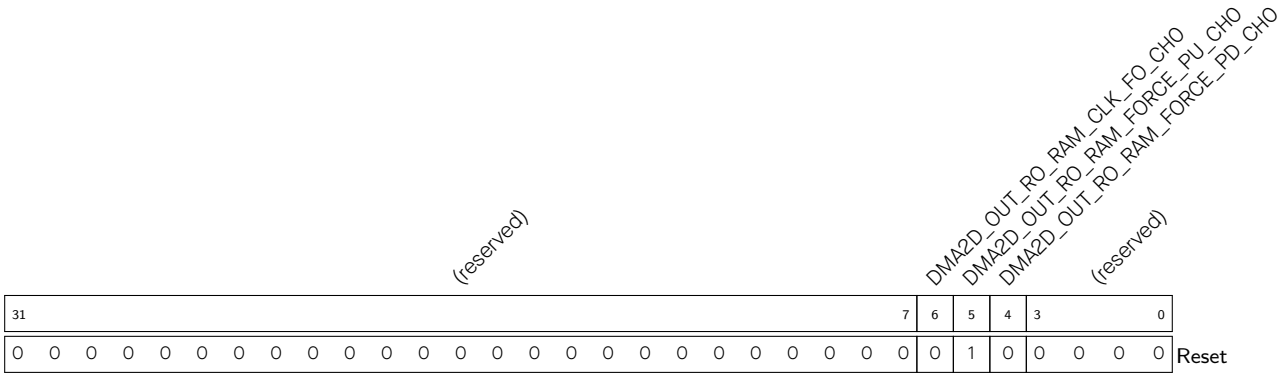
Register 8.4. DMA2D_OUT_LINK_ADDR_CH*n*_REG (*n*: 0-3) (0x0020+0x100**n*)

DMA2D_OUTLINK_ADDR_CH*n* Represents the first transmit descriptor's address. (R/W)

Register 8.5. DMA2D_OUT_ARB_CH*n*_REG (*n*: 0-3) (0x003C+0x100**n*)

DMA2D_OUT_ARB_TOKEN_NUM_CH*n* Configures the weight (i.e the number of tokens) of TX channel *n*.

Value range: 0 ~ 15. (R/W)



DMA2D_OUT_ARB_PRIORITY_CH*n* Configures the lower two bits of TX channel *n* priority.

Together with DMA2D_OUT_ARB_PRIORITY_H_CH*n*, this field forms a 4-bit priority value for TX channel *n*, ranging from 0 (lowest) to 15 (highest). (R/W)

DMA2D_OUT_ARB_PRIORITY_H_CH*n* Configures the higher two bits of TX channel *n* priority.

Together with DMA2D_OUT_ARB_PRIORITY_CH*n*, this field forms a 4-bit priority value for TX channel *n*, ranging from 0 (lowest) to 15 (highest). (R/W)

Register 8.6. DMA2D_OUT_RO_PD_CONF_CH0_REG (0x0044)

DMA2D_OUT_RO_RAM_FORCE_PD_CH0 Configures whether to force power down the macroblock reordering RAM for TX channel 0.

0: Not force power down

1: Force power down

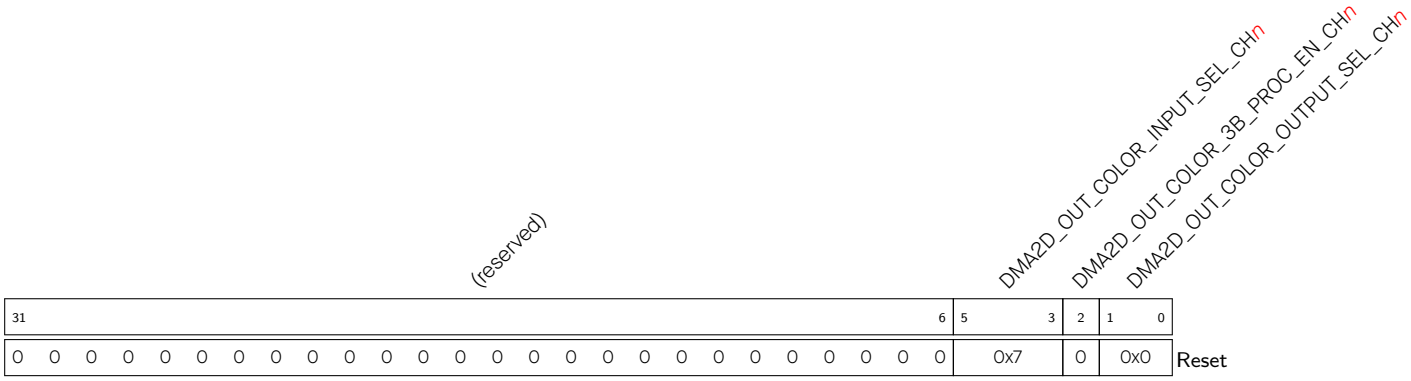
(R/W)

DMA2D_OUT_RO_RAM_FORCE_PU_CH0 Configures whether to force power up the macroblock reordering RAM for TX channel 0.

0: Not force power up

1: Force power up

(R/W)



DMA2D_OUT_RO_RAM_CLK_FO_CH0 Configures the clock gating when TX channel 0 accessing the 2D-DMA RAM.

0: Use the clock gate

1: Force the clock on and bypass the clock gate

(R/W)

Register 8.7. DMA2D_OUT_COLOR_CONVERT_CH*n*_REG (*n*: 0-3) (0x0048+0x100n*)**

DMA2D_OUT_COLOR_OUTPUT_SEL_CH*n* Configures the third stage output of color space conversion for TX channel *n*.

0: RGB888 to RGB565

1: YUV444 to YUV422

2: Output directly

Others: Invalid

(R/W)

DMA2D_OUT_COLOR_3B_PROC_EN_CH*n* Configures whether to enable the second stage of color space conversion for TX channel *n*.

0: Disable

1: Enable

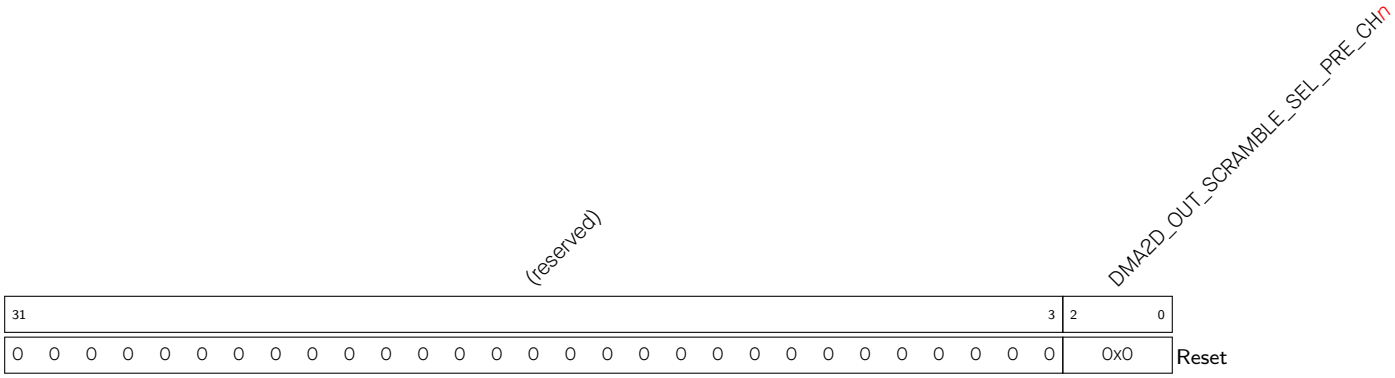
(R/W)

DMA2D_OUT_COLOR_INPUT_SEL_CH*n* Configures the first stage output of color space conversion for TX channel *n*.

0: RGB565 to RGB888

1: YUV422 to YUV444

2: Other 2 bytes/pixel color format



3: Other 3 bytes/pixel color format

7: Disable color space conversion

Others: Invalid

(R/W)

Register 8.8. DMA2D_OUT_SCRAMBLE_CH*n*_REG (*n*: 0-3) (0x004C+0x100**n*)

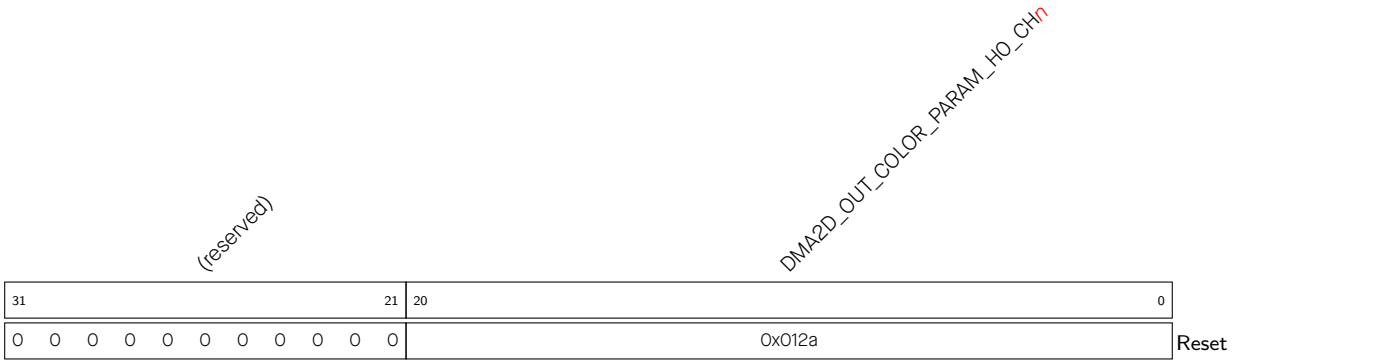
DMA2D_OUT_SCRAMBLE_SEL_PRE_CH*n* Configures the byte order scrambling before the color space conversion for TX channel *n*.

0: BYTE2-1-0

1: BYTE2-0-1

2: BYTE1-0-2

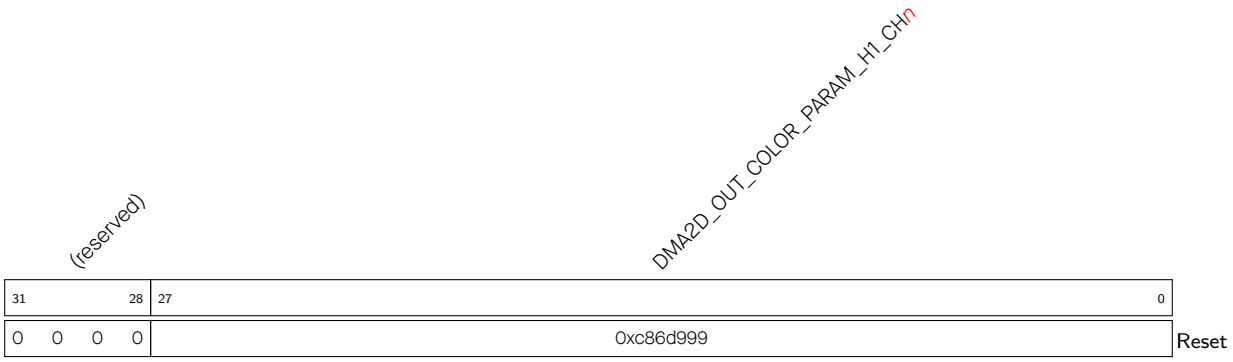
3: BYTE1-2-0



4: BYTE0-2-1

5: BYTE0-1-2

Others: Invalid

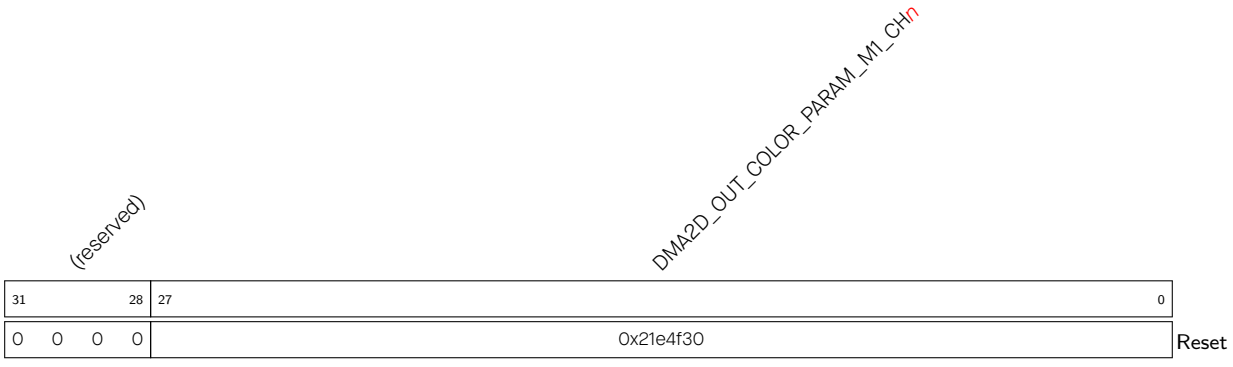


(R/W)

Register 8.9. DMA2D_OUT_COLOR_PARAM0_CH*n*_REG (*n*: 0-3) (0x0050+0x100**n*)

DMA2D_OUT_COLOR_PARAM_H0_CH*n* Configures the coefficient A and B for the most significant byte of the input of color space conversion's second stage for TX channel *n*. (R/W)

Register 8.10. DMA2D_OUT_COLOR_PARAM1_CH*n*_REG (*n*: 0-3) (0x0054+0x100**n*)

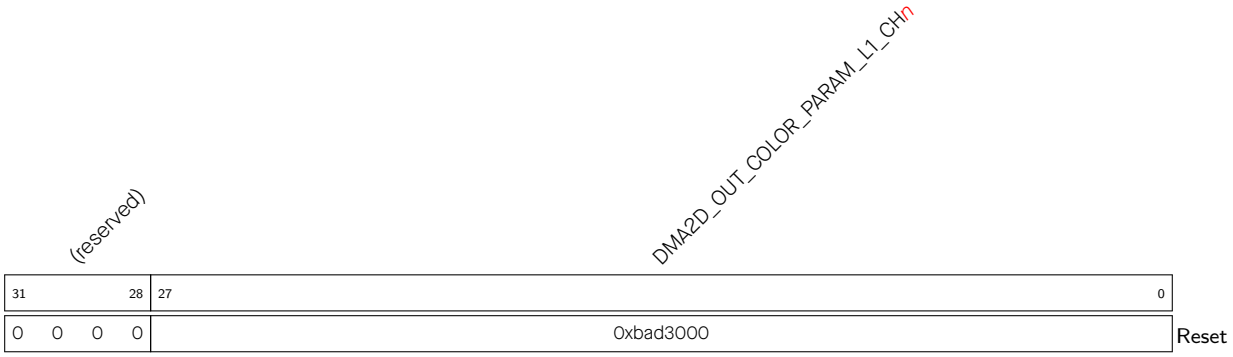


DMA2D_OUT_COLOR_PARAM_H1_CH*n* Configures the coefficient C and D for the most significant byte of the input of color space conversion's second stage for TX channel *n*. (R/W)

Register 8.11. DMA2D_OUT_COLOR_PARAM2_CH*n*_REG (*n*: 0-3) (0x0058+0x100**n*)

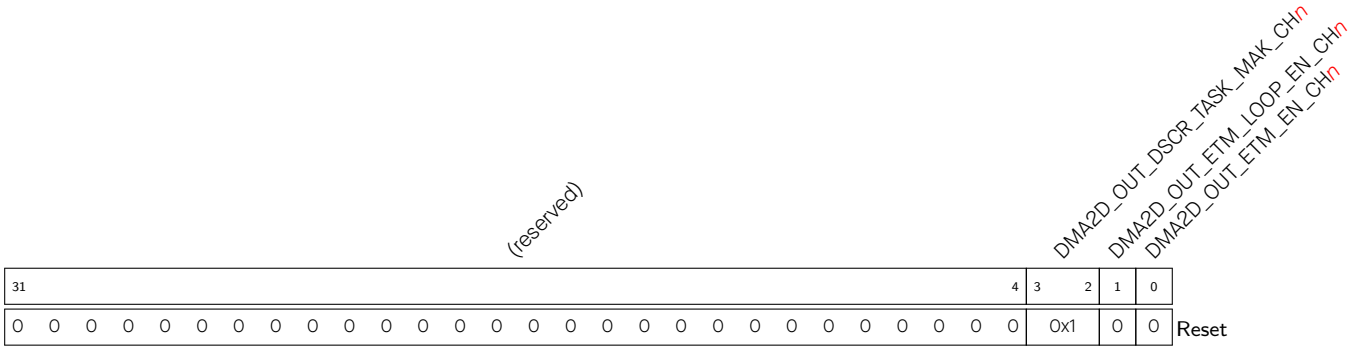
DMA2D_OUT_COLOR_PARAM_M0_CH*n* Configures the coefficient A and B for the middle byte of the input of color space conversion's second stage for TX channel *n*. (R/W)

Register 8.12. DMA2D_OUT_COLOR_PARAM3_CH*n*_REG (*n*: 0-3) (0x005C+0x100**n*)



DMA2D_OUT_COLOR_PARAM_M1_CH*n* Configures the coefficient C and D for the middle byte of the input of color space conversion's second stage for TX channel *n*. (R/W)

Register 8.13. DMA2D_OUT_COLOR_PARAM4_CH*n*_REG (*n*: 0-3) (0x0060+0x100n*)**



DMA2D_OUT_COLOR_PARAM_LO_CH*n* Configures the coefficient A and B for the least significant byte of the input of color space conversion's second stage for TX channel *n*. (R/W)

Register 8.14. DMA2D_OUT_COLOR_PARAM5_CH*n*_REG (*n*: 0-3) (0x0064+0x100n*)**

DMA2D_OUT_COLOR_PARAM_L1_CH*n* Configures the coefficient C and D for the least significant byte of the input of color space conversion's second stage for TX channel *n*. (R/W)

Register 8.15. DMA2D_OUT_ETM_CONF_CH*n*_REG (*n*: 0-3) (0x0068+0x100n*)**

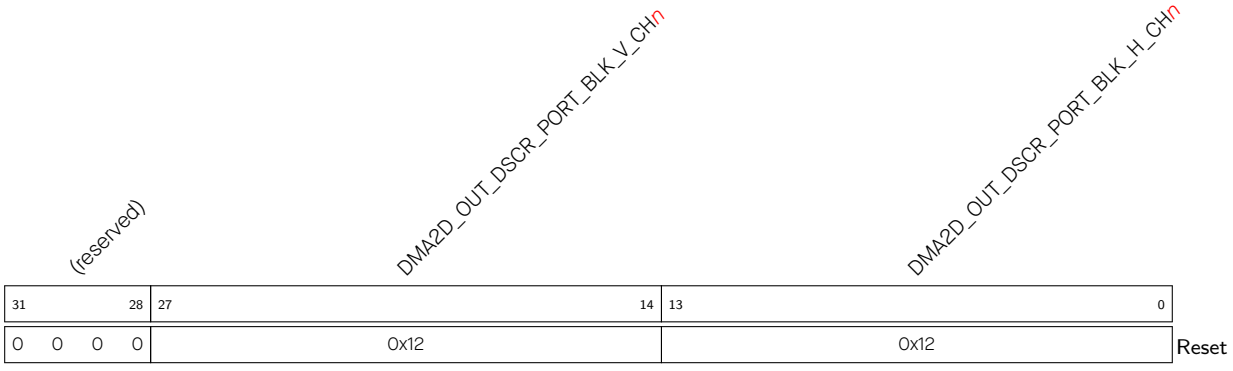
DMA2D_OUT_ETM_EN_CH*n* Configures whether to enable the ETM function for TX channel *n*.

0: Disable

1: Enable

(R/W)

DMA2D_OUT_ETM_LOOP_EN_CH*n* Configures whether to use the ETM task to indicate the processing of the next descriptor for TX channel *n*.



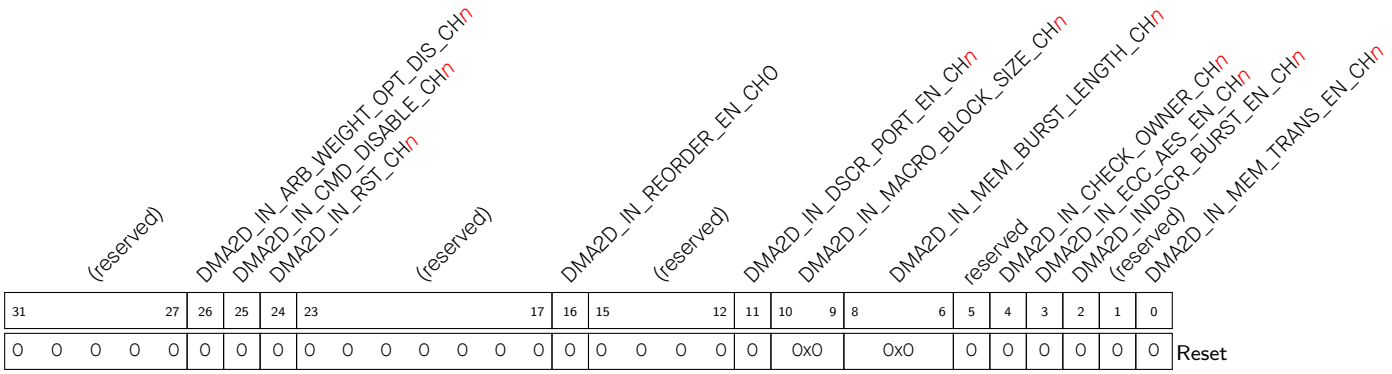
0: Not use ETM task

1: Use ETM task

(R/W)

DMA2D_OUT_DSCR_TASK_MAK_CH*n* Configures the maximum number of tasks that can be cached for TX channel *n*. (R/W)

Register 8.16. DMA2D_OUT_DSCR_PORT_BLK_CH*n*_REG (*n*: 0-3) (0x006C+0x100n*)**



DMA2D_OUT_DSCR_PORT_BLK_H_CH*n* Configures the horizontal width of the basic unit for TX channel *n* in DSCR-PORT mode.

Measurement unit: pixels. (R/W)

DMA2D_OUT_DSCR_PORT_BLK_V_CH*n* Configures the vertical height of the basic unit for TX channel *n* in DSCR-PORT mode.

Measurement unit: pixels. (R/W)

Register 8.17. DMA2D_IN_CONF0_CH*n*_REG (*n*: 0-2) (0x0500+0x100**n*)

(reserved)
DMA2D_IN_ARB_WEIGHT_OPT_DIS_CHn
DMA2D_IN_CMD_DISABLE_CHn
DMA2D_IN_RST_CHn
(reserved)
DMA2D_IN_REORDER_EN_CH0
(reserved)
DMA2D_IN_DSCR_PORT_EN_CHn
DMA2D_IN_MACRO_BLOCK_SIZE_CHn
DMA2D_IN_MEM_BURST_LENGTH_CHn
reserved

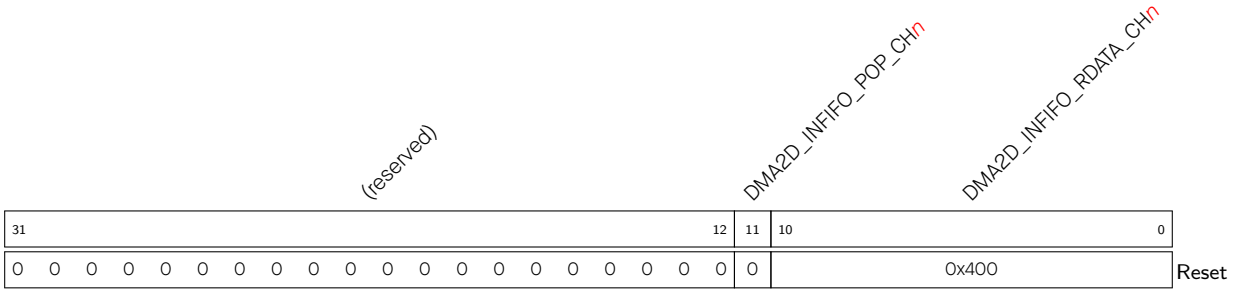
Register 8.17. DMA2D_IN_CONF0_CH*n*_REG (*n*: 0-2) (0x0500+0x100**n*)

Continued from the previous page...

DMA2D_IN_MACRO_BLOCK_SIZE_CH*n* Configures macroblock size for RX channel *n*. Used only in 2D-MOD1 mode.
0: 8 * 8 pixels
1: 8 * 16 pixels
2: 16 * 16 pixels
3: No macroblock
(R/W)

DMA2D_IN_DSCR_PORT_EN_CH*n* Configures whether to enable the DSCR-PORT mode for RX channel *n*.
0: Disable
1: Enable
(R/W)



DMA2D_IN_REORDER_EN_CH0 Configures whether to enable macroblock reordering for RX channel 0.
0: Disable
1: Enable
(R/W)

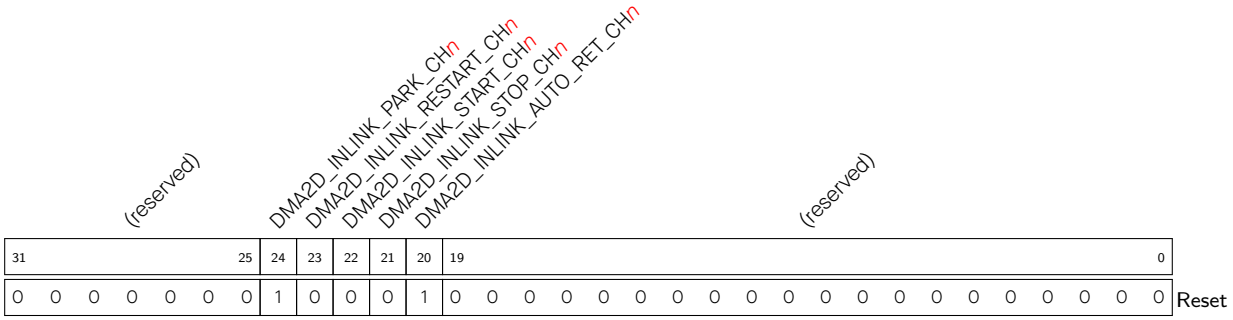
DMA2D_IN_RST_CH*n* Configures whether to reset RX channel *n*.
0: Invalid
1: Reset
(R/W)

DMA2D_IN_CMD_DISABLE_CH*n* Configures reset command for RX channel *n*.
0: Set 0 after reset release
1: Pause transfers before reset
(R/W)

DMA2D_IN_ARB_WEIGHT_OPT_DIS_CH*n* Configures whether to enable weight optimization for RX channel *n*.
0: Enable
1: Disable
(R/W)

Register 8.18. DMA2D_IN_POP_CH*n*_REG (*n*: 0-2) (0x0518+0x100n*)**

DMA2D_INFIFO_RDATA_CH*n* Represents the data popped from 2D-DMA RX FIFO. (RO)



DMA2D_INFIFO_POP_CH*n* Configures whether to pop data from 2D-DMA RX FIFO.

0: Not pop

1: Pop

(R/W/SC)

Register 8.19. DMA2D_IN_LINK_CONF_CH*n*_REG (*n*: 0-2) (0x051C+0x100**n*)

DMA2D_INLINK_AUTO_RET_CH*n* Configure the value of the owner bit written back to the receive descriptor.

0: Write back 0

1: Write back 1

(R/W)

DMA2D_INLINK_STOP_CH*n* Configures whether to stop RX channel *n* from receiving data.

0: Invalid. No effect

1: Stop

(R/W/SC)

DMA2D_INLINK_START_CH*n* Configures whether to enable RX channel *n* for data transfer.

0: Disable

1: Enable

(R/W/SC)

DMA2D_INLINK_RESTART_CH*n* Configures whether to restart RX channel *n* for 2D-DMA transfer.

0: Invalid. No effect

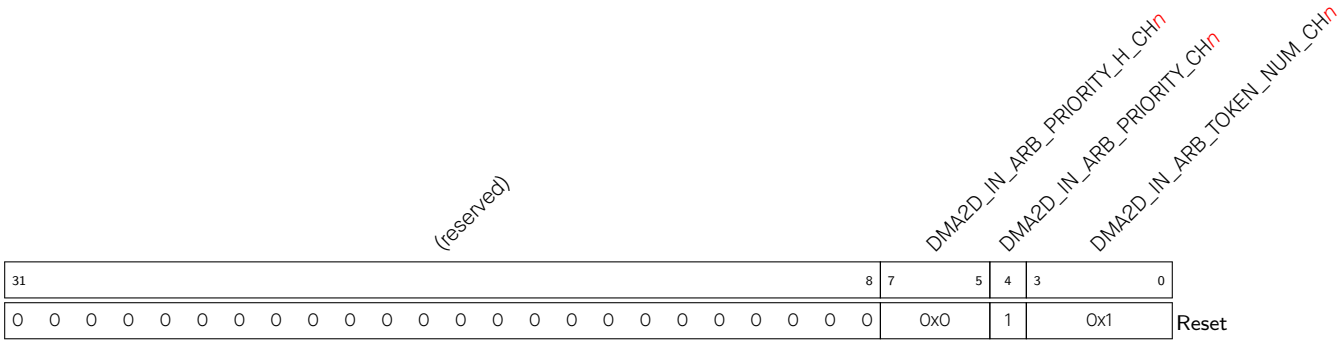
1: Restart

(R/W/SC)

DMA2D_INLINK_PARK_CH*n* Represents the status of the receive descriptor's FSM.

0: Running

1: Idle



(RO)

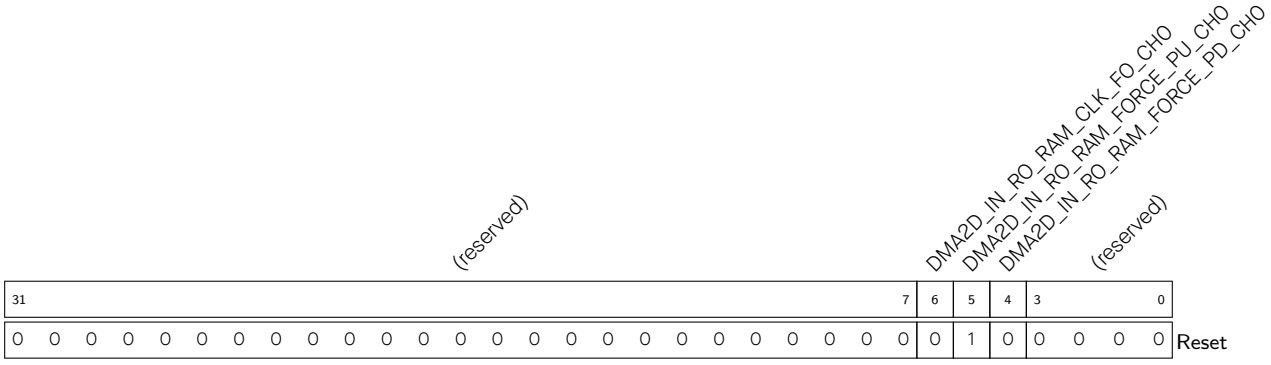
Register 8.20. DMA2D_IN_LINK_ADDR_CH*n*_REG (*n*: 0-2) (0x0520+0x100n*)**

DMA2D_INLINK_ADDR_CH*n* Represents the first receive descriptor's address. (R/W)

Register 8.21. DMA2D_IN_ARB_CH*n*_REG (*n*: 0-2) (0x0540+0x100n*)**

DMA2D_IN_ARB_TOKEN_NUM_CH*n* Configures the weight (i.e the number of tokens) of RX channel *n*.

Value range: 0 ~ 15. (R/W)



DMA2D_IN_ARB_PRIORITY_CH*n* Configures the lower two bits of RX channel *n* priority.

Together with DMA2D_IN_ARB_PRIORITY_H_CH*n*, this field forms a 4-bit priority value for TX channel *n*, ranging from 0 (lowest) to 15 (highest). (R/W)

DMA2D_IN_ARB_PRIORITY_H_CH*n* Configures the higher two bits of TX channel *n* priority.

Together with DMA2D_IN_ARB_PRIORITY_CH*n*, this field forms a 4-bit priority value for TX channel *n*, ranging from 0 (lowest) to 15 (highest). (R/W)

Register 8.22. DMA2D_IN_RO_PD_CONF_CH0_REG (0x0548)

DMA2D_IN_RO_RAM_FORCE_PD_CH0 Configures whether to force power down the macroblock reordering RAM for RX channel 0.

0: Not force power down

1: Force power down

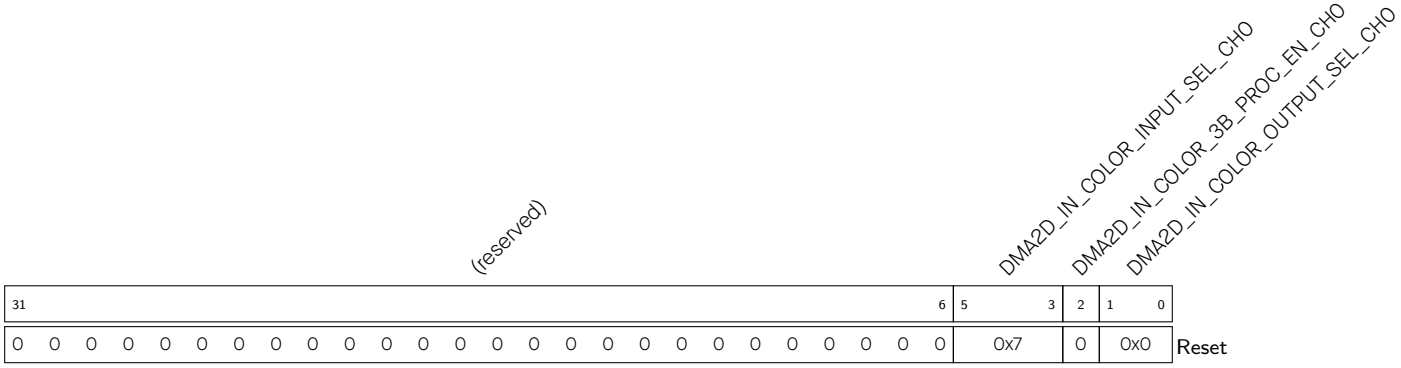
(R/W)

DMA2D_IN_RO_RAM_FORCE_PU_CH0 Configures whether to force power up the macroblock reordering RAM for RX channel 0.

0: Not force power up

1: Force power up

(R/W)



DMA2D_IN_RO_RAM_CLK_FO_CH0 Configures the clock gating when RX channel 0 accessing the 2D-DMA RAM.

0: Use the clock gate

1: Force the clock on and bypass the clock gate

(R/W)

Register 8.23. DMA2D_IN_COLOR_CONVERT_CH0_REG (0x054C)

DMA2D_IN_COLOR_OUTPUT_SEL_CH0 Configures the third stage output of color space conversion for RX channel 0.

0: RGB888 to RGB565

1: Output directly

(R/W)

DMA2D_IN_COLOR_3B_PROC_EN_CH0 Configures whether to enable the second stage of color space conversion for RX channel 0.

0: Disable

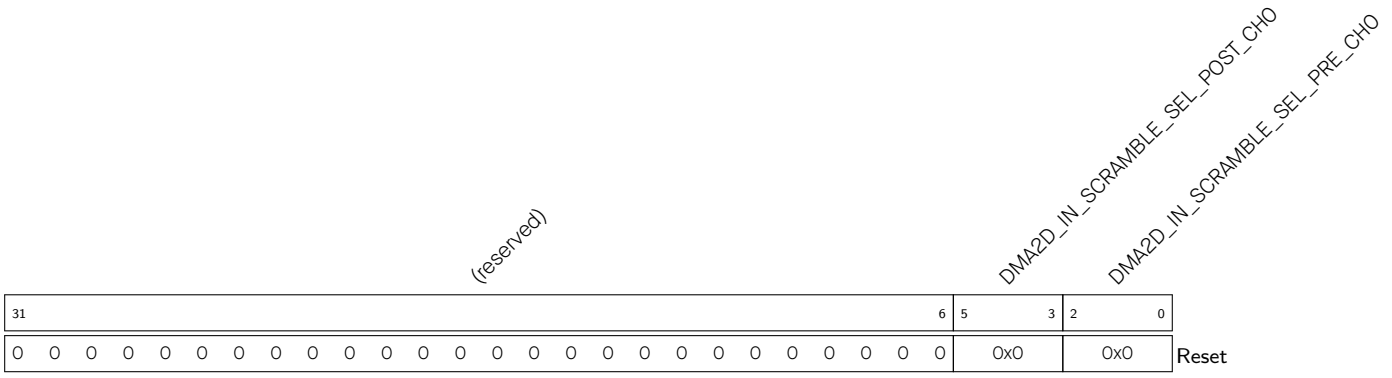
1: Enable

(R/W)

DMA2D_IN_COLOR_INPUT_SEL_CH0 Configures the first stage output of color space conversion for RX channel 0.

0: YUV422/420 to YUV444

1: YUV422



2: YUV444/420

7: Disable color space conversion

Others: Invalid

(R/W)

Register 8.24. DMA2D_IN_SCRAMBLE_CH0_REG (0x0550)

DMA2D_IN_SCRAMBLE_SEL_PRE_CH0 Configures the byte order scrambling before the color space conversion for RX channel 0.

0: BYTE2-1-0

1: BYTE2-0-1

2: BYTE1-0-2

3: BYTE1-2-0

4: BYTE0-2-1

5: BYTE0-1-2

Others: Invalid

(R/W)

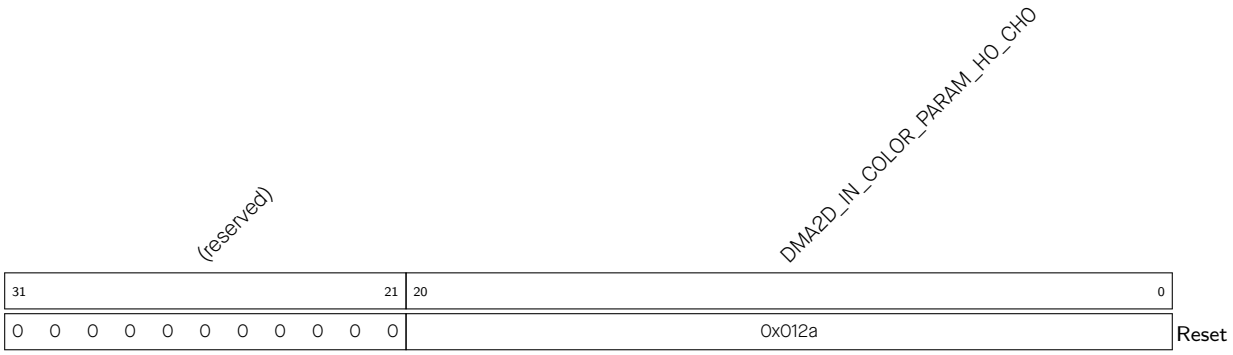
DMA2D_IN_SCRAMBLE_SEL_POST_CH0 Configures the byte order scrambling after the color space conversion for RX channel 0.

0: BYTE2-1-0

1: BYTE2-0-1

2: BYTE1-0-2

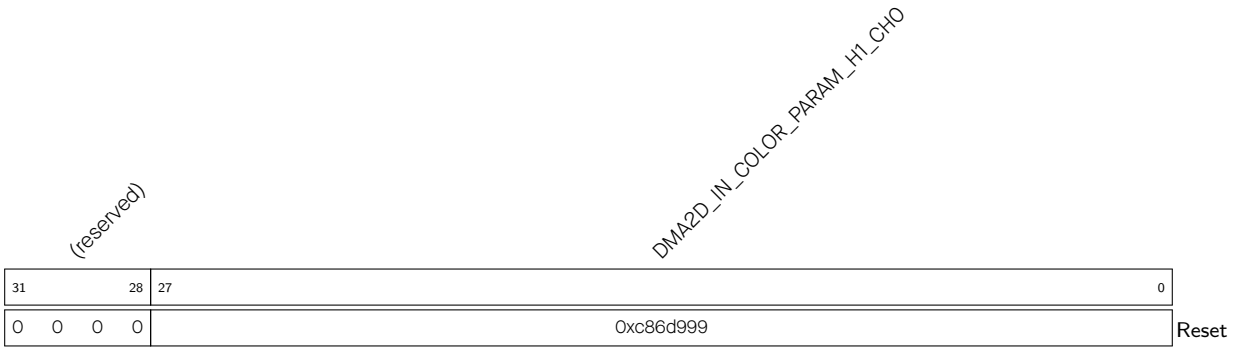
3: BYTE1-2-0



4: BYTE0-2-1

5: BYTE0-1-2

Others: Invalid

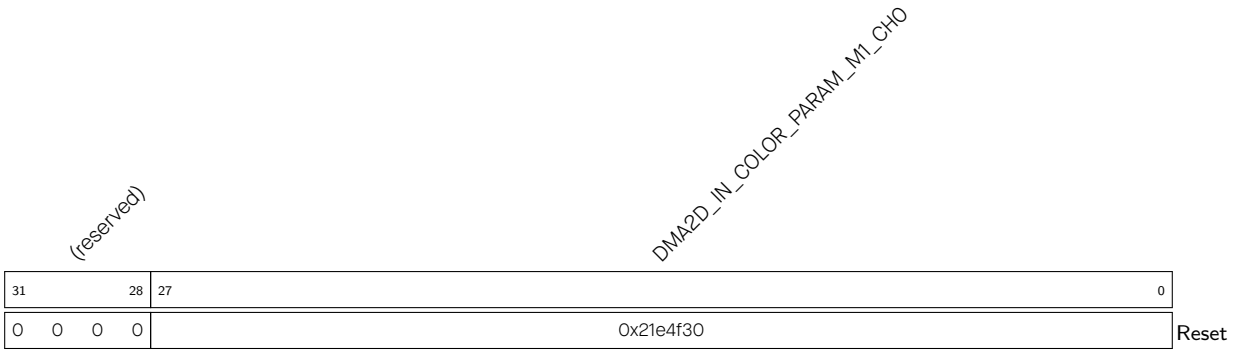


(R/W)

Register 8.25. DMA2D_IN_COLOR_PARAM0_CH0_REG (0x0554)

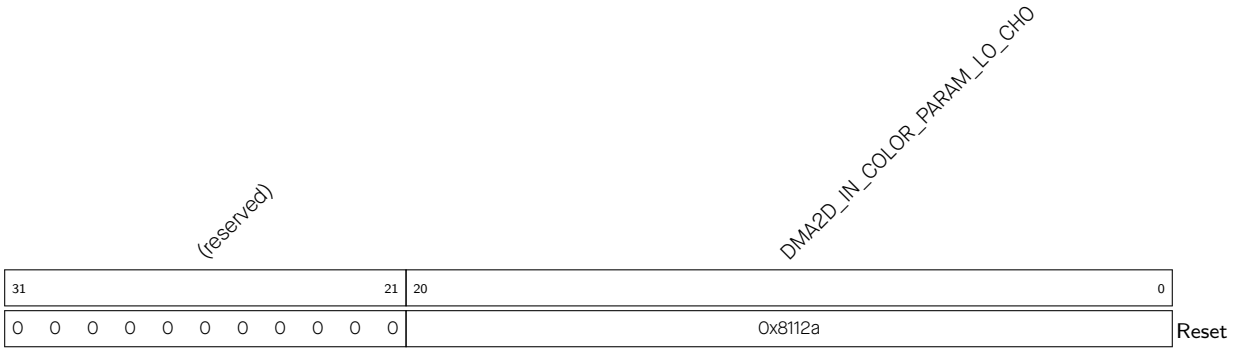
DMA2D_IN_COLOR_PARAM_H0_CH0 Configures the coefficient A and B for the most significant byte of the input of color space conversion's second stage for RX channel 0. (R/W)

Register 8.26. DMA2D_IN_COLOR_PARAM1_CH0_REG (0x0558)



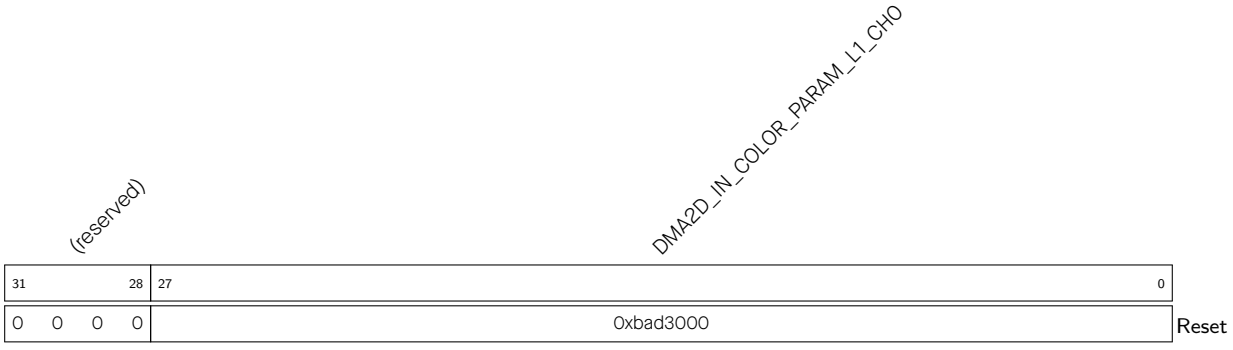
DMA2D_IN_COLOR_PARAM_H1_CH0 Configures the coefficient C and D for the most significant byte of the input of color space conversion's second stage for RX channel 0. (R/W)

Register 8.27. DMA2D_IN_COLOR_PARAM2_CH0_REG (0x055C)



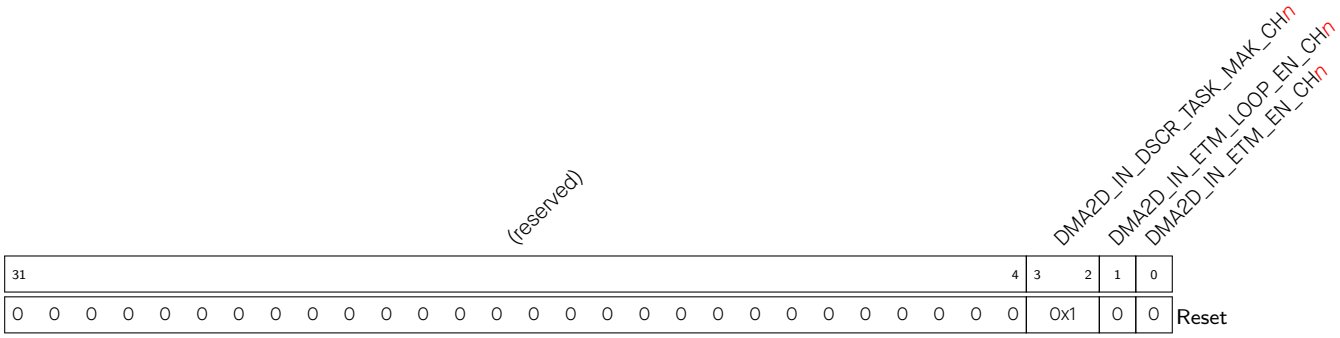
DMA2D_IN_COLOR_PARAM_M0_CH0 Configures the coefficient A and B for the middle byte of the input of color space conversion's second stage for RX channel 0. (R/W)

Register 8.28. DMA2D_IN_COLOR_PARAM3_CH0_REG (0x0560)



DMA2D_IN_COLOR_PARAM_M1_CH0 Configures the coefficient C and D for the middle byte of the input of color space conversion's second stage for RX channel 0. (R/W)

Register 8.29. DMA2D_IN_COLOR_PARAM4_CH0_REG (0x0564)



DMA2D_IN_COLOR_PARAM_L0_CH0 Configures the coefficient A and B for the least significant byte of the input of color space conversion's second stage for RX channel 0. (R/W)

Register 8.30. DMA2D_IN_COLOR_PARAM5_CH0_REG (0x0568)

DMA2D_IN_COLOR_PARAM_L1_CH0 Configures the coefficient C and D for the least significant byte of the input of color space conversion's second stage for RX channel 0. (R/W)

Register 8.31. DMA2D_IN_ETM_CONF_CH*n*_REG (*n*: 0-2) (0x056C+0x100n*)**

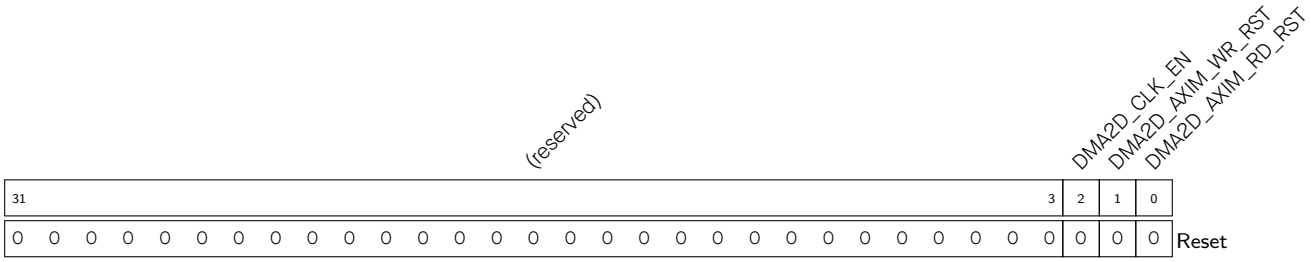
DMA2D_IN_ETM_EN_CH*n* Configures whether to enable the ETM function for RX channel *n*.

0: Disable

1: Enable

(R/W)

DMA2D_IN_ETM_LOOP_EN_CH*n* Configures whether to use the ETM task to indicate the processing of the next descriptor for RX channel *n*.



0: Not use ETM task

1: Use ETM task

(R/W)

DMA2D_IN_DSCR_TASK_MAK_CH*n* Configures the maximum number of tasks that can be cached for RX channel *n*. (R/W)

Register 8.32. DMA2D_RST_CONF_REG (0x0A04)

DMA2D_AXIM_RD_RST Configures whether to reset the AXI master read data FIFO.

0: No effect

1: Reset

(R/W)

DMA2D_AXIM_WR_RST Configures whether to reset the AXI master write data FIFO.

0: No effect

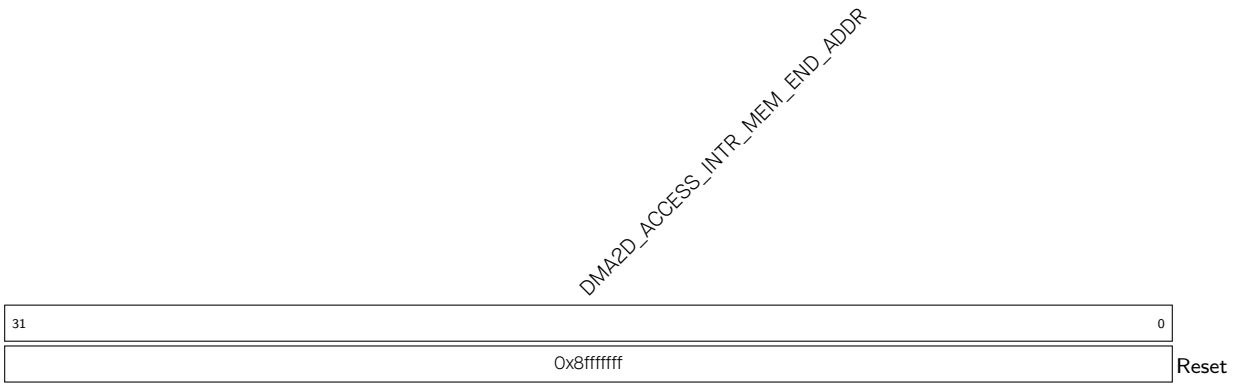
1: Reset

(R/W)

DMA2D_CLK_EN Configures the clock for registers.

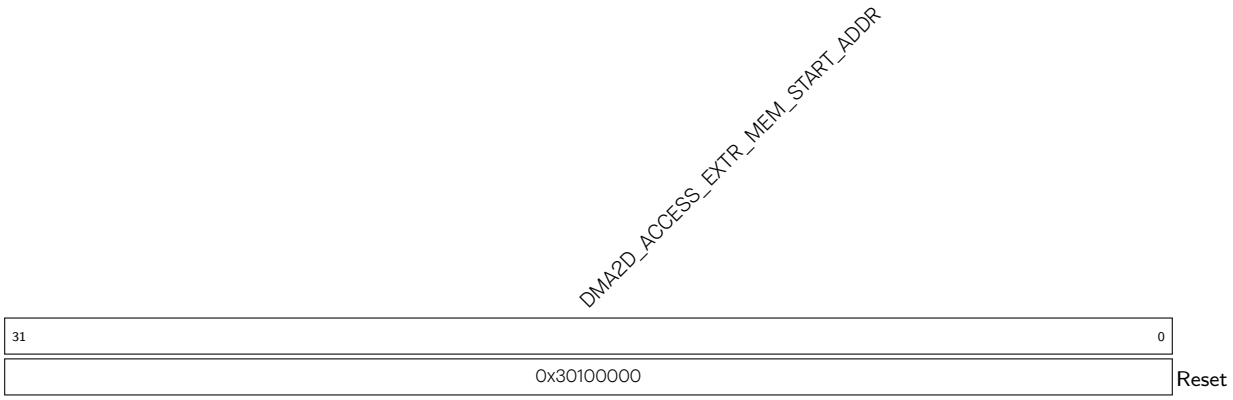
0: Support clock only when application writes registers

1: Force clock on for register



(R/W)

Register 8.33. DMA2D_INTR_MEM_START_ADDR_REG (0x0A08)

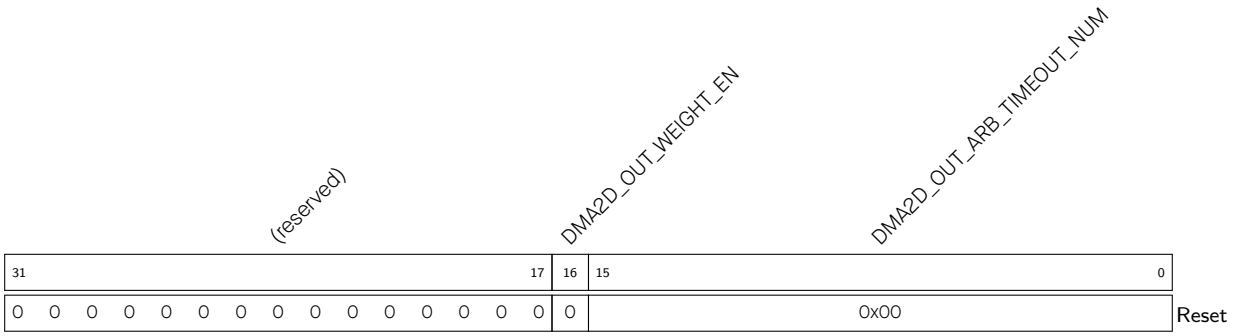


DMA2D_ACCESS_INTR_MEM_START_ADDR Configures the start address of the accessible internal address space. (R/W)

Register 8.34. DMA2D_INTR_MEM_END_ADDR_REG (0x0A0C)

DMA2D_ACCESS_INTR_MEM_END_ADDR Configures the end address of the accessible internal address space. Accessing an address beyond this range will result in a descriptor error. (R/W)

Register 8.35. DMA2D_EXTR_MEM_START_ADDR_REG (0x0A10)



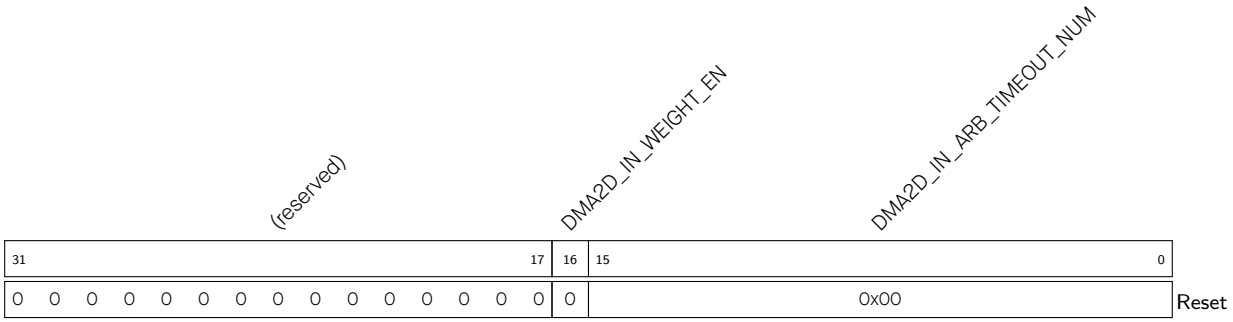
DMA2D_ACCESS_EXTR_MEM_START_ADDR Configures the start address of the accessible external address space. (R/W)

Register 8.36. DMA2D_EXTR_MEM_END_ADDR_REG (0x0A14)

DMA2D_ACCESS_EXTR_MEM_END_ADDR Configures the end address of the accessible external address space. Accessing an address beyond this range will result in a descriptor error. (R/W)

Register 8.37. DMA2D_OUT_ARB_CONFIG_REG (0x0A18)

DMA2D_OUT_ARB_TIMEOUT_NUM Configures the time slot for TX. Measurement unit: AXI bus clock cycle. (R/W)



DMA2D_OUT_WEIGHT_EN Configures whether to enable weight arbitration for TX.

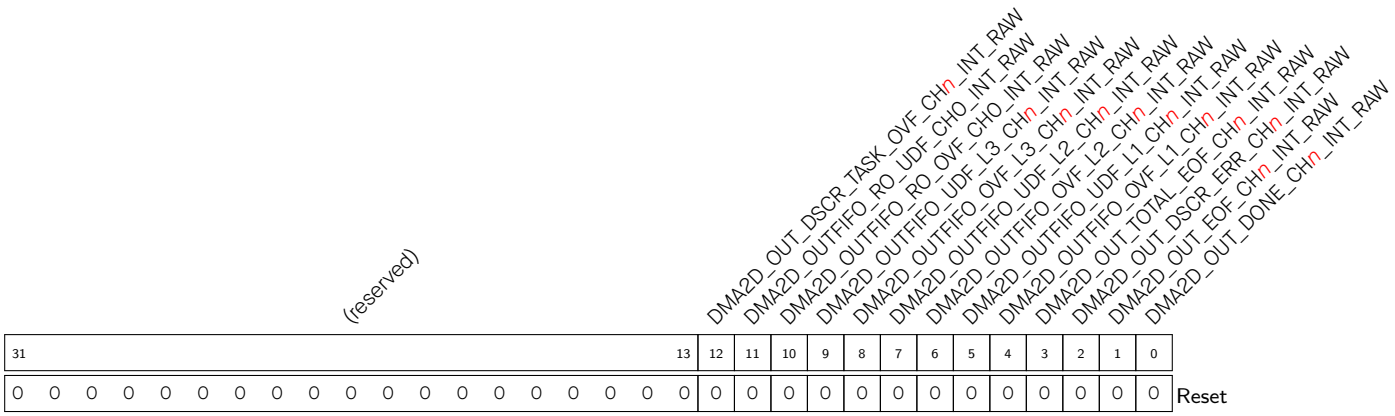
0: Disable

1: Enable

(R/W)

Register 8.38. DMA2D_IN_ARB_CONFIG_REG (0x0A1C)

DMA2D_IN_ARB_TIMEOUT_NUM Configures the time slot for RX. Measurement unit: AXI bus clock cycle. (R/W)



DMA2D_IN_WEIGHT_EN Configures whether to enable weight arbitration for RX.

0: Disable

1: Enable

(R/W)

Register 8.39. DMA2D_OUT_INT_RAW_CH*n*_REG (*n*: 0-3) (0x0004+0x100n*)**

DMA2D_OUT_DONE_CH*n*_INT_RAW The raw interrupt status bit of DMA2D_OUT_DONE_CH*n*_INT. (R/WTC/SS)

DMA2D_OUT_EOF_CH*n*_INT_RAW The raw interrupt status of DMA2D_OUT_EOF_CH*n*_INT. (R/WTC/SS)

DMA2D_OUT_DSCR_ERR_CH*n*_INT_RAW The raw interrupt status of DMA2D_OUT_DSCR_ERR_CH*n*_INT. (R/WTC/SS)

DMA2D_OUT_TOTAL_EOF_CH*n*_INT_RAW The raw interrupt status of DMA2D_OUT_TOTAL_EOF_CH*n*_INT. (R/WTC/SS)

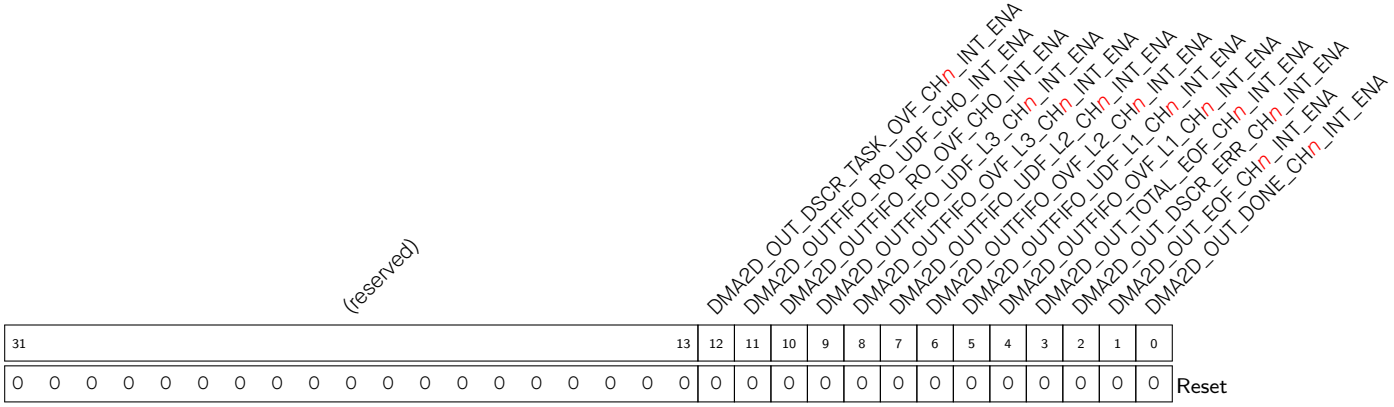
DMA2D_OUTFIFO_OVF_L1_CH*n*_INT_RAW The raw interrupt status of DMA2D_OUTFIFO_OVF_L1_CH*n*_INT. (R/WTC/SS)

DMA2D_OUTFIFO_UDF_L1_CH*n*_INT_RAW The raw interrupt status of DMA2D_OUTFIFO_UDF_L1_CH*n*_INT. (R/WTC/SS)

DMA2D_OUTFIFO_OVF_L2_CH*n*_INT_RAW The raw interrupt status of DMA2D_OUTFIFO_OVF_L2_CH*n*_INT. (R/WTC/SS)

DMA2D_OUTFIFO_UDF_L2_CH*n*_INT_RAW The raw interrupt status of DMA2D_OUTFIFO_UDF_L2_CH*n*_INT. (R/WTC/SS)

DMA2D_OUTFIFO_OVF_L3_CH*n*_INT_RAW The raw interrupt status of DMA2D_OUTFIFO_OVF_L3_CH*n*_INT. (R/WTC/SS)



DMA2D_OUTFIFO_UDF_L3_CH*n*_INT_RAW The raw interrupt status of DMA2D_OUTFIFO_UDF_L3_CH*n*_INT. (R/WTC/SS)

DMA2D_OUTFIFO_RO_OVF_CHO_INT_RAW The raw interrupt status of DMA2D_OUTFIFO_RO_OVF_CHO_INT. (R/WTC/SS)

DMA2D_OUTFIFO_RO_UDF_CHO_INT_RAW The raw interrupt status of DMA2D_OUTFIFO_RO_UDF_CHO_INT. (R/WTC/SS)

DMA2D_OUT_DSCR_TASK_OVF_CH*n*_INT_RAW The raw interrupt status of DMA2D_OUT_DSCR_TASK_OVF_CH*n*_INT. (R/WTC/SS)

Register 8.40. DMA2D_OUT_INT_ENA_CH*n*_REG (*n*: 0-3) (0x0008+0x100**n*)

DMA2D_OUT_DONE_CH*n*_INT_ENA Write 1 to enable the DMA2D_OUT_DONE_CH*n*_INT. (R/W)

DMA2D_OUT_EOF_CH*n*_INT_ENA Write 1 to enable the DMA2D_OUT_EOF_CH*n*_INT. (R/W)

DMA2D_OUT_DSCR_ERR_CH*n*_INT_ENA Write 1 to enable the DMA2D_OUT_DSCR_ERR_CH*n*_INT. (R/W)

DMA2D_OUT_TOTAL_EOF_CH*n*_INT_ENA Write 1 to enable the DMA2D_OUT_TOTAL_EOF_CH*n*_INT. (R/W)

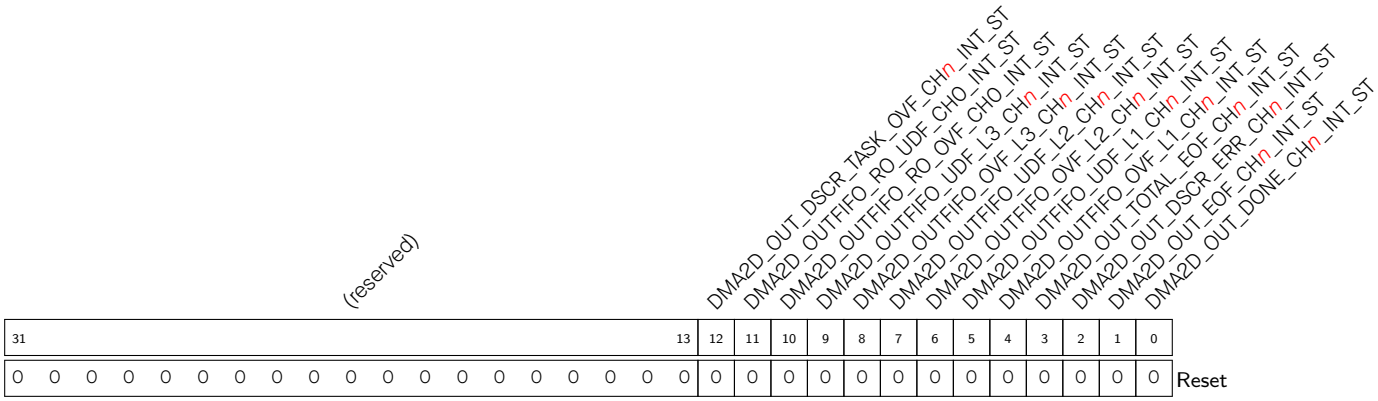
DMA2D_OUTFIFO_OVF_L1_CH*n*_INT_ENA Write 1 to enable the DMA2D_OUTFIFO_OVF_L1_CH*n*_INT. (R/W)

DMA2D_OUTFIFO_UDF_L1_CH*n*_INT_ENA Write 1 to enable the DMA2D_OUTFIFO_UDF_L1_CH*n*_INT. (R/W)

DMA2D_OUTFIFO_OVF_L2_CH*n*_INT_ENA Write 1 to enable the DMA2D_OUTFIFO_OVF_L2_CH*n*_INT. (R/W)

DMA2D_OUTFIFO_UDF_L2_CH*n*_INT_ENA Write 1 to enable the DMA2D_OUTFIFO_UDF_L2_CH*n*_INT. (R/W)

DMA2D_OUTFIFO_OVF_L3_CH*n*_INT_ENA Write 1 to enable the DMA2D_OUTFIFO_OVF_L3_CH*n*_INT. (R/W)



DMA2D_OUTFIFO_UDF_L3_CH*n*_INT_ENA Write 1 to enable the DMA2D_OUTFIFO_UDF_L3_CH*n*_INT. (R/W)

DMA2D_OUTFIFO_RO_OVF_CHO_INT_ENA Write 1 to enable the DMA2D_OUTFIFO_RO_OVF_CHO_INT. (R/W)

DMA2D_OUTFIFO_RO_UDF_CHO_INT_ENA Write 1 to enable the DMA2D_OUTFIFO_RO_UDF_CHO_INT. (R/W)

DMA2D_OUT_DSCR_TASK_OVF_CH*n*_INT_ENA Write 1 to enable the DMA2D_OUT_DSCR_TASK_OVF_CH*n*_INT. (R/W)

Register 8.41. DMA2D_OUT_INT_ST_CH*n*_REG (*n*: 0-3) (0x000C+0x100**n*)

DMA2D_OUT_DONE_CH*n*_INT_ST The masked interrupt status of DMA2D_OUT_DONE_CH*n*_INT. (RO)

DMA2D_OUT_EOF_CH*n*_INT_ST The masked interrupt status of DMA2D_OUT_EOF_CH*n*_INT. (RO)

DMA2D_OUT_DSCR_ERR_CH*n*_INT_ST The masked interrupt status of DMA2D_OUT_DSCR_ERR_CH*n*_INT. (RO)

DMA2D_OUT_TOTAL_EOF_CH*n*_INT_ST The masked interrupt status of DMA2D_OUT_TOTAL_EOF_CH*n*_INT. (RO)

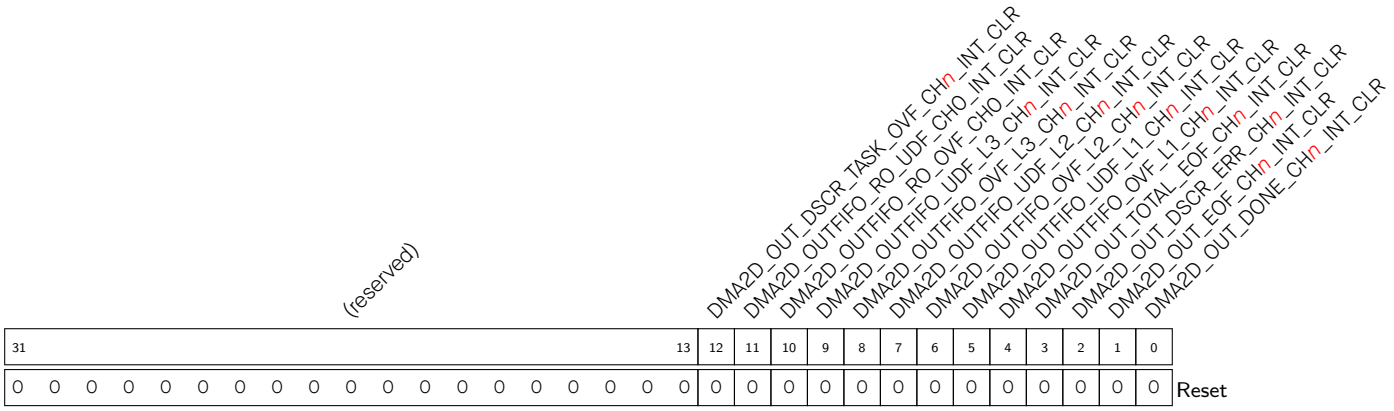
DMA2D_OUTFIFO_OVF_L1_CH*n*_INT_ST The masked interrupt status of DMA2D_OUTFIFO_OVF_L1_CH*n*_INT. (RO)

DMA2D_OUTFIFO_UDF_L1_CH*n*_INT_ST The masked interrupt status of DMA2D_OUTFIFO_UDF_L1_CH*n*_INT. (RO)

DMA2D_OUTFIFO_OVF_L2_CH*n*_INT_ST The masked interrupt status of DMA2D_OUTFIFO_OVF_L2_CH*n*_INT. (RO)

DMA2D_OUTFIFO_UDF_L2_CH*n*_INT_ST The masked interrupt status of DMA2D_OUTFIFO_UDF_L2_CH*n*_INT. (RO)

DMA2D_OUTFIFO_OVF_L3_CH*n*_INT_ST The masked interrupt status of DMA2D_OUTFIFO_OVF_L3_CH*n*_INT. (RO)



DMA2D_OUTFIFO_UDF_L3_CH*n*_INT_ST The masked interrupt status of DMA2D_OUTFIFO_UDF_L3_CH*n*_INT. (RO)

DMA2D_OUTFIFO_RO_OVF_CHO_INT_ST The masked interrupt status of DMA2D_OUTFIFO_RO_OVF_CHO_INT. (RO)

DMA2D_OUTFIFO_RO_UDF_CHO_INT_ST The masked interrupt status of DMA2D_OUTFIFO_RO_UDF_CHO_INT. (RO)

DMA2D_OUT_DSCR_TASK_OVF_CH*n*_INT_ST The masked interrupt status of DMA2D_OUT_DSCR_TASK_OVF_CH*n*_INT. (RO)

Register 8.42. DMA2D_OUT_INT_CLR_CH*n*_REG (*n*: 0-3) (0x0010+0x100***n*)

DMA2D_OUT_DONE_CH*n*_INT_CLR Write 1 to clear the DMA2D_OUT_DONE_CH*n*_INT. (WT)

DMA2D_OUT_EOF_CH*n*_INT_CLR Write 1 to clear the DMA2D_OUT_EOF_CH*n*_INT. (WT)

DMA2D_OUT_DSCR_ERR_CH*n*_INT_CLR Write 1 to clear the DMA2D_OUT_DSCR_ERR_CH*n*_INT. (WT)

DMA2D_OUT_TOTAL_EOF_CH*n*_INT_CLR Write 1 to clear the DMA2D_OUT_TOTAL_EOF_CH*n*_INT. (WT)

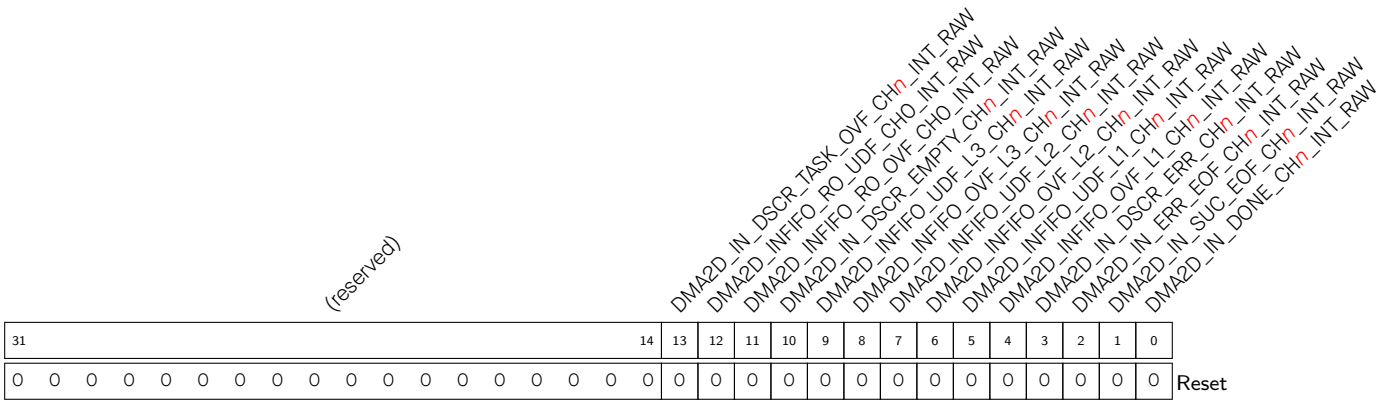
DMA2D_OUTFIFO_OVF_L1_CH*n*_INT_CLR Write 1 to clear the DMA2D_OUTFIFO_OVF_L1_CH*n*_INT. (WT)

DMA2D_OUTFIFO_UDF_L1_CH*n*_INT_CLR Write 1 to clear the DMA2D_OUTFIFO_UDF_L1_CH*n*_INT. (WT)

DMA2D_OUTFIFO_OVF_L2_CH*n*_INT_CLR Write 1 to clear the DMA2D_OUTFIFO_OVF_L2_CH*n*_INT. (WT)

DMA2D_OUTFIFO_UDF_L2_CH*n*_INT_CLR Write 1 to clear the DMA2D_OUTFIFO_UDF_L2_CH*n*_INT. (WT)

DMA2D_OUTFIFO_OVF_L3_CH*n*_INT_CLR Write 1 to clear the DMA2D_OUTFIFO_OVF_L3_CH*n*_INT. (WT)



DMA2D_OUTFIFO_UDF_L3_CH*n*_INT_CLR Write 1 to clear the DMA2D_OUTFIFO_UDF_L3_CH*n*_INT. (WT)

DMA2D_OUTFIFO_RO_OVF_CHO_INT_CLR Write 1 to clear the DMA2D_OUTFIFO_RO_OVF_CHO_INT. (WT)

DMA2D_OUTFIFO_RO_UDF_CHO_INT_CLR Write 1 to clear the DMA2D_OUTFIFO_RO_UDF_CHO_INT. (WT)

DMA2D_OUT_DSCR_TASK_OVF_CH*n*_INT_CLR Write 1 to clear the DMA2D_OUT_DSCR_TASK_OVF_CH*n*_INT. (WT)

Register 8.43. DMA2D_IN_INT_RAW_CH*n*_REG (*n*: 0-2) (0x0504+0x100n*)**

DMA2D_IN_DONE_CH*n*_INT_RAW The raw interrupt status of DMA2D_IN_DONE_CH*n*_INT. (R/WTC/SS)

DMA2D_IN_SUC_EOF_CH*n*_INT_RAW The raw interrupt status of DMA2D_IN_SUC_EOF_CH*n*_INT. (R/WTC/SS)

DMA2D_IN_ERR_EOF_CH*n*_INT_RAW The raw interrupt status of DMA2D_IN_ERR_EOF_CH*n*_INT. (R/WTC/SS)

DMA2D_IN_DSCR_ERR_CH*n*_INT_RAW The raw interrupt status of DMA2D_IN_DSCR_ERR_CH*n*_INT. (R/WTC/SS)

DMA2D_INFIFO_OVF_L1_CH*n*_INT_RAW The raw interrupt status of DMA2D_INFIFO_OVF_L1_CH*n*_INT. (R/WTC/SS)

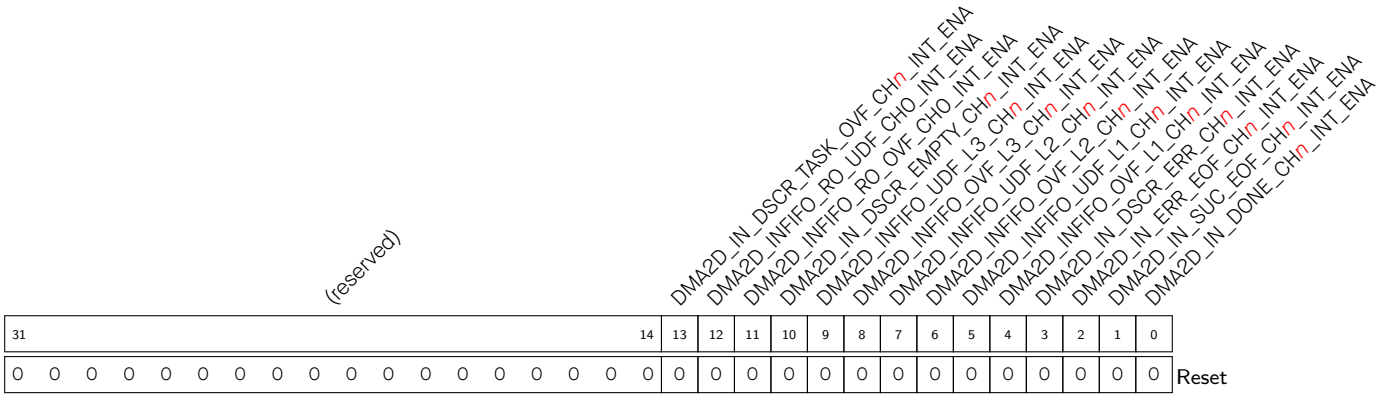
DMA2D_INFIFO_UDF_L1_CH*n*_INT_RAW The raw interrupt status of DMA2D_INFIFO_UDF_L1_CH*n*_INT. (R/WTC/SS)

DMA2D_INFIFO_OVF_L2_CH*n*_INT_RAW The raw interrupt status of DMA2D_INFIFO_OVF_L2_CH*n*_INT. (R/WTC/SS)

DMA2D_INFIFO_UDF_L2_CH*n*_INT_RAW The raw interrupt status of DMA2D_INFIFO_UDF_L2_CH*n*_INT. (R/WTC/SS)

DMA2D_INFIFO_OVF_L3_CH*n*_INT_RAW The raw interrupt status of DMA2D_INFIFO_OVF_L3_CH*n*_INT. (R/WTC/SS)

DMA2D_INFIFO_UDF_L3_CH*n*_INT_RAW The raw interrupt status of DMA2D_INFIFO_UDF_L3_CH*n*_INT. (R/WTC/SS)



DMA2D_IN_DSCR_EMPTY_CH*n*_INT_RAW The raw interrupt status of DMA2D_IN_DSCR_EMPTY_CH*n*_INT. (R/WTC/SS)

DMA2D_INFIFO_RO_OVF_CHO_INT_RAW The raw interrupt status of DMA2D_INFIFO_RO_OVF_CHO_INT. (R/WTC/SS)

DMA2D_INFIFO_RO_UDF_CHO_INT_RAW The raw interrupt status of DMA2D_INFIFO_RO_UDF_CHO_INT. (R/WTC/SS)

DMA2D_IN_DSCR_TASK_OVF_CH*n*_INT_RAW The raw interrupt status of DMA2D_IN_DSCR_TASK_OVF_CH*n*_INT. (R/WTC/SS)

Register 8.44. DMA2D_IN_INT_ENA_CH*n*_REG (*n*: 0-2) (0x0508+0x100**n*)

DMA2D_IN_DONE_CH*n*_INT_ENA Write 1 to enable the DMA2D_IN_DONE_CH*n*_INT. (R/W)

DMA2D_IN_SUC_EOF_CH*n*_INT_ENA Write 1 to enable the DMA2D_IN_SUC_EOF_CH*n*_INT. (R/W)

DMA2D_IN_ERR_EOF_CH*n*_INT_ENA Write 1 to enable the DMA2D_IN_ERR_EOF_CH*n*_INT. (R/W)

DMA2D_IN_DSCR_ERR_CH*n*_INT_ENA Write 1 to enable the DMA2D_IN_DSCR_ERR_CH*n*_INT. (R/W)

DMA2D_INFIFO_OVF_L1_CH*n*_INT_ENA Write 1 to enable the DMA2D_INFIFO_OVF_L1_CH*n*_INT. (R/W)

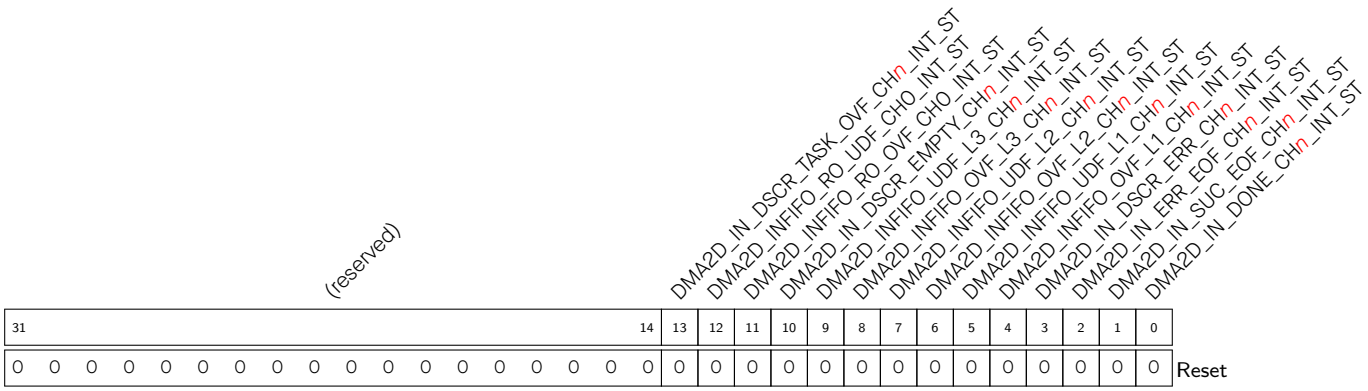
DMA2D_INFIFO_UDF_L1_CH*n*_INT_ENA Write 1 to enable the DMA2D_INFIFO_UDF_L1_CH*n*_INT. (R/W)

DMA2D_INFIFO_OVF_L2_CH*n*_INT_ENA Write 1 to enable the DMA2D_INFIFO_OVF_L2_CH*n*_INT. (R/W)

DMA2D_INFIFO_UDF_L2_CH*n*_INT_ENA Write 1 to enable the DMA2D_INFIFO_UDF_L2_CH*n*_INT. (R/W)

DMA2D_INFIFO_OVF_L3_CH*n*_INT_ENA Write 1 to enable the DMA2D_INFIFO_OVF_L3_CH*n*_INT. (R/W)

DMA2D_INFIFO_UDF_L3_CH*n*_INT_ENA Write 1 to enable the DMA2D_INFIFO_UDF_L3_CH*n*_INT. (R/W)



DMA2D_IN_DSCR_EMPTY_CH*n*_INT_ENA Write 1 to enable the DMA2D_IN_DSCR_EMPTY_CH*n*_INT. (R/W)

DMA2D_INFIFO_RO_OVF_CH0_INT_ENA Write 1 to enable the DMA2D_INFIFO_RO_OVF_CH0_INT. (R/W)

DMA2D_INFIFO_RO_UDF_CH0_INT_ENA Write 1 to enable the DMA2D_INFIFO_RO_UDF_CH0_INT. (R/W)

DMA2D_IN_DSCR_TASK_OVF_CH*n*_INT_ENA Write 1 to enable the DMA2D_IN_DSCR_TASK_OVF_CH*n*_INT. (R/W)

Register 8.45. DMA2D_IN_INT_ST_CH*n*_REG (*n*: 0-2) (0x050C+0x100*n)

DMA2D_IN_DONE_CH*n*_INT_ST The masked interrupt status of the DMA2D_IN_DONE_CH*n*_INT. (RO)

DMA2D_IN_SUC_EOF_CH*n*_INT_ST The masked interrupt status of the DMA2D_IN_SUC_EOF_CH*n*_INT. (RO)

DMA2D_IN_ERR_EOF_CH*n*_INT_ST The masked interrupt status of the DMA2D_IN_ERR_EOF_CH*n*_INT. (RO)

DMA2D_IN_DSCR_ERR_CH*n*_INT_ST The masked interrupt status of the DMA2D_IN_DSCR_ERR_CH*n*_INT. (RO)

DMA2D_INFIFO_OVF_L1_CH*n*_INT_ST The masked interrupt status of the DMA2D_INFIFO_OVF_L1_CH*n*_INT. (RO)

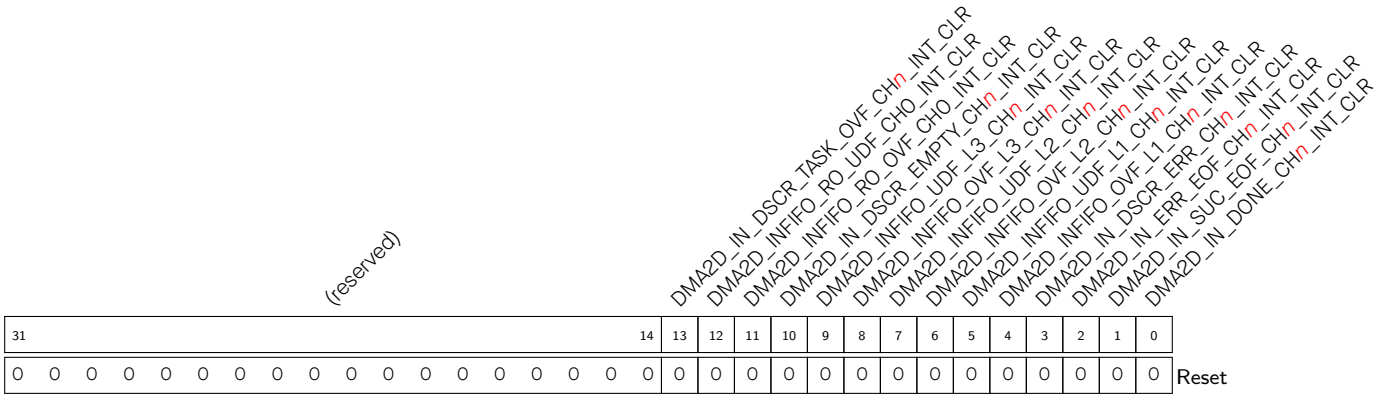
DMA2D_INFIFO_UDF_L1_CH*n*_INT_ST The masked interrupt status of the DMA2D_INFIFO_UDF_L1_CH*n*_INT. (RO)

DMA2D_INFIFO_OVF_L2_CH*n*_INT_ST The masked interrupt status of the DMA2D_INFIFO_OVF_L2_CH*n*_INT. (RO)

DMA2D_INFIFO_UDF_L2_CH*n*_INT_ST The masked interrupt status of the DMA2D_INFIFO_UDF_L2_CH*n*_INT. (RO)

DMA2D_INFIFO_OVF_L3_CH*n*_INT_ST The masked interrupt status of the DMA2D_INFIFO_OVF_L3_CH*n*_INT. (RO)

DMA2D_INFIFO_UDF_L3_CH*n*_INT_ST The masked interrupt status of the DMA2D_INFIFO_UDF_L3_CH*n*_INT. (RO)



DMA2D_IN_DSCR_EMPTY_CH*n*_INT_ST The masked interrupt status of the DMA2D_IN_DSCR_EMPTY_CH*n*_INT. (RO)

DMA2D_INFIFO_RO_OVF_CHO_INT_ST The masked interrupt status of the DMA2D_INFIFO_RO_OVF_CHO_INT. (RO)

DMA2D_INFIFO_RO_UDF_CHO_INT_ST The masked interrupt status of the DMA2D_INFIFO_RO_UDF_CHO_INT. (RO)

DMA2D_IN_DSCR_TASK_OVF_CH*n*_INT_ST The masked interrupt status of the DMA2D_IN_DSCR_TASK_OVF_CH*n*_INT. (RO)

Register 8.46. DMA2D_IN_INT_CLR_CHn_REG (n: 0-2) (0x0510+0x100*n)

DMA2D_IN_DONE_CHn_INT_CLR Write 1 to clear the DMA2D_IN_DONE_CHn_INT. (WT)

DMA2D_IN_SUC_EOF_CHn_INT_CLR Write 1 to clear the DMA2D_IN_SUC_EOF_CHn_INT. (WT)

DMA2D_IN_ERR_EOF_CHn_INT_CLR Write 1 to clear the DMA2D_IN_ERR_EOF_CHn_INT. (WT)

DMA2D_IN_DSCR_ERR_CHn_INT_CLR Write 1 to clear the DMA2D_IN_DSCR_ERR_CHn_INT. (WT)

DMA2D_INFIFO_OVF_L1_CHn_INT_CLR Write 1 to clear the DMA2D_INFIFO_OVF_L1_CHn_INT. (WT)

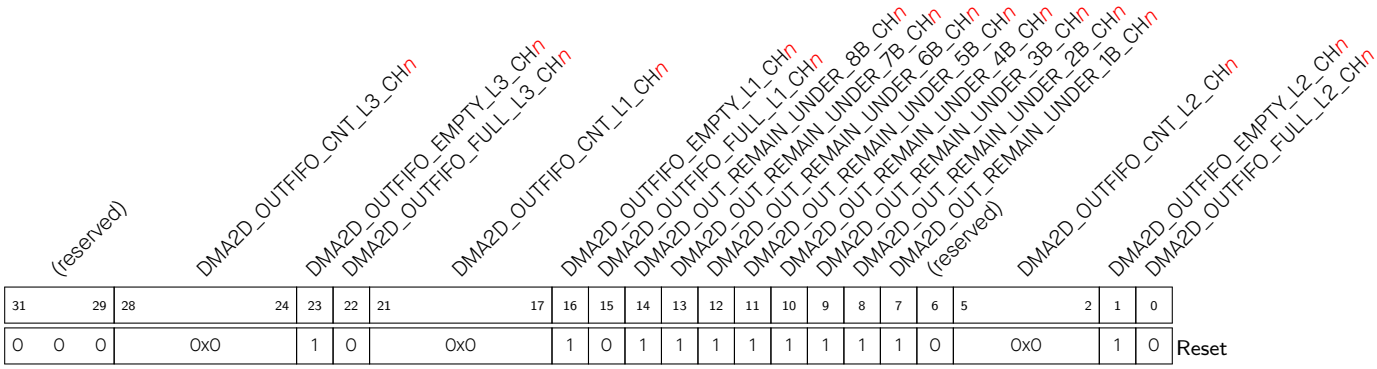
DMA2D_INFIFO_UDF_L1_CHn_INT_CLR Write 1 to clear the DMA2D_INFIFO_UDF_L1_CHn_INT. (WT)

DMA2D_INFIFO_OVF_L2_CHn_INT_CLR Write 1 to clear the DMA2D_INFIFO_OVF_L2_CHn_INT. (WT)

DMA2D_INFIFO_UDF_L2_CHn_INT_CLR Write 1 to clear the DMA2D_INFIFO_UDF_L2_CHn_INT. (WT)

DMA2D_INFIFO_OVF_L3_CHn_INT_CLR Write 1 to clear the DMA2D_INFIFO_OVF_L3_CHn_INT. (WT)

DMA2D_INFIFO_UDF_L3_CHn_INT_CLR Write 1 to clear the DMA2D_INFIFO_UDF_L3_CHn_INT. (WT)



DMA2D_IN_DSCR_EMPTY_CHn_INT_CLR Write 1 to clear the DMA2D_IN_DSCR_EMPTY_CHn_INT. (WT)

DMA2D_INFIFO_RO_OVF_CHO_INT_CLR Write 1 to clear the DMA2D_INFIFO_RO_OVF_CHO_INT. (WT)

DMA2D_INFIFO_RO_UDF_CHO_INT_CLR Write 1 to clear the DMA2D_INFIFO_RO_UDF_CHO_INT. (WT)

DMA2D_IN_DSCR_TASK_OVF_CHn_INT_CLR Write 1 to clear the DMA2D_IN_DSCR_TASK_OVF_CHn_INT. (WT)

Register 8.47. DMA2D_OUTFIFO_STATUS_CH*n*_REG (*n*: 0-3) (0x0014+0x100n*)**

DMA2D_OUTFIFO_FULL_L2_CH*n* Represents whether the L2 TX FIFO for TX channel *n* is full.

0: Not full

1: Full

(RO)

DMA2D_OUTFIFO_EMPTY_L2_CH*n* Represents whether the L2 TX FIFO for TX channel *n* is empty.

0: Not empty

1: Empty

(RO)

DMA2D_OUTFIFO_CNT_L2_CH*n* Represents the number of data bytes in L2 TX FIFO for TX channel *n*. (RO)

DMA2D_OUT_REMAIN_UNDER_1B_CH*n* Reserved. (RO)

DMA2D_OUT_REMAIN_UNDER_2B_CH*n* Reserved. (RO)

Continued from the previous page...

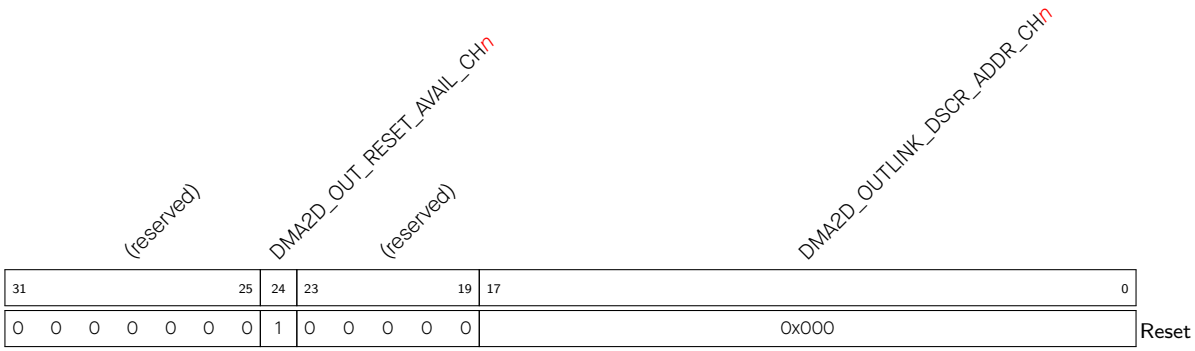
DMA2D_OUTFIFO_FULL_L3_CH*n* Represents whether the L3 TX FIFO for TX channel *n* is full.

0: Not full

1: Full

(RO)

DMA2D_OUTFIFO_EMPTY_L3_CH*n* Represents whether the L3 TX FIFO for TX channel *n* is empty.



0: Not empty

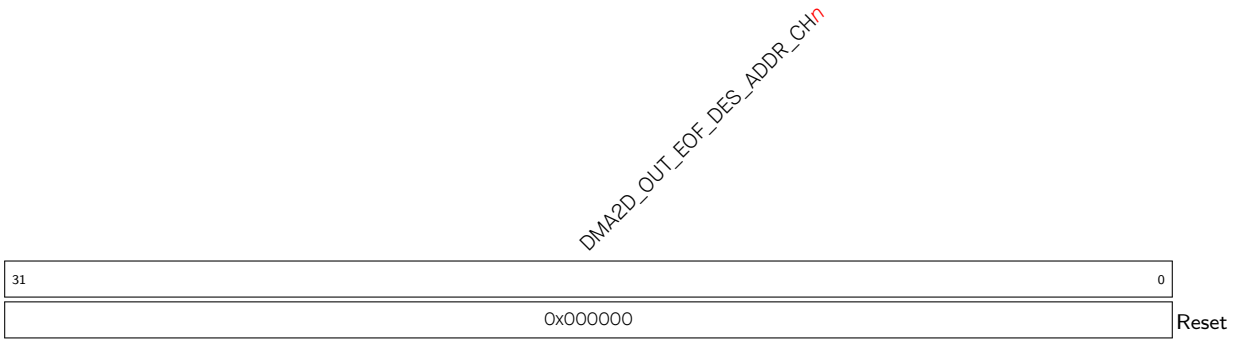
1: Empty

(RO)

DMA2D_OUTFIFO_CNT_L3_CH*n* Represents the number of data bytes in L3 TX FIFO for TX channel *n*. (RO)

Register 8.48. DMA2D_OUT_STATE_CH*n*_REG (*n*: 0-3) (0x0024+0x100**n*)

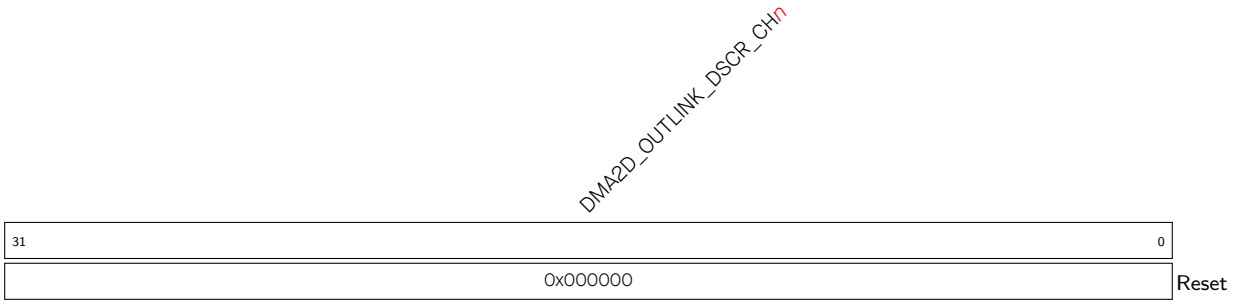
DMA2D_OUTLINK_DSCR_ADDR_CH*n* Represents the lower 18 bits of the next transmit descriptor address that is pre-read (but not processed yet). If the current transmit descriptor is the last descriptor, then this field represents the address of the current transmit descriptor. (RO)



DMA2D_OUT_RESET_AVAIL_CH*n* Represents whether it is safe to reset TX channel *n*.

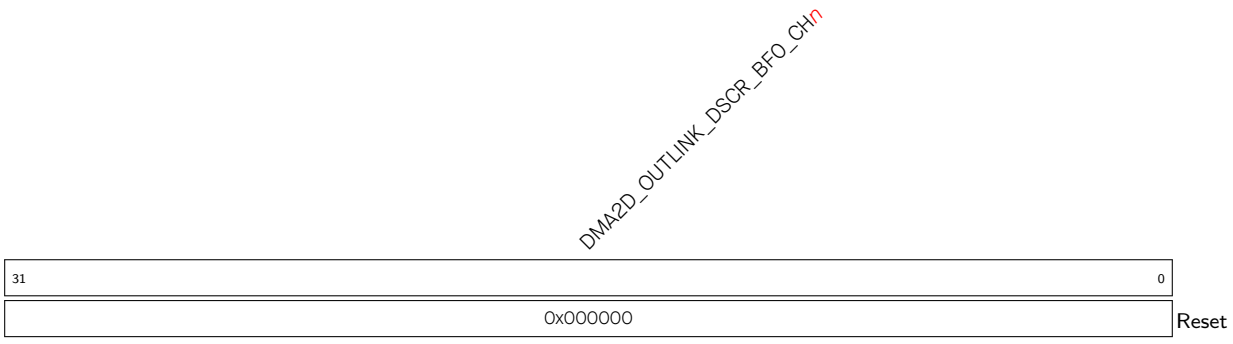
0: Not safe

1: Safe



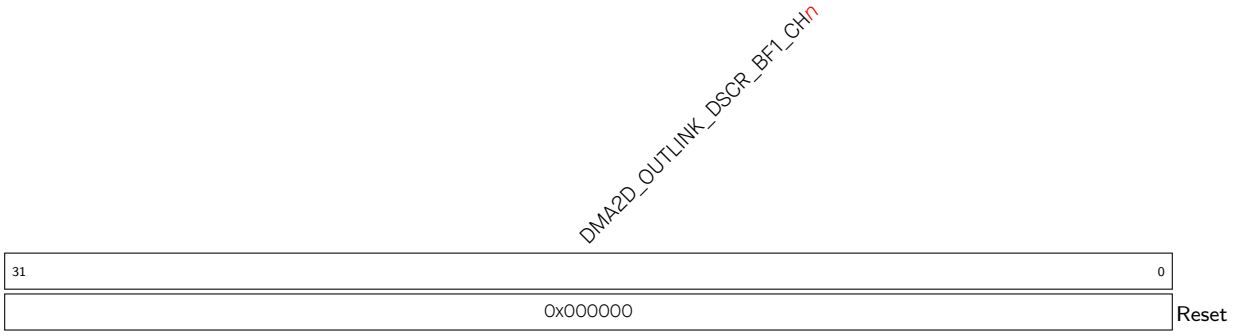
(RO)

Register 8.49. DMA2D_OUT_EOF_DES_ADDR_CH*n*_REG (*n*: 0-3) (0x0028+0x100**n*)



DMA2D_OUT_EOF_DES_ADDR_CH*n* Represents the address of the transmit descriptor when the eof bit in this descriptor is 1. (RO)

Register 8.50. DMA2D_OUT_DSCR_CH*n*_REG (*n*: 0-3) (0x002C+0x100**n*)



DMA2D_OUTLINK_DSCR_CH*n* Represents the address of the next transmit descriptor pointed by the current transmit descriptor that is pre-read. (RO)

Register 8.51. DMA2D_OUT_DSCR_BF0_CH*n*_REG (*n*: 0-3) (0x0030+0x100**n*)

DMA2D_OUTLINK_DSCR_BF0_CH*n* Represents the address of the current transmit descriptor that is pre-read. (RO)

Register 8.52. DMA2D_OUT_DSCR_BF1_CH*n*_REG (*n*: 0-3) (0x0034+0x100n*)**

DMA2D_OUTLINK_DSCR_BF1_CH*n* Represents the address of the previous transmit descriptor that is pre-read. (RO)

Register 8.53. DMA2D_INFIFO_STATUS_CH*n*_REG (*n*: 0-2) (0x0514+0x100**n*)

DMA2D_INFIFO_FULL_L2_CH*n* Represents whether the L2 RX FIFO for RX channel *n* is full.

0: Not full

1: Full

(RO)

DMA2D_INFIFO_EMPTY_L2_CH*n* Represents whether the L2 RX FIFO for RX channel *n* is empty.

0: Not empty

1: Empty

(RO)

DMA2D_INFIFO_CNT_L2_CH*n* Represents the number of data bytes in the L2 RX FIFO for RX channel *n*. (RO)

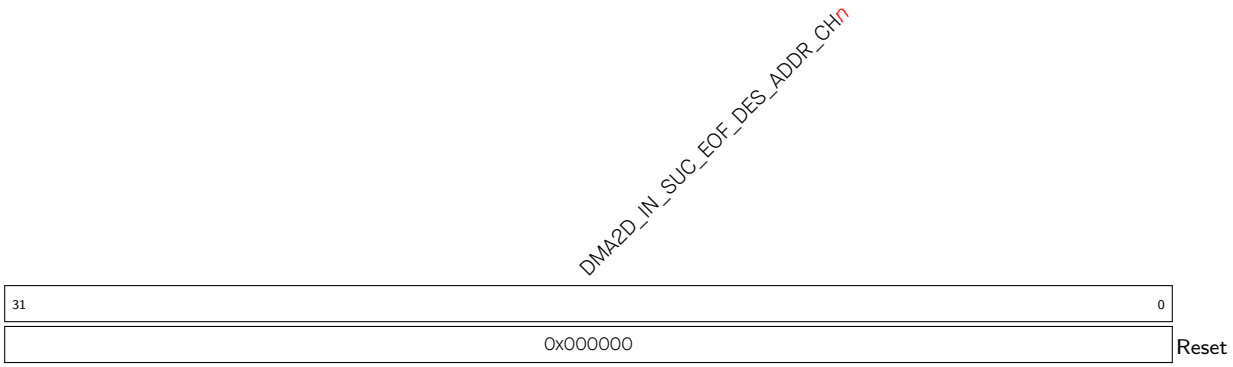
DMA2D_INFIFO_CNT_L3_CH*n* Represents the number of data bytes in the L3 RX FIFO for RX channel *n*. (RO)

Register 8.54. DMA2D_IN_STATE_CH*n*_REG (*n*: 0-2) (0x0524+0x100**n*)

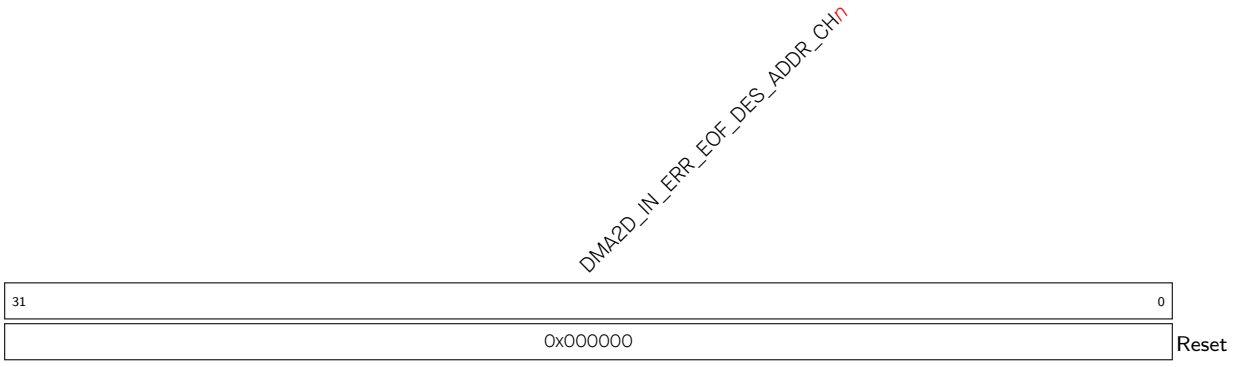
DMA2D_INLINK_DSCR_ADDR_CH*n* Represents the lower 18 bits of the next receive descriptor address that is pre-read (but not processed yet). If the current receive descriptor is the last descriptor, then this field represents the address of the current receive descriptor. (RO)



DMA2D_IN_RESET_AVAIL_CH*n* Represents whether it is safe to reset RX channel *n*.

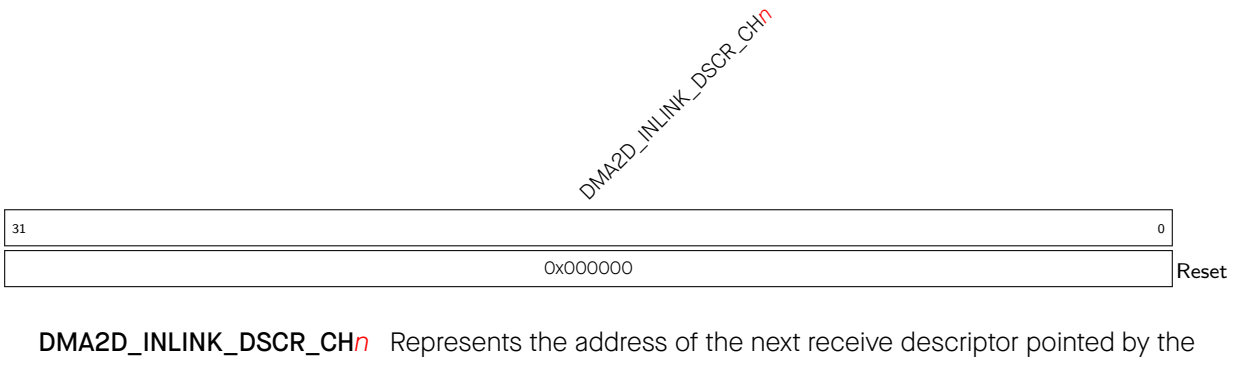
0: Not safe

1: Safe



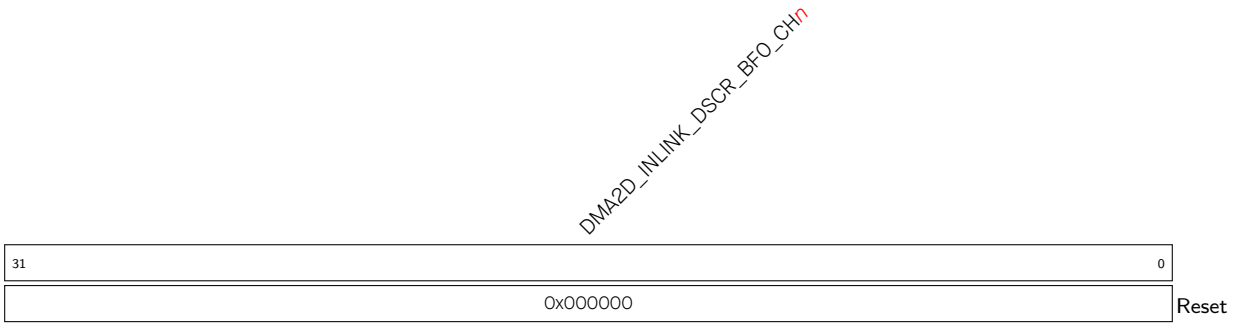
(RO)

Register 8.55. DMA2D_IN_SUC_EOF_DES_ADDR_CH*n*_REG (*n*: 0-2) (0x0528+0x100*n)



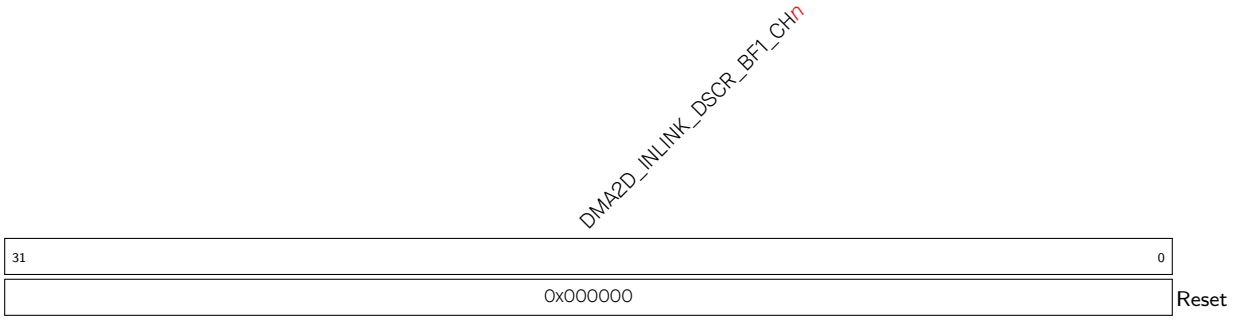
DMA2D_IN_SUC_EOF_DES_ADDR_CH*n* Represents the address of the receive descriptor when the eof bit in this descriptor is 1. (RO)

Register 8.56. DMA2D_IN_ERR_EOF_DES_ADDR_CH*n*_REG (*n*: 0-2) (0x052C+0x100*n)



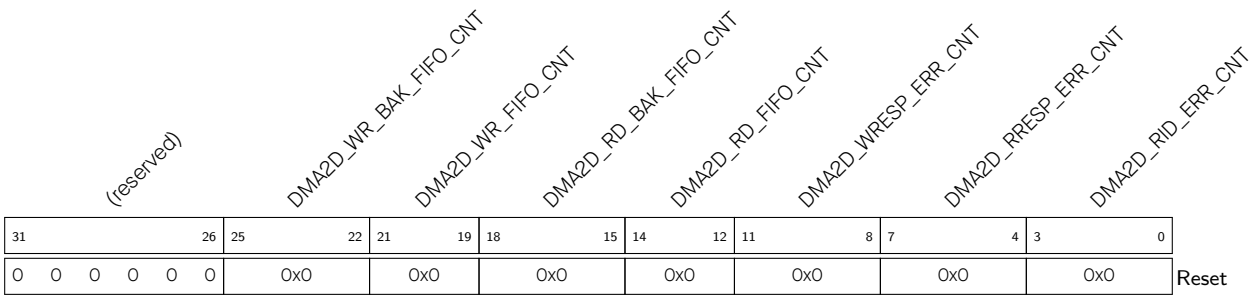
DMA2D_IN_ERR_EOF_DES_ADDR_CH*n* Represents the address of the receive descriptor when there are some errors in the currently received data. Valid only for JPEG. (RO)

Register 8.57. DMA2D_IN_DSCR_CH*n*_REG (*n*: 0-2) (0x0530+0x100*n)



DMA2D_INLINK_DSCR_CH*n* Represents the address of the next receive descriptor pointed by the current receive descriptor that is pre-read. (RO)

Register 8.58. DMA2D_IN_DSCR_BF0_CH*n*_REG (*n*: 0-2) (0x0534+0x100**n*)



DMA2D_INLINK_DSCR_BF0_CH*n* Represents the address of the current receive descriptor that is pre-read. (RO)

Register 8.59. DMA2D_IN_DSCR_BF1_CH*n*_REG (*n*: 0-2) (0x0538+0x100**n*)

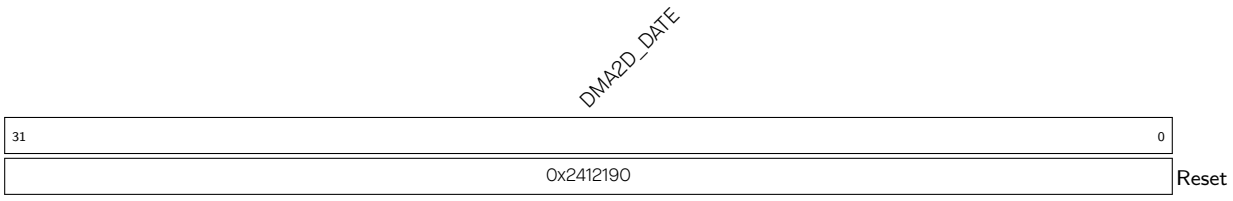
DMA2D_INLINK_DSCR_BF1_CH*n* Represents the address of the previous receive descriptor that is pre-read. (RO)

Register 8.60. DMA2D_AXI_ERR_REG (0x0A00)

DMA2D_RID_ERR_CNT Represents the number of AXI read ID errors. (RO)

DMA2D_RRESP_ERR_CNT Represents the number of AXI read response errors. (RO)

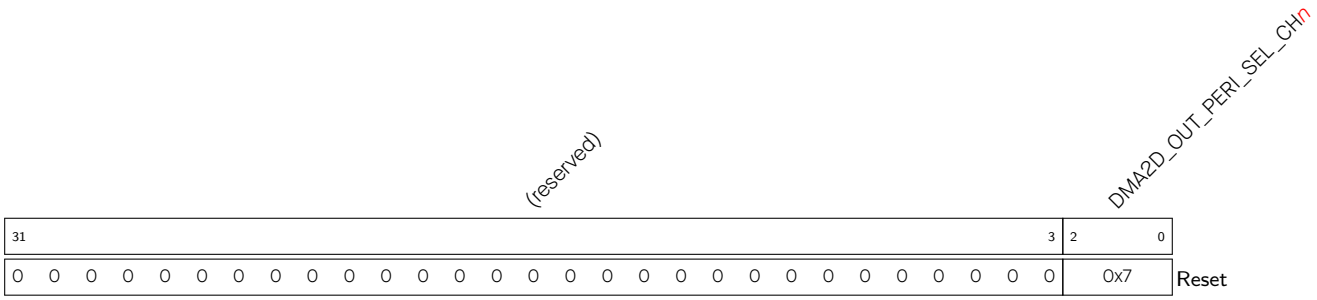
DMA2D_WRESP_ERR_CNT Represents the number of AXI write response errors. (RO)



DMA2D_RD_FIFO_CNT Represents the number of remaining commands in the AXI read command FIFO. (RO)

DMA2D_RD_BAK_FIFO_CNT Represents the number of remaining commands in the AXI read backup command FIFO. (RO)

DMA2D_WR_FIFO_CNT Represents the number of remaining commands in the AXI write command FIFO. (RO)



DMA2D_WR_BAK_FIFO_CNT Represents the number of remaining commands in the AXI write backup command FIFO. (RO)

Register 8.61. DMA2D_DATE_REG (0x0A2C)

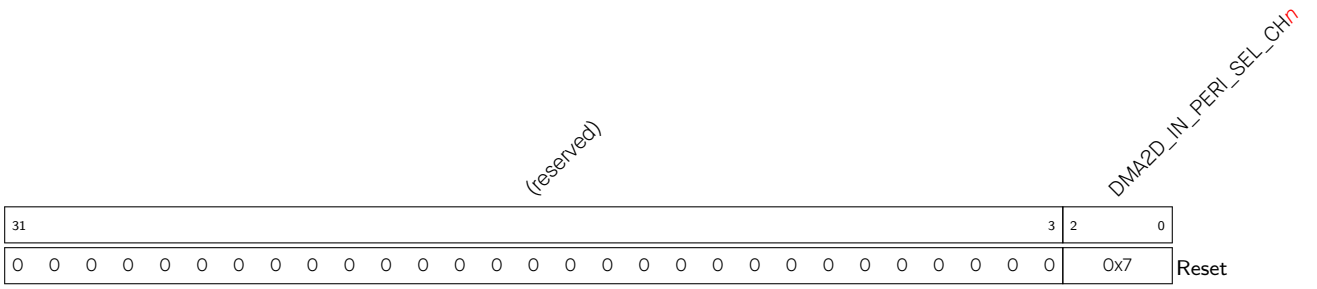
DMA2D_DATE Version control register. (R/W)

Register 8.62. DMA2D_OUT_PERI_SEL_CH*n*_REG (*n*: 0-3) (0x0038+0x100n*)**

DMA2D_OUT_PERI_SEL_CH*n* Configures the peripheral connected to TX channel *n*.

0: JPEG

1: SRM module of PPA



2: BLEND0 channel of PPA

3: BLEND1 channel of PPA

4 ~ 7: Dummy 4 ~ 7

(R/W)

Register 8.63. DMA2D_IN_PERI_SEL_CH*n*_REG (*n*: 0-2) (0x053C+0x100n*)**

DMA2D_IN_PERI_SEL_CH*n* Configures the peripheral connected to RX channel *n*.

0: JPEG

1: SRM module of PPA

2: BLEND module of PPA

3 ~ 7: Dummy 3 ~ 7

(R/W)

Part III

Memory Organization

This part provides insights into the system's memory structure, discussing the organization and mapping of RAM, ROM, eFuse, and external memories, offering a framework for understanding memory-related subsystems.

Chapter 9

System and Memory

9.1 Overview

ESP32-P4 integrates two processors:

- a high-performance 32-bit RISC-V dual-core processor (HP CPU), five-stage pipeline, clock frequency up to 400 MHz.
- a low-power 32-bit RISC-V single-core processor (LP CPU), two-stage pipeline, clock frequency up to 40 MHz.

All internal memory, external memory, and peripherals are located on the HP CPU and LP CPU buses.

9.2 Features

- **Address Space**
  - 896 KB of HP internal memory address space, accessible by the instruction bus or data bus of HP CPU via cache
  - 8 KB of HP internal memory address space, accessible by the instruction bus or data bus of HP CPU
  - 48 KB of LP internal memory address space, accessible by the instruction bus or data bus of LP CPU with zero latency
  - 1256 KB of peripheral address space
  - 64 MB of external flash virtual address space, accessible by the instruction bus or data bus
  - 64 MB of external RAM virtual address space, accessible by the instruction bus or data bus
  - 768 KB of internal DMA address space
  - 128 MB of external DMA address space
- **Internal Memory**
  - 128 KB of HP ROM
  - 768 KB of HP L2MEM
  - 8 KB of HP SPM (Scratchpad Memory)
  - 16 KB of LP ROM
  - 32 KB of LP SRAM
- **External Memory**

  - Supports up to 64 MB of external flash and RAM

- **Peripheral Space**
  - 96 modules/peripherals in total
- **GDMA**
  - 7 GDMA-AHB supported modules/peripherals
  - 6 GDMA-AXI supported modules/peripherals

9.3 Functional Description

9.3.1 Address Mapping

Figure 9.3-1 illustrates the system structure and address mapping. All the non-reserved addresses are accessible via both the instruction bus and the data bus, meaning that the instruction bus and the data bus share the same address space.

Both the data bus and instruction bus of the HP CPU and LP CPU are little-endian. However, the HP CPU's data bus (DBUS) has a 128-bit data width, while other buses maintain a 32-bit data width.

The HP CPU can access data via the data bus using single-byte, double-byte, 4-byte alignment, and, in case of AI Instruction, up to 16-byte alignment. The LP CPU can access data via the data bus using single-byte, double-byte, and 4-byte alignment.

The HP CPU has the following access capabilities:

- Direct access to HP SPM via both the data bus and instruction bus.
- Access to internal memory and external memory mapped into the address space via cache, including:
  - 128 KB HP ROM (0x4FC0_0000 ~ 0x4FC1_FFFF)
  - 768 KB HP L2MEM (0x4FF0_0000 ~ 0x4FFB_FFFF)
  - 64 MB external flash (0x4000_0000 ~ 0x43FF_FFFF)
  - 64 MB external RAM (0x4800_0000 ~ 0x4BFF_FFFF)

  Note:
  Software can use the addresses starting with "0x4" in two ways: cache-able access or noncache-able access, depending on the control of CPU Physical Memory Attribution (PMA). Cache-able access is done via cache. Noncache-able access is done without cache, which is similar to the direct access to the addresses starting with "0x8", however, such direct access to "0x8" addresses is usually for debugging.

- Direct access to internal memory and external memory mapped into the following address space without cache. This access is slower than that via cache.
  - 128 KB HP ROM (0x8FC0_0000 ~ 0x8FC1_FFFF)
  - 768 KB HP L2MEM (0x8FF0_0000 ~ 0x8FFB_FFFF)
  - 32 KB LP SRAM (0x5010_8000 ~ 0x5010_FFFF)

  - 64 MB external flash (0x8000_0000 ~ 0x83FF_FFFF)
  - 64 MB external RAM (0x8800_0000 ~ 0x8BFF_FFFF)
- Direct access to modules/peripherals via the data bus, including:
  - HP CPU Peripherals
  - HP Peripherals
  - LP Peripherals

The LP CPU's access capabilities include:

- Direct access to LP SRAM and LP ROM via both the data bus and instruction bus.
- Access to internal memory and external memory, including:
  - 128 KB HP ROM (0x4FC0_0000 ~ 0x4FC1_FFFF)
  - 768 KB HP L2MEM (0x4FF0_0000 ~ 0x4FFB_FFFF)
  - 64 MB external flash (0x4000_0000 ~ 0x43FF_FFFF)
  - 64 MB external RAM (0x4800_0000 ~ 0x4BFF_FFFF)
- Direct access to modules/peripherals via the data bus, including:
  - HP CPU Peripherals
  - HP Peripherals
  - LP Peripherals

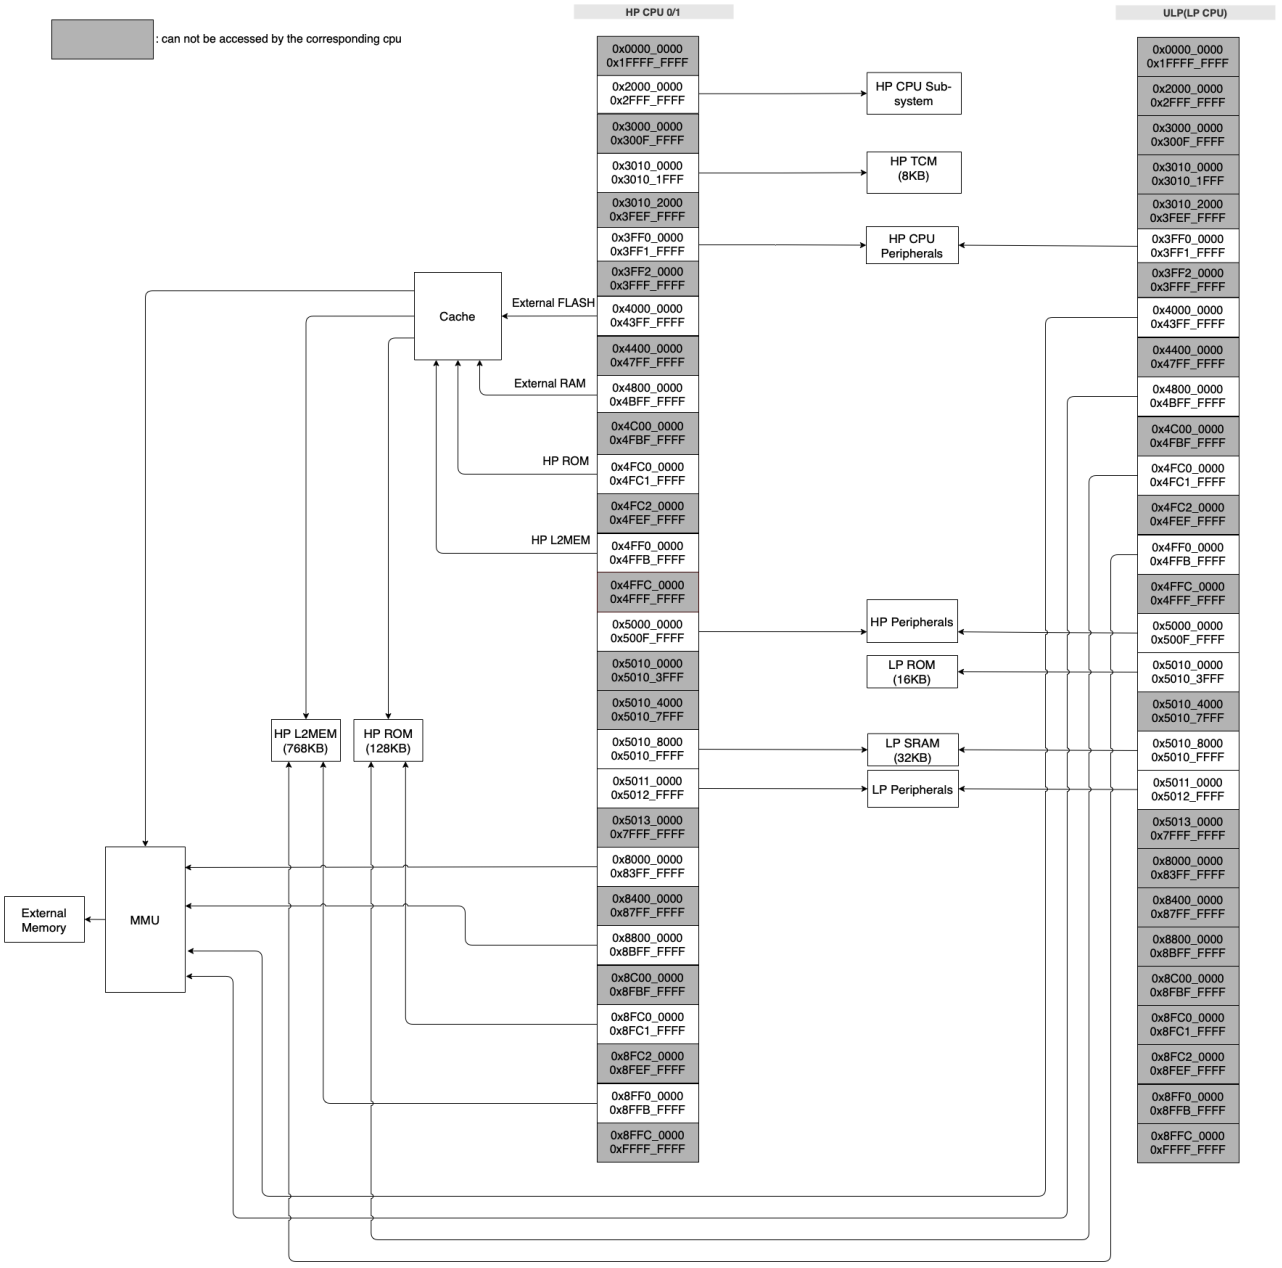


Figure 9.3-1. System Structure and Address Mapping

- The range of addresses available in the address space may be larger than the actual available memory of a particular type.
- For HP CPU sub-system, please refer to Chapter *2 High-Performance CPU*.

Table 9.3-1 lists the address ranges on the data bus and instruction bus and their corresponding target memories.

Table 9.3-1. Memory Address Mapping

Bus Type	Boundary Address		Size	Target*
	Low Address	High Address		
	0x0000_0000	0x300F_FFFF		Reserved

Cont'd on next page

Table 9.3-1 – cont'd from previous page

Bus Type	Boundary Address		Size	Target*
	Low Address	High Address		
Data/Instruction bus	0x3010_0000	0x3010_1FFF	8 KB	HP SPM
	0x3010_2000	0x3FEF_FFFF		Reserved
Data/Instruction bus	0x3FF0_0000	0x3FF1_FFFF	128 KB	HP CPU peripherals
	0x3FF2_0000	0x3FFF_FFFF		Reserved
Data/Instruction bus	0x4000_0000	0x43FF_FFFF	64 MB	External flash
	0x4400_0000	0x47FF_FFFF		Reserved
Data/Instruction bus	0x4800_0000	0x4BFF_FFFF	64 MB	External RAM
	0x4C00_000	0x4FBF_FFFF		Reserved
Data/Instruction bus	0x4FC0_0000	0x4FC1_FFFF	128 KB	HP ROM
	0x4FC2_0000	0x4FEF_FFFF		Reserved
Data/Instruction bus	0x4FF0_0000	0x4FFB_FFFF	768 KB	HP L2MEM
	0x4FFC_0000	0x4FFF_FFFF		Reserved
Data/Instruction bus	0x5000_0000	0x500F_FFFF	1 MB	HP peripherals
Data/Instruction bus	0x5010_0000	0x5010_3FFF	16 KB	LP ROM
	0x5010_4000	0x5010_7FFF		Reserved
Data/Instruction bus	0x5010_8000	0x5010_FFFF	32 KB	LP SRAM
Data/Instruction bus	0x5011_0000	0x5012_FFFF	128 KB	LP peripherals
	0x5013_0000	0x7FFF_FFFF		Reserved
Data/Instruction bus	0x8000_0000	0x83FF_FFFF	64 MB	External flash (direct access by CPU)
	0x8400_0000	0x87FF_FFFF		Reserved
Data/Instruction bus	0x8800_0000	0x8BFF_FFFF	64 MB	External RAM (direct access by CPU)
	0x8C00_000	0x8FBF_FFFF		Reserved
Data/Instruction bus	0x8FC0_0000	0x8FC1_FFFF	128 KB	HP ROM (direct access by CPU)
	0x8FC2_0000	0x8FEF_FFFF		Reserved
Data/Instruction bus	0x8FF0_0000	0x8FFB_FFFF	768 KB	HP L2MEM (direct access by CPU)
	0x8FFC_0000	0xFFFF_FFFF		Reserved

* Address starting with 0x4xxx_xxxx can be configured as noncache-able or cache-able, depending on CPU PMA, whereas address starting with 0x8xxx_xxxx is accessed directly by CPU.

* For the targets accessible by HP CPU or LP CPU, see Figure 9.3-1.

9.3.2 Internal Memory

ESP32-P4 has various types of internal memory:

- **HP ROM (128 KB):** This read-only memory is dedicated to the HP system and is not programmable. It contains the ROM code and read-only data of some low-level system software. The HP ROM is accessed by the HP CPU through the l2 cache at half the frequency of HP CPU.
- **HP L2MEM (768 KB):** A volatile memory accessible by the HP CPU, LP CPU, or DMA peripherals at half the frequency of the HP CPU. HP L2MEM can be configured to retain power during Light-sleep mode, making it suitable for data retention or register backup.
- **LP ROM (16 KB):** This read-only memory serves the LP system, containing the code for booting the LP CPU and some basic system functions. The LP ROM is accessed by the LP CPU with zero latency.

- **LP SRAM (32 KB):** A volatile memory accessible by both the HP CPU and LP CPU, operating at the same frequency as the LP CPU.
- **HP SPM (8 KB):** A volatile memory accessed by the HP CPU, finishing one access in two cycles.

1. Details for HP ROM

The 128 KB HP ROM is a read-only memory accessed by the HP CPU through the instruction bus or data bus via the following addresses as shown in Table 9.3-1:

- 0x4FC0_0000 (cache-able or noncache-able, configuration-dependent) ~ 0x4FC1_FFFF (cache-able or noncache-able, configuration-dependent).
- 0x8FC0_0000 (direct access by CPU) ~ 0x8FC1_FFFF (direct access by CPU).

2. Details for HP L2MEM

This 768 KB HP L2MEM is a read-and-write memory accessed by the HP CPU or LP CPU through the instruction bus or data bus, or by DMA master through AHB matrix or AXI matrix via the following addresses as shown in Table 9.3-1:

- 0x4FF0_0000 (cache-able or noncache-able, configuration-dependent) ~ 0x4FFB_FFFF (cache-able or noncache-able, configuration-dependent).
- 0x8FF0_0000 (direct access by CPU) ~ 0x8FFB_FFFF (direct access by CPU).

L2MEM supports multiple capacity split configurations: L2 RAM and L2 cache share a total capacity of 768 KB, and one of the following four configurations can be selected:

- Config 0: L2 RAM 256 KB, L2 cache 512 KB
- Config 1: L2 RAM 512 KB, L2 cache 256 KB
- Config 2: L2 RAM 640 KB, L2 cache 128 KB
- Config 3: L2 RAM 768 KB, L2 cache 0 KB

The address layout of HP L2MEM for the above four configurations is shown in Figure 9.3-2.

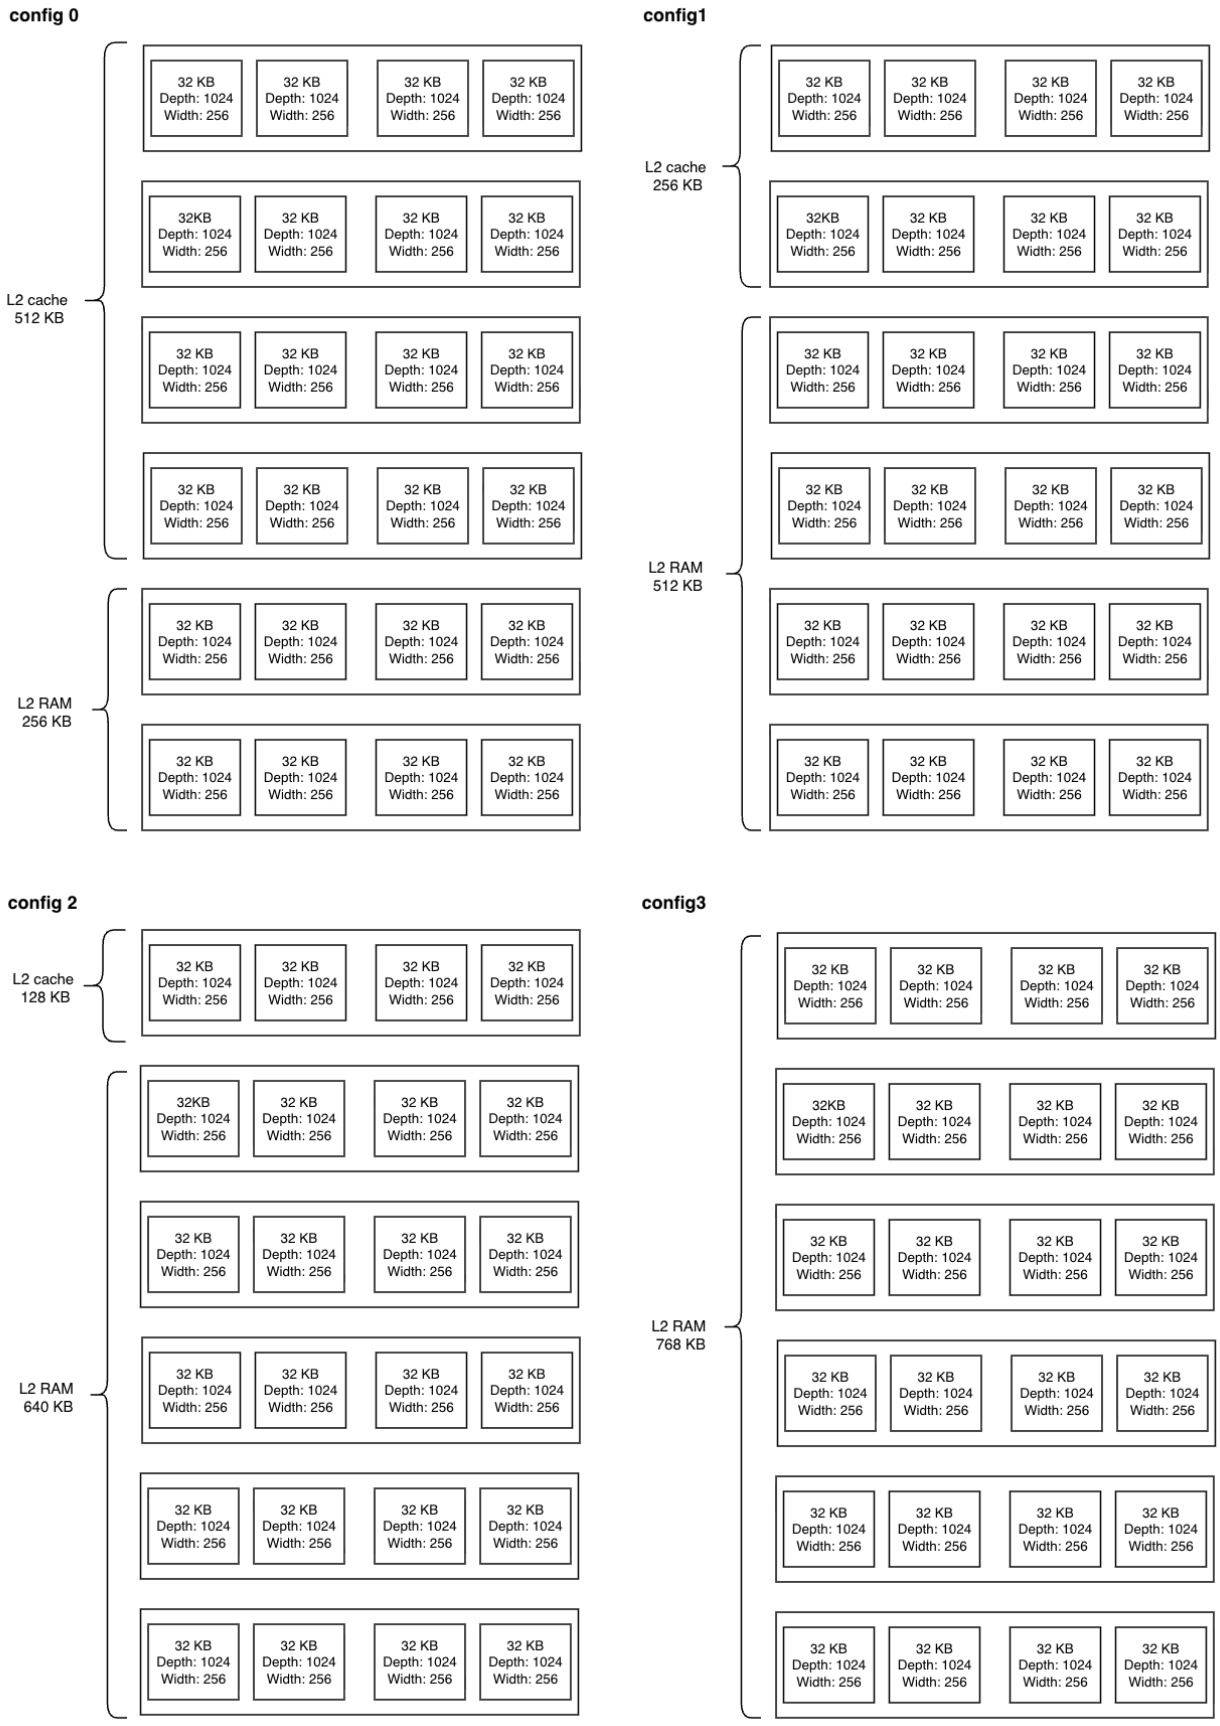

Figure 9.3-2. HP L2MEM Address Layout

HP L2MEM can be accessed by various peripherals:

- by USB 2.0 High-Speed OTG, USB 2.0 Full-Speed OTG, GMAC, SDMMC, TRACE, GDMA-AHB, and SYSMON via AHB matrix.
- by GDMA, GDMA-AXI, 2D-DMA, and H264 Encoder via AXI matrix.

The HP L2MEM supports Error Correction Code (ECC) check to correct one-bit memory flip error. In the event of a one-bit flip error, the data in HP L2MEM still remains valid. Before ECC check, HP L2MEM itself must be initialized first.

HP L2MEM consists of six memory units, each occupying 128 KB. The initialization process allows individual configuration of each unit for power considerations. It is recommended to initialize memory units sequentially rather than simultaneously. This sequential approach helps prevent excessive power consumption and avoids triggering a brownout condition when initializing the entire 768 KB HP L2MEM.

Detailed Configuration Steps:
Take unit0 as an example, other units follow the same configuration steps.

- Set HP_SYSTEM_L2_MEM_UNIT0_REFRESH_EN and clear HP_SYSTEM_L2_MEM_REFRESH_CNT_RESET to start initializing HP L2MEM.
- Read the value of HP_SYSTEM_L2_MEM_UNIT0_REFRESH_DONE.
- Once HP_SYSTEM_L2_MEM_UNIT0_REFRESH_DONE reaches a value of 1, set HP_SYSTEM_L2_RAM_UNIT0_ECC_EN to start ECC check.
- (Recommended) clear HP_SYSTEM_L2_MEM_UNIT0_REFRESH_EN and set HP_SYSTEM_L2_MEM_REFRESH_CNT_RESET after HP_SYSTEM_L2_MEM_UNIT0_REFRESH_DONE reaches 1 to complete the initialization process.

During the initialization process, avoid any access to HP L2MEM unit being initialized.

3. Details for LP ROM

This 16 KB LP ROM is a read-only memory accessed by LP CPU through the instruction bus or data bus via their shared address 0x5010_0000 ~ 0x5010_3FFF as shown in Table 9.3-1.

4. Details for LP SRAM

This 32 KB LP SRAM is a read-and-write memory accessed by the HP CPU via AHB matrix and by the LP CPU through the instruction bus or data bus via their shared address 0x5010_8000 ~ 0x5010_FFFF as shown in Table 9.3-1. LP SRAM supports atomic operation.

5. Details for HP SPM

This 8 KB HP SPM is a read-and-write memory accessed by the HP CPU through the instruction bus or data bus via their shared address 0x3010_0000 ~ 0x3010_1FFF as shown in Table 9.3-1. Additionally, HP SPM supports atomic operation of the HP CPU.

HP SPM supports parity check to detect one-bit memory flip error. Before conducting the parity check, HP SPM itself must be initialized first.

Detailed Configuration Steps:

- Set HP_SYSTEM_SPM_INIT_EN and clear HP_SYSTEM_SPM_INIT_CNT_RESET to start initializing HP SPM.

- Read the value of HP_SYSTEM_SPM_INIT_DONE.
- Once HP_SYSTEM_SPM_INIT_DONE reaches a value of 1, set HP_SYSTEM_HP_SPM_PARITY_CHECK_EN to start parity check.
- (Recommended) clear HP_SYSTEM_SPM_INIT_EN and set HP_SYSTEM_SPM_INIT_CNT_RESET after HP_SYSTEM_SPM_INIT_CNT_RESET reaches 1 to complete the initialization process.

During the above process, avoid any access to HP SPM.

9.3.3 External Memory

ESP32-P4 supports SPI, dual SPI, quad SPI and QPI interfaces for connecting to external flash, as well as OPI and HPI interfaces for connecting to external RAM.

ESP32-P4 provides the following security features to protect users' data in external flash and RAM:

- hardware manual encryption and automatic decryption based on XTS-AES algorithm to protect users' programs and data stored in the external flash.
- automatic encryption and decryption based on XTS-AES algorithm to protect users' data in the external RAM.

9.3.3.1 External Memory Address Mapping

HP CPU can access external flash or RAM via 0x4000_0000 ~ 0x43FF_FFFF or via 0x4800_0000 ~ 0x4BFF_FFFF using cache-able or noncache-able methods. HP CPU can also access external flash or RAM directly via 0x8000_0000 ~ 0x83FF_FFFF or via 0x8800_0000 ~ 0x8BFF_FFFF, which is slower than the access via cache and is therefore commonly used for debugging.
When the HP CPU accesses external memory, it maps the addresses to physical addresses based on the information in the Memory Management Unit (MMU).

- Range (0x4000_0000 ~ 0x43FF_FFFF) is mapped to the physical address of the external flash accessed by HP CPU via cache.
- Range (0x4800_0000 ~ 0x4BFF_FFFF) is mapped to the physical address of the external RAM accessed by HP CPU via cache.
- Range (0x8000_0000 ~ 0x83FF_FFFF) is mapped to the physical address of the external flash accessed by HP CPU directly.
- Range (0x8800_0000 ~ 0x8BFF_FFFF) is mapped to the physical address of the external RAM accessed by HP CPU directly.

This mapping allows ESP32-P4 to address up to 64 MB of external flash and 64 MB of external RAM. **Note that** the instruction bus shares the same address space (64 MB) with the data bus for accessing external memory.

9.3.3.2 Cache

As shown in Figure 9.3-3, ESP32-P4 has a two-level cache system, with the following features:

- L1 cache, including:
  - 16 KB of instruction cache (icache) with a 64 B block size, four-way set associative

  - 64 KB of data cache (dcache) with a 64 B block size, two-way set associative, supporting two writing strategies: write-through and write-back
- L2 cache: 128 KB/256 KB/512 KB with 64 B/128 B block sizes, eight-way set associative
- Cache-able and noncache-able access, depending on CPU PMA
- Preload operation
- Lock operation
- Critical word first and early restart

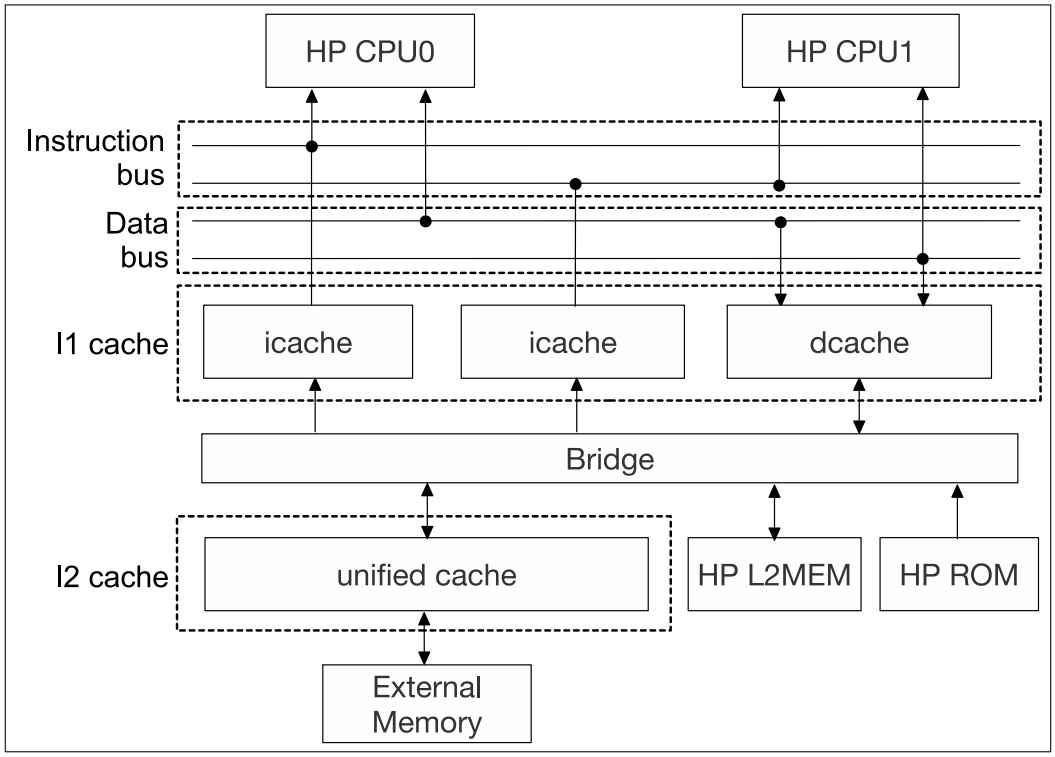

Figure 9.3-3. Cache Structure

9.3.3.3 Cache Operations

ESP32-P4 I1 cache and I2 cache supports the following operations:

1. **Write-back** (for dcache and I2 cache only):
   - Clears dirty bits in the tag memory and updates new data to external memory.
   - After the write-back operation, the new data is updated to external memory.
   - Users can choose whether to invalidate the data in the cache.
   - If the data is not invalidated, CPU will read/write data directly from/to the cache where data missing will not occur.
2. **Clean** (for dcache and I2 cache only):
   - Clears dirty bits in the tag memory without updating data to external memory.
   - After the clean operation, old data remains in external memory, while the cache holds the new one (unaware of it).

- CPU can then read/write the data directly from/to the cache, where data missing will not occur.

3. **Invalidate**:
   - Removes valid data from the cache.
   - Once this operation is done, the deleted data is stored only in external memory.
   - HP CPU needs to access external memory if it wants to access the data again.
   - Two types of invalidate operation:
     - Manual-Invalidate: is performed only on data in the specified cache area.
     - Invalidate-All: is performed on all data in the cache.
4. **Preload**:
   - Loads instructions and data into the cache in advance.
   - Minimum unit of preload-operation is one block.
   - Two types of preload operation:
     - Manual-Preload: involves the hardware prefetching continuous data based on the virtual address specified by the software.
     - Auto-Preload: involves the hardware prefetching continuous data based on the current address where the cache hits or misses (configuration-dependent).
5. **Lock/Unlock**:
   - Lock operation prevents easily replacing data in the cache.
   - Two types of lock:
     - Prelock: locks data in the specified area when filling missing data to cache memory, leaving the data outside the specified area unlocked.
     - Manual Lock: checks data in the cache memory and locks data only if it falls in the specified area, leaving data outside the specified area unlocked.
   - When there is missing data, the cache replaces the data in the unlocked way first, ensuring that the data in the locked way remains in the cache and will not be replaced.
   - When all ways within the cache are locked, the cache will replace data, as if it was not locked.
   - Unlocking is the reverse of locking and can only be done manually.
   - Note: Manual-Invalidate operation only works on the unlocked data. If you plan to perform this operation on the locked data, please unlock them first.

9.3.4 DMA Address Space

ESP32-P4 includes AHB General Direct Memory Access (GDMA-AHB), AXI General Direct Memory Access (GDMA-AXI), and VDMA, all providing general direct memory access services.

In ESP32-P4, masters like USB 2.0 High-Speed OTG, USB 2.0 Full-Speed OTG, GDMAC, Trace0/1, VDMA, 2D-DMA, and H264 Encoder have built-in DMA function modules, providing direct memory access services.

All DMA-enabled master devices mentioned above can access:

- HP L2MEM (0x4FF0_0000~0x4FFB_FFFF).
- external flash (0x4000_0000 ~ 0x43FF_FFFF).
- external RAM (0x4800_0000 ~ 0x4BFF_FFFF).

Additionally, VDMA Master 1 can also access:

- MIPI CSI internal memory (0x5010_4000 ~ 0x5010_4FFF).
- MIPI DSI internal memory (0x5010_5000 ~ 0x5010_5FFF).

Note:
When accessing a memory via DMA, a corresponding access permission is needed, otherwise this access may fail. For more information about permission control, please refer to Chapter 20 *Permission Control (PMS)*.

9.3.5 Modules/Peripherals Address Mapping

Table 9.3-2 lists all the modules/peripherals and their respective address ranges. Note that the address space of specific modules/peripherals is defined by "Boundary Address" (including both Low Address and High Address).

Table 9.3-2. Module/Peripheral Address Mapping

9.4 eFuse Controller (EFUSE)

9.4.1 Overview

ESP32-P4 contains a 4096-bit eFuse memory to store parameters and user data. The parameters include control parameters for some hardware modules, system data parameters and keys used for the encryption/decryption module. Once an eFuse bit is programmed to 1, it can never be reverted to 0. The eFuse controller programs individual bits of parameters in eFuse according to user configurations. From outside the chip, eFuse data can only be read via the eFuse controller. For some data, such as some keys stored in eFuse for internal use by hardware cryptography modules (e.g., digital signature, HMAC), if read protection is not enabled, the data can be read from outside the chip; if read protection is enabled, the data cannot be read from outside the chip.

9.4.2 Features

- 4096-bit one-time programmable memory (including up to 1792 bits reserved for custom use, depending on whether all EFUSE_KEY_PURPOSE_*n* parameters are set to 0. For more information, see Table 9.4-2)
- Configurable write protection
- Configurable read protection
- Multiple hardware encoding schemes against data corruption

9.4.3 Functional Description

9.4.3.1 Structure

The eFuse system consists of the eFuse controller and eFuse memory. Data flow in this system is shown in Figure 9.4-1.

Users can program bits in the eFuse memory via the eFuse controller by writing the data to be programmed to the programming register and executing the programming instruction. For detailed programming steps, please refer to Section 9.4.3.2.

Users cannot directly read the data programmed in the eFuse memory, so they need to read the programmed data into the Reading Data Register of the corresponding address segment through the eFuse controller. During the reading process, if the data is inconsistent with that in the eFuse memory, the eFuse controller can automatically correct it through the hardware encoding mechanism (see Section 9.4.3.1.3 for details), and send the error message to the error report register. For detailed steps to read parameters, please refer to the Section 9.4.3.3.

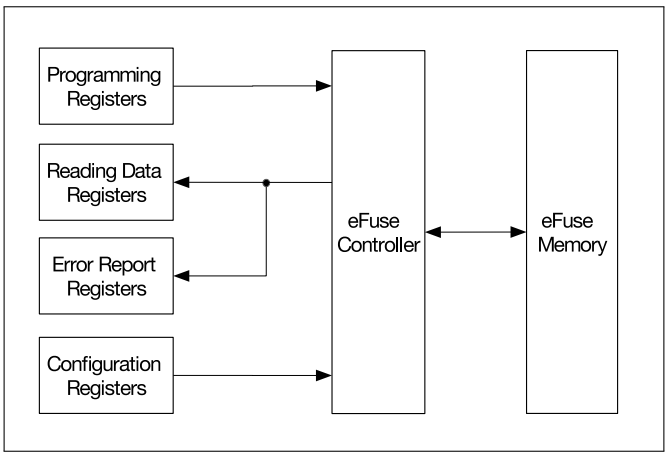

Figure 9.4-1. Data Flow in eFuse

Data in eFuse memory is organized in 11 blocks (BLOCK0 ~ BLOCK10).

BLOCK0 holds most parameters for software and hardware uses.

Table 9.4-1 lists the name, bit width, hardware accessibility, write-protection bit, and brief function description of every parameter in BLOCK0 that is accessible to users (readable and usable). For more information on each parameter, follow the link in the table.

The **EFUSE_WR_DIS** parameter controls write protection for other parameters. **EFUSE_RD_DIS** controls read protection for BLOCK4 ~ BLOCK10. For more information on these two parameters, please see Section 9.4.3.1.1 and Section 9.4.3.1.2.

Table 9.4-1. Parameters in eFuse BLOCK0

Parameters	Bit Width	Accessible by Hardware	Write Protection by EFUSE_WR_DIS Bit Number	Description
EFUSE_WR_DIS	32	Y	N/A	Represents whether writing of eFuse bits by eFuse controller is disabled.
EFUSE_RD_DIS	7	Y	0	Represents whether reading data from BLOCK4 ~ BLOCK10 in eFuse memory by users is disabled.
EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_0_1	2	N	N/A	Represents the starting flash sector (flash sector size is 0x1000) of the recovery bootloader used by the ROM bootloader if the primary bootloader fails.
EFUSE_DIS_USB_JTAG	1	Y	2	Represents whether the USB-to-JTAG function in the USB device module is disabled.
EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_2_2	1	N	N/A	Represents the starting flash sector (flash sector size is 0x1000) of the recovery bootloader used by the ROM bootloader if the primary bootloader fails.
EFUSE_DIS_FORCE_DOWNLOAD	1	Y	2	Set this bit to disable the function that forces chip into download mode.
EFUSE_SPI_DOWNLOAD_MSPI_DIS	1	Y	2	Set this bit to disable accessing MSPI flash/MSPI RAM by SYS AXI matrix during boot_mode_download.
EFUSE_DIS_TWAI	1	Y	2	Set this bit to disable TWAI function.
EFUSE_JTAG_SEL_ENABLE	1	Y	2	Set this bit to enable selection between usb_to_jtag and pad_to_jtag through strapping gpio25 when both EFUSE_DIS_PAD_JTAG and EFUSE_DIS_USB_JTAG are equal to 0.
EFUSE_SOFT_DIS_JTAG	3	Y	31	Represents whether JTAG is soft-disabled. It can be restarted via HMAC. Odd count of bits with a value of 1: Disabled, Even count of bits with a value of 1: Enabled.
EFUSE_DIS_PAD_JTAG	1	Y	2	Set this bit to hard-disable JTAG. (Permanent disable)

Table 9.4-1 – cont'd from previous page

Parameters	Bit Width	Accessible by Hardware	Write Protection by EFUSE_WR_DIS Bit Number	Description
EFUSE_DIS_DOWNLOAD_MANUAL_ENCRYPT	1	Y	2	Set this bit to disable flash manual encrypt function (except in SPI boot mode).
EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_3_6	4	N	N/A	Represents the starting flash sector (flash sector size is 0x1000) of the recovery bootloader used by the ROM bootloader if the primary bootloader fails.
EFUSE_USB_PHY_SEL	1	Y	30	Configures the corresponding relationship between the two PHYs and the USB interfaces.
EFUSE_HUK_GEN_STATE	5	Y	19	Set the bits to control validation of HUK generate mode. The value is valid when the count of 1 bits is even, and invalid when odd.
EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_7_7	1	N	N/A	Represents the starting flash sector (flash sector size is 0x1000) of the recovery bootloader used by the ROM bootloader if the primary bootloader fails.
EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_8_10	3	N	N/A	Represents the starting flash sector (flash sector size is 0x1000) of the recovery bootloader used by the ROM bootloader if the primary bootloader fails.
EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_11_11	1	N	N/A	Represents the starting flash sector (flash sector size is 0x1000) of the recovery bootloader used by the ROM bootloader if the primary bootloader fails.
EFUSE_KM_RND_SWITCH_CYCLE	1	Y	1	Set the bits to control key manager random number switch cycle.

Cont'd on next page

Table 9.4-1 – cont'd from previous page

Parameters	Bit Width	Accessible by Hardware	Write Protection by EFUSE_WR_DIS Bit Number	Description
EFUSE_KM_DEPLOY_ONLY_ONCE	4	Y	1	This field, together with EFUSE_KM_DEPLOY_ONLY_ONCE_H form one field: EFUSE_KM_DEPLOY_ONLY_ONCE_H, EFUSE_KM_DEPLOY_ONLY_ONCE[3:0]. Set each bit to control whether corresponding key can only be deployed once. 1 is true, 0 is false. bit 0: ecsda, bit 1: xts, bit2: hmac, bit3: ds, bit4: psram
EFUSE_FORCE_USE_KEY_MANAGER_KEY	4	Y	1	This field, together with EFUSE_FORCE_USE_KEY_MANAGER_KEY_H, forms EFUSE_FORCE_USE_KEY_MANAGER_KEY_H, EFUSE_FORCE_USE_KEY_MANAGER_KEY[3:0]. Each bit determines whether the corresponding key must be sourced from the key manager.
EFUSE_FORCE_DISABLE_SW_INIT_KEY	1	Y	1	Set this bit to disable software written init key, and force use efuse_init_key.
EFUSE_KM_XTS_KEY_LENGTH_256	1	N	1	Set this bit to use XTS-512 key for flash encryption, otherwise XTS-256 key is used when the key manager is enabled.
EFUSE_ECC_FORCE_CONST_TIME	1	Y	14	Set this bit to permanently turn on ECC const-time mode.
EFUSE_WDT_DELAY_SEL	1	Y	2	Select LP WDT timeout threshold.
EFUSE_SPI_BOOT_CRYPT_CNT	3	Y	4	Set this bit to enable SPI boot encrypt/decrypt.
EFUSE_SECURE_BOOT_KEY_REVOKE0	1	N	5	Set this bit to enable revoking first secure boot key.
EFUSE_SECURE_BOOT_KEY_REVOKE1	1	N	6	Set this bit to enable revoking second secure boot key.
EFUSE_SECURE_BOOT_KEY_REVOKE2	1	N	7	Set this bit to enable revoking third secure boot key.
EFUSE_KEY_PURPOSE_0	4	Y	8	Purpose of Key0.
EFUSE_KEY_PURPOSE_1	4	Y	9	Purpose of Key1.
EFUSE_KEY_PURPOSE_2	4	Y	10	Purpose of Key2.
EFUSE_KEY_PURPOSE_3	4	Y	11	Purpose of Key3.

Table 9.4-1 – cont'd from previous page

Parameters	Bit Width	Accessible by Hardware	Write Protection by EFUSE_WR_DIS Bit Number	Description
EFUSE_KEY_PURPOSE_4	4	Y	12	Purpose of Key4.
EFUSE_KEY_PURPOSE_5	4	Y	13	Purpose of Key5.
EFUSE_SEC_DPA_LEVEL	2	Y	14	Configures the clock random divide mode to determine the DPA secure level.
EFUSE_XTS_DPA_CLK_ENABLE	1	Y	14	Sets this bit to enable xts clock anti-DPA attack function.
EFUSE_SECURE_BOOT_EN	1	N	15	Set this bit to enable secure boot.
EFUSE_SECURE_BOOT_AGGRESSIVE_REVOKE	1	N	16	Set this bit to enable revoking aggressive secure boot.
EFUSE_KM_DEPLOY_ONLY_ONCE_H	1	Y	1	This field, together with EFUSE_KM_DEPLOY_ONLY_ONCE, forms EFUSE_KM_DEPLOY_ONLY_ONCE_H, EFUSE_KM_DEPLOY_ONLY_ONCE[3:0]. Each bit controls whether the corresponding key can be deployed only once.
EFUSE_FORCE_USE_KEY_MANAGER_KEY_H	1	Y	1	Form one field together with EFUSE_FORCE_USE_KEY_MANAGER_KEY: EFUSE_FORCE_USE_KEY_MANAGER_KEY_H, EFUSE_FORCE_USE_KEY_MANAGER_KEY[3:0]. Set each bit to control whether corresponding key must come from key manager.
EFUSE_FLASH_ECC_EN	1	N	18	Set this bit to enable ECC for flash boot.
EFUSE_DIS_USB_OTG_DOWNLOAD_MODE	1	N	18	Set this bit to disable download via USB-OTG.
EFUSE_FLASH_TPUW	4	N	18	Configures flash waiting time after power-up, in unit of ms.
EFUSE_DIS_DOWNLOAD_MODE	1	N	18	Set this bit to disable download mode (boot_mode[3:0] = 0, 1, 2, 4, 5, 6, 7).
EFUSE_DIS_DIRECT_BOOT	1	N	18	Set this bit to disable direct boot mode.
EFUSE_DIS_USB_SERIAL_JTAG_ROM_PRINT	1	N	18	Set this bit to disable USB-Serial-JTAG print during rom boot.

Table 9.4-1 – cont'd from previous page

Parameters	Bit Width	Accessible by Hardware	Write Protection by EFUSE_WR_DIS Bit Number	Description
EFUSE_LOCK_KM_KEY	1	N	1	set this bit to lock the key manager key after deploy.
EFUSE_DIS_USB_SERIAL_JTAG_DOWNLOAD_MODE	1	N	18	Set this bit to disable the USB-Serial-JTAG download function.
EFUSE_ENABLE_SECURITY_DOWNLOAD	1	N	18	Set this bit to enable security download mode.
EFUSE_UART_PRINT_CONTROL	2	N	18	Set the type of UART printing.
EFUSE_FORCE_SEND_RESUME	1	N	18	Set this bit to force ROM code to send a resume command during SPI boot.
EFUSE_SECURE_VERSION	16	N	18	Secure version used by ESP-IDF anti-rollback feature.
EFUSE_SECURE_BOOT_DISABLE_FAST_WAKE	1	N	18	Represents whether FAST VERIFY ON WAKE is disabled when Secure Boot is enabled.
EFUSE_HYS_EN_PAD	1	Y	2	Set bits to enable hysteresis function of PAD0 27.
EFUSE_KEY_PURPOSE_0_H	1	Y	8	Purpose of Key0 (5th bit).
EFUSE_KEY_PURPOSE_1_H	1	Y	9	Purpose of Key1 (5th bit).
EFUSE_KEY_PURPOSE_2_H	1	Y	10	Purpose of Key2. (5th bit).
EFUSE_KEY_PURPOSE_3_H	1	Y	11	Purpose of Key3. (5th bit).
EFUSE_KEY_PURPOSE_4_H	1	Y	12	Purpose of Key4. (5th bit).
EFUSE_OPXA_TIEH_SEL_0	2	Y	2	Output LDO VO0 tieh source select.
EFUSE_PVT_GLITCH_EN	1	Y	3	Represents whether to enable PVT power glitch monitor function.
EFUSE_KEY_PURPOSE_5_H	1	Y	13	Purpose of Key5. (5th bit).
EFUSE_KM_DISABLE_DEPLOY_MODE_H	1	Y	1	EFUSE_KM_DISABLE_DEPLOY_MODE and EFUSE_KM_DISABLE_DEPLOY_MODE_H together form one field: EFUSE_KM_DISABLE_DEPLOY_MODE_H, EFUSE_KM_DISABLE_DEPLOY_MODE[3:0]. Set each bit to control whether corresponding key's deploy mode of new value deployment is disabled.

Table 9.4-1 – cont'd from previous page

Parameters	Bit Width	Accessible by Hardware	Write Protection by EFUSE_WR_DIS Bit Number	Description
EFUSE_KM_DISABLE_DEPLOY_MODE	4	Y	1	This field, together with EFUSE_KM_DISABLE_DEPLOY_MODE_H, forms a complete field EFUSE_KM_DISABLE_DEPLOY_MODE_H, EFUSE_KM_DISABLE_DEPLOY_MODE[3:0]. Each bit controls whether the deploy mode for new value deployment of the corresponding key is disabled.
EFUSE_XTS_DPA_PSEUDO_LEVEL	2	Y	14	Sets this bit to control the xts pseudo-round anti-dpa attack function.
EFUSE_HP_PWR_SRC_SEL	1	Y	17	HP system power source select.
EFUSE_SECURE_BOOT_SHA384_EN	1	N	N/A	Represents whether secure boot using SHA-384 is enabled.
EFUSE_DIS_WDT	1	Y	2	Set this bit to disable watch dog.
EFUSE_DIS_SWD	1	Y	2	Set bit to disable super-watchdog.
EFUSE_PVT_GLITCH_MODE	2	Y	3	Use to configure glitch mode.

Table 9.4-2 lists all key purposes and their values. Setting the eFuse parameter EFUSE_KEY_PURPOSE_*n* declares the purpose of KEY*n* (*n*: 0 ~ 5).

Table 9.4-2. Secure Key Purpose Values

Key Purpose Values	Purposes
0	Designated for user use
1	Designated for ECDSA_KEY
2	Designated for XTS_AES_256_KEY_1
3	Designated for XTS_AES_256_KEY_2
4	Designated for XTS_AES_128_KEY (for flash/SRAM encryption and decryption)
5	Designated for HMAC Downstream mode (JTAG and Digital Signature)
6	Designated for JTAG in HMAC Downstream mode
7	Designated for Digital Signature in HMAC Downstream mode
8	Designated for HMAC Upstream mode
9	Designated for SECURE_BOOT_DIGEST0 (secure boot key digest)
10	Designated for SECURE_BOOT_DIGEST1 (secure boot key digest)
11	Designated for SECURE_BOOT_DIGEST2 (secure boot key digest)
12	Designated for KM_INIT_KEY

Table 9.4-3 provides the details of parameters in BLOCK1 ~ BLOCK10.

Table 9.4-3. Parameters in BLOCK1 to BLOCK10

BLOCK	Parameters	Bit Width	Accessible by Hardware	Write Protection by EFUSE_WR_DIS Bit Number	Read Protection by EFUSE_RD_DIS Bit Number	Description
BLOCK1	EFUSE_MAC	48	Y	20	N/A	Represents the MAC address (lower 48 bits).
	EFUSE_SYS_DATA_PART0	78	N	20	N/A	Represents the first 78 bits of Part 0 of system data.
BLOCK2	EFUSE_SYS_DATA_PART1	256	N	21	N/A	System data
BLOCK3	EFUSE_USR_DATA	256	N	22	N/A	User data
BLOCK4	EFUSE_KEY0_DATA	256	Y	23	0	KEY0 or user data
BLOCK5	EFUSE_KEY1_DATA	256	Y	24	1	KEY1 or user data
BLOCK6	EFUSE_KEY2_DATA	256	Y	25	2	KEY2 or user data
BLOCK7	EFUSE_KEY3_DATA	256	Y	26	3	KEY3 or user data
BLOCK8	EFUSE_KEY4_DATA	256	Y	27	4	KEY4 or user data
BLOCK9	EFUSE_KEY5_DATA	256	Y	28	5	KEY5 or user data
BLOCK10	EFUSE_SYS_DATA_PART2	192	N	29	6	Represents the first 32 bits of Part 2 of system data.
	EFUSE_USB_DEVICE_EXCHG_PINS	1	Y	29	6	Enables swapping of the D+ and D- pins for USB-Serial-JTAG.
	EFUSE_USB_OTG11_EXCHG_PINS	1	Y	29	6	Enables swapping of the D+ and D- pins for USB OTG11.

Among these blocks, BLOCK4 ~ 9 can be used to store KEY0 ~ 5. Up to six 256-bit keys can be written into eFuse. Whenever a key is written, its purpose value should also be written (see table 9.4-2). For example, when a key for the JTAG function in HMAC Downstream mode is written to KEY3 (i.e., BLOCK7), its key purpose value 6 should also be written to EFUSE_KEY_PURPOSE_3.

Note:
Do not program the XTS-AES key into the KEY5 block, i.e., BLOCK9. Otherwise, the key may be unreadable. Instead, program it into the preceding blocks, i.e., BLOCK4 ~ BLOCK8. The last block, BLOCK9, is used to program other keys.

BLOCK1 ~ BLOCK10 use the RS coding scheme, so there are some limitations on writing to these parameters. For more detailed information, please refer to Section 9.4.3.1.3 and Section 9.4.3.2.

9.4.3.1.1 EFUSE_WR_DIS

Parameter EFUSE_WR_DIS determines whether individual eFuse parameters are write-protected. After EFUSE_WR_DIS has been programmed, execute an eFuse read operation so the new values would take effect.

Column "Write Protection by EFUSE_WR_DIS Bit Number" in Table 9.4-1 and Table 9.4-3 list the specific bits in EFUSE_WR_DIS that disable writing.

When the write protection bit of a parameter is set to 0, it means that this parameter is not write-protected and can be programmed, unless it has been programmed before.

When the write protection bit of a parameter is set to 1, it means that this parameter is write-protected and none of its bits can be modified, with non-programmed bits always remaining 0 and programmed bits always remaining 1. That is to say, if a parameter is write-protected, it will always remain in this state and cannot be changed.

9.4.3.1.2 EFUSE_RD_DIS

Among all parameters, only those in BLOCK4 ~ BLOCK10 can be configured for user read protection, i.e., the entries in Table 9.4-3 for which column "Read Protection by EFUSE_RD_DIS Bit Number" is not N/A. After EFUSE_RD_DIS has been programmed, execute an eFuse read operation so the new values would take effect.

If the corresponding EFUSE_RD_DIS bit is 0, the parameter controlled by this bit is not read-protected from users. If it is 1, the parameter controlled by it is read-protected from users.

Other parameters that are not in BLOCK4 ~ BLOCK10 can always be read by users.

When BLOCK4 ~ BLOCK10 are set to be read-protected, the data in them can still be read by hardware cryptography modules if the EFUSE_KEY_PURPOSE_*n* bit is set accordingly.

9.4.3.1.3 Data Storage

Internally, eFuse uses the hardware encoding scheme to protect data from corruption. The scheme and the encoding process are invisible to users.

All BLOCK0 parameters except for EFUSE_WR_DIS are stored with four backups, meaning each bit is stored four times. This backup scheme is not visible to users.

In BLOCK0, EFUSE_WR_DIS occupies 32 bits, and each of the other parameters occupies 152 bits. Therefore, BLOCK0 occupies $32 + 152 \times 4 = 640$ bits in eFuse memory.

BLOCK1 ~ BLOCK10 use RS (44, 32) coding scheme that supports up to 6 bytes of automatic error correction. The primitive polynomial of RS (44, 32) is $p(x) = x^8 + x^4 + x^3 + x^2 + 1$.

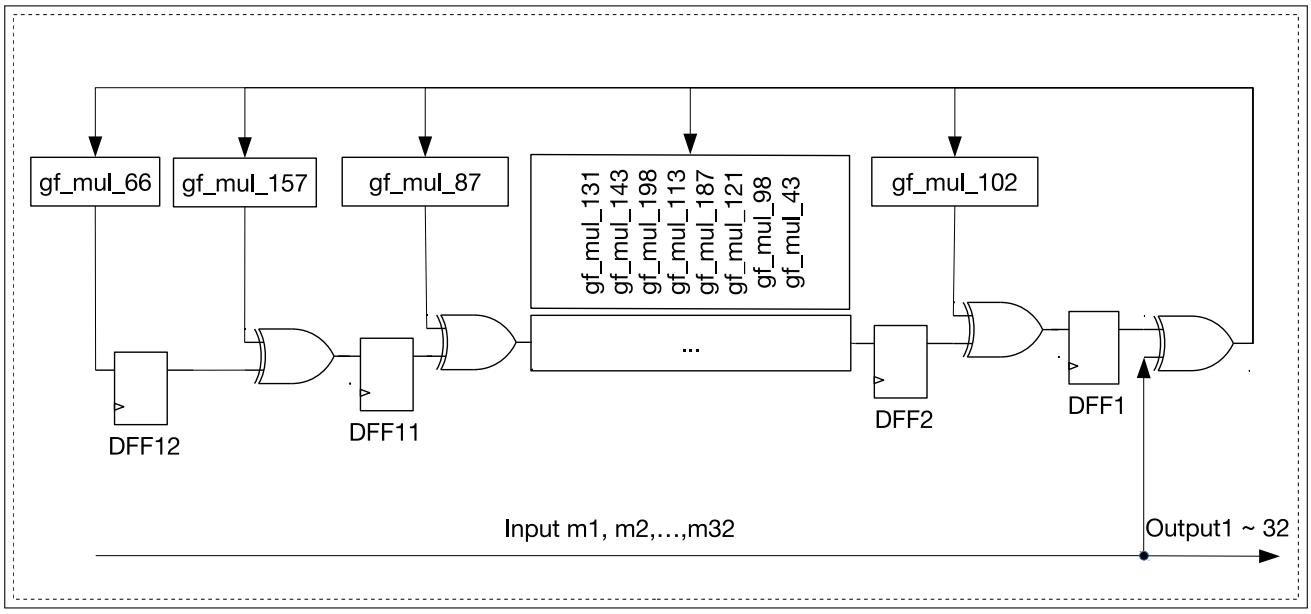

Figure 9.4-2. Shift Register Circuit (first 32 bytes)

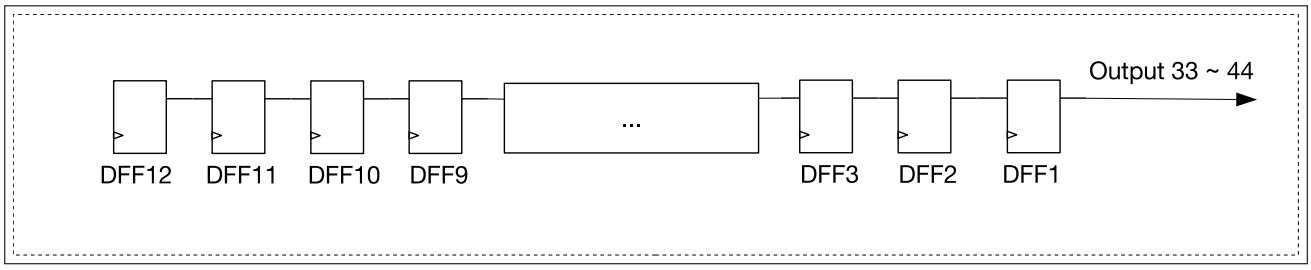

Figure 9.4-3. Shift Register Circuit (last 12 bytes)

The shift register circuit shown in Figure 9.4-2 and 9.4-3 processes 32 data bytes using RS (44, 32). This coding scheme encodes 32 bytes of data into 44 bytes:

- Bytes [0:31] are the data bytes themselves
- Bytes [32:43] are the encoded parity bytes stored in 8-bit flip-flops DFF1, DFF2, ..., DFF12 (gf_mul_n is the result of multiplying a byte of data in $GF(2^8)$ by α^n, where n is an integer).

After that, the hardware programs into eFuse the 44-byte codeword consisting of the data bytes and the parity bytes. When the eFuse block is read, the eFuse controller automatically decodes the codeword and applies error correction if needed.

Because the RS check codes are generated on the entire 32-byte eFuse block, each block can only be written once.

Since the size of BLOCK1 is less than 32 bytes, the unused bits will be treated as 0 by hardware during the RS (44, 32) encoding. Thus, the final coding result will not be affected.

Among blocks using the RS (44, 32) coding scheme, the parameters in BLOCK1 is 24 bytes, and the RS check code is 12 bytes, so BLOCK1 occupies 24 + 12 = 36 bytes in eFuse memory.

In each of the other blocks (BLOCK2~BLOCK10), the parameter data is 32 bytes and the RS check code is 12 bytes, so those nine blocks occupy $(32 + 12) \times 9 = 396$ bytes in eFuse memory.

9.4.3.2 Programming of Parameters

The eFuse controller can only program eFuse parameters in one block at a time. BLOCK0 ~ BLOCK10 share the same address range to store the parameters to be programmed. Configure parameter EFUSE_BLK_NUM to indicate which block should be programmed.

Since there is a one-to-one correspondence between the reading data registers and the programming data registers (see table 9.4-4 for details), users can find out where the data to be programmed is located in programming registers by checking the parameter description and the parameter location in the corresponding read registers.

For example, if the user wants to program the parameter EFUSE_USB_DEVICE_EXCHG_PINS in BLOCK0 to 1, they can first search the reading data registers EFUSE_RD_REPEAT_DATA0 ~ 4_REG in BLOCK0 for where the parameter is located, namely, the 8th bit in EFUSE_RD_REPEAT_DATA0_REG. So, the user can set the 8th bit of EFUSE_PGM_DATA1_REG to 1 and follow the programming steps below. After the steps are completed, the corresponding bit in the eFuse memory will be programmed to 1.

Programming preparation

- Programming BLOCK0
  1. Set EFUSE_BLK_NUM to 0.
  2. Write into EFUSE_PGM_DATA0_REG ~ EFUSE_PGM_DATA5_REG the data to be programmed to BLOCK0.
     The data in EFUSE_PGM_DATA6_REG ~ EFUSE_PGM_DATA7_REG and EFUSE_PGM_CHECK_VALUE0_REG ~ EFUSE_PGM_CHECK_VALUE2_REG does not affect the programming of BLOCK0.
- BLOCK1 cannot be programmed by users as it has been programmed at manufacturing.
- Programming BLOCK2 ~ 10
  1. Set EFUSE_BLK_NUM to the block number.
  2. Write into EFUSE_PGM_DATA0_REG ~ EFUSE_PGM_DATA7_REG the data to be programmed. Write into EFUSE_PGM_CHECK_VALUE0_REG ~ EFUSE_PGM_CHECK_VALUE2_REG the corresponding RS code.

Programming process

The process of programming parameters is as follows:

1. Configure the value of parameter EFUSE_BLK_NUM to determine the block to be programmed.
2. Write parameters to be programmed to registers EFUSE_PGM_DATA0_REG ~ EFUSE_PGM_DATA7_REG and EFUSE_PGM_CHECK_VALUE0_REG ~ EFUSE_PGM_CHECK_VALUE2_REG.
3. Make sure the eFuse programming voltage VDDQ is configured correctly as described in Section 9.4.3.4.
4. Configure the field EFUSE_OP_CODE of register EFUSE_CONF_REG to 0x5A5A.

5. Configure the field EFUSE_PGM_CMD of register EFUSE_CMD_REG to 1.
6. Poll register EFUSE_CMD_REG until it is 0x0, or wait for a PGM_DONE interrupt. For more information on how to identify a PGM_DONE or READ_DONE interrupt, please see the end of Section 9.4.3.3.
7. Clear the parameters in EFUSE_PGM_DATA0_REG ~ EFUSE_PGM_DATA7_REG and EFUSE_PGM_CHECK_VALUE0_REG ~ EFUSE_PGM_CHECK_VALUE2_REG.
8. Trigger an eFuse read operation (see Section 9.4.3.3) to update eFuse registers with the new values.
9. Check error record registers. If the values read in error record registers are not 0, run the programming process again following steps 1 ~ 7 above. This can resolve cases where error record registers are non-zero due to insufficient programming. The error record registers to check for each eFuse block are as follows:
    - BLOCK0: EFUSE_RD_REPEAT_DATA_ERR0_REG ~ EFUSE_RD_REPEAT_DATA_ERR4_REG
    - BLOCK1: EFUSE_RD_MAC_SYS_ERR_NUM, EFUSE_RD_MAC_SYS_FAIL
    - BLOCK2: EFUSE_RD_SYS_PART1_DATA_ERR_NUM, EFUSE_RD_SYS_PART1_DATA_FAIL
    - BLOCK3: EFUSE_RD_USR_DATA_ERR_NUM, EFUSE_RD_USR_DATA_FAIL
    - BLOCK4: EFUSE_RD_KEY0_DATA_ERR_NUM, EFUSE_RD_KEY0_DATA_FAIL
    - BLOCK5: EFUSE_RD_KEY1_DATA_ERR_NUM, EFUSE_RD_KEY1_DATA_FAIL
    - BLOCK6: EFUSE_RD_KEY2_DATA_ERR_NUM, EFUSE_RD_KEY2_DATA_FAIL
    - BLOCK7: EFUSE_RD_KEY3_DATA_ERR_NUM, EFUSE_RD_KEY3_DATA_FAIL
    - BLOCK8: EFUSE_RD_KEY4_DATA_ERR_NUM, EFUSE_RD_KEY4_DATA_FAIL
    - BLOCK9: EFUSE_RD_KEY5_DATA_ERR_NUM, EFUSE_RD_KEY5_DATA_FAIL
    - BLOCK10: EFUSE_RD_SYS_PART2_DATA_ERR_NUM, EFUSE_RD_SYS_PART2_DATA_FAIL

Limitations

In BLOCK0, different parameters, or even different bits within the same parameter, may be programmed across multiple programming cycles. However, this is not recommended; the number of programming cycles should be minimized. We recommend programming all bits of a parameter that need to be set in a single programming action. In addition, after all parameters controlled by a given bit of EFUSE_WR_DIS are programmed, that bit should be programmed immediately. The parameters controlled by that bit and the write-protection bit itself may even be programmed together in one action.

BLOCK1 cannot be programmed by users as it has been programmed at manufacturing.

BLOCK2 ~ 10 can only be programmed once. Repeated programming is not allowed.

9.4.3.3 Reading of Parameters by Users

Users cannot read eFuse bits directly. The eFuse controller hardware reads all eFuse bits and stores the results to their corresponding registers in its memory space. Then, users can read eFuse bits by reading the registers that start with EFUSE_RD_. Details are provided in Table 9.4-4.

Table 9.4-4. User Read Registers and Programming Registers

BLOCK	Read Registers	Registers When Programming This Block
0	EFUSE_RD_WR_DIS_REG	EFUSE_PGM_DATA0_REG
0	EFUSE_RD_REPEAT_DATA0 ~ 4_REG	EFUSE_PGM_DATA1 ~ 5_REG
1	EFUSE_RD_MAC_SYS_0 ~ 5_REG	EFUSE_PGM_DATA0 ~ 5_REG
2	EFUSE_RD_SYS_PART1_DATA0 ~ 7_REG	EFUSE_PGM_DATA0 ~ 7_REG
3	EFUSE_RD_USR_DATA0 ~ 7_REG	EFUSE_PGM_DATA0 ~ 7_REG
4-9	EFUSE_RD_KEY*n*_DATA0 ~ 7_REG (*n*: 0 ~ 5)	EFUSE_PGM_DATA0 ~ 7_REG
10	EFUSE_RD_SYS_PART2_DATA0 ~ 7_REG	EFUSE_PGM_DATA0 ~ 7_REG

Updating reading data registers

The eFuse controller reads eFuse memory to update corresponding registers. This read operation happens at system reset and can also be triggered manually by users as needed (e.g., if new eFuse values have been programmed). The process of triggering a read operation by users is as follows:

1. Configure the field EFUSE_OP_CODE in register EFUSE_CONF_REG to 0x5AA5.
2. Configure the field EFUSE_READ_CMD in register EFUSE_CMD_REG to 1.
3. Poll register EFUSE_CMD_REG until it is 0x0, or wait for a READ_DONE interrupt. Information on how to identify a PGM_DONE or READ_DONE interrupt is provided below in this section.
4. Read the values of each parameter from eFuse memory.

The eFuse read registers will hold all values until the next read operation.

Programming error detection

The programming error record registers allow users to check the integrity of parameters stored in the eFuse memory. For instance, they can help detect whether the four-backup parameters are consistent and whether parameters protected by RS encoding are decoded successfully.

Registers EFUSE_RD_REPEAT_ERR0 ~ 3_REG indicate if there are any errors in programming parameters (except EFUSE_WR_DIS) to BLOCK0. The value 1 indicates an error is detected in programming the corresponding bit. The value 0 indicates no error.

Registers EFUSE_RD_RS_ERR0 ~ 1_REG store the number of corrected bytes as well as the result of RS decoding when eFuse controller reads BLOCK1 ~ BLOCK10.

The values of the above registers will be updated every time the reading data registers of eFuse controller have been updated.

Identifying completion of program or read operations

The methods to identify the completion of a program/read operation are described below. Please note that bit 1 corresponds to a program operation, and bit 0 corresponds to a read operation.

- Method one: Poll bit 1/0 in register EFUSE_INT_RAW_REG until it becomes 1, which represents the completion of a program/read operation.
- Method two:
  1. Set bit 1/0 in register EFUSE_INT_ENA_REG to 1 to enable the eFuse controller to post a PGM_DONE or READ_DONE interrupt.

2. Configure the Interrupt Matrix to enable the CPU to respond to eFuse interrupt signals. See Chapter 13 *Interrupt Matrix*.
3. Wait for the PGM_DONE or READ_DONE interrupt.
4. Set bit 1/0 in register EFUSE_INT_CLR_REG to 1 to clear the PGM_DONE or READ_DONE interrupt.

Note

When eFuse controller is updating its registers, it will use EFUSE_PGM_DATA*n*_REG (n=0, 1, ... ,7) again to store data. So please do not write important data into these registers before this updating process is initiated.
During the chip boot process, eFuse controller will automatically update data from eFuse memory into the registers that can be accessed by users. Users can get programmed eFuse data by reading corresponding registers. Thus, there is no need to update the reading data registers in such case.

9.4.3.4 eFuse VDDQ Timing

The eFuse controller operates at the clock frequency of 20 MHz, and its programming voltage VDDQ should be configured as follows:

- EFUSE_DAC_NUM (the rising period of VDDQ): The default value of VDDQ is 2.5 V and the voltage increases by 0.01 V in each clock cycle. The default value of this parameter is 255.
- EFUSE_DAC_CLK_DIV (the clock divisor of VDDQ): The clock period to program VDDQ should be larger than 1 μs.
- EFUSE_PWR_ON_NUM (the power-on time for VDDQ): The programming voltage should be stabilized after this time, which means the value of this parameter should be configured to exceed the result of EFUSE_DAC_CLK_DIV × EFUSE_DAC_NUM.
- EFUSE_PWR_OFF_NUM (the power-off time for VDDQ): The value of this parameter should be larger than 10 μs.

Table 9.4-5. Configuration of Default VDDQ Timing Parameters

EFUSE_DAC_NUM	EFUSE_DAC_CLK_DIV	EFUSE_PWR_ON_NUM	EFUSE_PWR_OFF_NUM
0xFF	0x28	0x3000	0x190

9.4.3.5 Parameters Used by Hardware Modules

Some hardware modules are directly connected to the eFuse peripheral in order to use the parameters that are marked with "Y" in columns "Accessible by Hardware" of Table 9.4-1 and Table 9.4-3. Users cannot intervene in this process.

9.4.4 Interrupts

ESP32-P4's eFuse controller can generate the following interrupt signal that will be sent to the Interrupt Matrix.

- EFUSE_INT

There are several internal interrupt sources from eFuse controller that can generate the above interrupt signal. The interrupt sources from eFuse controller are listed with their trigger conditions and the resulted interrupt signal in Table 9.4-6.

Table 9.4-6. eFuse's Internal Interrupt Sources

Internal Interrupt Source	Trigger Condition	Interrupt Signal
EFUSE_PGM_DONE_INT	Programming of eFuse completes	EFUSE_INT
EFUSE_READ_DONE_INT	Reading of eFuse completes	

Note:
For definitions of *interrupt*, *interrupt signal*, *interrupt source*, and their correlations, please refer to Chapter 13 *Interrupt Matrix* > Section 13.2 *Interrupt Terminology in ESP32-P4*.

Each interrupt source can be configured by a common set of registers that are described in Section *Interrupt Configuration Registers*. The specific registers can be found in Section 9.4.5 *Register Summary*.

9.4.5 Register Summary

The addresses in this section are relative to eFuse controller base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Programming Data Registers			
EFUSE_PGM_DATA0_REG	Represents pgm_data0	0x0000	R/W
EFUSE_PGM_DATA1_REG	Represents pgm_data1	0x0004	R/W
EFUSE_PGM_DATA2_REG	Represents pgm_data2	0x0008	R/W
EFUSE_PGM_DATA3_REG	Represents pgm_data3	0x000C	R/W
EFUSE_PGM_DATA4_REG	Represents pgm_data4	0x0010	R/W
EFUSE_PGM_DATA5_REG	Represents pgm_data5	0x0014	R/W
EFUSE_PGM_DATA6_REG	Represents pgm_data6	0x0018	R/W
EFUSE_PGM_DATA7_REG	Represents pgm_data7	0x001C	R/W
EFUSE_PGM_CHECK_VALUE0_REG	Represents pgm_check_value0	0x0020	R/W
EFUSE_PGM_CHECK_VALUE1_REG	Represents pgm_check_value1	0x0024	R/W
EFUSE_PGM_CHECK_VALUE2_REG	Represents pgm_check_value2	0x0028	R/W
Block 0 Registers			
EFUSE_RD_WR_DIS_REG	Represents rd_wr_dis	0x002C	RO
EFUSE_RD_REPEAT_DATA0_REG	Represents rd_repeat_data	0x0030	RO

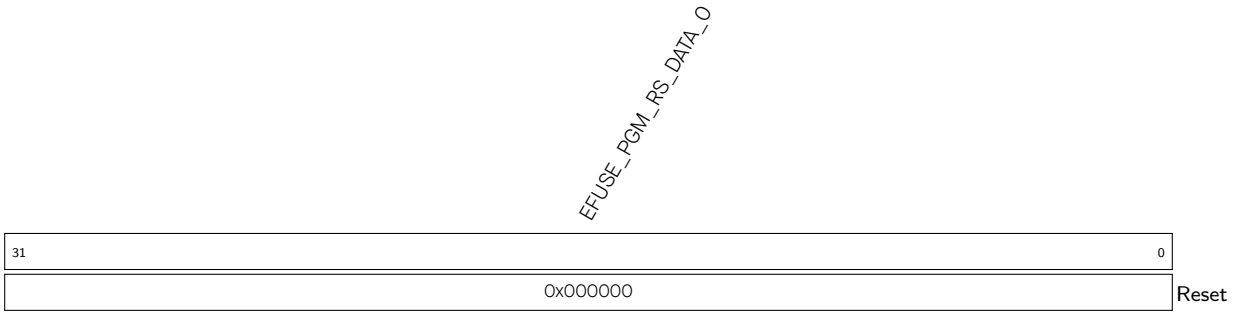
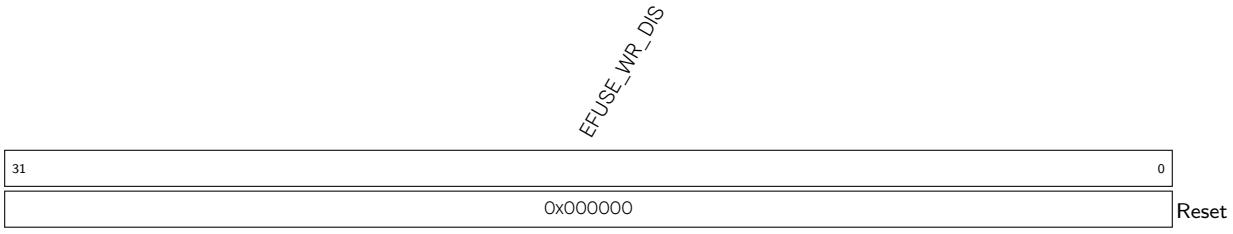
9.4.6 Registers

The addresses in this section are relative to eFuse controller base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.



For how to program reserved fields, please refer to Section *Programming Reserved Register Field*.

Register 9.1. EFUSE_PGM_DATA*n*_REG (*n*: 0-7) (0x0000+0x4n*)**

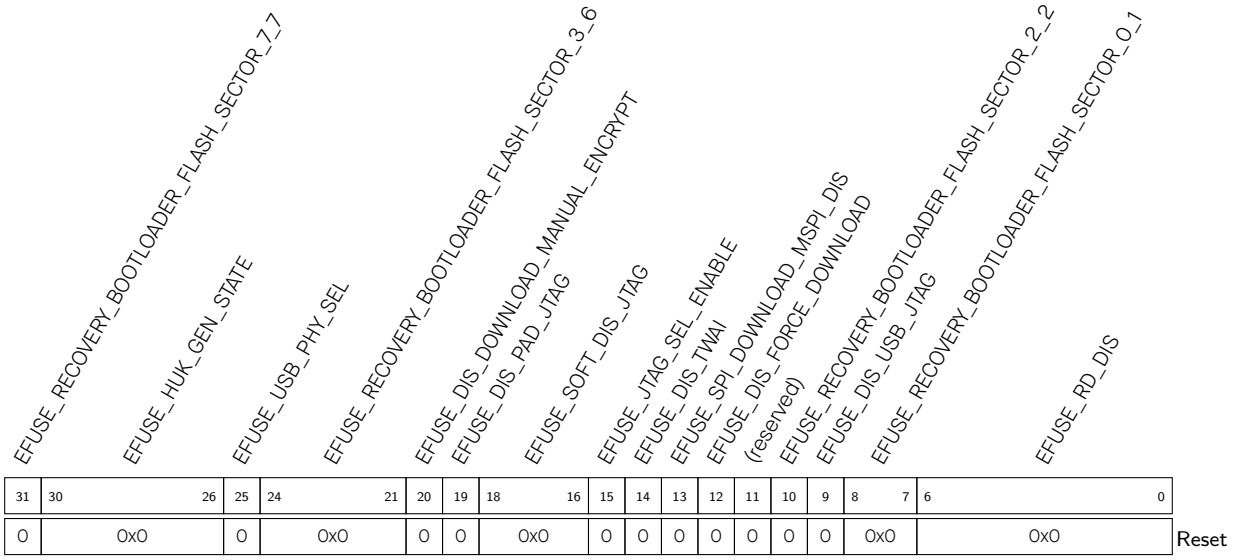


EFUSE_PGM_DATA_*n* Configures the *n*th 32-bit data to be programmed. (R/W)

Register 9.2. EFUSE_PGM_CHECK_VALUE*n*_REG (*n*: 0-2) (0x0020+0x4n*)**

EFUSE_PGM_RS_DATA_*n* Configures the *n*th RS code to be programmed. (R/W)

Register 9.3. EFUSE_RD_WR_DIS_REG (0x002C)



EFUSE_WR_DIS Represents whether programming of eFuse memory bits is disabled. For mapping between the bits of this field and the eFuse memory bits, please refer to Table 9.4-1 and Table 9.4-3. (RO)

1: Disabled

0: Enabled

Register 9.4. EFUSE_RD_REPEAT_DATA0_REG (0x0030)

EFUSE_RD_DIS Represents whether reading of individual eFuse block (block4 block10) is disabled or enabled. (RO)

1: disabled

0: enabled

EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_0_1 Represents the starting flash sector (flash sector size is 0x1000) of the recovery bootloader used by the ROM bootloader if the primary bootloader fails. (RO)

0 and 0xFFF: this feature is disabled

EFUSE_DIS_USB_JTAG Represents whether the USB to JTAG switch in the USB device module is disabled. (RO)

EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_2_2 Represents the starting flash sector (flash sector size is 0x1000) of the recovery bootloader used by the ROM bootloader if the primary bootloader fails. (RO)

0 and 0xFFF: this feature is disabled

EFUSE_DIS_FORCE_DOWNLOAD Represents whether the function that forces chip into download mode is disabled. (RO)

EFUSE_SPI_DOWNLOAD_MSPI_DIS Represents whether accessing MSPI flash/MSPI RAM by SYS AXI matrix during boot_mode_download is disabled. (RO)

EFUSE_DIS_TWAI Represents whether the TWAI function is disabled. (RO)

EFUSE_JTAG_SEL_ENABLE Represents whether selection between usb_to_jtag and pad_to_jtag through strapping GPIO25 is enabled when both EFUSE_DIS_PAD_JTAG and EFUSE_DIS_USB_JTAG are equal to 0. (RO)

Continued on the next page...

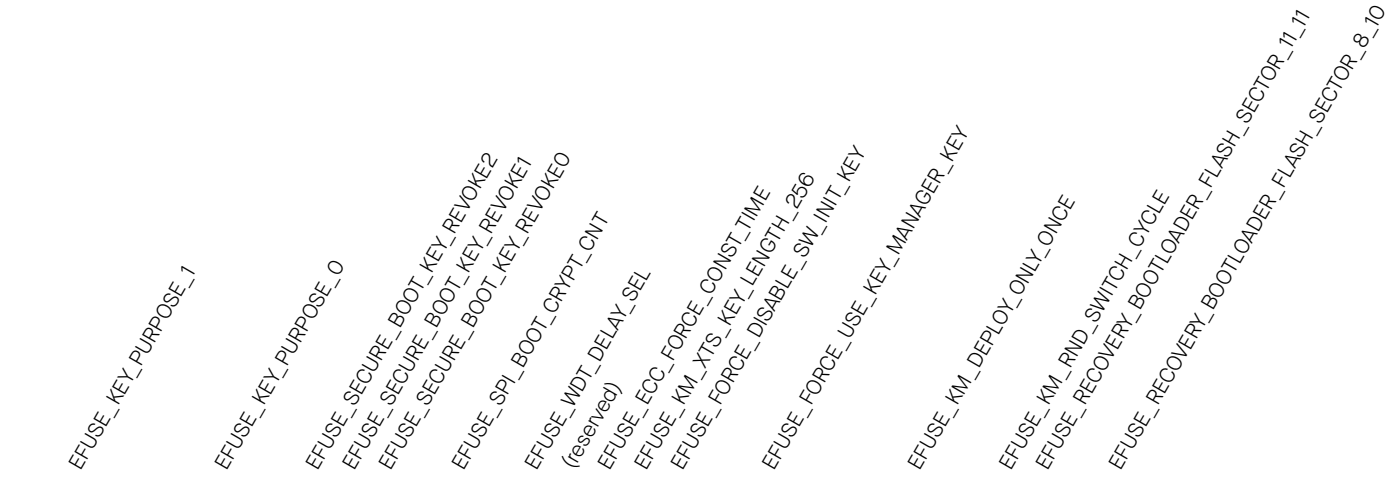
Register 9.4. EFUSE_RD_REPEAT_DATA0_REG (0x0030)

Continued from the previous page...

EFUSE_SOFT_DIS_JTAG Represents whether JTAG is disabled in the soft way or not. JTAG can be restarted in the HMAC module. (RO)
Odd count of bits with a value of 1: Disabled
Even count of bits with a value of 1: Enabled.

EFUSE_DIS_PAD_JTAG Represents whether JTAG is disabled in the hard way (permanently). (RO)

EFUSE_DIS_DOWNLOAD_MANUAL_ENCRYPT Represents whether the flash manual encrypt function is disabled (except in SPI boot mode). (RO)



EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_3_6 Represents the starting flash sector (flash sector size is 0x1000) of the recovery bootloader used by the ROM bootloader if the primary bootloader fails. (RO)
0 and 0xFFF: this feature is disabled

EFUSE_USB_PHY_SEL Configures the corresponding relationship between the two PHYs and the USB interfaces. (RO)
0: The PHY on GPIO24/GPIO25 is connected to usb_device, while the PHY on GPIO26/GPIO27 is connected to usb_otg11
1: the PHY on GPIO26/GPIO27 is connected to usb_device, while the PHY on GPIO24/GPIO25 is connected to usb_otg11

EFUSE_HUK_GEN_STATE Represents the validation status of the HUK generation mode. (RO)
Odd count of bits with a value of 1: invalid
Even count of bits with a value of 1: valid

EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_7_7 Represents the starting flash sector of the recovery bootloader (flash sector size is 0x1000). When the primary bootloader fails, the ROM bootloader loads and executes the recovery bootloader from this sector. (RO)
0 and 0xFFF: The recovery bootloader feature is disabled

Register 9.5. EFUSE_RD_REPEAT_DATA1_REG (0x0034)

EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_8_10 Represents the starting flash sector of the recovery bootloader (flash sector size is 0x1000). When the primary bootloader fails, the ROM bootloader loads and executes the recovery bootloader from this sector. (RO)
0 and 0xFFF: The recovery bootloader feature is disabled

EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_11_11 Represents the starting flash sector of the recovery bootloader (flash sector size is 0x1000). When the primary bootloader fails, the ROM bootloader loads and executes the recovery bootloader from this sector. (RO)
0 and 0xFFF: The recovery bootloader feature is disabled

EFUSE_KM_RND_SWITCH_CYCLE Represents the key manager random number switch cycle. (RO)
0: control by register
1: 8 km clk cycles
2: 16 km cycles
3: 32 km cycles

EFUSE_KM_DEPLOY_ONLY_ONCE EFUSE_KM_DEPLOY_ONLY_ONCE and EFUSE_KM_DEPLOY_ONLY_ONCE_H together form one field: EFUSE_KM_DEPLOY_ONLY_ONCE_H, EFUSE_KM_DEPLOY_ONLY_ONCE[3:0]. Represents whether each corresponding key can only be deployed once. (RO)
1: true
0: false
bit 0: ecsda
bit 1: xts
bit 2: hmac
bit 3: ds
bit 4: psram

Continued on the next page...

Register 9.5. EFUSE_RD_REPEAT_DATA1_REG (0x0034)

Continued from the previous page...

EFUSE_FORCE_USE_KEY_MANAGER_KEY EFUSE_FORCE_USE_KEY_MANAGER_KEY and EFUSE_FORCE_USE_KEY_MANAGER_KEY_H together form one field: EFUSE_FORCE_USE_KEY_MANAGER_KEY_H, EFUSE_FORCE_USE_KEY_MANAGER_KEY[3:0]. Represents whether each corresponding key must come from key manager. (RO)
1: true
0: false
bit 0: ecsda
bit 1: xts
bit 2: hmac
bit 3: ds
bit 4: psram

EFUSE_FORCE_DISABLE_SW_INIT_KEY Represents whether software written init key is disabled, and efuse_init_key is forced to be used. (RO)

EFUSE_KM_XTS_KEY_LENGTH_256 Represents whether flash encryption uses XTS-512 key. Otherwise, the key manager will use the XTS-256 key. (RO)

EFUSE_ECC_FORCE_CONST_TIME Represents whether ECC const-time mode is permanently turned on. (RO)

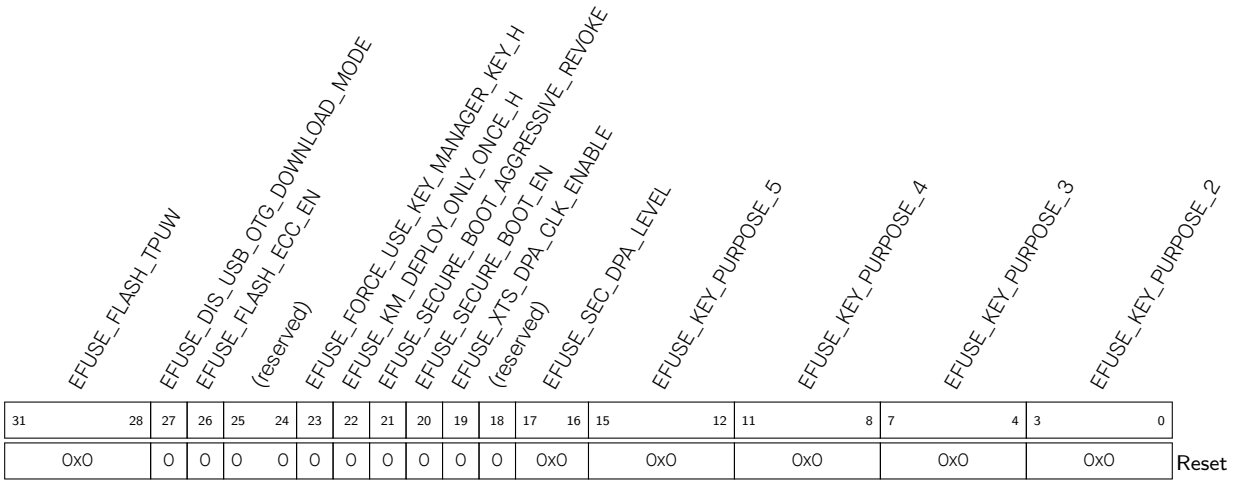
EFUSE_WDT_DELAY_SEL Represents the LP WDT timeout threshold selection. The relationship is

$$\text{startup_timeout} = \text{initial_timeout_value} \times 2^{(\text{EFUSE_WDT_DELAY_SEL}+1)}$$

(RO)

EFUSE_SPI_BOOT_CRYPT_CNT Represents whether SPI boot encrypt/decrypt is enabled. (RO)
Odd number of 1: enabled
Even number of 1: disabled

EFUSE_SECURE_BOOT_KEY_REVOKE0 Represents whether revoking the first secure boot key is enabled. (RO)



EFUSE_SECURE_BOOT_KEY_REVOKE1 Represents whether revoking the second secure boot key is enabled. (RO)

EFUSE_SECURE_BOOT_KEY_REVOKE2 Represents whether revoking the third secure boot key is enabled. (RO)

EFUSE_KEY_PURPOSE_0 Represents the purpose of Key0. For more information, see Table 9.4-2. (RO)

EFUSE_KEY_PURPOSE_1 Represents the purpose of Key1. For more information, see Table 9.4-2. (RO)

Register 9.6. EFUSE_RD_REPEAT_DATA2_REG (0x0038)

EFUSE_KEY_PURPOSE_2 Represents the purpose of Key2. For more information, see Table 9.4-2. (RO)

EFUSE_KEY_PURPOSE_3 Represents the purpose of Key3. For more information, see Table 9.4-2. (RO)

EFUSE_KEY_PURPOSE_4 Represents the purpose of Key4. For more information, see Table 9.4-2. (RO)

EFUSE_KEY_PURPOSE_5 Represents the purpose of Key5. For more information, see Table 9.4-2. (RO)

EFUSE_SEC_DPA_LEVEL Represents the DPA security level. This field effectively sets the protection level by configuring the clock random divide mode. (RO)

EFUSE_XTS_DPA_CLK_ENABLE Represents whether the XTS clock anti-DPA attack function is enabled. (RO)

EFUSE_SECURE_BOOT_EN Represents whether secure boot is enabled. (RO)

EFUSE_SECURE_BOOT_AGGRESSIVE_REVOKE Represents whether revoking aggressive secure boot is enabled. (RO)

EFUSE_KM_DEPLOY_ONLY_ONCE_H EFUSE_KM_DEPLOY_ONLY_ONCE and EFUSE_KM_DEPLOY_ONLY_ONCE_H together form one field: EFUSE_KM_DEPLOY_ONLY_ONCE_H & EFUSE_KM_DEPLOY_ONLY_ONCE[3:0]. Represents whether each corresponding key can only be deployed once. (RO)

1: true

0: false

bit 0: ecsda

bit 1: xts

bit 2: hmac

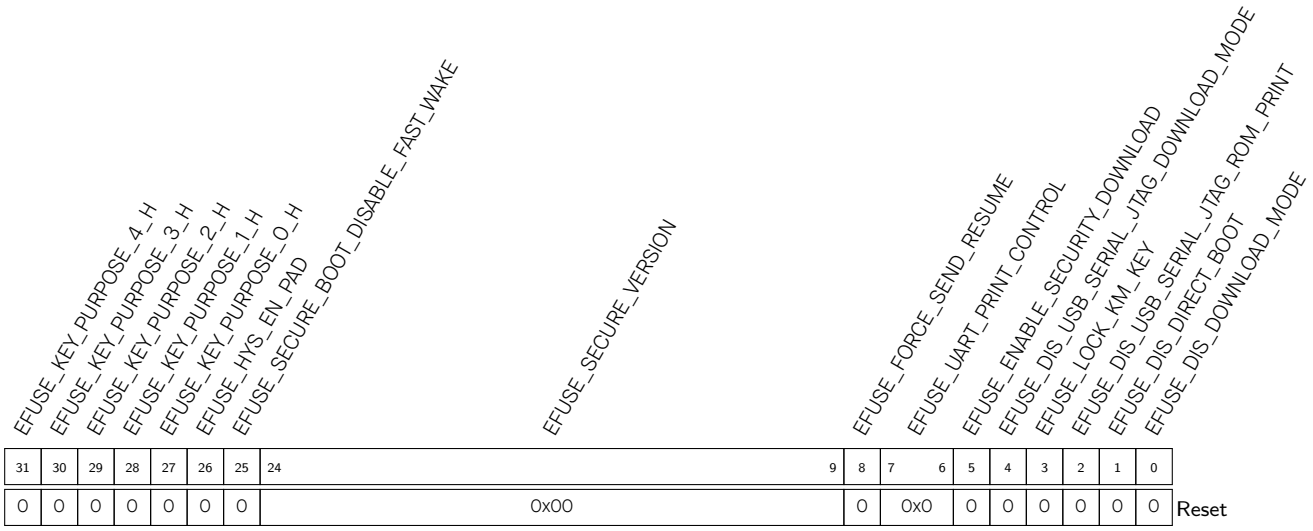
bit 3: ds

bit 4: psram

Continued on the next page...

Register 9.6. EFUSE_RD_REPEAT_DATA2_REG (0x0038)

Continued from the previous page...



EFUSE_FORCE_USE_KEY_MANAGER_KEY_H EFUSE_FORCE_USE_KEY_MANAGER_KEY and EFUSE_FORCE_USE_KEY_MANAGER_KEY_H together form one field: EFUSE_FORCE_USE_KEY_MANAGER_KEY_H & EFUSE_FORCE_USE_KEY_MANAGER_KEY[3:0]. Represents whether each corresponding key must come from key manager. (RO)
1: true
0: false
bit 0: ecsda
bit 1: xts
bit 2: hmac
bit 3: ds
bit 4: psram

EFUSE_FLASH_ECC_EN Represents whether ECC for flash boot is enabled. (RO)

EFUSE_DIS_USB_OTG_DOWNLOAD_MODE Represents whether download via USB-OTG is disabled. (RO)

EFUSE_FLASH_TPUW Represents the flash waiting time after power-up, in unit of ms. (RO)
When the value is less than 15, the waiting time is the configurable value.
Otherwise, the waiting time is 30.

Register 9.7. EFUSE_RD_REPEAT_DATA3_REG (0x003C)

EFUSE_DIS_DOWNLOAD_MODE Represents whether all Download modes are disabled. (RO)

EFUSE_DIS_DIRECT_BOOT Represents whether direct boot mode is disabled. (RO)

EFUSE_DIS_USB_SERIAL_JTAG_ROM_PRINT Represents whether USB-Serial-JTAG print during ROM boot is disabled. (RO)

EFUSE_LOCK_KM_KEY Represents whether the key manager key is locked after deploy. (RO)

EFUSE_DIS_USB_SERIAL_JTAG_DOWNLOAD_MODE Represents whether the USB-Serial-JTAG download function is disabled. (RO)

EFUSE_ENABLE_SECURITY_DOWNLOAD Represents whether security download mode is enabled. (RO)

EFUSE_UART_PRINT_CONTROL Represents the type of UART printing. (RO)

00: force enable printing

01: enable printing when GPIO8 is reset at low level

10: enable printing when GPIO8 is reset at high level

11: force disable printing

EFUSE_FORCE_SEND_RESUME Represents whether ROM code is forced to send a resume command during SPI boot. (RO)

EFUSE_SECURE_VERSION Represents the secure version used by the ESP-IDF anti-rollback feature. (RO)

EFUSE_SECURE_BOOT_DISABLE_FAST_WAKE When secure boot is enabled, represents whether FAST VERIFY ON WAKE is disabled. (RO)

1: disabled

0: enabled

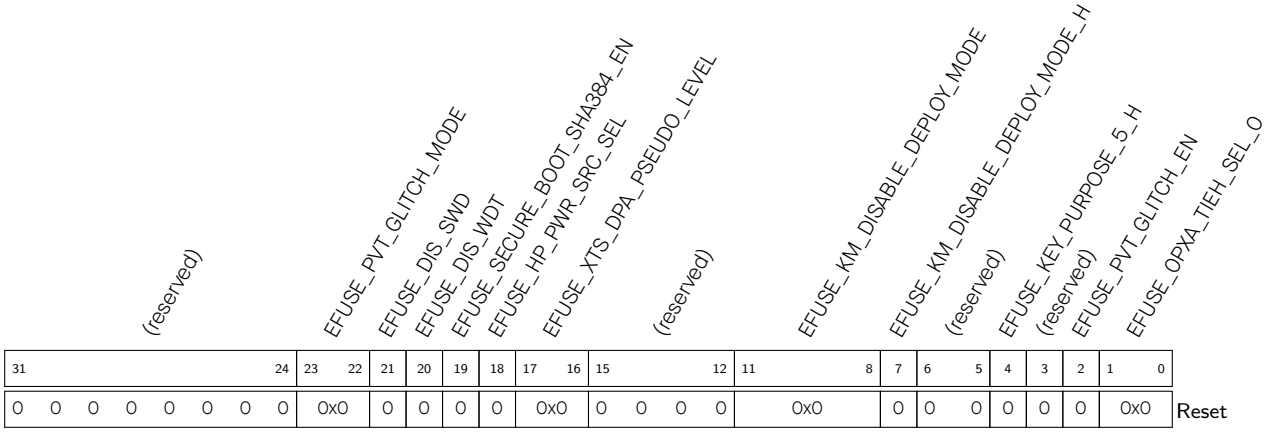
Continued on the next page...

Register 9.7. EFUSE_RD_REPEAT_DATA3_REG (0x003C)

Continued from the previous page...

EFUSE_HYS_EN_PAD Represents whether hysteresis function of PAD0 27 is enabled. (RO)

EFUSE_KEY_PURPOSE_0_H Represents the purpose of Key0. The 5th bit. (RO)



EFUSE_KEY_PURPOSE_1_H Represents the purpose of Key1. The 5th bit. (RO)

EFUSE_KEY_PURPOSE_2_H Represents the purpose of Key2. The 5th bit. (RO)

EFUSE_KEY_PURPOSE_3_H Represents the purpose of Key3. The 5th bit. (RO)

EFUSE_KEY_PURPOSE_4_H Represents the purpose of Key4. The 5th bit. (RO)

Register 9.8. EFUSE_RD_REPEAT_DATA4_REG (0x0040)

EFUSE_OPXA_TIEH_SEL_0 Represents the control selection for the LDO VO0 pull-high (tieh) source. (RO)

0: tied high

1: SDMMC1 peripheral

2: register field

3: SDMMC0 peripheral

EFUSE_PVT_GLITCH_EN Represents whether PVT power glitch monitor function is enabled. (RO)

1: Enable

0: Disable

EFUSE_KEY_PURPOSE_5_H Represents the purpose of Key5. The 5th bit. (RO)

EFUSE_KM_DISABLE_DEPLOY_MODE_H EFUSE_KM_DISABLE_DEPLOY_MODE and EFUSE_KM_-DISABLE_DEPLOY_MODE_H together form one field: EFUSE_KM_DISABLE_DEPLOY_MODE_H & EFUSE_KM_DISABLE_DEPLOY_MODE[3:0]. Represents whether each corresponding key's deploy mode of new value deployment is disabled. (RO)

1: true

0: false

bit 0: ecsda

bit 1: xts

bit 2: hmac

bit 3: ds

bit 4: psram

Continued on the next page...

Register 9.8. EFUSE_RD_REPEAT_DATA4_REG (0x0040)

Continued from the previous page...

EFUSE_KM_DISABLE_DEPLOY_MODE EFUSE_KM_DISABLE_DEPLOY_MODE and EFUSE_KM_-DISABLE_DEPLOY_MODE_H together form one field: EFUSE_KM_DISABLE_DEPLOY_MODE_H & EFUSE_KM_DISABLE_DEPLOY_MODE[3:0]. Represents whether each corresponding key's deploy mode of new value deployment is disabled. (RO)

1: true

0: false

bit 0: ecsda

bit 1: xts

bit 2: hmac

bit 3: ds

bit 4: psram

EFUSE_XTS_DPA_PSEUDO_LEVEL Represents the XTS pseudo-round anti-DPA attack function control. (RO)

0: controlled by register

1-3: the higher the value is, the more pseudo-rounds are inserted to the XTS-AES calculation

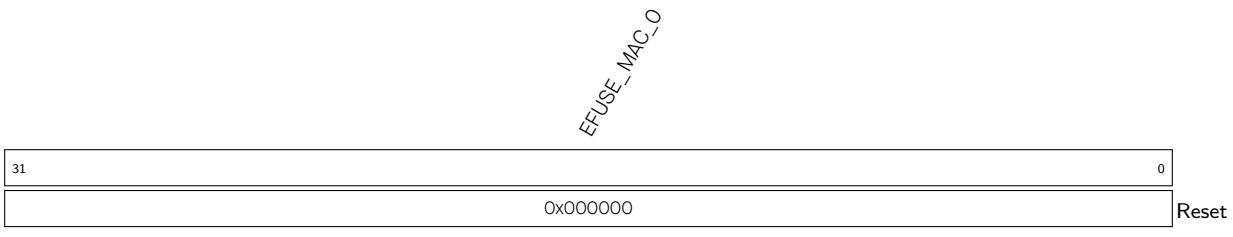
EFUSE_HP_PWR_SRC_SEL Represents the HP system power source selection. (RO)

0: LDO

1: DCDC

EFUSE_SECURE_BOOT_SHA384_EN Represents whether secure boot using SHA-384 is enabled. (RO)

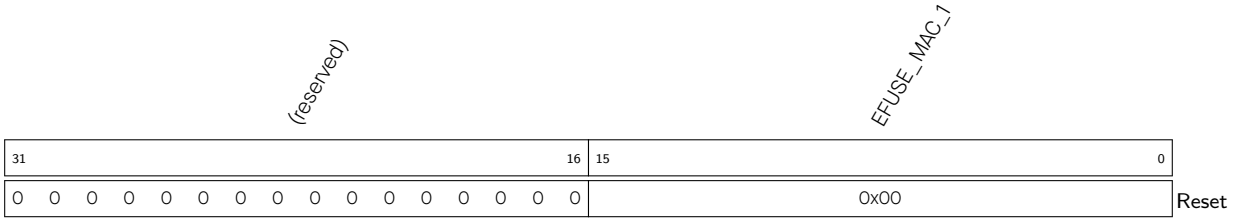
0: disable



1: enable

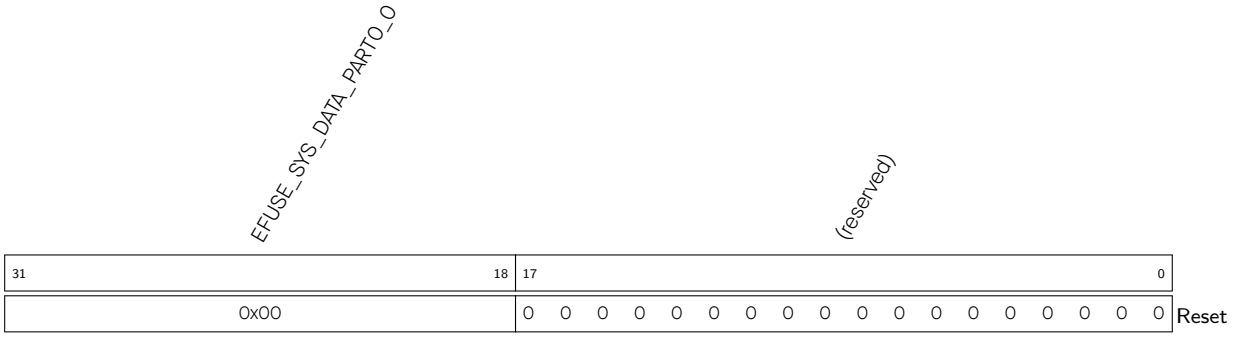
EFUSE_DIS_WDT Represents whether the watchdog is disabled. (RO)

EFUSE_DIS_SWD Represents whether the super-watchdog is disabled. (RO)



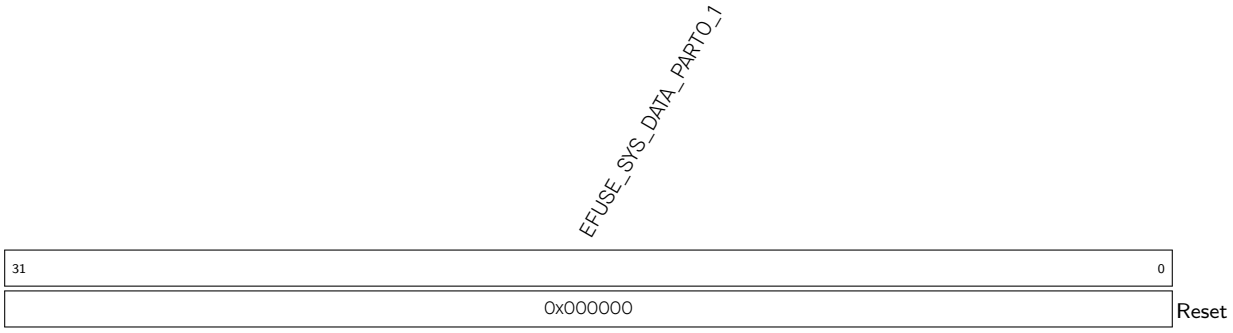
EFUSE_PVT_GLITCH_MODE Configures PVT glitch handling mode. (RO)

Register 9.9. EFUSE_RD_MAC_SYS0_REG (0x0044)



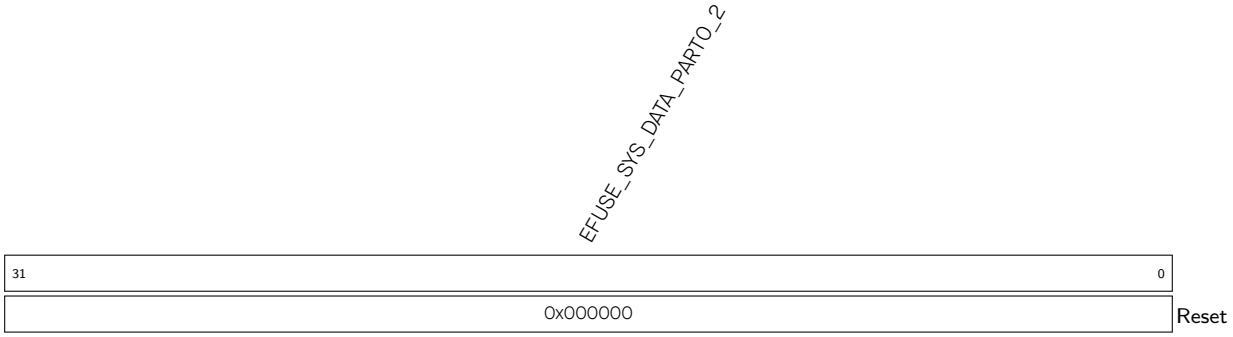
EFUSE_MAC_0 Represents the MAC address (lower 32 bits). (RO)

Register 9.10. EFUSE_RD_MAC_SYS1_REG (0x0048)



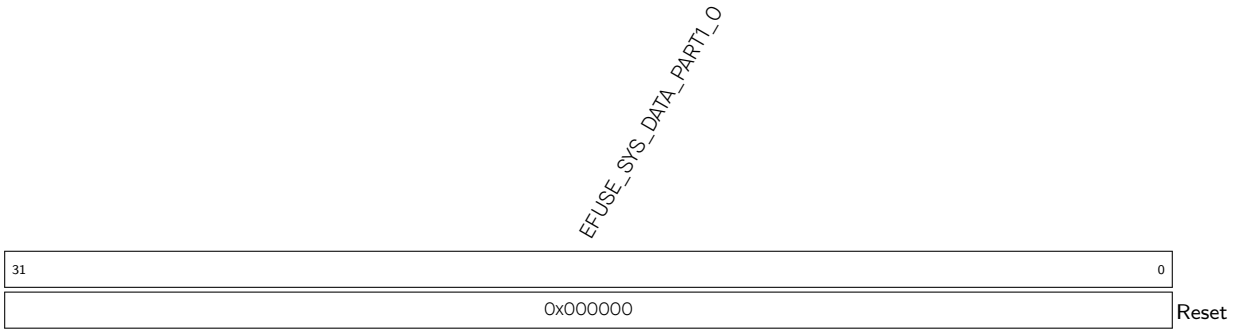
EFUSE_MAC_1 Represents the MAC address (upper 16 bits). (RO)

Register 9.11. EFUSE_RD_MAC_SYS3_REG (0x0050)



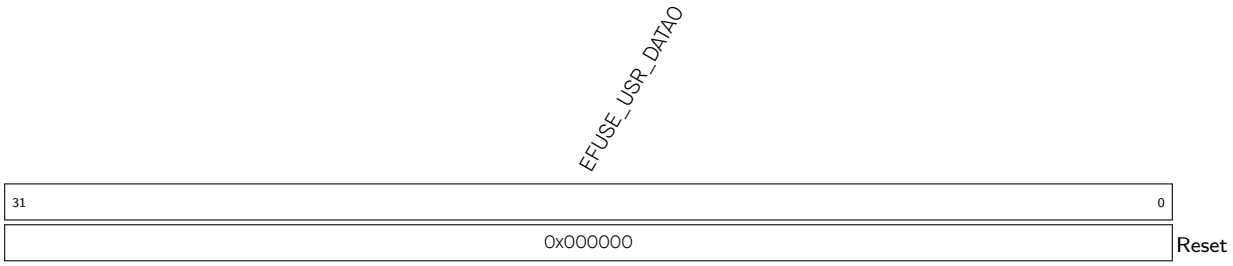
EFUSE_SYS_DATA_PART0_0 Represents the first 14 bits of Part 0 of system data. (RO)

Register 9.12. EFUSE_RD_MAC_SYS4_REG (0x0054)



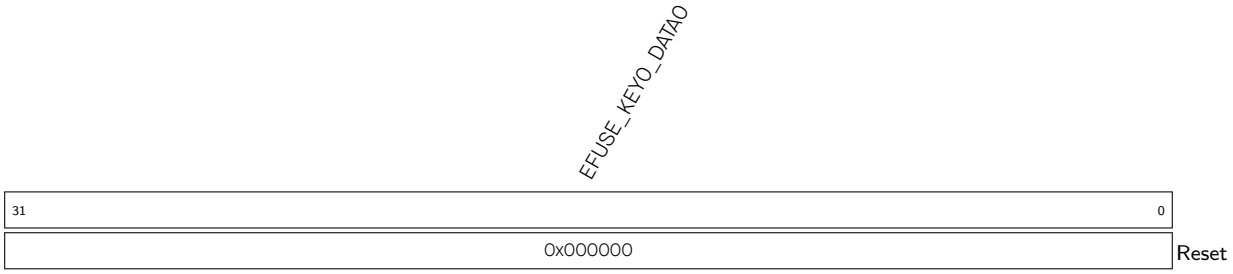
EFUSE_SYS_DATA_PART0_1 Represents the first 32-bit field of Part 0 of system data. (RO)

Register 9.13. EFUSE_RD_MAC_SYS5_REG (0x0058)



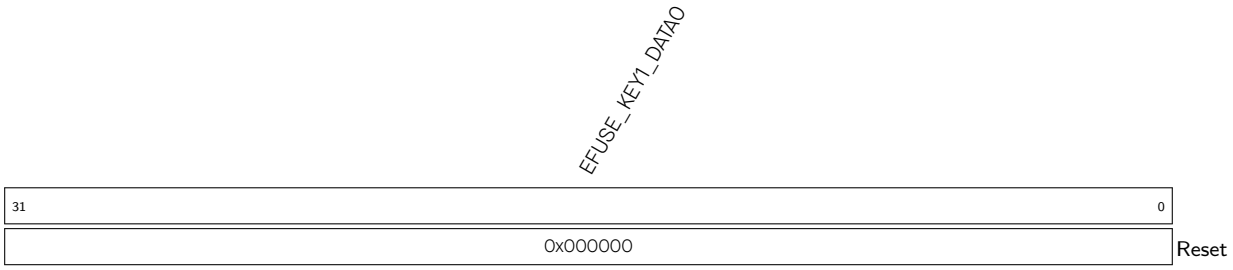
EFUSE_SYS_DATA_PART0_2 Represents the second 32-bit field of Part 0 of system data. (RO)

Register 9.14. EFUSE_RD_SYS_PART1_DATA*n*_REG (*n*: 0-7) (0x005C+0x4**n*)



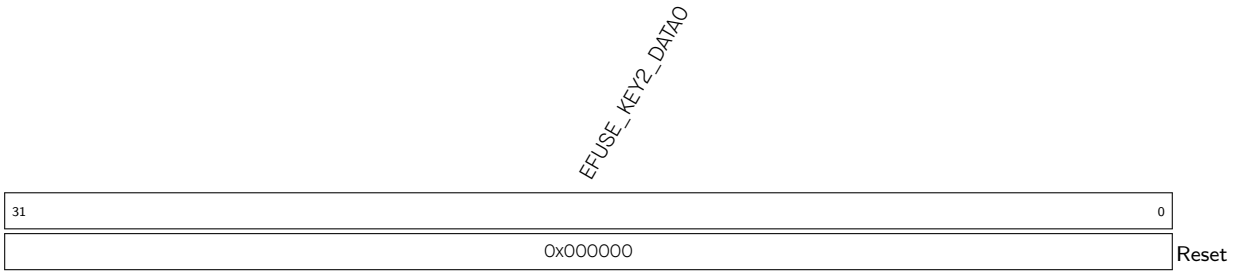
EFUSE_SYS_DATA_PART1_*n* Represents 32-bit word *n* of Part 1 of system data. (RO)

Register 9.15. EFUSE_RD_USR_DATA*n*_REG (*n*: 0-7) (0x007C+0x4**n*)



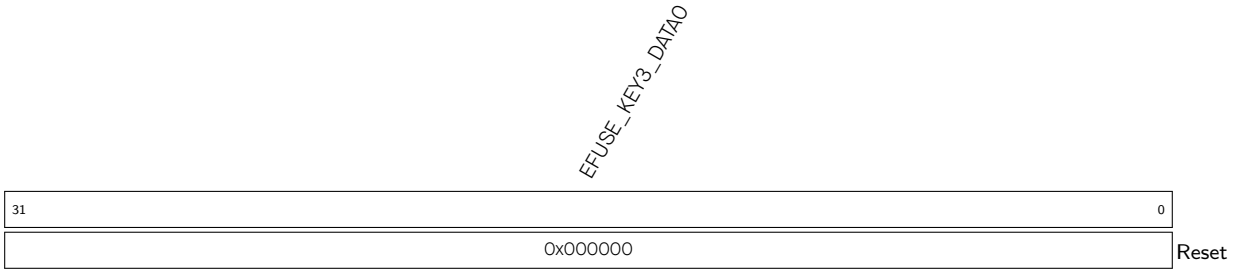
EFUSE_USR_DATA*n* Represents 32-bit word *n* of BLOCK3 (user data). (RO)

Register 9.16. EFUSE_RD_KEY0_DATA*n*_REG (*n*: 0-7) (0x009C+0x4**n*)



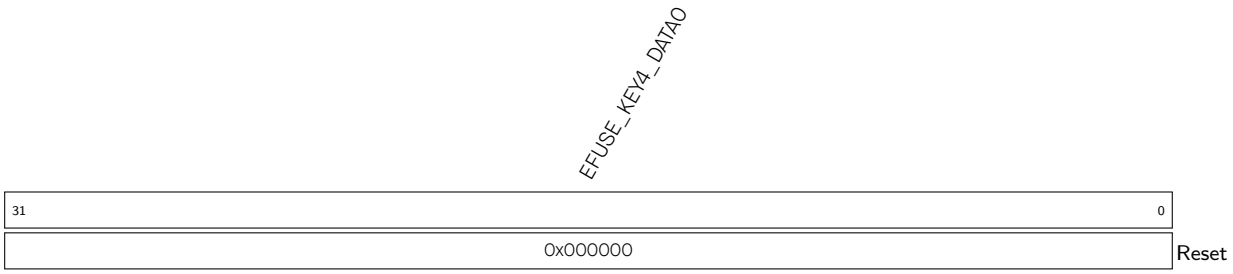
EFUSE_KEY0_DATA*n* Represents 32-bit word *n* of KEY0. (RO)

Register 9.17. EFUSE_RD_KEY1_DATA*n*_REG (*n*: 0-7) (0x00BC+0x4**n*)



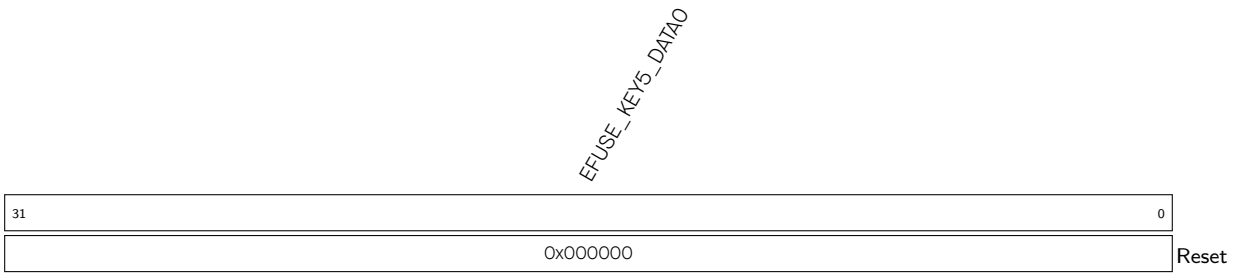
EFUSE_KEY1_DATA*n* Represents 32-bit word *n* of KEY1. (RO)

Register 9.18. EFUSE_RD_KEY2_DATA*n*_REG (*n*: 0-7) (0x00DC+0x4**n*)



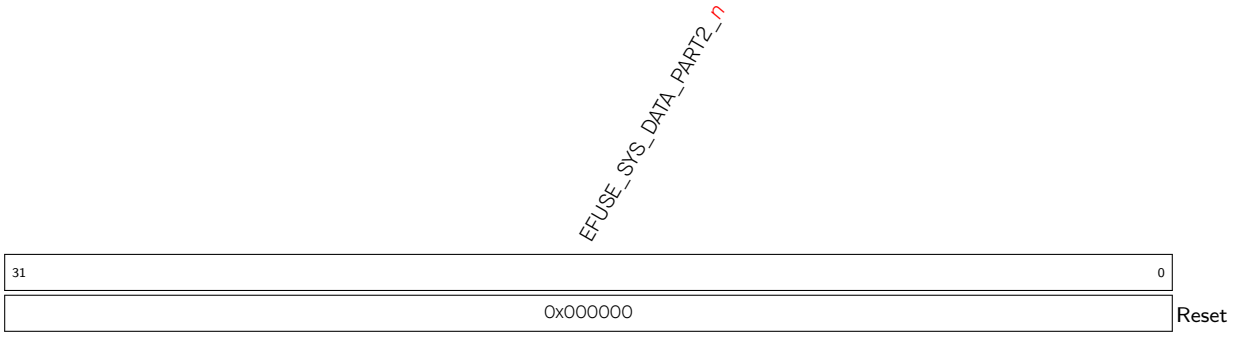
EFUSE_KEY2_DATA*n* Represents 32-bit word *n* of KEY2. (RO)

Register 9.19. EFUSE_RD_KEY3_DATA*n*_REG (*n*: 0-7) (0x00FC+0x4**n*)



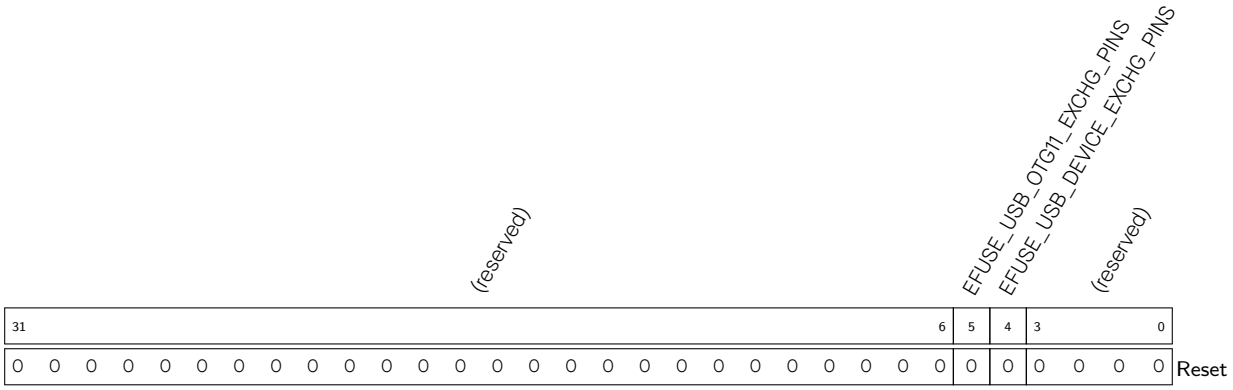
EFUSE_KEY3_DATA*n* Represents 32-bit word *n* of KEY3. (RO)

Register 9.20. EFUSE_RD_KEY4_DATA*n*_REG (*n*: 0-7) (0x011C+0x4**n*)



EFUSE_KEY4_DATA*n* Represents 32-bit word *n* of KEY4. (RO)

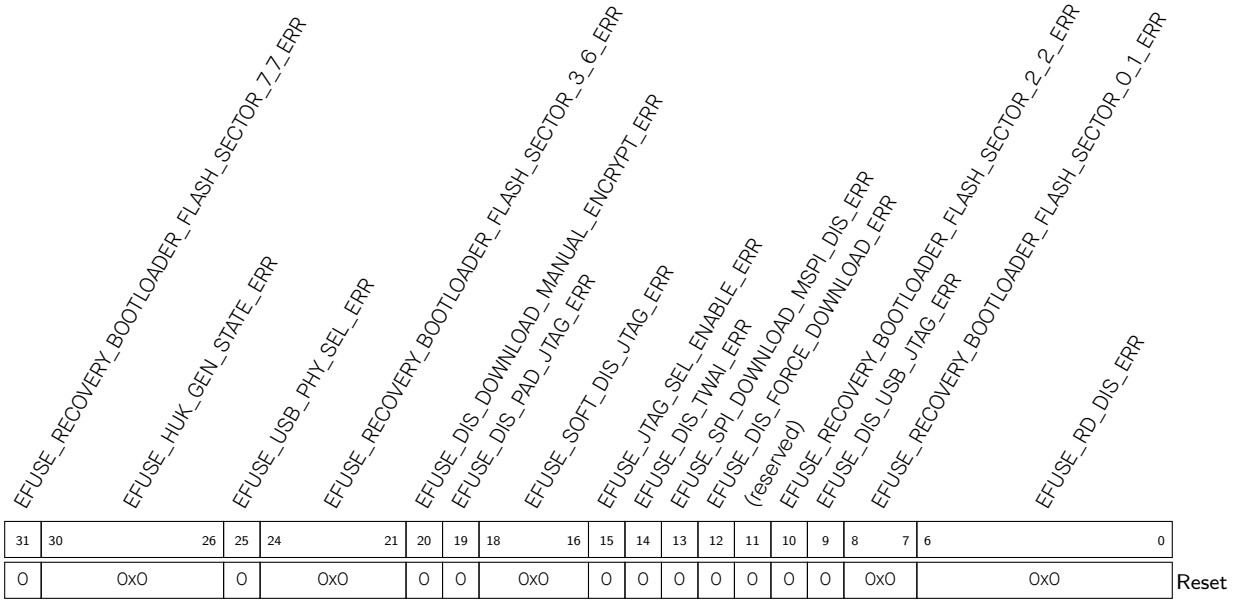
Register 9.21. EFUSE_RD_KEY5_DATA*n*_REG (*n*: 0-7) (0x013C+0x4**n*)



EFUSE_KEY5_DATA*n* Represents 32-bit word *n* of KEY5. (RO)

Register 9.22. EFUSE_RD_SYS_PART2_DATA*n*_REG (*n*: 0-5) (0x015C+0x4**n*)

EFUSE_SYS_DATA_PART2_*n* Represents 32-bit word *n* of the second part of system data. (RO)



Register 9.23. EFUSE_RD_SYS_PART2_DATA7_REG (0x0178)

EFUSE_USB_DEVICE_EXCHG_PINS Represents whether USB device exchange pins of D+ and D- are enabled. (RO)

EFUSE_USB_OTG11_EXCHG_PINS Represents whether USB OTG11 exchange pins of D+ and D- are enabled. (RO)

Register 9.24. EFUSE_RD_REPEAT_DATA_ERR0_REG (0x017C)

EFUSE_RD_DIS_ERR Represents the programming error of EFUSE_RD_DIS (RO)

EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_0_1_ERR Represents the programming error of EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_0_1 (RO)

EFUSE_DIS_USB_JTAG_ERR Represents the programming error of EFUSE_DIS_USB_JTAG (RO)

EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_2_2_ERR Represents the programming error of EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_2_2 (RO)

EFUSE_DIS_FORCE_DOWNLOAD_ERR Represents the programming error of EFUSE_DIS_FORCE_-DOWNLOAD (RO)

EFUSE_SPI_DOWNLOAD_MSPI_DIS_ERR Represents the programming error of EFUSE_SPI_-DOWNLOAD_MSPI_DIS (RO)

EFUSE_DIS_TWAI_ERR Represents the programming error of EFUSE_DIS_TWAI (RO)

EFUSE_JTAG_SEL_ENABLE_ERR Represents the programming error of EFUSE_JTAG_SEL_-ENABLE (RO)

EFUSE_SOFT_DIS_JTAG_ERR Represents the programming error of EFUSE_SOFT_DIS_JTAG (RO)

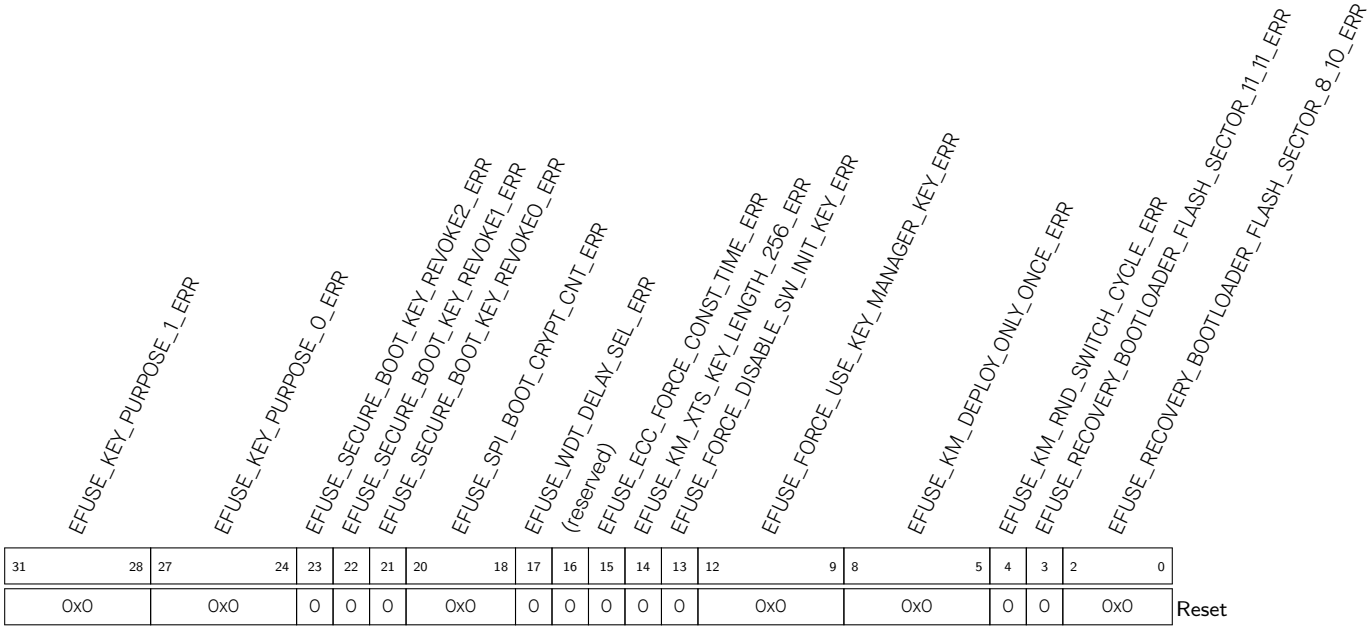
EFUSE_DIS_PAD_JTAG_ERR Represents the programming error of EFUSE_DIS_PAD_JTAG (RO)

EFUSE_DIS_DOWNLOAD_MANUAL_ENCRYPT_ERR Represents the programming error of EFUSE_-DIS_DOWNLOAD_MANUAL_ENCRYPT (RO)

EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_3_6_ERR Represents the programming error of EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_3_6 (RO)

EFUSE_USB_PHY_SEL_ERR Represents the programming error of EFUSE_USB_PHY_SEL (RO)

Continued on the next page...



Register 9.24. EFUSE_RD_REPEAT_DATA_ERR0_REG (0x017C)

Continued from the previous page...

EFUSE_HUK_GEN_STATE_ERR Represents the programming error of EFUSE_HUK_GEN_STATE (RO)

EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_7_7_ERR Represents the programming error of EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_7_7 (RO)

Register 9.25. EFUSE_RD_REPEAT_DATA_ERR1_REG (0x0180)

EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_8_10_ERR Represents the programming error of EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_8_10 (RO)

EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_11_11_ERR Represents the programming error of EFUSE_RECOVERY_BOOTLOADER_FLASH_SECTOR_11_11 (RO)

EFUSE_KM_RND_SWITCH_CYCLE_ERR Represents the programming error of EFUSE_KM_RND_SWITCH_CYCLE (RO)

EFUSE_KM_DEPLOY_ONLY_ONCE_ERR Represents the programming error of EFUSE_KM_DEPLOY_ONLY_ONCE (RO)

EFUSE_FORCE_USE_KEY_MANAGER_KEY_ERR Represents the programming error of EFUSE_FORCE_USE_KEY_MANAGER_KEY (RO)

EFUSE_FORCE_DISABLE_SW_INIT_KEY_ERR Represents the programming error of EFUSE_FORCE_DISABLE_SW_INIT_KEY (RO)

EFUSE_KM_XTS_KEY_LENGTH_256_ERR Represents the programming error of EFUSE_KM_XTS_KEY_LENGTH_256 (RO)

EFUSE_ECC_FORCE_CONST_TIME_ERR Represents the programming error of EFUSE_ECC_FORCE_CONST_TIME (RO)

EFUSE_WDT_DELAY_SEL_ERR Represents the programming error of EFUSE_WDT_DELAY_SEL (RO)

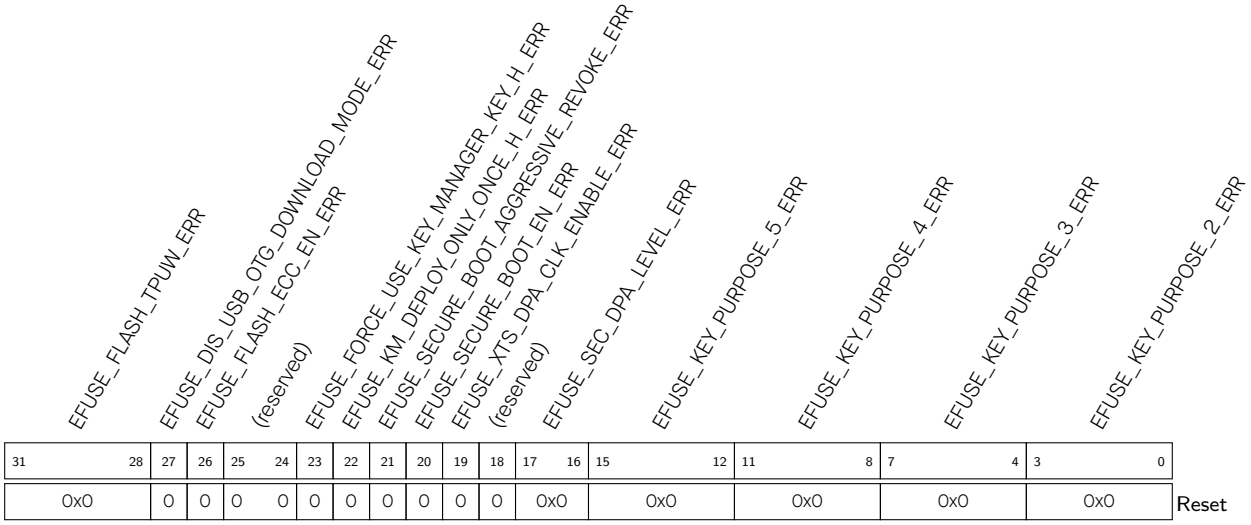
EFUSE_SPI_BOOT_CRYPT_CNT_ERR Represents the programming error of EFUSE_SPI_BOOT_CRYPT_CNT (RO)

EFUSE_SECURE_BOOT_KEY_REVOKE0_ERR Represents the programming error of EFUSE_SECURE_BOOT_KEY_REVOKE0 (RO)

Continued on the next page...

Register 9.25. EFUSE_RD_REPEAT_DATA_ERR1_REG (0x0180)

Continued from the previous page...



EFUSE_SECURE_BOOT_KEY_REVOKE1_ERR Represents the programming error of EFUSE_SECURE_BOOT_KEY_REVOKE1 (RO)

EFUSE_SECURE_BOOT_KEY_REVOKE2_ERR Represents the programming error of EFUSE_SECURE_BOOT_KEY_REVOKE2 (RO)

EFUSE_KEY_PURPOSE_0_ERR Represents the programming error of EFUSE_KEY_PURPOSE_0 (RO)

EFUSE_KEY_PURPOSE_1_ERR Represents the programming error of EFUSE_KEY_PURPOSE_1 (RO)

Register 9.26. EFUSE_RD_REPEAT_DATA_ERR2_REG (0x0184)

EFUSE_KEY_PURPOSE_2_ERR Represents the programming error of EFUSE_KEY_PURPOSE_2 (RO)

Continued from the previous page...

EFUSE_KEY_PURPOSE_1_H_ERR Represents the programming error of EFUSE_KEY_PURPOSE_1_H (RO)

EFUSE_KEY_PURPOSE_2_H_ERR Represents the programming error of EFUSE_KEY_PURPOSE_2_H (RO)

EFUSE_KEY_PURPOSE_3_H_ERR Represents the programming error of EFUSE_KEY_PURPOSE_3_H (RO)

EFUSE_KEY_PURPOSE_4_H_ERR Represents the programming error of EFUSE_KEY_PURPOSE_4_H (RO)

Register 9.28. EFUSE_RD_REPEAT_DATA_ERR4_REG (0x018C)

EFUSE_OPXA_TIEH_SEL_0_ERR Represents the programming error of EFUSE_OPXA_TIEH_SEL_0 (RO)

EFUSE_PVT_GLITCH_EN_ERR Represents the programming error of EFUSE_PVT_GLITCH_EN (RO)

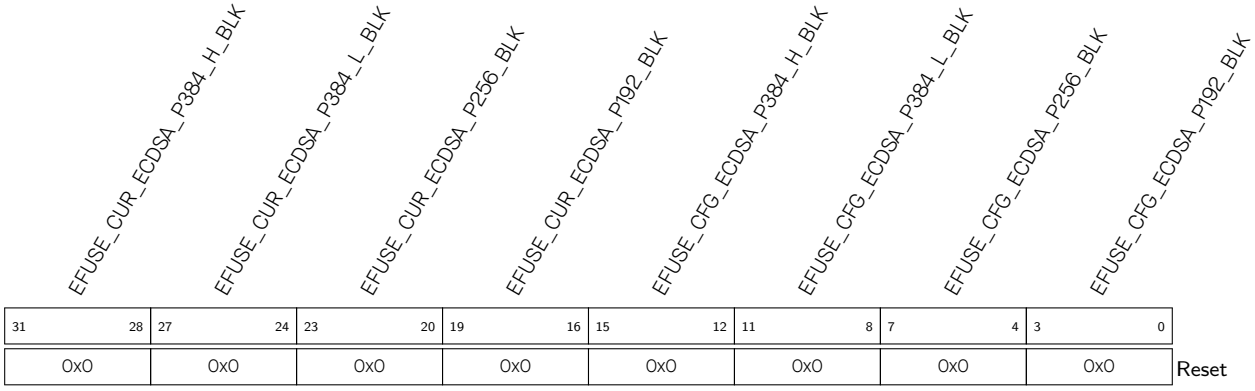
EFUSE_KEY_PURPOSE_5_H_ERR Represents the programming error of EFUSE_KEY_PURPOSE_5_H (RO)

EFUSE_KM_DISABLE_DEPLOY_MODE_H_ERR Represents the programming error of EFUSE_KM_DISABLE_DEPLOY_MODE_H (RO)

EFUSE_KM_DISABLE_DEPLOY_MODE_ERR Represents the programming error of EFUSE_KM_DISABLE_DEPLOY_MODE (RO)

EFUSE_XTS_DPA_PSEUDO_LEVEL_ERR Represents the programming error of EFUSE_XTS_DPA_PSEUDO_LEVEL (RO)

EFUSE_HP_PWR_SRC_SEL_ERR Represents the programming error of EFUSE_HP_PWR_SRC_SEL (RO)



EFUSE_SECURE_BOOT_SHA384_EN_ERR Represents the programming error of EFUSE_SECURE_BOOT_SHA384_EN (RO)

EFUSE_DIS_WDT_ERR Represents the programming error of EFUSE_DIS_WDT (RO)

EFUSE_DIS_SWD_ERR Represents the programming error of EFUSE_DIS_SWD (RO)

EFUSE_PVT_GLITCH_MODE_ERR Represents the programming error of EFUSE_PVT_GLITCH_MODE (RO)

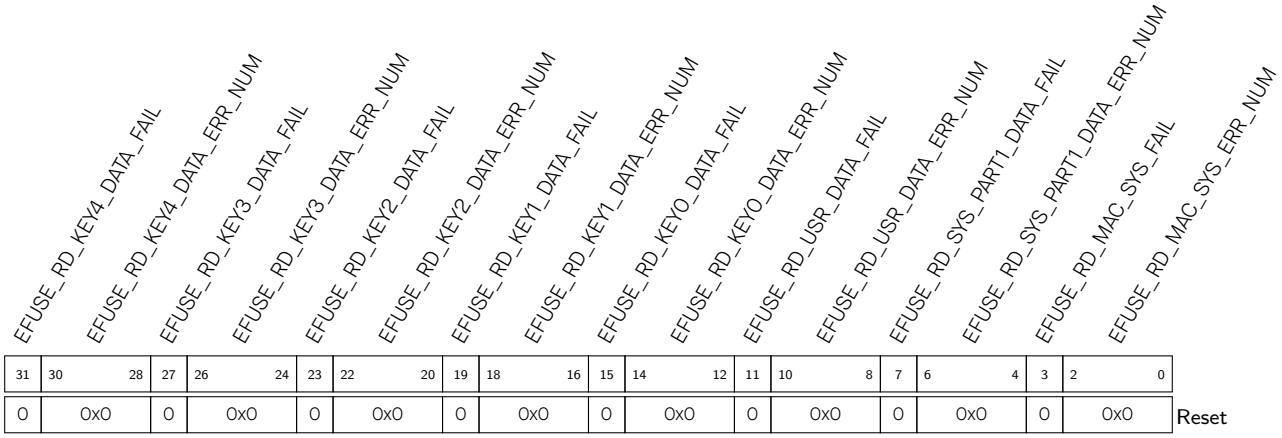
Register 9.29. EFUSE_ECDSA_REG (0x01B0)

EFUSE_CFG_ECDSA_P192_BLK Configures which block to use for ECDSA P192 key output. (R/W)

EFUSE_CFG_ECDSA_P256_BLK Configures which block to use for ECDSA P256 key output. (R/W)

EFUSE_CFG_ECDSA_P384_L_BLK Configures which block to use for ECDSA P384 key low part output. (R/W)

EFUSE_CFG_ECDSA_P384_H_BLK Configures which block to use for ECDSA P384 key high part output. (R/W)



EFUSE_CUR_ECDSA_P192_BLK Represents which block is used for ECDSA P192 key output. (RO)

EFUSE_CUR_ECDSA_P256_BLK Represents which block is used for ECDSA P256 key output. (RO)

EFUSE_CUR_ECDSA_P384_L_BLK Represents which block is used for ECDSA P384 key low part output. (RO)

EFUSE_CUR_ECDSA_P384_H_BLK Represents which block is used for ECDSA P384 key high part output. (RO)

Register 9.30. EFUSE_RD_RS_DATA_ERR0_REG (0x01C0)

EFUSE_RD_MAC_SYS_ERR_NUM Represents the error number of registers. (RO)

The value of this signal means the number of error bytes in rd_mac_sys.

EFUSE_RD_MAC_SYS_FAIL Represents the error status of register. (RO)

0: means no failure and that the data of rd_mac_sys is reliable

1: means that programming rd_mac_sys failed and the number of error bytes is over 6

EFUSE_RD_SYS_PART1_DATA_ERR_NUM Represents the error number of registers. (RO)

The value of this signal means the number of error bytes in rd_sys_part1_data (RO)

EFUSE_RD_SYS_PART1_DATA_FAIL Represents the error status of register. (RO)

0: means no failure and that the data of rd_sys_part1_data is reliable

1: means that programming rd_sys_part1_data failed and the number of error bytes is over 6.

EFUSE_RD_USR_DATA_ERR_NUM Represents the error number of registers. (RO)

The value of this signal means the number of error bytes in rd_usr_data (RO)

EFUSE_RD_USR_DATA_FAIL Represents the error status of register. (RO)

0: means no failure and that the data of rd_usr_data is reliable

1: means that programming rd_usr_data failed and the number of error bytes is over 6.

EFUSE_RD_KEY0_DATA_ERR_NUM Represents the error number of registers. (RO)

The value of this signal means the number of error bytes in rd_key0_data (RO)

EFUSE_RD_KEY0_DATA_FAIL Represents the error status of register. (RO)

0: means no failure and that the data of rd_key0_data is reliable

1: means that programming rd_key0_data failed and the number of error bytes is over 6.

EFUSE_RD_KEY1_DATA_ERR_NUM Represents the error number of registers. (RO)

The value of this signal means the number of error bytes in rd_key1_data (RO)

EFUSE_RD_KEY1_DATA_FAIL Represents the error status of register. (RO)

0: means no failure and that the data of rd_key1_data is reliable

1: means that programming rd_key1_data failed and the number of error bytes is over 6.

EFUSE_RD_KEY2_DATA_ERR_NUM Represents the error number of registers. (RO)

The value of this signal means the number of error bytes in rd_key2_data (RO)

Continued on the next page...

Register 9.30. EFUSE_RD_RS_DATA_ERR0_REG (0x01C0)

Continued from the previous page...

EFUSE_RD_KEY2_DATA_FAIL Represents the error status of register. (RO)

0: means no failure and that the data of rd_key2_data is reliable

1: means that programming rd_key2_data failed and the number of error bytes is over 6.

EFUSE_RD_KEY3_DATA_ERR_NUM Represents the error number of registers. (RO)

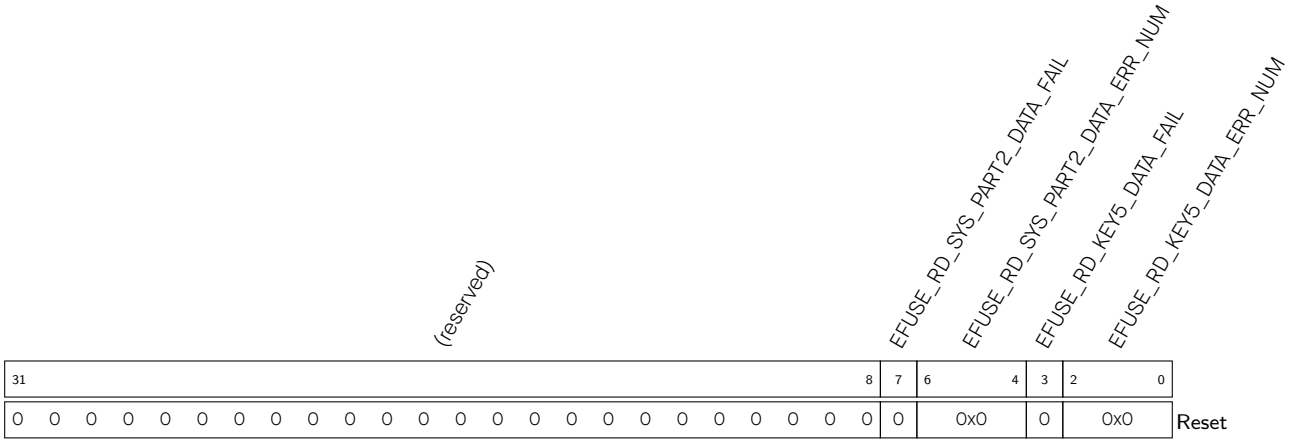
The value of this signal means the number of error bytes in rd_key3_data (RO)

EFUSE_RD_KEY3_DATA_FAIL Represents the error status of register. (RO)

0: means no failure and that the data of rd_key3_data is reliable

1: means that programming rd_key3_data failed and the number of error bytes is over 6.

EFUSE_RD_KEY4_DATA_ERR_NUM Represents the error number of registers. (RO)



The value of this signal means the number of error bytes in rd_key4_data.

EFUSE_RD_KEY4_DATA_FAIL Represents the error status of register. (RO)

0: means no failure and that the data of rd_key4_data is reliable

1: means that programming rd_key4_data failed and the number of error bytes is over 6.

Register 9.31. EFUSE_RD_RS_DATA_ERR1_REG (0x01C4)

EFUSE_RD_KEY5_DATA_ERR_NUM Represents the error number of registers. (RO)

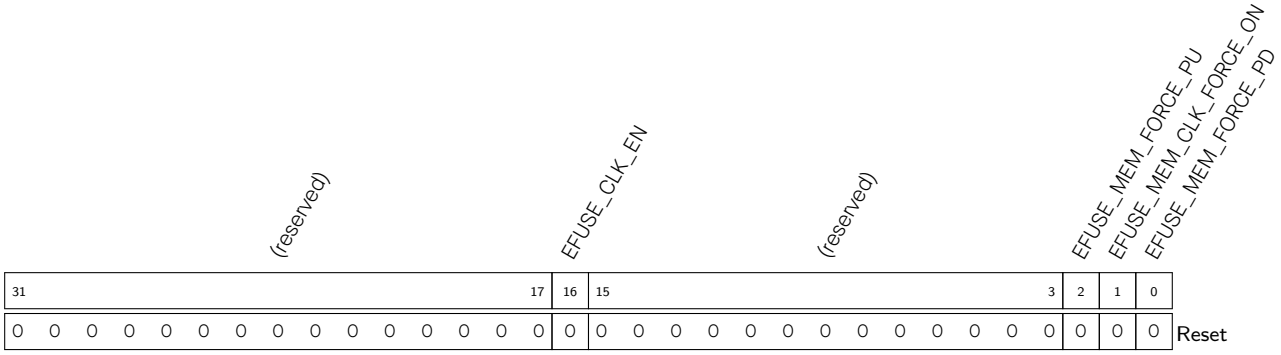
The value of this signal means the number of error bytes in rd_key5_data (RO)

EFUSE_RD_KEY5_DATA_FAIL Represents the error status of register. (RO)

0: means no failure and that the data of rd_key5_data is reliable

1: means that programming rd_key5_data failed and the number of error bytes is over 6

EFUSE_RD_SYS_PART2_DATA_ERR_NUM Represents the error number of registers. (RO)



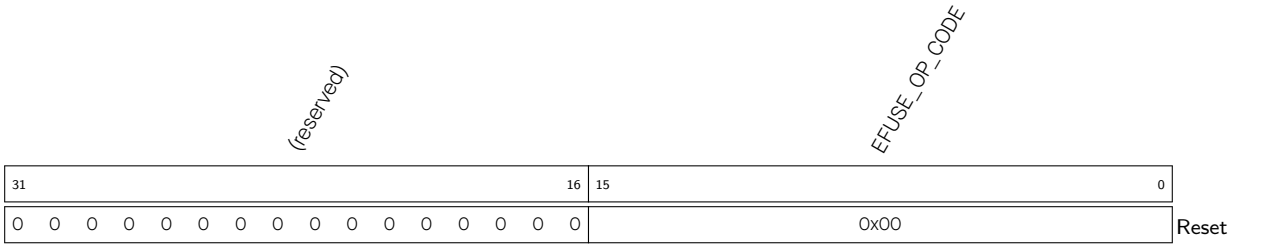
The value of this signal means the number of error bytes in rd_sys_part2_data (RO)

EFUSE_RD_SYS_PART2_DATA_FAIL Represents the error status of register. (RO)

0: means no failure and that the data of rd_sys_part2_data is reliable

1: means that programming rd_sys_part2_data failed and the number of error bytes is over 6

Register 9.32. EFUSE_CLK_REG (0x01C8)



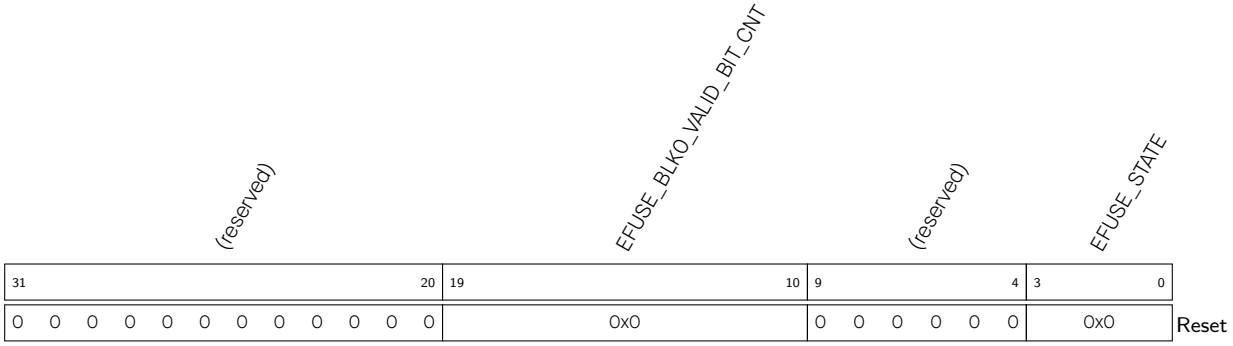
EFUSE_MEM_FORCE_PD Configures whether to force eFuse SRAM into power-saving mode. (R/W)

EFUSE_MEM_CLK_FORCE_ON Configures whether to force activate clock signal of eFuse SRAM. (R/W)

EFUSE_MEM_FORCE_PU Configures whether to force eFuse SRAM into working mode. (R/W)

EFUSE_CLK_EN Configures whether to force enable eFuse register configuration clock signal. (R/W)

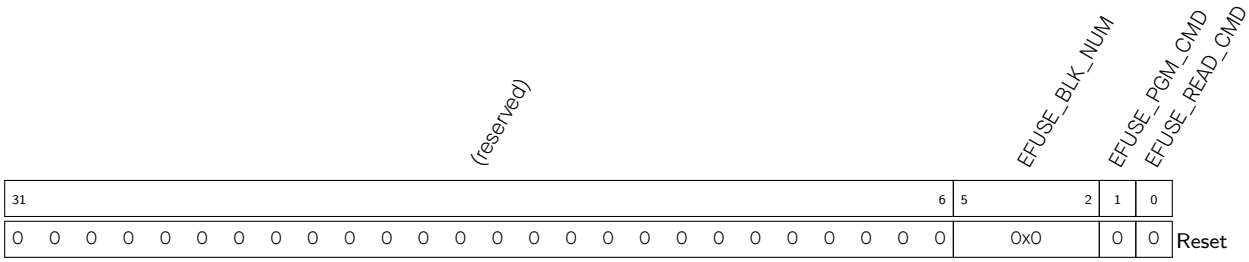
Register 9.33. EFUSE_CONF_REG (0x01CC)



EFUSE_OP_CODE Configures the operation command. (R/W)

0x5A5A: programming operation command

0x5AA5: read operation command

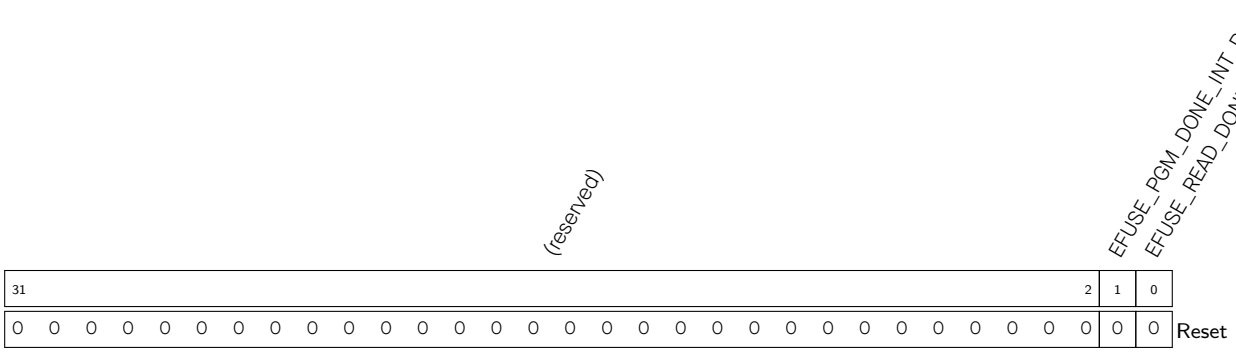


Register 9.34. EFUSE_STATUS_REG (0x01D0)

EFUSE_STATE Represents the state of the eFuse state machine. (RO)

EFUSE_BLK0_VALID_BIT_CNT Represents the number of block valid bits. (RO)

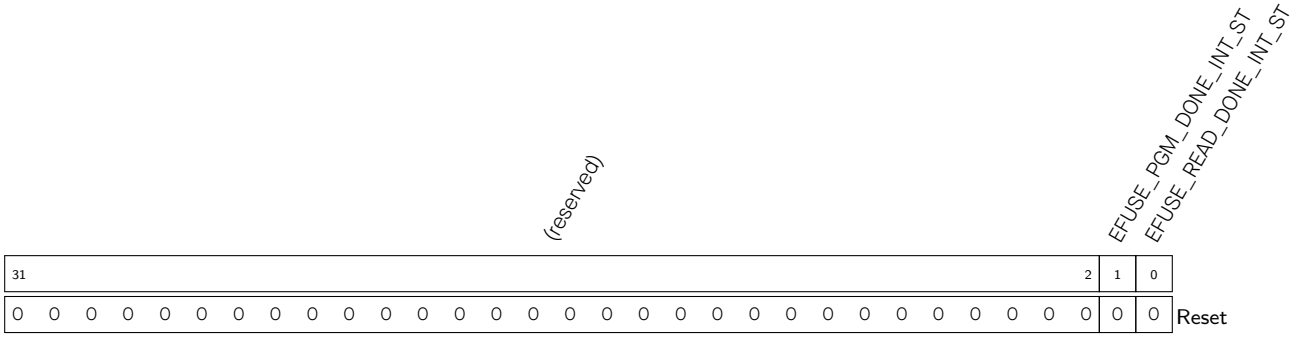
Register 9.35. EFUSE_CMD_REG (0x01D4)



EFUSE_READ_CMD Configures whether to send read command. (R/W/SC)

EFUSE_PGM_CMD Configures whether to send programming command. (R/W/SC)

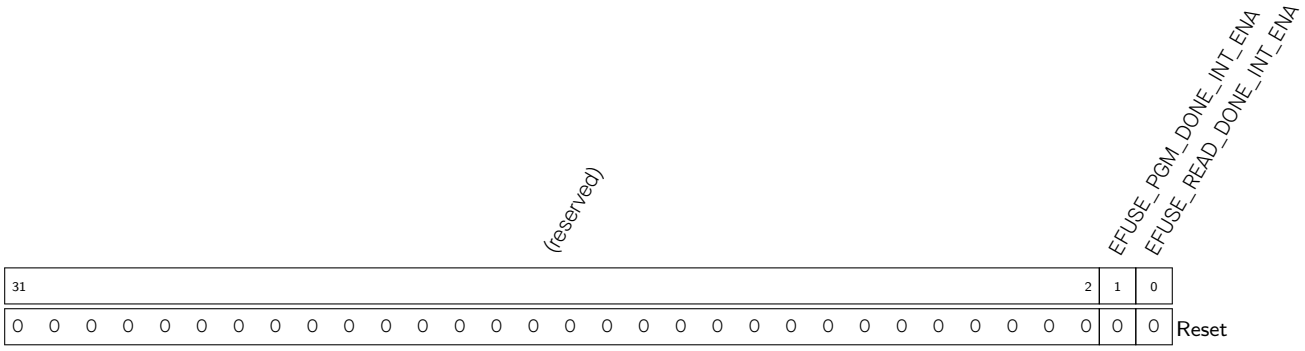
EFUSE_BLK_NUM Configures the serial number of the block to be programmed. (R/W)
Value 0-10 corresponds to block number 0-10, respectively.



Register 9.36. EFUSE_INT_RAW_REG (0x01D8)

EFUSE_READ_DONE_INT_RAW The raw interrupt status of read_done interrupt. (R/SS/WTC)

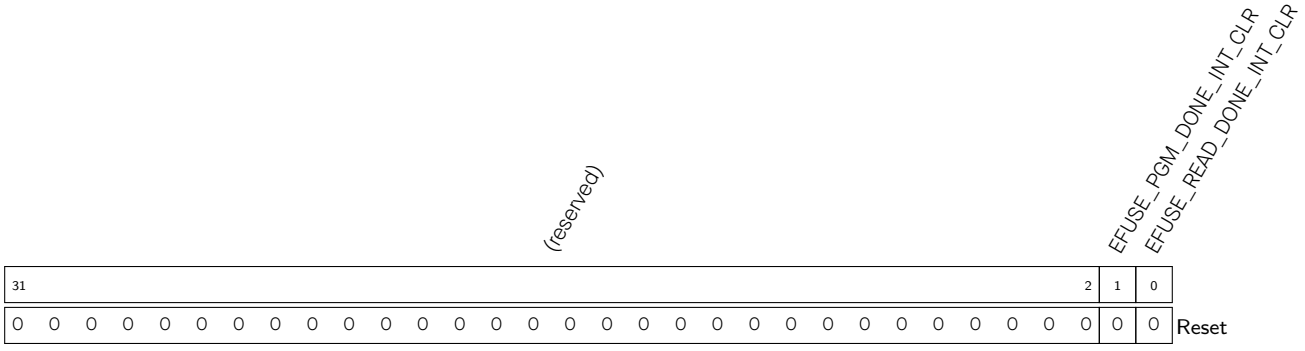
EFUSE_PGM_DONE_INT_RAW The raw interrupt status of pgm_done interrupt. (R/SS/WTC)



Register 9.37. EFUSE_INT_ST_REG (0x01DC)

EFUSE_READ_DONE_INT_ST The interrupt status of read_done interrupt. (RO)

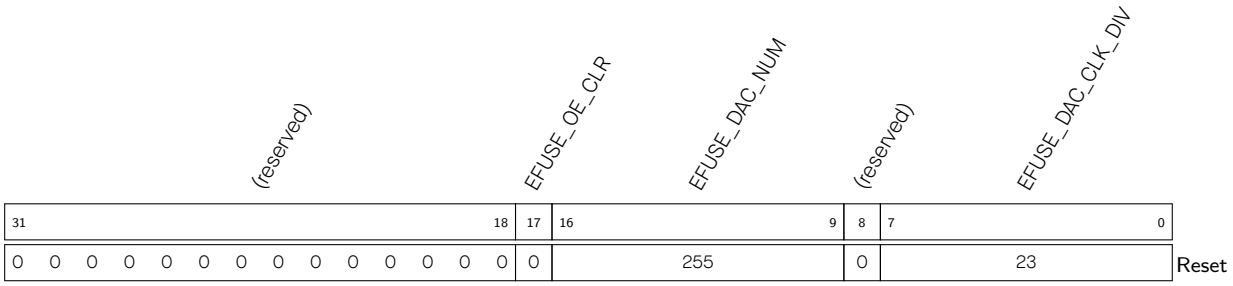
EFUSE_PGM_DONE_INT_ST The interrupt status of pgm_done interrupt. (RO)



Register 9.38. EFUSE_INT_ENA_REG (0x01E0)

EFUSE_READ_DONE_INT_ENA Write 1 to enable read_done interrupt. (R/W)

EFUSE_PGM_DONE_INT_ENA Write 1 to enable pgm_done interrupt. (R/W)

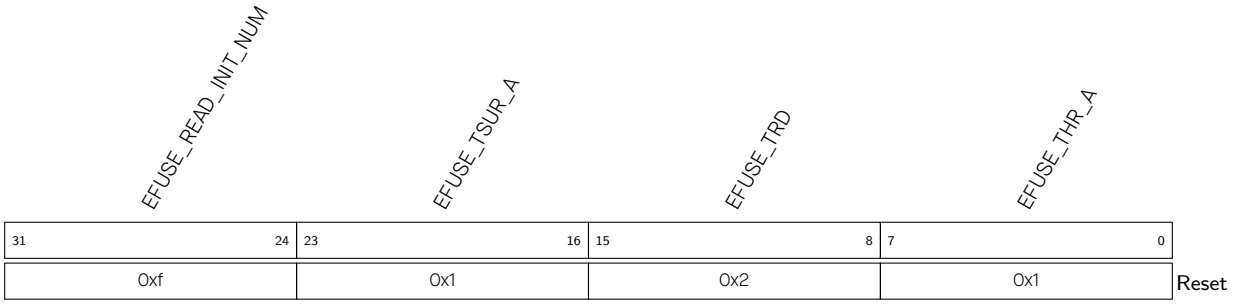


Register 9.39. EFUSE_INT_CLR_REG (0x01E4)

EFUSE_READ_DONE_INT_CLR Write 1 to clear read_done interrupt. (WT)

EFUSE_PGM_DONE_INT_CLR Write 1 to clear pgm_done interrupt. (WT)

Register 9.40. EFUSE_DAC_CONF_REG (0x01E8)

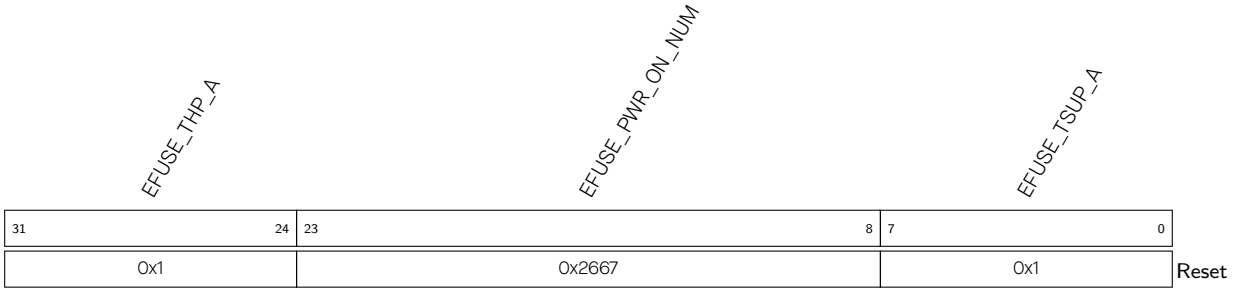


EFUSE_DAC_CLK_DIV Configures the division factor of the rising clock of the programming voltage. (R/W)

EFUSE_DAC_NUM Configures the rising period of the programming voltage. (R/W)

EFUSE_OE_CLR Configures whether to reduce the power supply of the programming voltage. (R/W)

Register 9.41. EFUSE_RD_TIM_CONF_REG (0x01EC)



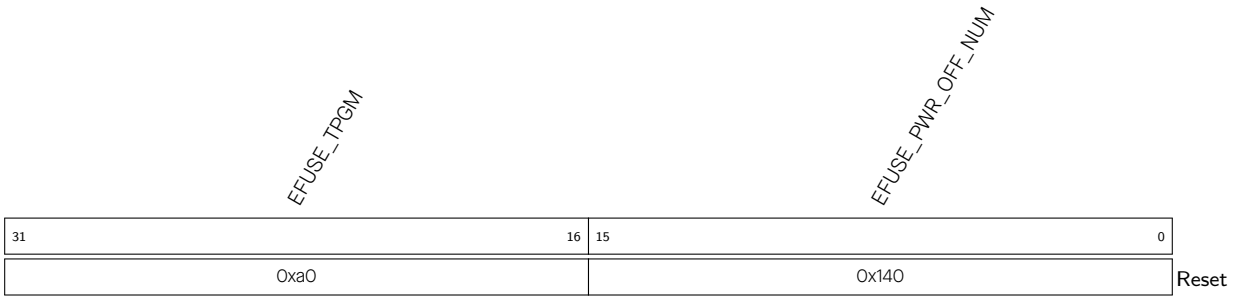
EFUSE_THR_A Configures the read hold time. (R/W)

EFUSE_TRD Configures the read time. (R/W)

EFUSE_TSUR_A Configures the read setup time. (R/W)

EFUSE_READ_INIT_NUM Configures the waiting time of reading eFuse memory. (R/W)

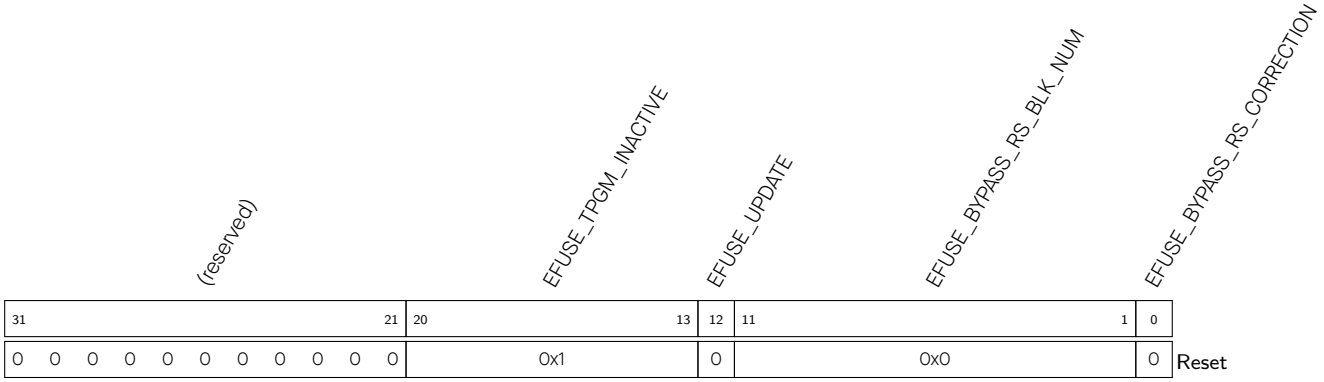
Register 9.42. EFUSE_WR_TIM_CONF1_REG (0x01F0)



EFUSE_TSUP_A Configures the programming setup time. (R/W)

EFUSE_PWR_ON_NUM Configures the power up time for VDDQ. (R/W)

EFUSE_THP_A Configures the programming hold time. (R/W)

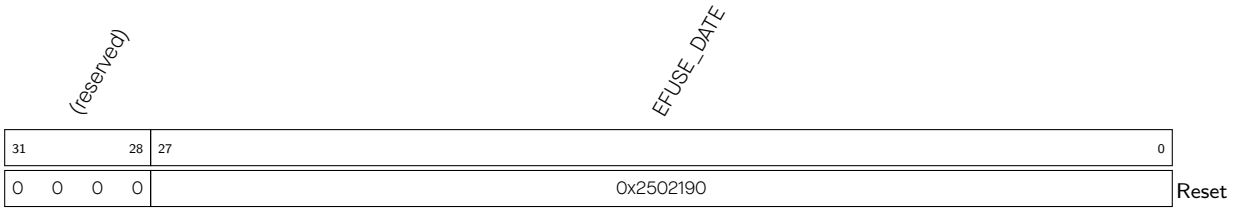


Register 9.43. EFUSE_WR_TIM_CONF2_REG (0x01F4)

EFUSE_PWR_OFF_NUM Configures the power outage time for VDDQ. (R/W)

EFUSE_TPGM Configures the active programming time. (R/W)

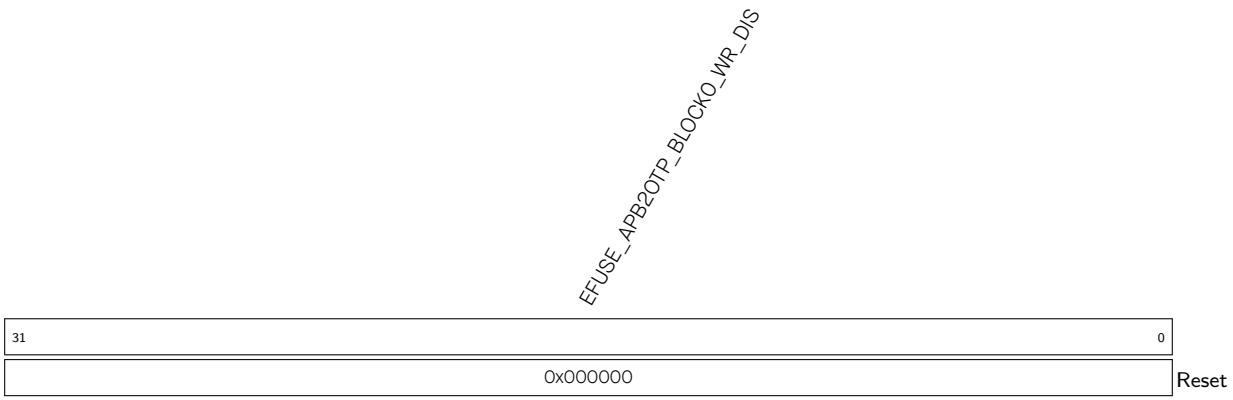
Register 9.44. EFUSE_WR_TIM_CONF0_RS_BYPASS_REG (0x01F8)



EFUSE_BYPASS_RS_CORRECTION Configures whether to bypass Reed-Solomon correction step. (R/W)

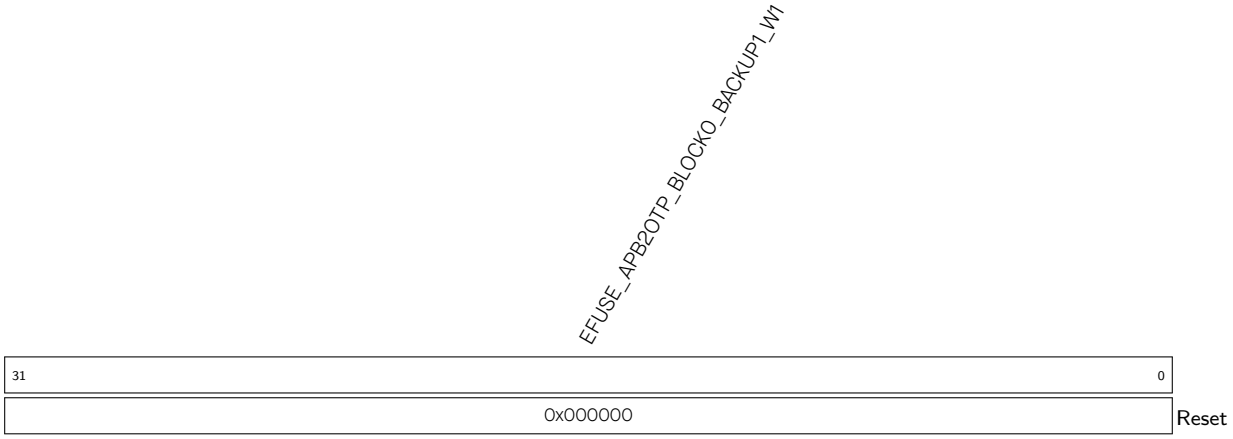
EFUSE_BYPASS_RS_BLK_NUM Configures block number of programming twice operation. (R/W)

EFUSE_UPDATE Write 1 to update multi-bit register signals. (WT)



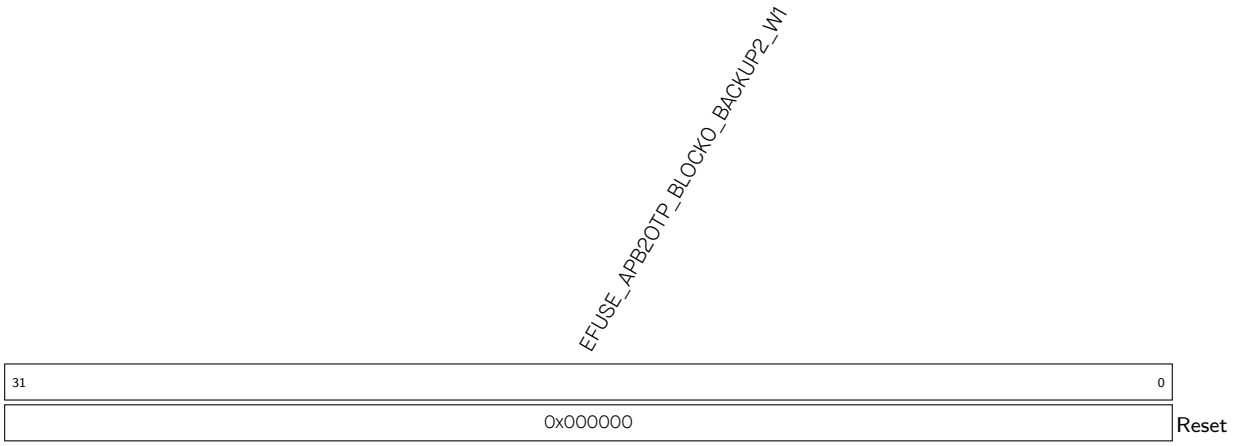
EFUSE_TPGM_INACTIVE Configures the inactive programming time. (R/W)

Register 9.45. EFUSE_DATE_REG (0x01FC)



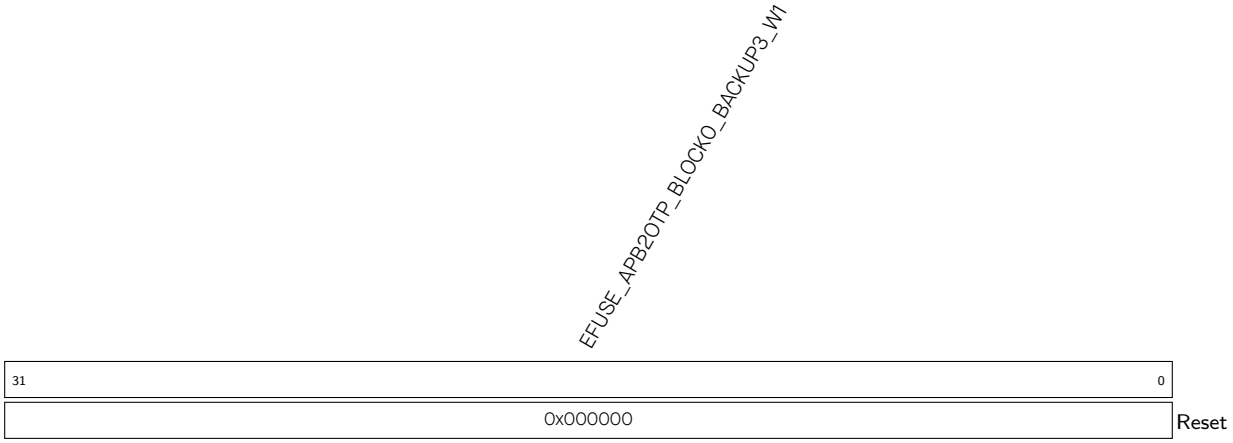
EFUSE_DATE Configures the eFuse version. (R/W)

Register 9.46. EFUSE_APB2OTP_WR_DIS_REG (0x0800)



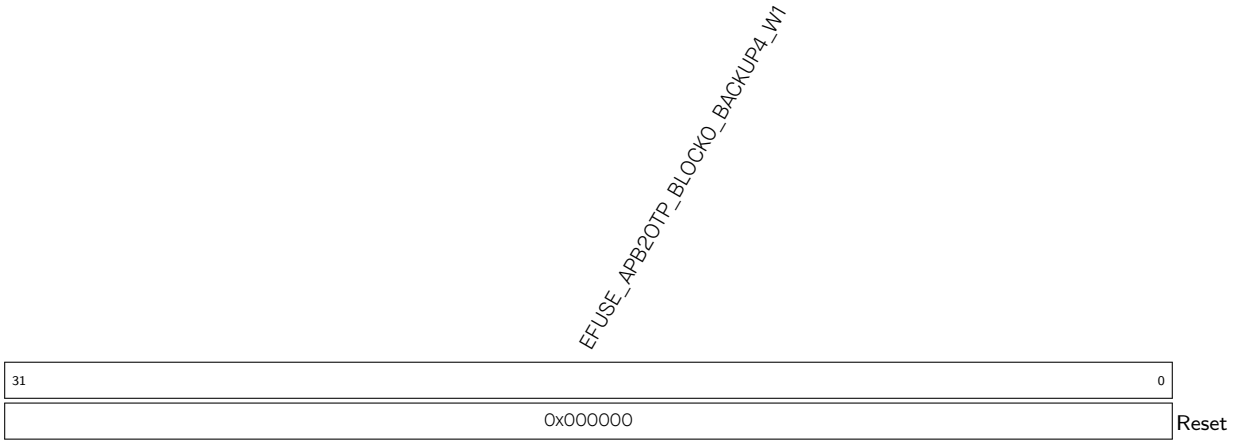
EFUSE_APB2OTP_BLOCK0_WR_DIS Represents OTP block0 write disable data. (RO)

Register 9.47. EFUSE_APB2OTP_BLK0_BACKUP1_W*n*_REG (*n*: 1-5) (0x0800+0x4**n*)



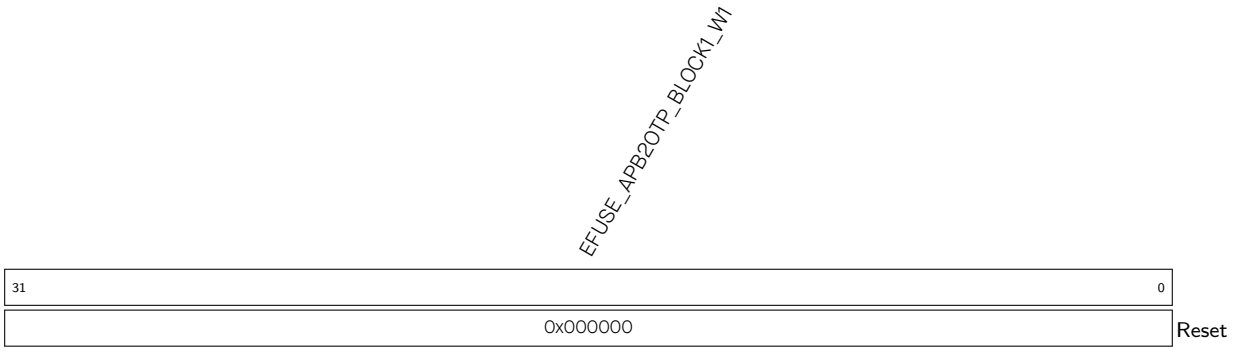
EFUSE_APB2OTP_BLOCK0_BACKUP1_W*n* Represents 32-bit word *n* of OTP block0 backup1. (RO)

Register 9.48. EFUSE_APB2OTP_BLK0_BACKUP2_W*n*_REG (*n*: 1-5) (0x0814+0x4**n*)



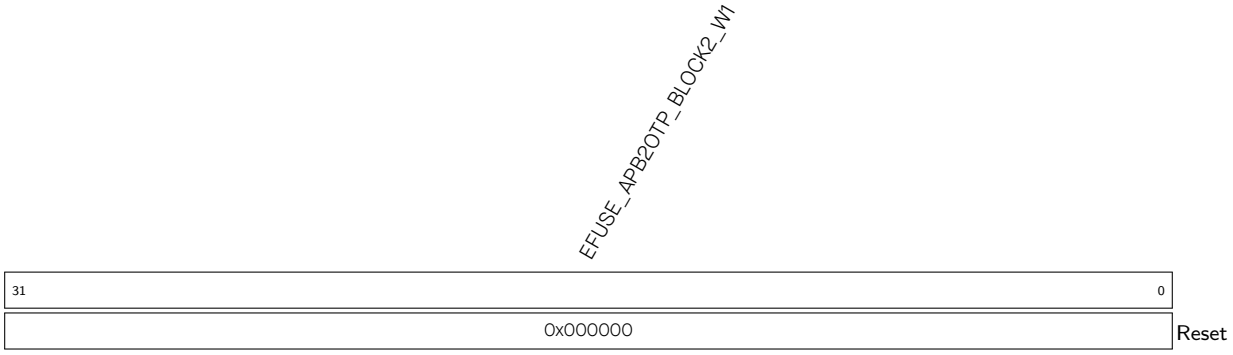
EFUSE_APB2OTP_BLOCK0_BACKUP2_W*n* Represents 32-bit word *n* of OTP block0 backup2. (RO)

Register 9.49. EFUSE_APB2OTP_BLK0_BACKUP3_W*n*_REG (*n*: 1-5) (0x0828+0x4**n*)



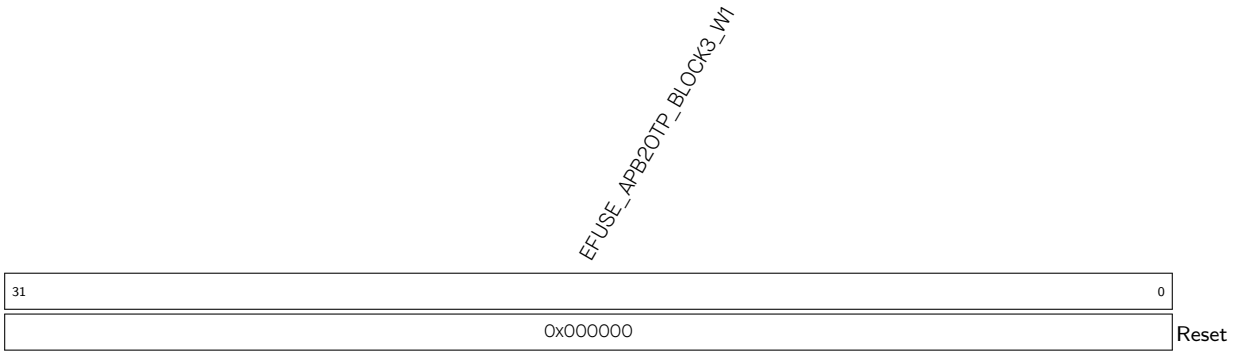
EFUSE_APB2OTP_BLOCK0_BACKUP3_W*n* Represents 32-bit word *n* of OTP block0 backup3. (RO)

Register 9.50. EFUSE_APB2OTP_BLK0_BACKUP4_W*n*_REG (*n*: 1-5) (0x083C+0x4**n*)



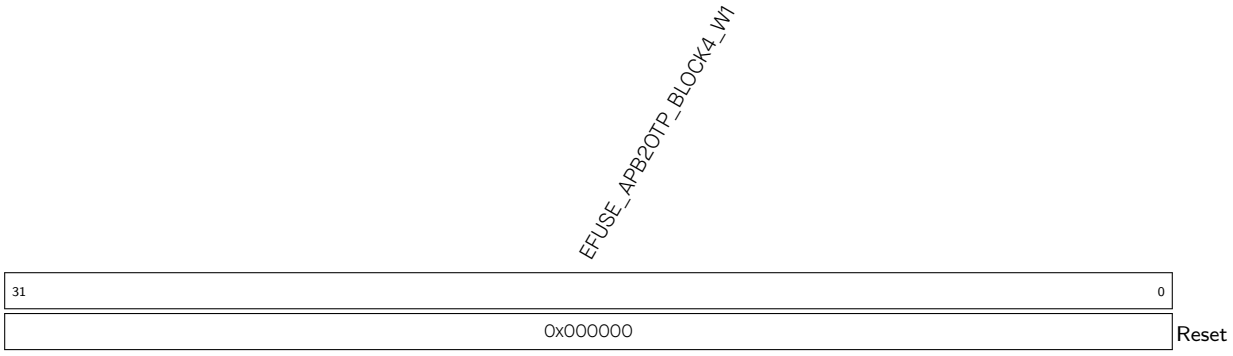
EFUSE_APB2OTP_BLOCK0_BACKUP4_W*n* Represents 32-bit word *n* of OTP block0 backup4. (RO)

Register 9.51. EFUSE_APB2OTP_BLK1_W*n*_REG (*n*: 1-9) (0x0850+0x4**n*)



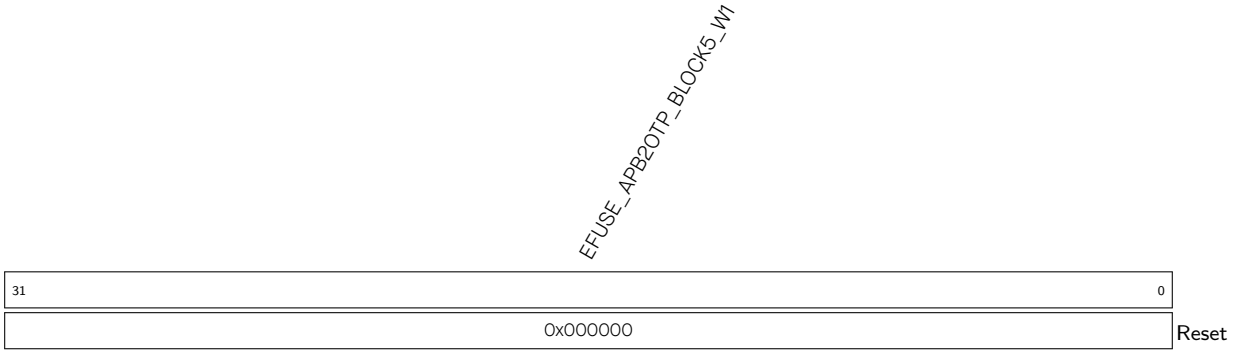
EFUSE_APB2OTP_BLOCK1_W*n* Represents 32-bit word *n* of OTP block1. (RO)

Register 9.52. EFUSE_APB2OTP_BLK2_W*n*_REG (*n*: 1-11) (0x0874+0x4**n*)



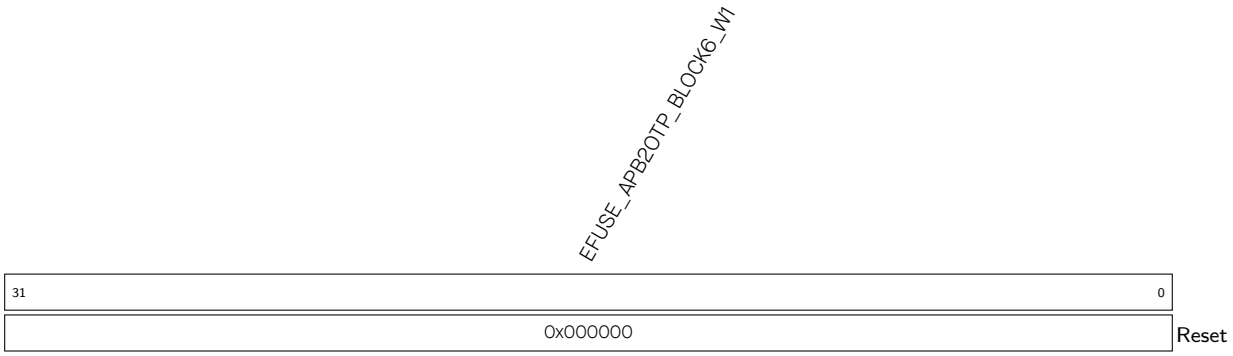
EFUSE_APB2OTP_BLOCK2_W*n* Represents 32-bit word *n* of OTP block2. (RO)

Register 9.53. EFUSE_APB2OTP_BLK3_W*n*_REG (*n*: 1-11) (0x08A0+0x4**n*)



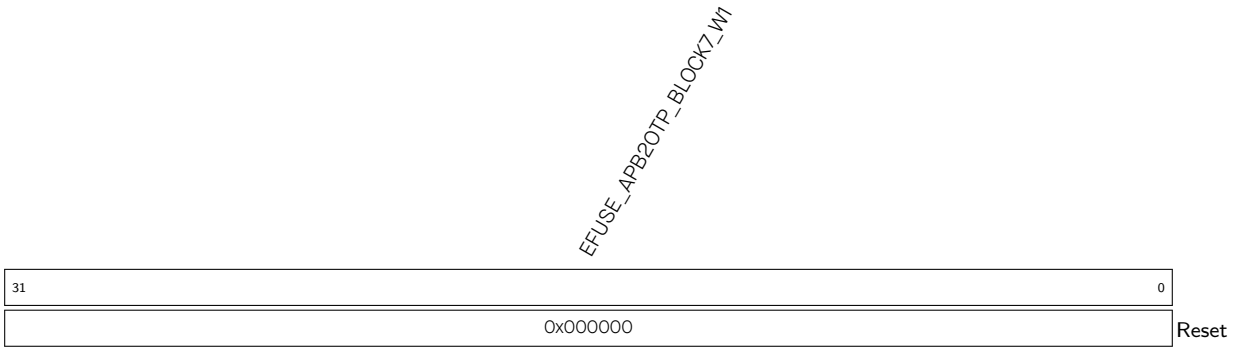
EFUSE_APB2OTP_BLOCK3_W*n* Represents 32-bit word *n* of OTP block3. (RO)

Register 9.54. EFUSE_APB2OTP_BLK4_W*n*_REG (*n*: 1-11) (0x08CC+0x4**n*)



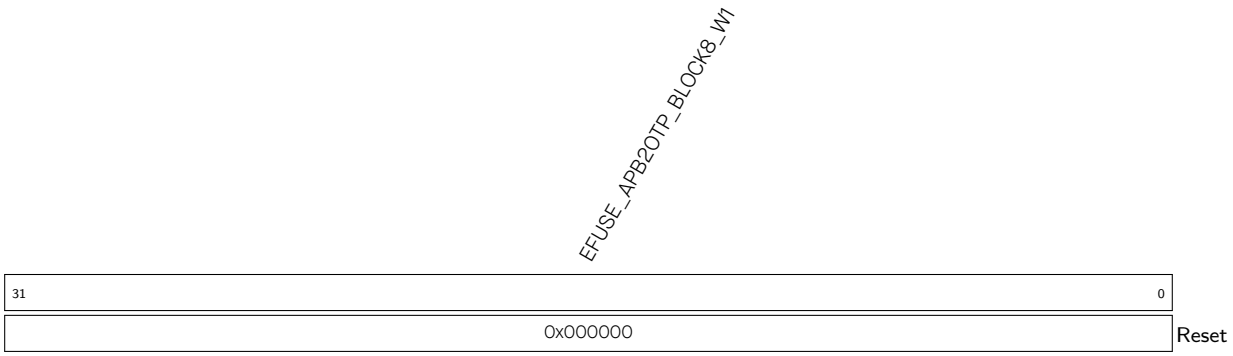
EFUSE_APB2OTP_BLOCK4_W*n* Represents 32-bit word *n* of OTP block4. (RO)

Register 9.55. EFUSE_APB2OTP_BLK5_W*n*_REG (*n*: 1-11) (0x08F8+0x4**n*)



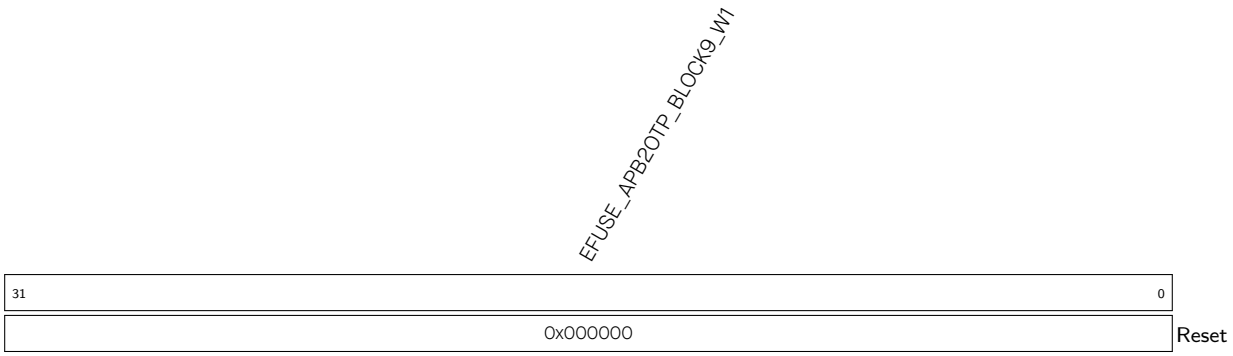
EFUSE_APB2OTP_BLOCK5_W*n* Represents 32-bit word *n* of OTP block5. (RO)

Register 9.56. EFUSE_APB2OTP_BLK6_W*n*_REG (*n*: 1-11) (0x0924+0x4**n*)



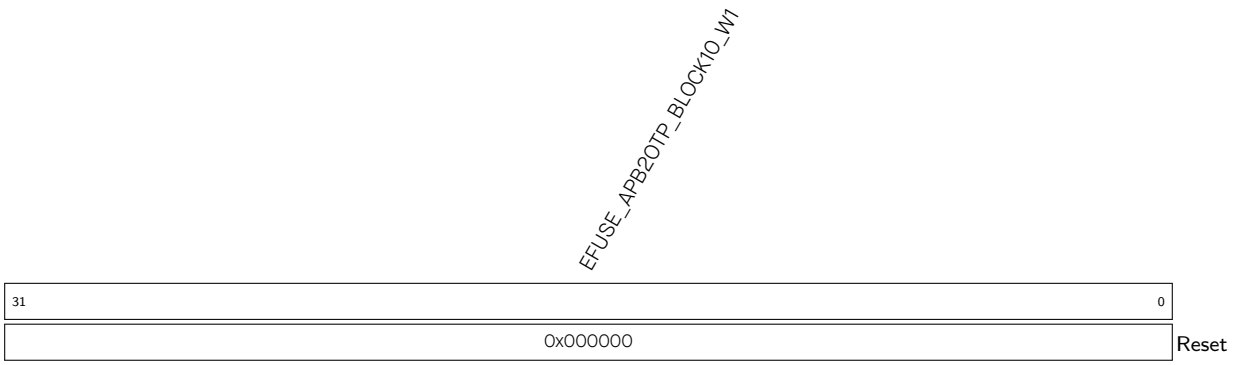
EFUSE_APB2OTP_BLOCK6_W*n* Represents 32-bit word *n* of OTP block6. (RO)

Register 9.57. EFUSE_APB2OTP_BLK7_W*n*_REG (*n*: 1-11) (0x0950+0x4**n*)



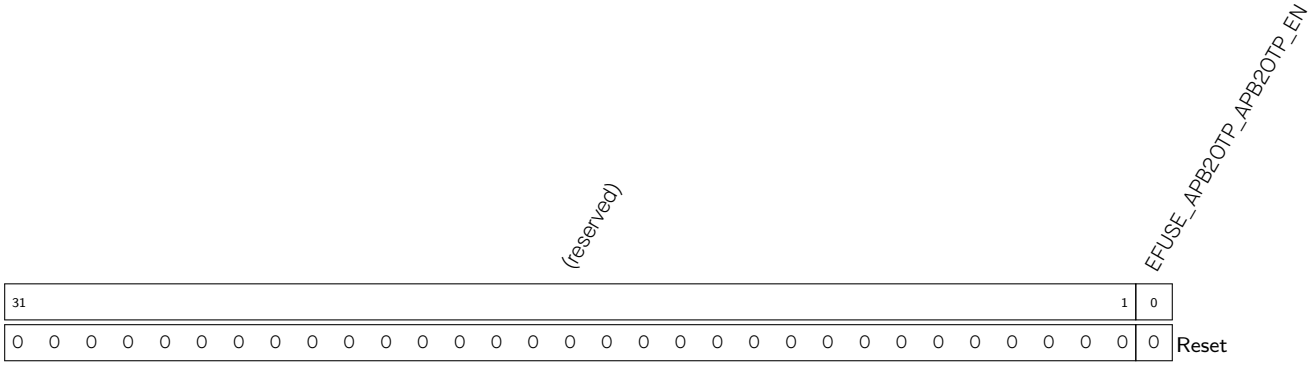
EFUSE_APB2OTP_BLOCK7_W*n* Represents 32-bit word *n* of OTP block7. (RO)

Register 9.58. EFUSE_APB2OTP_BLK8_W*n*_REG (*n*: 1-11) (0x097C+0x4**n*)



EFUSE_APB2OTP_BLOCK8_W*n* Represents 32-bit word *n* of OTP block8. (RO)

Register 9.59. EFUSE_APB2OTP_BLK9_W*n*_REG (*n*: 1-11) (0x09A8+0x4**n*)



EFUSE_APB2OTP_BLOCK9_W*n* Represents 32-bit word *n* of OTP block9. (RO)

Register 9.60. EFUSE_APB2OTP_BLK10_W*n*_REG (*n*: 1-11) (0x09D4+0x4**n*)

EFUSE_APB2OTP_BLOCK10_W*n* Represents 32-bit word *n* of OTP block10. (RO)

Register 9.61. EFUSE_APB2OTP_EN_REG (0x0A08)

EFUSE_APB2OTP_APB2OTP_EN Configures whether APB2OTP mode is enabled. (R/W)

Part IV

System Component

Encompassing a range of system-level functionalities, this part describes components related to system boot, clocks, GPIO, timers, watchdogs, debug assistance, event and interrupt handling, low-power management, and various system registers.

Chapter 10

GPIO Matrix and IO MUX

10.1 Overview

GPIO matrix is a hardware structure that allows dynamic remapping between the GPIO pins and peripheral input/output signals to provide greater flexibility. IO MUX (Input/output multiplexing) is a technology that allows the same pin to perform different functions at different times, allowing dynamic switching of pin functions through configuration. ESP32-P4 provides two groups of IO MUX and GPIO matrix:

- HP GPIO matrix and HP IO MUX
- LP GPIO matrix and LP IO MUX

The ESP32-P4 chip features 55 GPIO pins, including 16 low-power (LP) GPIO pins and 39 high-performance (HP) GPIO pins. Each pin can be used as a general-purpose I/O, or be connected to an internal peripheral signal.

- Through HP GPIO matrix and HP IO MUX, HP peripheral input signals can be from any GPIO pins, and HP peripheral output signals can be routed to any GPIO pins.
- Through LP GPIO matrix and LP IO MUX, LP peripheral input signals can be from any LP GPIO pins, and LP peripheral output signals can be routed to any LP GPIO pins.

Together these modules provide highly configurable I/O. The 55 GPIO pins are numbered from GPIO0 to GPIO54.

- LP GPIO pins (GPIO0 ~ GPIO15) can be used by either HP or LP peripherals.
- HP GPIO pins (GPIO16 ~ GPIO54) can be used only by HP peripherals.

The ESP32-P4 chip has dedicated pins for external flash and in-package PSRAM. Such pins can not be used for other purpose. See *ESP32-P4 Datasheet* > Section *Pin Mapping Between Chip and Flash/PSRAM*.

Unless otherwise specified, GPIO matrix refers to both LP GPIO matrix and HP GPIO matrix, so as to IO MUX.

10.2 Features

10.2.1 HP GPIO Matrix and HP IO MUX

HP GPIO matrix has the following features:

- A full-switching matrix between HP peripheral input/output signals and the GPIO pins
- 222 HP peripheral input signals sourced from the input of any GPIO pins
- 232 HP peripheral output signals routed to the output of any GPIO pins

- Signal synchronization for HP peripheral inputs based on **HP IO MUX operating clock**
- GPIO Filter hardware for input signal filtering
- Glitch Filter hardware for second-time filtering on input signal
- Sigma delta modulated (SDM) output
- GPIO simple input and output
- HP GPIO Wakeup

HP IO MUX has the following features:

- Control of 55 GPIOs (GPIO0 ~ GPIO54) for HP peripherals.
- A configuration register IO_MUX_GPIO*n*_REG provided for each GPIO pin, to control the pin's input/output, pull-up/pull-down, drive strength, and function selection.
- Better high-frequency digital performance achieved by routing some digital signals (SPI, EMAC) directly from HP IO MUX to peripherals.

10.2.2 LP GPIO Matrix and LP IO MUX

LP GPIO matrix has the following features:

- A full-switching matrix between the LP peripheral input/output signals and the LP GPIO pins
- 14 LP peripheral input signals sourced from the input of any LP GPIO pins
- 14 LP peripheral output signals routed to the output of any LP GPIO pins
- GPIO Filter hardware for input signal filtering
- GPIO simple input and output
- LP GPIO Wakeup

LP IO MUX has the following feature:

- Control of 16 LP GPIO pins (GPIO0 ~ GPIO15) for LP peripherals.
- A configuration register LP_IOMUX_PAD*n*_REG provided for each LP GPIO pin, to control the pin's input/output, pull-up/pull-down, drive strength, function selection, and IO MUX selection.

10.3 Architectural Overview

Figure 10.3-1 shows in details how HP GPIO matrix, HP IO MUX, LP GPIO matrix, and LP IO MUX route signals from pins to peripherals, and from peripherals to pins.

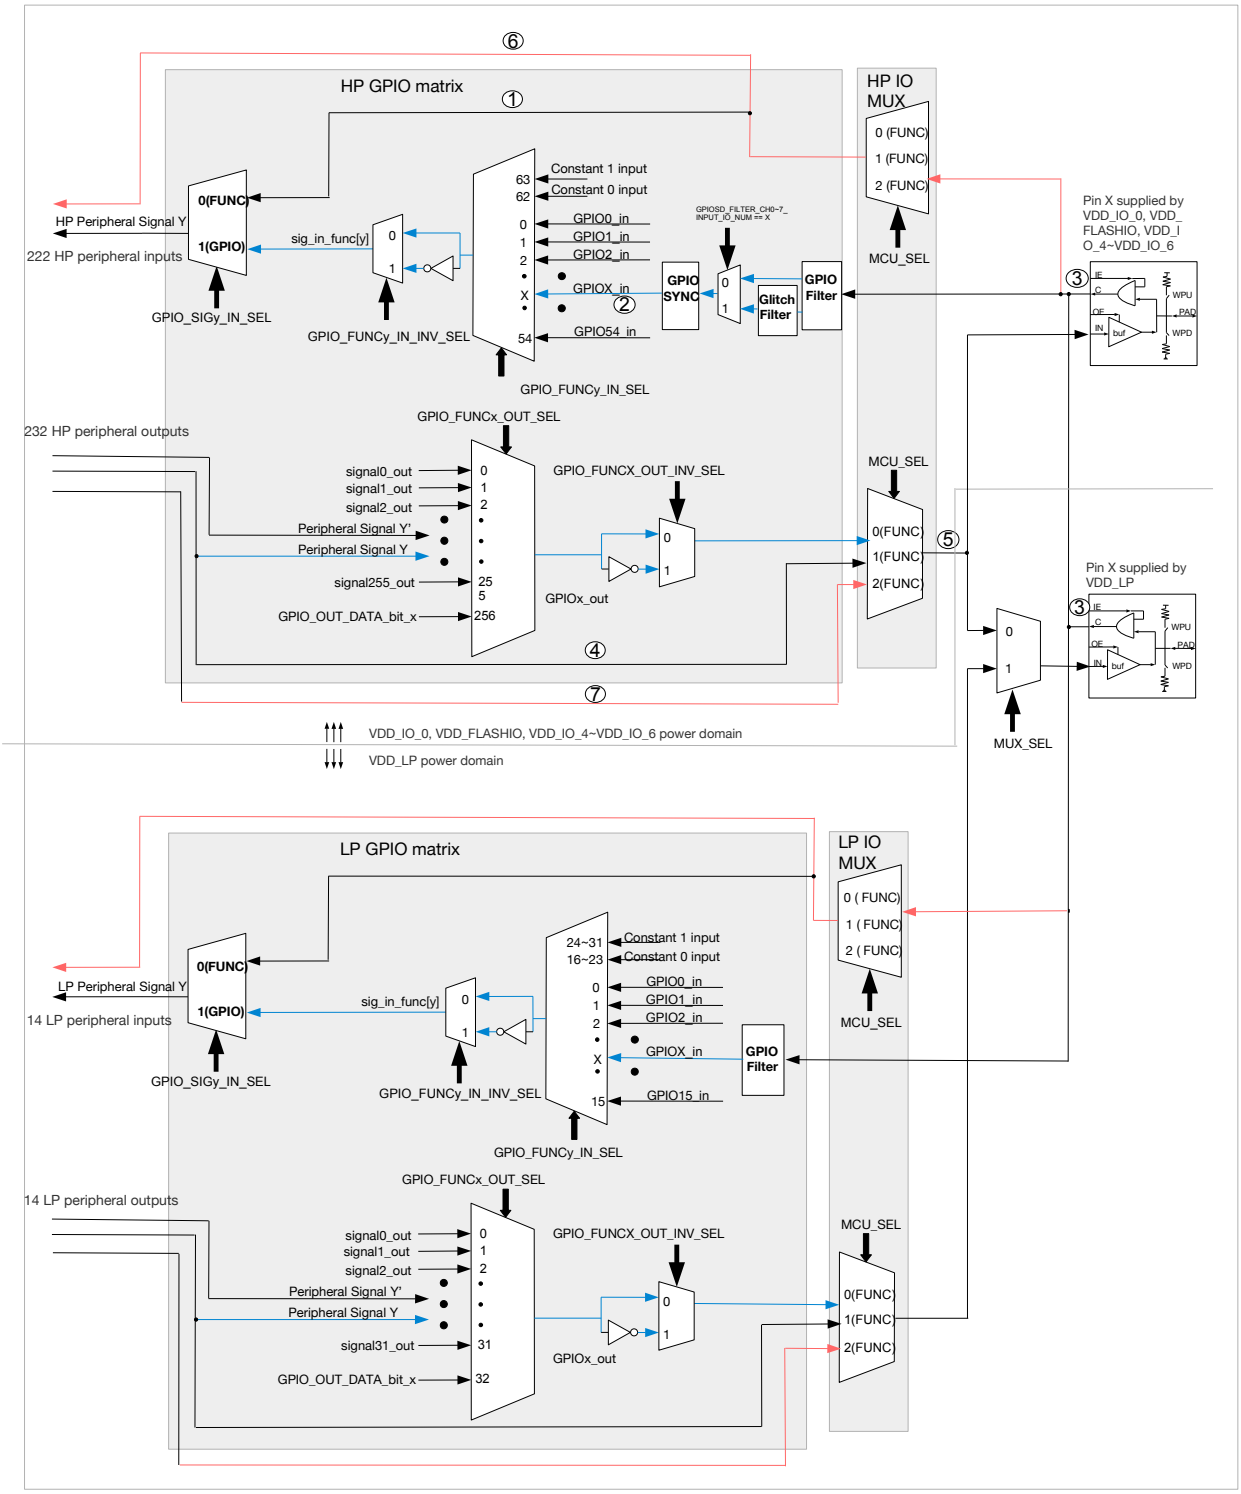


Figure 10.3-1. Architecture of HP GPIO Matrix, HP IO MUX, LP GPIO Matrix, and LP IO MUX

The following points explain the areas marked numerically in the figure above, taking the HP system as an example:

- ① Part of peripheral input signals (marked “yes” in column “Direct input through HP IO MUX” in Table

10.12-1) can be routed to the peripherals via HP IO MUX, or via HP GPIO matrix, while the other input signals can only be routed to the peripherals via HP GPIO matrix.

- ② There are only 55 inputs from GPIO SYNC to HP GPIO matrix, since ESP32-P4 provides 55 GPIO pins in total.
- ③ The pins supplied by VDD_IO_0, VDD_FLASHIO, VDD_IO_4 ~ VDD_IO_6, and VDD_LP are controlled by the signals: IE, OE, HYS, WPU, and WPD.
- ④ Part of peripheral outputs (marked "yes" in column "Direct output through HP IO MUX" in Table 10.12-1) can be routed to pins via HP IO MUX or via HP GPIO matrix, while the other output signals can only be routed to pins via HP GPIO matrix.
- ⑤ There are 55 outputs (corresponding to GPIO pin *X*: 0 ~ 54) from HP GPIO matrix to HP IO MUX.
- ⑥ There are peripheral inputs only through HP IO MUX.
- ⑦ There are peripheral outputs only through HP IO MUX.

Figure 10.3-2 shows the internal structure of a pad, which is an electrical interface between the chip logic and the GPIO pin. The structure is applicable to all 55 GPIO pins and can be controlled using IE, OE, WPU, and WPD signals. For the configuration of these signals, see IO_MUX_GPIO*x*_REG orLP_IOMUX_PAD*x*_REG.

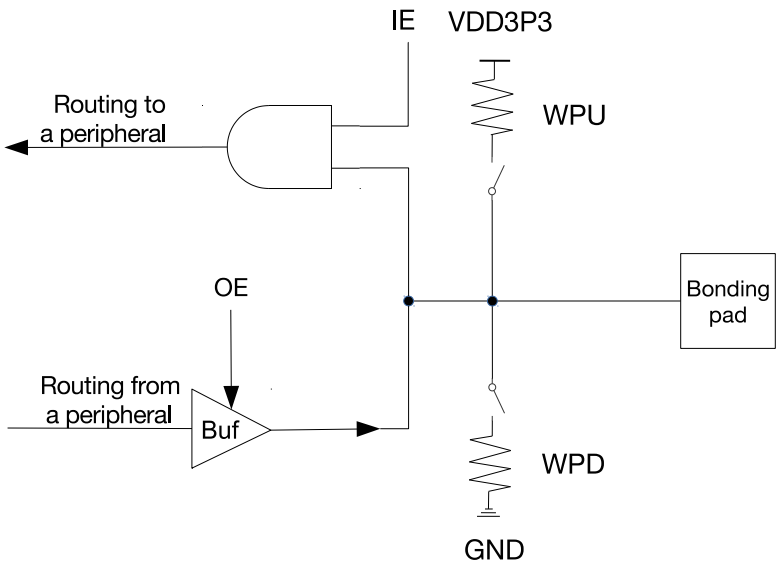

Figure 10.3-2. Internal Structure of a Pad

- IE: input enable
- OE: output enable
- WPU: internal weak pull-up resistor
- WPD: internal weak pull-down resistor
- Bonding pad: a terminal point of the chip logic used to make a physical connection from the chip die to GPIO pin in the chip package

10.4 Peripheral Input via GPIO Matrix

10.4.1 Overview

To receive a peripheral input signal via HP GPIO matrix,

- configure the matrix to source the peripheral input signal from one of the 55 GPIOs (0 ~ 54), see Table 10.12-1.
- configure the peripheral signal to receive input signal via HP GPIO matrix.
- configure the GPIO pin to be controlled by HP IO MUX.

For detailed configuration, see Figure 10.3-1 and Section 10.4.7.

To receive a peripheral input signal via LP GPIO matrix,

- configure the matrix to source the peripheral input signal from one of the 16 GPIOs (0 ~ 15), see Table 10.13-1.
- configure the peripheral signal to receive input signal via LP GPIO matrix.
- configure the LP GPIO pin to be controlled by LP IO MUX.

For detailed configuration, see Figure 10.3-1 and Section 10.4.7.

As shown in Figure 10.3-1, when GPIO matrix is used to input a signal from the pin, all external input signals are sourced from the GPIO pins and then filtered by the GPIO Filter, as shown in Step 2 in Section 10.4.7.

The Glitch Filter is only available in HP GPIO matrix. The Glitch Filter hardware can filter eight of the output signals from the GPIO Filter, and the other unselected signals go directly to the GPIO SYNC hardware, as shown in Step 3 in Section 10.4.7.

All signals filtered by the GPIO Filter hardware or the Glitch Filter hardware are synchronized by the GPIO SYNC hardware to IO MUX operating clock and then enter the GPIO matrix, see Section 10.4.2. Such signal filtering and synchronization features apply to all GPIO matrix signals but do not apply when using the IO MUX.

10.4.2 Signal Synchronization

Only HP GPIO matrix supports this signal synchronization function. Figure 10.4-1 shows the functionality of GPIO SYNC. In the figure, negative sync and positive sync mean GPIO input is synchronized on falling edge and on rising edge of HP IO MUX operating clock respectively.

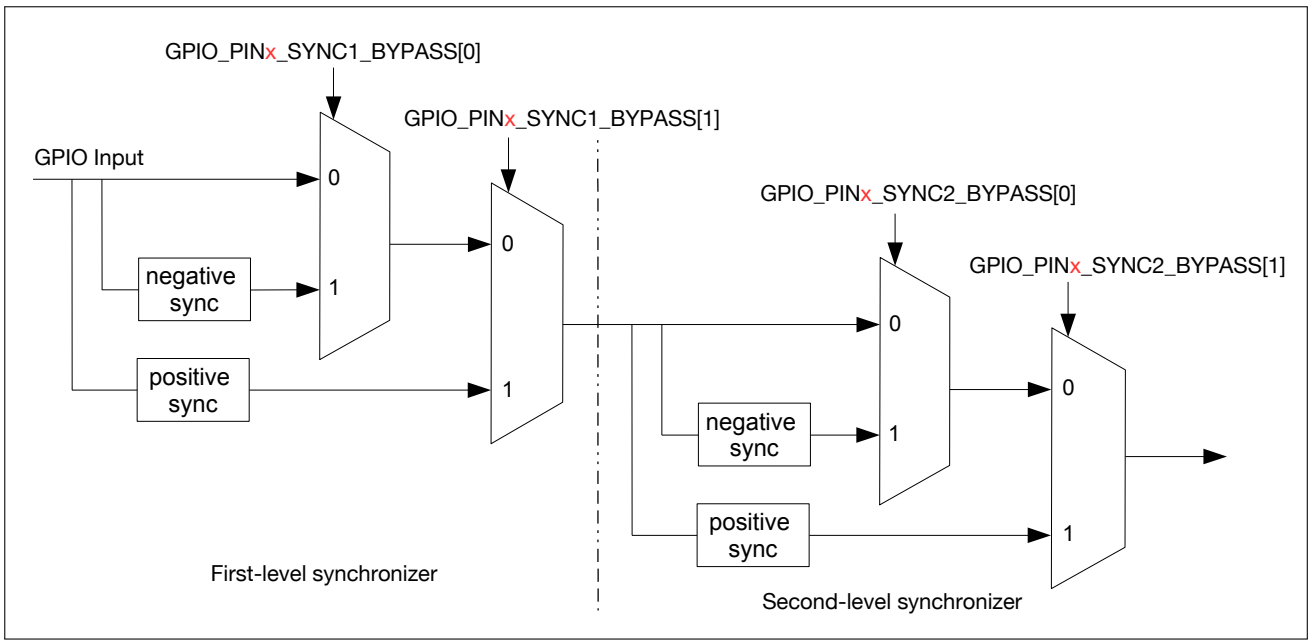

Figure 10.4-1. GPIO Input Synchronized on Rising Edge or on Falling Edge of HP IO MUX Operating Clock

The synchronization function is disabled by default by the synchronizer. But when an asynchronous peripheral signal is connected to the pin, the signal should be synchronized by the two-level synchronizer (i.e., the first-level synchronizer and the second-level synchronizer as shown in Figure 10.4-1) to lower the probability of causing metastability.

10.4.3 GPIO Filter

Both the HP GPIO matrix and LP GPIO matrix support GPIO Filter function. When this function is enabled, only signals with a valid width of more than two clock cycles can be sampled, as illustrated in Figure 10.4-2.

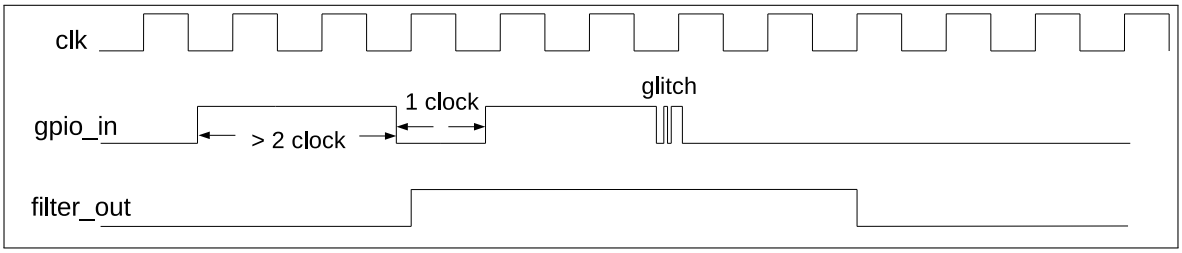

Figure 10.4-2. GPIO Filter Timing of GPIO Input Signals

10.4.4 Glitch Filter

The Glitch Filter function is exclusive to the HP GPIO matrix. The Glitch Filter hardware supports eight channels, each of which selects one signal from the 55 (0 ~ 54) output signals generated by the GPIO Filter hardware. It then conducts a second round of filtering on the selected signal. This Glitch Filter hardware can be used to filter slow-speed signals. For more information, see Step 3 in Section 10.4.7.1.

10.4.5 Simple GPIO Input

Both the HP GPIO matrix and LP GPIO matrix support the Simple GPIO Input function. Enabling this function allows the direct reading of the input value of a GPIO pin at any time, without the need to route the GPIO input to any peripherals.

For HP GPIO matrix, to implement simple GPIO input, follow the steps below:

- Set IO_MUX_GPIO*x*_MCU_IE in IO_MUX_GPIO*x*_REG, to enable pin input.
- Read the GPIO input from GPIO_IN_REG[*x*].

For LP GPIO matrix, to implement simple GPIO input, follow the steps below:

- Set LP_IOMUX_PAD*x*_FUN_IE in LP_IO_MUX_PAD*x*_REG, to enable pin input.
- Read the GPIO input from LP_GPIO_IN_REG[*x*].

10.4.6 GPIO Wakeup

10.4.6.1 HP GPIO Wakeup

The HP GPIO wakeup feature is designed to awaken the system from Light-sleep when the HP system is in clock gating mode. HP GPIO wakeup is not available when the HP system is powered down.

GPIO0 ~ GPIO54 can be used to generate HP GPIO wakeup by enabling GPIO_PIN*x*_WAKEUP_ENABLE (*x*: 0 ~ 54).

HP GPIO wakeup supports both high-voltage sensitive and low-voltage sensitive wakeups, with specific conditions based on the GPIO configuration.

Table 10.4-1. HP GPIO Wakeup Signal Trigger and Clear Conditions

GPIO_PIN*x*_INT_TYPE[1,2]	Wakeup is generated when	Wakeup is cleared when
5	the input GPIO is high-level.	the input GPIO is low-level.
4	the input GPIO is low-level.	the input GPIO is high-level.

[1] *x* ranges from 0 to 54.
[2] If the register is configured to any other value, HP GPIO wakeup feature is disabled.

10.4.6.2 LP GPIO Wakeup

The LP GPIO wakeup feature is designed to awaken the system from Deep-sleep when the LP peripherals are not in power gating mode. LP GPIO wakeup is not available when the LP peripherals are powered down.

GPIO0 ~ GPIO15 can be used to generate LP GPIO wakeup by enabling LP_GPIO_PIN*n*_WAKEUP_ENABLE (*n*: 0 ~ 15).

LP GPIO wakeup supports posedge sensitive, negedge sensitive, both posedge and negedge sensitive, high-voltage sensitive and low-voltage sensitive wakeups, with specific conditions based on the GPIO configuration.

Table 10.4-2. LP GPIO Wakeup Signal Trigger and Clear Conditions

LP_GPIO_PIN*x*_INT_TYPE[1,2]	Wakeup is generated when	Wakeup is cleared when
1	the input GPIO toggles from low-level to high-level.	LP_GPIO_PIN*x*_EDGE_WAKEUP_CLR is set.
2	the input GPIO toggles from high-level to low-level.	LP_GPIO_PIN*x*_EDGE_WAKEUP_CLR is set.
3	the input GPIO toggles from high-level to low-level, or vice versa.	LP_GPIO_PIN*x*_EDGE_WAKEUP_CLR is set.
4	the input GPIO is low-level.	the input GPIO is high-level.
5	the input GPIO is high-level.	the input GPIO is low-level.

[1] *x* ranges from 0 to 15.

[2] If the register is configured to any other value, LP GPIO wakeup feature is disabled.

10.4.7 Programming Procedure

10.4.7.1 HP GPIO Matrix

To read GPIO pin *X*[1] into HP peripheral signal *Y*, follow the steps below:

1. Configure GPIO_FUNC*y*_IN_SEL_CFG_REG corresponding to HP peripheral signal *Y* in HP GPIO matrix:
   - Set GPIO_SIG*y*_IN_SEL to enable peripheral signal input via HP GPIO matrix.
   - Set GPIO_FUNC*y*_IN_SEL to the desired GPIO pin, i.e., *X* here.

   Note that some peripheral signals have no valid GPIO_SIG*y*_IN_SEL bit, namely, these peripherals can only receive input signals via HP GPIO matrix.
2. Optionally enable the GPIO Filter for pin input signals by setting IO_MUX_GPIO*n*_FILTER_EN.
3. Enable Glitch Filter feature as follows:
   - Configure GPIO_EXT_FILTER_CH*n*_INPUT_IO_NUM to *m*. *n* (0 ~ 7) represents the channel number. *m* (0 ~ 54) represents the GPIO pin number.
   - Configure GPIO_EXT_FILTER_CH*n*_WINDOW_WIDTH to **VALUE1** and GPIO_EXT_FILTER_CH*n*_WINDOW_THRES to **VALUE2**. During **VALUE1** + 1 cycles, if there are **VALUE2** + 1 input signals that do not match the current output signal value, the Glitch Filter hardware inverts the output signal. GPIO_EXT_FILTER_CH*n*_WINDOW_WIDTH and GPIO_EXT_FILTER_CH*n*_WINDOW_THRES can be configured to the same value **VALUE3**, then only signals with a width greater than **VALUE3** + 1 clock cycles will be sampled.
   - Set GPIO_EXT_FILTER_CH*n*_EN to enable channel *n*.

   An example is shown in Figure 10.4-3, where GPIO_EXT_FILTER_CH*x*_WINDOW_WIDTH is configured to 3 and GPIO_EXT_FILTER_CH*x*_WINDOW_THRES to 2. The output signal value (signal_out) keeps as "0" in the four clock cycles before T1. The input signal value (signal_in) has been "1" for three clock cycles in the same period, then the output signal is inverted to "1" after T1.

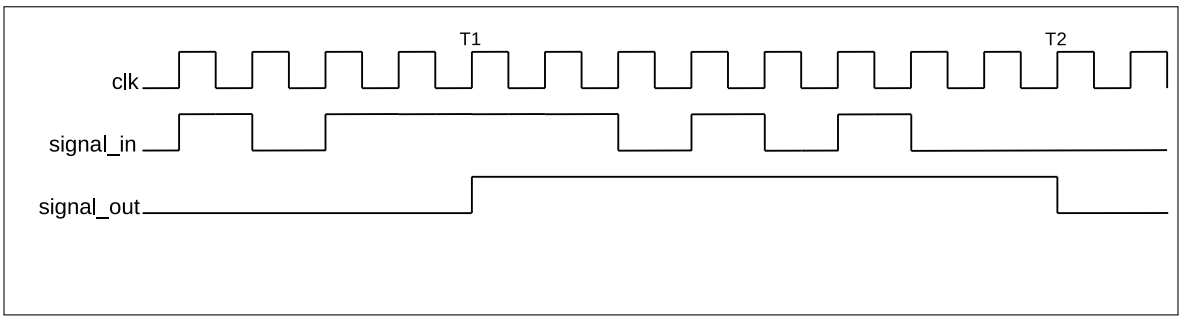

Figure 10.4-3. Glitch Filter Timing Example

4. Synchronize GPIO input signals. To do so, please set GPIO_PIN*x*_REG corresponding to GPIO pin *X* as follows:
   - Set GPIO_PIN*x*_SYNC1_BYPASS to enable input signal synchronized on rising edge or on falling edge in the first-level synchronization, see Figure 10.4-1.
   - Set GPIO_PIN*x*_SYNC2_BYPASS to enable input signal synchronized on rising edge or on falling edge in the second-level synchronization, see Figure 10.4-1.
5. Configure HP IO MUX register to enable pin input. For this end, please set IO_MUX_GPIO*x*_REG corresponding to GPIO pin *X* as follows:
   - Set IO_MUX_GPIO*x*_FUN_IE to enable input[2].
   - Set or clear IO_MUX_GPIO*x*_FUN_WPU and IO_MUX_GPIO*x*_FUN_WPD as desired to enable or disable pull-up and pull-down resistors.

For example, to connect UART0 TXD input signal[3] (uart0_rxd_pad_in, signal index 10) to GPIO7, please follow the steps below.

1. Set GPIO_SIG10_IN_SEL in GPIO_FUNC10_IN_SEL_CFG_REG to enable peripheral signal input via HP GPIO matrix.
2. Set GPIO_FUNC10_IN_SEL in GPIO_FUNC10_IN_SEL_CFG_REG to 7, i.e., select GPIO7.
3. Set IO_MUX_GPIO7_FUN_IE in IO_MUX_GPIO7_REG to enable pin input.

Note:

1. One input pin can be connected to multiple peripheral input signals.
2. The input signal can be inverted by configuring GPIO_FUNC*y*_IN_INV_SEL.
3. It is possible to have a HP peripheral read a constantly low or constantly high input value without connecting this input to a pin. This can be done by selecting a special GPIO_FUNC*y*_IN_SEL input, instead of a GPIO number:
   - When GPIO_FUNC*y*_IN_SEL is set to 62, input signal is always 0.
   - When GPIO_FUNC*y*_IN_SEL is set to 63, input signal is always 1.

10.4.7.2 LP GPIO Matrix

The programming procedure for peripheral input via the LP GPIO matrix resembles that of Section 10.4.7.1. However, it's worth noting that:

- the LP GPIO matrix lacks a Glitch Filter function.
- The control and status registers must use LP GPIO related registers. See Section 10.19.4 and Section 10.19.5.

Note:
It is possible to have a LP peripheral read a constantly low or constantly high input value without connecting this input to a pin. This can be done by selecting a special LP_GPIO_SIG*y*_IN_SEL input, instead of a GPIO number:

- When LP_GPIO_SIG*y*_IN_SEL is set to 16, input signal is always 0.
- When LP_GPIO_SIG*y*_IN_SEL is set to 24, input signal is always 1.

10.5 Peripheral Output via GPIO Matrix

10.5.1 Overview

To output a signal from a peripheral via GPIO matrix,

- configure the HP GPIO matrix to route HP peripheral output signals (only signals with a name assigned in the column "Output signal" in Table 10.12-1) to one of the 55 GPIOs (0 ~ 54).
- Or configure the LP GPIO matrix to route LP peripherals (only signals with a name assigned in the column "Output signal" in Table 10.13-1) to one of the 16 LP GPIOs (0 ~ 15).
- The output signal is routed from the peripheral into GPIO matrix and then into IO MUX. IO MUX must be configured to set the chosen pin to GPIO function. This enables the GPIO output signal to be connected to the pin.

Note:
There is a range of peripheral output signals (250 ~ 255 in Table 10.12-1) which are not connected to any peripheral, but to the input signals (250 ~ 255) directly.

10.5.2 Simple GPIO Output

GPIO matrix can also be used for simple GPIO output. For this case, one GPIO pin can be configured to directly output the desired value, without routing any peripheral output to this pin.

Follow the steps below to configure HP GPIO matrix for simple GPIO output:

- Set GPIO_FUNC*x*_OUT_SEL with a special peripheral index 256 (0x100).
- Configure the corresponding bit in GPIO_OUT_REG/GPIO_OUT1_REG to the desired GPIO output value.

Note:

- GPIO_OUT_REG[0] ~ GPIO_OUT_REG[31] correspond to GPIO0 ~ GPIO31, and GPIO_OUT1_REG[0] ~ GPIO_OUT1_REG[22] to GPIO32 ~ GPIO54.
- Recommended operation: use GPIO_OUT/OUT1_W1TS and GPIO_OUT/OUT1_W1TC to set or clear GPIO_OUT/OUT1_REG.

Follow the steps below to configure LP GPIO matrix for simple GPIO output:

- Set LP_GPIO_FUNC*x*_OUT_SEL with a special peripheral index 32 (0x20).
- Configure the corresponding bit in LP_GPIO_OUT_REG to the desired GPIO output value.

Note:
Recommended operation: use LP_GPIO_OUT_DATA_W1TS and LP_GPIO_OUT_DATA_W1TC to set or clear LP_GPIO_OUT_REG.

10.5.3 Sigma Delta Modulated Output (SDM)

10.5.3.1 Functional Description

Eight HP peripheral output signals (index: 72 ~ 79 in Table 10.12-1) support 1-bit second-order sigma delta modulation. By default the output is enabled for these eight channels. This Sigma Delta modulator can also output PDM (pulse density modulation) signal with configurable duty cycle. The function is:

$$H(z) = \mathrm{X(z)z^{-1} + E(z)(1\text{-}z^{-1})^2}$$

E(z) is quantization error and X(z) is the input.
This modulator supports scaling down of IO MUX operating clock by divider 1 ~ 256:

- Set GPIO_EXT_SD_FUNCTION_CLK_EN to enable the modulator clock.
- Configure GPIO_EXT_SD*n*_PRESCALE (*n* = 0 ~ 7 for the eight channels).

After scaling, the clock cycle is equal to one pulse output cycle from the modulator.

GPIO_EXT_SD*n*_IN is a signed number with a range of [-128, 127] and is used to control the duty cycle[1] of PDM output signal.

- GPIO_EXT_SD*n*_IN = -128, the duty cycle of the output signal is 0%.
- GPIO_EXT_SD*n*_IN = 0, the duty cycle of the output signal is near 50%.
- GPIO_EXT_SD*n*_IN = 127, the duty cycle of the output signal is near 100%.

The formula for calculating PDM signal duty cycle is shown as below:

$$Duty_Cycle = \frac{GPIO_EXT_SDn_IN + 128}{256}$$

Note:
For PDM signals, duty cycle refers to the percentage of high level cycles to the whole statistical period (several pulse cycles, for example, 256 pulse cycles).

10.5.3.2 SDM Configuration

The configuration of SDM is shown below:

- Route one of SDM outputs to a pin via HP GPIO matrix, see Section 10.5.4.1.

- Enable the modulator clock by setting GPIO_EXT_SD_FUNCTION_CLK_EN.
- Configure the divider value by setting GPIO_EXT_SD*n*_PRESCALE.
- Configure the duty cycle of SDM output signal by setting GPIO_EXT_SD*n*_IN.

10.5.4 Programming Procedure

10.5.4.1 HP GPIO Matrix

The output signals with a name assigned in the column "Output signal" in Table 10.12-1 can be set to go through the HP GPIO matrix into HP IO MUX and then to a pin. Figure 10.3-1 illustrates the configuration.

To output peripheral signal *Y* to a particular GPIO pin *X*, follow the steps below:

1. Configure GPIO_FUNC*x*_OUT_SEL_CFG_REG and GPIO_ENABLE_REG[*x*] corresponding to GPIO pin *X* in HP GPIO matrix. Recommended operation: use corresponding W1TS (write 1 to set) and W1TC (write 1 to clear) registers to set or clear GPIO_ENABLE_REG.
   - Set the GPIO_FUNC*x*_OUT_SEL field in register GPIO_FUNC*x*_OUT_SEL_CFG_REG to the index of the desired peripheral output signal *Y*.
   - If the signal should always be enabled as an output, set the GPIO_FUNC*x*_OE_SEL bit in register GPIO_FUNC*x*_OUT_SEL_CFG_REG and the bit in register GPIO_ENABLE_W1TS_REG, corresponding to GPIO pin *X*. To have the output enable signal decided by internal logic (for example, the spi2_dqs_pad_oe in column "Output enable signal when GPIO_FUNC*n*_OE_SEL = 0" in Table 10.12-1), clear the GPIO_FUNC*x*_OE_SEL bit instead.
   - Set the corresponding bit in register GPIO_ENABLE_W1TC_REG to disable the output from the GPIO pin.
2. For an open drain output, set the GPIO_PIN*x*_PAD_DRIVER bit in register GPIO_PIN*x*_REG corresponding to GPIO pin *X*.
3. Configure HP IO MUX register to enable output via HP GPIO matrix. Set IO_MUX_GPIO*x*_REG corresponding to GPIO pin *X* as follows:
   - Set the field IO_MUX_GPIO*x*_MCU_SEL to desired HP IO MUX function corresponding to GPIO pin *X*. This is Function 1 (GPIO function), numeric value 1, for all pins.
   - Set the IO_MUX_GPIO*x*_FUN_DRV field to the desired value for output strength (0 ~ 3). The higher the drive strength, the more current can be sourced/sunk from the pin.
   - If using open drain mode, set/clear the IO_MUX_GPIO*x*_FUN_WPU and IO_MUX_GPIO*x*_FUN_WPD bits to enable/disable the internal pull-up/pull-down resistors.
4. Enable hysteresis function:
   - GPIO0 ~ GPIO15: set LP_IOMUX_LP_GPIO_HYS[*x*] (*x*: 0 ~ 15, corresponding to GPIO0 ~ GPIO15).
   - GPIO16 ~ GPIO47: set HP_SYSTEM_GPIO_0_HYS_LOW[*x*] (*x*: 0 ~ 31, corresponding to GPIO16 ~ GPIO47).
   - GPIO48 ~ GPIO54: set HP_SYSTEM_GPIO_0_HYS_HIGH[*x*] (*x*: 0 ~ 6, corresponding to GPIO48 ~ GPIO54).

Note:

- The output signal from a single peripheral can be sent to multiple pins simultaneously.
- The output signal can be inverted by setting GPIO_FUNC*x*_OUT_INV_SEL.

10.5.4.2 LP GPIO Matrix

The programming procedure for peripheral input via the LP GPIO matrix resembles that of 10.5.4.1. However, it's worth noting that the control and status registers must use LP GPIO matrix registers. See Section 10.19.4 and Section 10.19.5.

10.6 Direct Input and Output via IO MUX

10.6.1 Overview

Some digital signals (SDMMC, EMAC, etc.) can bypass GPIO matrix for better high-frequency digital performance. In this case, IO MUX is used to connect these pins directly to peripherals. This option is less flexible than routing signals via GPIO matrix, as the IO MUX register for each GPIO pin can only select from a limited number of functions, but high-frequency digital performance can be improved.

ESP32-P4 provides 16 GPIO pins with low power (LP) capabilities. These pins can be controlled by either HP IO MUX or LP IO MUX. If controlled by LP IO MUX, these pins will bypass HP IO MUX and HP GPIO matrix for the use by peripherals in LP system.

When configured as LP GPIOs, the pins can still be controlled by the peripherals in LP system during chip Deep-sleep, and wake up the chip from Deep-sleep.

10.6.2 Functional Description

The pins with LP functions (GPIO0 ~ GPIO15) are controlled by LP_IOMUX_PAD*n*_MUX_SEL (*n*: 0 ~ 15) in register LP_IOMUX_PAD*n*_REG. By default, all bits in these registers are set to 0, routing all input/output signals via HP IO MUX.

If LP_IOMUX_PAD*n*_MUX_SEL is set, then input/output signals are controlled by LP IO MUX. In this mode, LP_IOMUX_PAD*n*_REG is used to control the LP GPIO pins. See 10.15-1 for the LP functions of each LP GPIO pin. Note that LP_IOMUX_PAD*n*_REG applies the LP GPIO pin numbering, not the HP GPIO pin numbering.

10.6.2.1 HP IO MUX

Two fields must be configured in order to bypass HP GPIO matrix for HP peripheral input signals:

1. IO_MUX_GPIO*n*_MCU_SEL for the GPIO pin must be set to the required pin function. For the list of pin functions, please refer to Table 10.14-1.
2. Clear GPIO_SIG*n*_IN_SEL to route the input directly to the peripheral.

To bypass HP GPIO matrix for HP peripheral output signals, IO_MUX_GPIO*n*_MCU_SEL for the GPIO pin must be set to the required pin function.

10.6.2.2 LP IO MUX

Two fields must be configured in order to bypass LP GPIO matrix for LP peripheral input signals:

1. LP_IOMUX_PAD*n*_MUX_SEL for the GPIO pin must be set to the required pin function. For the list of pin functions, please refer to Table 10.15-1.
2. Clear LP_GPIO_GPIO_SIG*n*_IN_SEL to route the input directly to the peripheral.

To bypass LP GPIO matrix for LP peripheral output signals, LP_IOMUX_PAD*n*_MUX_SEL for the GPIO pin must be set to the required pin function.

Note:
Not all signals can be directly connected to peripheral via IO MUX. Some input/output signals can only be connected to peripheral via GPIO matrix.

10.7 Analog Functions

10.7.1 Overview

ESP32-P4 provides 34 GPIO pins with analog functions, including 16 LP GPIO pins and 18 HP GPIO pins. See Table 10.16-1.

10.7.2 Analog Functions

When the pin is used for analog purpose, make sure this pin is left floating by configuring registers. By such way, the external analog signal is directly connected to internal analog signal via GPIO pin. The configuration is as follows:

- Clear IO_MUX_GPIO*n*_FUN_IE, IO_MUX_GPIO*n*_FUN_WPU, and IO_MUX_GPIO*n*_FUN_WPD, to set the pin floating.
- Write 1 to the corresponding bit in GPIO_ENABLE_W1TC and GPIO_ENABLE1_W1TC, to clear output enable.

To use these functions listed in Table 10.16-1, please refer to the following related chapters:

- For XTAL_32K related functions, see Chapter 15 *Low-Power Management*.
- For TOUCH related functions, see Chapter 63 *Touch Sensor (TOUCH)*.
- For ADC related functions, see Chapter 65 *ADC Controller (ADC)*.
- For COMP related functions, see Chapter 66 *Analog Voltage Comparator*.

Note:
GPIO51 ~ GPIO54 each has two different analog functions, which can be used simultaneously.

10.8 Pin Functions in Light-sleep

Pins may provide different functions when ESP32-P4 is in Light-sleep mode. If IO_MUX_GPIO*n*_SLP_SEL in register IO_MUX_GPIO*n*_REG for a GPIO pin is set to 1, a different set of bits will be used to control the pin when the chip is in Light-sleep mode.

Table 10.8-1. Bit Used to Control IO MUX Functions in Light-sleep Mode

IO MUX Function	Normal Execution OR IO_MUX_GPIO*n*_SLP_SEL = 0	Light-sleep Mode AND IO_MUX_GPIO*n*_SLP_SEL = 1
Output Drive Strength	IO_MUX_GPIO*n*_FUN_DRV	IO_MUX_GPIO*n*_MCU_DRV
Pull-up Resistor	IO_MUX_GPIO*n*_FUN_WPU	IO_MUX_GPIO*n*_MCU_WPU
Pull-down Resistor	IO_MUX_GPIO*n*_FUN_WPD	IO_MUX_GPIO*n*_MCU_WPD
Input Enable	IO_MUX_GPIO*n*_FUN_IE	IO_MUX_GPIO*n*_MCU_IE
Output Enable	OE_SEL from GPIO matrix*	IO_MUX_GPIO*n*_MCU_OE

Note:
If IO_MUX_GPIO*n*_SLP_SEL is set to 0, pin functions remain the same in both normal execution and in Light-sleep mode. Please refer to Section 10.5.4.1 for how to enable output in normal execution.

10.9 Pin Hold Feature

Each GPIO pin has an individual hold function controlled by Power Management Unit (PMU) or registers. When the pin is set to hold, the state is latched at that moment and will not change no matter how the internal signals change or how the IO MUX/GPIO configuration is modified. Users can use the hold function for the pins to retain the pin state through a core reset triggered by watchdog time-out or Deep-sleep events.

HP Pins (GPIO16 ~ GPIO54):

The Hold state of each HP pin is controlled by the result of OR operation of the pin's Hold enable signal and the global Hold enable signal.

- Each pin's Hold enable signal is controlled by the following registers:
  - In Deep-sleep mode:
    * LP_SYSTEM_REG_PAD_RTC_HOLD_CTRL0[*n*] (*n* = 16~31), controls the Hold signal of each pin of GPIO16~GPIO31.
    * LP_SYSTEM_REG_PAD_RTC_HOLD_CTRL1[*n*] (*n* = 0~22), controls the Hold signal of each pin of GPIO32~GPIO54.
  - In non-Deep-sleep mode:
    * HP_SYSTEM_GPIO_O_HOLD_LOW[*n*] (*n* = 0~31), controls the Hold signal of each pin of GPIO16~GPIO47.
    * HP_SYSTEM_GPIO_O_HOLD_HIGH[*n*](*n* = 0~6), controls the Hold signal of each pin of GPIO48~GPIO54.

> **Note:**
> In non-Deep-sleep mode, besides the above HP_SYSTEM registers, the LP_SYSTEM registers (LP_SYSTEM_REG_PAD_RTC_HOLD_CTRL0/1) can also control the Hold function for corresponding pins, with the same effect as the HP_SYSTEM registers.

- PMU_TIE_HIGH_HP_PAD_HOLD_ALL, controls the global Hold signal of all HP pins.

To use this feature, follow the steps below:

- To maintain the pin's input/output status in Deep-sleep, set LP_SYSTEM_REG_PAD_RTC_HOLD_CTRL0[*n*] (*n* = 16∼31) or LP_SYSTEM_REG_PAD_RTC_HOLD_CTRL1[*n*] (*n* = 0∼22) before powering down. To disable the hold function after waking up, clear both registers.
- To maintain the pin's input/output status in non-Deep-sleep mode, set HP_SYSTEM_GPIO_O_HOLD_LOW[*n*] (*n* = 0∼31) or HP_SYSTEM_GPIO_O_HOLD_HIGH[*n*] (*n* = 0∼6) before powering down. To disable the hold function after waking up, clear both registers. You can also use the LP_SYSTEM registers (LP_SYSTEM_REG_PAD_RTC_HOLD_CTRL0/1) as described above.
- Alternatively, set PMU_TIE_HIGH_HP_PAD_HOLD_ALL to maintain the input/output status of all HP pins and set PMU_TIE_LOW_HP_PAD_HOLD_ALL to disable the hold function for all HP pins.
- Alternatively, configure the PMU task to hold the HP pins before Deep-sleep. In Deep-sleep, the HP pins would be hold automatically by the PMU.

LP Pins (GPIO0 ∼ GPIO15):

The Hold state of each LP pin is controlled by the result of OR operation of the pin's Hold enable signal and the global Hold enable signal.

- Each pin's Hold enable signal is controlled by the following registers:
  - In Deep-sleep mode, LP_SYSTEM_REG_PAD_RTC_HOLD_CTRL0[*n*] (*n* = 0∼15) controls the Hold signal of each pin of GPIO0∼GPIO15.
  - In non-Deep-sleep mode, LP_IOMUX_LP_PAD_HOLD_REG[*n*] (*n* = 0∼15) controls the Hold signal of each pin of GPIO0∼GPIO15.

> **Note:**
> In non-Deep-sleep mode, besides the above LP_IOMUX register, the LP_SYSTEM register (LP_SYSTEM_REG_PAD_RTC_HOLD_CTRL0) can also control the Hold function for corresponding pins, with the same effect as the LP_IOMUX register.

- PMU_TIE_HIGH_LP_PAD_HOLD_ALL controls the global Hold signal of all LP pins.

To use this feature, follow the steps below:

- To maintain the pin's input/output status in Deep-sleep, set LP_SYSTEM_REG_PAD_RTC_HOLD_CTRL0[*n*] (*n* = 0∼15) to hold the value of GPIO*n*, or clear LP_SYSTEM_REG_PAD_RTC_HOLD_CTRL0[*n*] (*n* = 0∼15) to disable the hold function of GPIO*n*.
- To maintain the pin's input/output status in non-Deep-sleep mode, set LP_IOMUX_LP_PAD_HOLD_REG[*n*] (*n* = 0∼15) to hold the value of GPIO*n*, or clear

LP_IOMUX_LP_PAD_HOLD_REG[*n*] (*n* = 0~15) to disable the hold function of GPIO*n*. You can also use the LP_SYSTEM register (LP_SYSTEM_REG_PAD_RTC_HOLD_CTRL0) as described above.

- Alternatively, set PMU_TIE_HIGH_LP_PAD_HOLD_ALL to hold the values of all LP pins, and set PMU_TIE_LOW_LP_PAD_HOLD_ALL to disable the hold function of all LP pins.
- Alternatively, configure the PMU task to hold LP pins before Deep-sleep. In Deep-sleep, LP pins will be hold automatically by the PMU.

10.10 Hysteresis Characteristics of GPIO Pins

Each GPIO pin has hysteresis functionality. When hysteresis is not enabled, as shown in Figure 10.10-1, the level flip of the signal (C) input to the chip from the PAD has only one threshold (Vt, about 1.7 V). When the voltage on the PAD is higher than Vt, the level on the C is high. Otherwise, it is low. However, noise on the PAD may affect the signal on C.

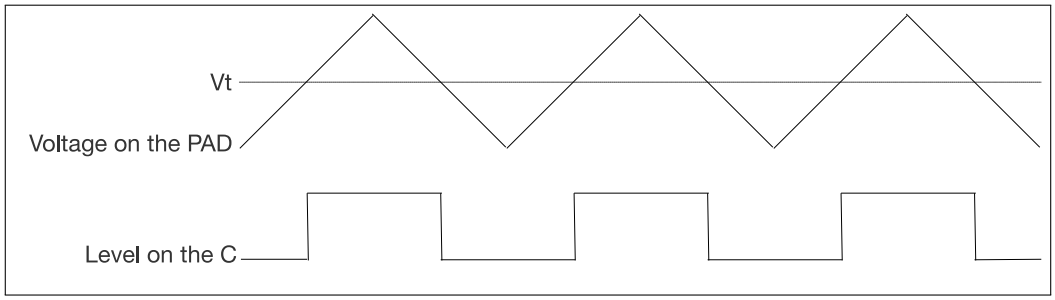

Figure 10.10-1. Example of Level Flip on the Chip Pad — Hysteresis Function Not Enabled

When hysteresis is enabled, as shown in Figure 10.10-2, the level flip of C has two thresholds, high-level threshold (Vth, about 1.7 V) and low-level threshold (Vtl, about 1.4 V). When the voltage of pad goes from low to high, if the voltage is higher than Vth, the level of C is high. When the voltage of PAD goes from high to low, if the voltage is lower than Vtl, the level of C is low. When the voltage of PAD is between Vth and Vtl, the level of C does not change. The hysteresis function plays an anti-interference role by mitigating the impact of noise, consequently reducing the level flip time of C.

To enable the hysteresis function, follow the steps below:

- Set LP_IOMUX_LP_GPIO_HYS[*n*] (*n* ranges from 0 ~ 15, corresponding to GPIO0 ~ GPIO15), HP_SYS_GPIO0_HYS_LOW[*n*] (*n* ranges from 0 ~ 31, corresponding to GPIO16 ~ GPIO47) or HP_SYS_GPIO0_HYS_HIGH[*n*] (*n* ranges from 0 ~ 6, corresponding to GPIO48 ~ GPIO54) to 1 to enable the hysteresis function for GPIO*n*.
- Set LP_IOMUX_LP_GPIO_HYS[*n*] (*n* ranges from 0 ~ 15, corresponding to GPIO0 ~ GPIO15), HP_SYS_GPIO0_HYS_LOW[*n*] (*n* ranges from 0 ~ 31, corresponding to GPIO16 ~ GPIO47) or HP_SYS_GPIO0_HYS_HIGH[*n*] (*n* ranges from 0 ~ 6, corresponding to GPIO48 ~ GPIO54) to 0 to disable the hysteresis function for GPIO*n*.

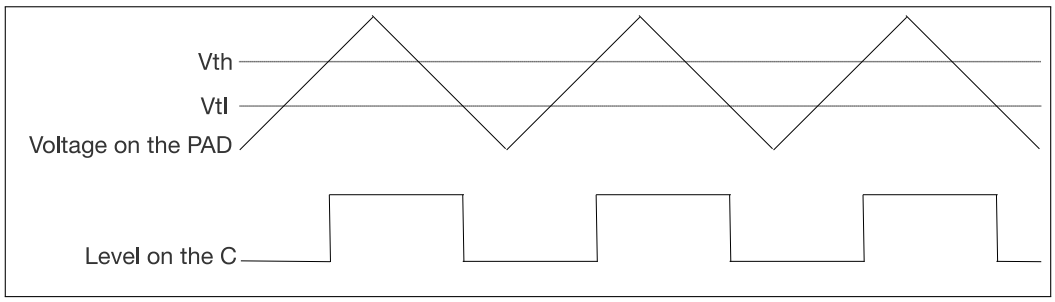

Figure 10.10-2. Example of Level Flip on the Chip Pad — Hysteresis Function Enabled

10.11 Power Supplies and Management of GPIO Pins

10.11.1 Power Supplies of GPIO Pins

For more information on the power supply for GPIO pins, please refer to Pin Definition in *ESP32-P4 Datasheet*. All the pins can be used to wake up the chip from Light-sleep, but only the pins (GPIO0 ~ GPIO15) in VDD_LP domain can be used to wake up the chip from Deep-sleep.

10.11.2 Power Supply Management

Each ESP32-P4 pin is connected to one of the following power domains.

- VDD_LP: the input power supply for LP GPIO pins
- VDD_IO_0, VDD_FLASHIO, VDD_IO_4 ~ VDD_IO_6: the input power supply for HP GPIO pins

10.12 HP Peripheral Signal List

Table 10.12-1 shows the peripheral input/output signals via HP GPIO matrix.

Please pay attention to the configuration of the bit GPIO_FUNC*n*_OE_SEL:

- GPIO_FUNC*n*_OE_SEL = 1: the output enable is controlled by the corresponding bit *n* of GPIO_ENABLE/ENABLE1_REG:
  - GPIO_ENABLE/ENABLE1_REG = 0: output is disabled.
  - GPIO_ENABLE/ENABLE1_REG = 1: output is enabled.
- GPIO_FUNC*n*_OE_SEL = 0: use the output enable signal from peripheral, for example spi2_dqs_pad_oe in the column "Output enable signal when GPIO_FUNC*n*_OE_SEL = 0" of Table 10.12-1. Note that the signals such as spi2_dqs_pad_oe can be 1 (1'd1) or 0 (1'd0), depending on the configuration of corresponding peripherals. If it's 1'd1 in column "Output enable signal when GPIO_FUNC*n*_OE_SEL = 0", it indicates that once GPIO_FUNC*n*_OE_SEL is cleared, the output signal is always enabled by default.

Note:

Signals are numbered consecutively, but not all signals are valid.

- Only the signals with a name assigned in the column "Input signal" in Table 10.12-1 are valid input signals.
- Only the signals with a name assigned in the column "Output signal" in Table 10.12-1 are valid output signals.

Table 10.12-1. Peripheral Signals via HP GPIO Matrix

Signal No.	Input Signal	Default Value	Direct Input via HP IO MUX	Output Signal	Output Enable Signal when GPIO_FUNCn_OE_SEL = 0	Direct Output via HP IO MUX

10.13 LP Peripheral Signal List

Table 10.13-1 shows the peripheral input/output signals via LP GPIO matrix.

Please pay attention to the configuration of the bit LP_GPIO_FUNC*n*_OE_SEL:

- LP_GPIO_FUNC*n*_OE_SEL = 1: the output enable is controlled by the corresponding bit*n* of LP_GPIO_ENABLE_REG:
  - LP_GPIO_ENABLE_REG = 0: output is disabled.
  - LP_GPIO_ENABLE_REG = 1: output is enabled.
- LP_GPIO_FUNC*n*_OE_SEL = 0: use the output enable signal from peripheral, for example lp_spi_clk_pad_oe in the column "Output enable signal when LP_GPIO_FUNC*n*_OE_SEL = 0" of Table 10.13-1. Note that the signals such as lp_spi_clk_pad_oe can be 1 (1'd1) or 0 (1'd0), depending on the configuration of corresponding peripherals. If it's 1'd1 in column "Output enable signal when LP_GPIO_FUNC*n*_OE_SEL = 0", it indicates that once LP_GPIO_FUNC*n*_OE_SEL is cleared, the output signal is always enabled by default.

Note:

Signals are numbered consecutively, but not all signals are valid.

- Only the signals with a name assigned in the column "Input signal" in Table 10.13-1 are valid input signals.
- Only the signals with a name assigned in the column "Output signal" in Table 10.13-1 are valid output signals.

GPIO53	GPIO53	GPIO53	—	GMAC_PHY_RXD1_PAD	2	0	R
GPIO54	GPIO54	GPIO54	—	GMAC_PHY_RXER_PAD	2	0	R

Drive Strength

"DRV" column shows the drive strength of each pin after reset:

- **0** - Drive current = ~5 mA
- **1** - Drive current = ~10 mA
- **2** - Drive current = ~20 mA
- **3** - Drive current = ~40 mA

Reset

The default configuration of each pin after reset:

- **0** - input disabled, in high impedance state (IE = 0)
- **1** - input enabled, in high impedance state (IE = 1)
- **1*** - When the value of eFuse bit EFUSE_DIS_PAD_JTAG is
  0 (default), input enabled, pull-up resistor enabled (IE = 1, WPU = 1)
  1, input disabled, in high impedance state (IE = 1)
- **3*** - input disabled, pull-up resistor enabled (IE = 0, USB_PU = 1). See details in Notes.
- **5** - input disabled (IE = 0). Output is controlled by the peripheral of Function 0, and the default output is 1.

We recommend pulling high or low GPIO pins in high impedance state to avoid unnecessary power consumption. You may add pull-up and pull-down resistors in your PCB design, or enable internal pull-up and pull-down resistors during software initialization.

Notes

- **R** - These pins have analog functions.
- **USB** - The pull-up value of a USB pin is controlled by the pin's pull-up value together with the USB pull-up value. If any of the two pull-up values is 1, the pin's pull-up resistor will be enabled.

Notice:
In HP IO MUX, unused pins must be configured to GPIO function.

10.15 LP IO MUX Functions List

Table 10.15-1 shows the LP IO MUX functions of each GPIO pin. GPIO pins are default controlled by HP IO MUX, so Table 10.15-1 only show functions of LP IO MUX.

Table 10.15-1. LP IO MUX Pin Functions

Name	Function 0	Function 1
GPIO0	LP_GPIO0	LP_GPIO0
GPIO1	LP_GPIO1	LP_GPIO1
GPIO2	LP_GPIO2	LP_GPIO2

10.17 Event Task Matrix Function

In ESP32-P4, GPIO supports ETM function, that is, the ETM task of GPIO can be triggered by the ETM event of any peripheral, or the ETM task of any peripheral can be triggered by the ETM event of GPIO. For more details about ETM, please refer to Chapter 14 *Event Task Matrix (ETM)*. Only ETM tasks and ETM events related to GPIO are introduced here.

The GPIO ETM provides eight task channels *x* (0 ~ 7). The ETM tasks that each task channel can receive are:

- GPIO_TASK_CH*x*_SET: GPIO goes high when triggered.
- GPIO_TASK_CH*x*_CLEAR: GPIO goes low when triggered.
- GPIO_TASK_CH*x*_TOGGLE: GPIO toggles level when triggered.

Below is an example to configure task channel *x* to control GPIO*y*:

- Configure IO_MUX_GPIO*y*_MCU_SEL to 1, to select Function 1 listed in Table 10.14-1.
- Configure GPIO_ENABLE_REG[*y*] to 1.
- Configure GPIO_EXT_ETM_TASK_GPIO*y*_SEL to *x*.
- Set GPIO_EXT_ETM_TASK_GPIO*y*_EN, to enable ETM task channel *x* to control GPIO*y*.

Note:

- One task channel can be selected by one or more GPIOs.
- When two or three of the signals GPIO_TASK_CH*x*_SET, GPIO_TASK_CH*x*_CLEAR, and GPIO_TASK_CH*x*_TOGGLE of the task channel *x* selected by GPIO*y* are valid at the same time, then GPIO_TASK_CH*x*_SET has the highest priority, GPIO_TASK_CH*x*_CLEAR takes the second higher priority, and GPIO_TASK_CH*x*_TOGGLE has the

lowest priority.

- When GPIO*y* is controlled by ETM task channel, the values of GPIO_OUT_REG, GPIO_FUNC*n*_OUT_INV_SEL, and GPIO_FUNC*n*_OUT_SEL may be modified by the hardware. For such reason, it's recommended to reconfigure these registers when the GPIO is free from the control of ETM task channel.

GPIO has eight event channels, and the ETM events that each event channel can generate are:

- GPIO_EVT_CH*x*_RISE_EDGE: Indicates that the output signal of the corresponding GPIO Filter (see Figure 10.3-1) has a rising edge.
- GPIO_EVT_CH*x*_FALL_EDGE: Indicates that the output signal of the corresponding GPIO Filter (see Figure 10.3-1) has a falling edge.
- GPIO_EVT_CH*x*_ANY_EDGE: Indicates that the output signal of the corresponding GPIO Filter (see Figure 10.3-1) is reversed.

The specific configuration of the event channel is as follows:

- Set GPIO_EXT_ETM_CH*x*_EVENT_EN to enable event channel *x* (0 ~ 7).
- Configure GPIO_EXT_ETM_CH*x*_EVENT_SEL to *y* (0 ~ 54), i.e., select one from the 55 GPIOs.

Note:
One GPIO can be selected by one or more event channels.

In specific applications, GPIO ETM events can be used to trigger GPIO ETM tasks. For example, event channel 0 selects GPIO0, GPIO1 selects task channel 0, and the GPIO_EVT_CH*0*_RISE_EDGE event is used to trigger the GPIO_TASK_CH*0*_TOGGLE task. When a square wave signal is input to the chip through GPIO0, the chip outputs a square wave signal with a frequency divided by 2 through GPIO1.

10.18 Interrupts

ESP32-P4's HP IO MUX and HP GPIO matrix can generate the following interrupt signals that will be sent to the Interrupt Matrix.

- GPIO_INTR0
- GPIO_INTR1
- GPIO_INTR2
- GPIO_INTR3
- GPIO_PAD_COMP_INTR

There are several internal interrupt sources from HP IO MUX and HP GPIO matrix that can generate the above interrupt signals. The interrupt sources from HP IO MUX and HP GPIO matrix are listed with their trigger conditions and the resulted interrupt signals in Table 10.18-1. For more detailed information about GPIO_PAD_COMP_INTR, please refer to Chapter 66 *Analog Voltage Comparator*.

Table 10.18-1. HP IO MUX and HP GPIO Matrix's Internal Interrupt Sources

Internal Interrupt Source	Trigger Condition	Interrupt Signal

GPIO_INTR0	GPIO_STATUS_INTERRUPT[*n*] & GPIO_PIN*n*_INT_ENA[0] (n: 0 ~ 31)	GPIO_INTR0
GPIO_INTR0	GPIO_STATUS1_INTERRUPT[*n*] & GPIO_PIN*n+32*_INT_ENA[0] (n: 0 ~ 22)	GPIO_INTR0
GPIO_INTR1	GPIO_STATUS_INTERRUPT[*n*] & GPIO_PIN*n*_INT_ENA[1] (n: 0 ~ 31)	GPIO_INTR1
GPIO_INTR1	GPIO_STATUS1_INTERRUPT[*n*] & GPIO_PIN*n+32*_INT_ENA[1] (n: 0 ~ 22)	GPIO_INTR1
GPIO_INTR2	GPIO_STATUS_INTERRUPT[*n*] & GPIO_PIN*n*_INT_ENA[3] (n: 0 ~ 31)	GPIO_INTR2
GPIO_INTR2	GPIO_STATUS1_INTERRUPT[*n*] & GPIO_PIN*n+32*_INT_ENA[3] (n: 0 ~ 22)	GPIO_INTR2
GPIO_INTR3	GPIO_STATUS_INTERRUPT[*n*] & GPIO_PIN*n*_INT_ENA[4] (n: 0 ~ 31)	GPIO_INTR3
GPIO_INTR3	GPIO_STATUS1_INTERRUPT[*n*] & GPIO_PIN*n+32*_INT_ENA[4] (n: 0 ~ 22)	GPIO_INTR3

ESP32-P4's LP IO MUX and GPIO matrix can generate the following interrupt signals that will be sent to the Interrupt Matrix.

- LP_GPIO_INTR0

The interrupt source from LP IO MUX and LP GPIO matrix are listed with their trigger conditions and the resulted interrupt signals in Table 10.18-2.

Table 10.18-2. LP IO MUX and LP GPIO Matrix's Internal Interrupt Sources

Internal Interrupt Source	Trigger Condition	Interrupt Signal
LP_GPIO_INTR	LP_GPIO_STATUS_DATA[*n*] (n: 0 ~ 15)	LP_GPIO_INTR

10.19 Register Summary

10.19.1 HP GPIO Matrix Register Summary

The addresses in this section are relative to HP GPIO matrix base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Configuration Registers			
GPIO_OUT_REG	GPIO0 ~ GPIO31 output register	0x0004	R/W/SC/WTC
GPIO_OUT_W1TS_REG	GPIO0 ~ GPIO31 output set register	0x0008	WT

10.19.2 HP IO MUX Register Summary

The addresses in this section are relative to the HP IO MUX base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
IO MUX Configuration Registers			
IO_MUX_GPIO0_REG	IO MUX configuration register for GPIO0	0x0004	R/W
IO_MUX_GPIO1_REG	IO MUX configuration register for GPIO1	0x0008	R/W
IO_MUX_GPIO2_REG	IO MUX configuration register for GPIO2	0x000C	R/W
IO_MUX_GPIO3_REG	IO MUX configuration register for GPIO3	0x0010	R/W
IO_MUX_GPIO4_REG	IO MUX configuration register for GPIO4	0x0014	R/W
IO_MUX_GPIO5_REG	IO MUX configuration register for GPIO5	0x0018	R/W
IO_MUX_GPIO6_REG	IO MUX configuration register for GPIO6	0x001C	R/W
IO_MUX_GPIO7_REG	IO MUX configuration register for GPIO7	0x0020	R/W
IO_MUX_GPIO8_REG	IO MUX configuration register for GPIO8	0x0024	R/W
IO_MUX_GPIO9_REG	IO MUX configuration register for GPIO9	0x0028	R/W
IO_MUX_GPIO10_REG	IO MUX configuration register for GPIO10	0x002C	R/W
IO_MUX_GPIO11_REG	IO MUX configuration register for GPIO11	0x0030	R/W
IO_MUX_GPIO12_REG	IO MUX configuration register for GPIO12	0x0034	R/W
IO_MUX_GPIO13_REG	IO MUX configuration register for GPIO13	0x0038	R/W
IO_MUX_GPIO14_REG	IO MUX configuration register for GPIO14	0x003C	R/W
IO_MUX_GPIO15_REG	IO MUX configuration register for GPIO15	0x0040	R/W

Name	Description	Address	Access
IO_MUX_GPIO16_REG	IO MUX configuration register for GPIO16	0x0044	R/W
IO_MUX_GPIO17_REG	IO MUX configuration register for GPIO17	0x0048	R/W
IO_MUX_GPIO18_REG	IO MUX configuration register for GPIO18	0x004C	R/W
IO_MUX_GPIO19_REG	IO MUX configuration register for GPIO19	0x0050	R/W
IO_MUX_GPIO20_REG	IO MUX configuration register for GPIO20	0x0054	R/W
IO_MUX_GPIO21_REG	IO MUX configuration register for GPIO21	0x0058	R/W
IO_MUX_GPIO22_REG	IO MUX configuration register for GPIO22	0x005C	R/W
IO_MUX_GPIO23_REG	IO MUX configuration register for GPIO23	0x0060	R/W
IO_MUX_GPIO24_REG	IO MUX configuration register for GPIO24	0x0064	R/W
IO_MUX_GPIO25_REG	IO MUX configuration register for GPIO25	0x0068	R/W
IO_MUX_GPIO26_REG	IO MUX configuration register for GPIO26	0x006C	R/W
IO_MUX_GPIO27_REG	IO MUX configuration register for GPIO27	0x0070	R/W
IO_MUX_GPIO28_REG	IO MUX configuration register for GPIO28	0x0074	R/W
IO_MUX_GPIO29_REG	IO MUX configuration register for GPIO29	0x0078	R/W
IO_MUX_GPIO30_REG	IO MUX configuration register for GPIO30	0x007C	R/W
IO_MUX_GPIO31_REG	IO MUX configuration register for GPIO31	0x0080	R/W
IO_MUX_GPIO32_REG	IO MUX configuration register for GPIO32	0x0084	R/W
IO_MUX_GPIO33_REG	IO MUX configuration register for GPIO33	0x0088	R/W
IO_MUX_GPIO34_REG	IO MUX configuration register for GPIO34	0x008C	R/W
IO_MUX_GPIO35_REG	IO MUX configuration register for GPIO35	0x0090	R/W
IO_MUX_GPIO36_REG	IO MUX configuration register for GPIO36	0x0094	R/W
IO_MUX_GPIO37_REG	IO MUX configuration register for GPIO37	0x0098	R/W
IO_MUX_GPIO38_REG	IO MUX configuration register for GPIO38	0x009C	R/W
IO_MUX_GPIO39_REG	IO MUX configuration register for GPIO39	0x00A0	R/W
IO_MUX_GPIO40_REG	IO MUX configuration register for GPIO40	0x00A4	R/W
IO_MUX_GPIO41_REG	IO MUX configuration register for GPIO41	0x00A8	R/W
IO_MUX_GPIO42_REG	IO MUX configuration register for GPIO42	0x00AC	R/W
IO_MUX_GPIO43_REG	IO MUX configuration register for GPIO43	0x00B0	R/W
IO_MUX_GPIO44_REG	IO MUX configuration register for GPIO44	0x00B4	R/W
IO_MUX_GPIO45_REG	IO MUX configuration register for GPIO45	0x00B8	R/W
IO_MUX_GPIO46_REG	IO MUX configuration register for GPIO46	0x00BC	R/W
IO_MUX_GPIO47_REG	IO MUX configuration register for GPIO47	0x00C0	R/W
IO_MUX_GPIO48_REG	IO MUX configuration register for GPIO48	0x00C4	R/W
IO_MUX_GPIO49_REG	IO MUX configuration register for GPIO49	0x00C8	R/W
IO_MUX_GPIO50_REG	IO MUX configuration register for GPIO50	0x00CC	R/W
IO_MUX_GPIO51_REG	IO MUX configuration register for GPIO51	0x00D0	R/W
IO_MUX_GPIO52_REG	IO MUX configuration register for GPIO52	0x00D4	R/W
IO_MUX_GPIO53_REG	IO MUX configuration register for GPIO53	0x00D8	R/W
IO_MUX_GPIO54_REG	IO MUX configuration register for GPIO54	0x00DC	R/W
Version Register			
IO_MUX_DATE_REG	Version control register	0x0104	R/W

10.19.3 GPIO EXT Register Summary

GPIO EXT registers consist of SDM registers, Glitch Filter registers, and ETM registers.

The addresses in this section are relative to (HP GPIO matrix base address + 0x0F00). GPIO base address is provided in Table 9.3-2 in Chapter 9 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
SDM Configuration Registers			
GPIO_EXT_SIGMADELTA0_REG	SDM channel 0 duty cycle configuration register	0x0000	R/W
GPIO_EXT_SIGMADELTA1_REG	SDM channel 1 duty cycle configuration register	0x0004	R/W
GPIO_EXT_SIGMADELTA2_REG	SDM channel 2 duty cycle configuration register	0x0008	R/W
GPIO_EXT_SIGMADELTA3_REG	SDM channel 3 duty cycle configuration register	0x000C	R/W
GPIO_EXT_SIGMADELTA4_REG	SDM channel 4 duty cycle configuration register	0x0010	R/W
GPIO_EXT_SIGMADELTA5_REG	SDM channel 5 duty cycle configuration register	0x0014	R/W
GPIO_EXT_SIGMADELTA6_REG	SDM channel 6 duty cycle configuration register	0x0018	R/W
GPIO_EXT_SIGMADELTA7_REG	SDM channel 7 duty cycle configuration register	0x001C	R/W
GPIO_EXT_SIGMADELTA_MISC_REG	MISC register	0x0024	R/W
Glitch Filter Configuration Registers			
GPIO_EXT_GLITCH_FILTER_CH0_REG	Glitch Filter configuration register for channel 0	0x0030	R/W
GPIO_EXT_GLITCH_FILTER_CH1_REG	Glitch Filter configuration register for channel 1	0x0034	R/W
GPIO_EXT_GLITCH_FILTER_CH2_REG	Glitch Filter configuration register for channel 2	0x0038	R/W
GPIO_EXT_GLITCH_FILTER_CH3_REG	Glitch Filter configuration register for channel 3	0x003C	R/W
GPIO_EXT_GLITCH_FILTER_CH4_REG	Glitch Filter configuration register for channel 4	0x0040	R/W
GPIO_EXT_GLITCH_FILTER_CH5_REG	Glitch Filter configuration register for channel 5	0x0044	R/W
GPIO_EXT_GLITCH_FILTER_CH6_REG	Glitch Filter configuration register for channel 6	0x0048	R/W
GPIO_EXT_GLITCH_FILTER_CH7_REG	Glitch Filter configuration register for channel 7	0x004C	R/W
ETM Configuration Registers			
GPIO_EXT_ETM_EVENT_CH0_CFG_REG	ETM configuration register for channel 0	0x0060	R/W

Name	Description	Address	Access
GPIO_EXT_ETM_EVENT_CH1_CFG_REG	ETM configuration register for channel 1	0x0064	R/W
GPIO_EXT_ETM_EVENT_CH2_CFG_REG	ETM configuration register for channel 2	0x0068	R/W
GPIO_EXT_ETM_EVENT_CH3_CFG_REG	ETM configuration register for channel 3	0x006C	R/W
GPIO_EXT_ETM_EVENT_CH4_CFG_REG	ETM configuration register for channel 4	0x0070	R/W
GPIO_EXT_ETM_EVENT_CH5_CFG_REG	ETM configuration register for channel 5	0x0074	R/W
GPIO_EXT_ETM_EVENT_CH6_CFG_REG	ETM configuration register for channel 6	0x0078	R/W
GPIO_EXT_ETM_EVENT_CH7_CFG_REG	ETM configuration register for channel 7	0x007C	R/W
GPIO_EXT_ETM_TASK_P0_CFG_REG	GPIO selection register 0 for ETM	0x00A0	R/W
GPIO_EXT_ETM_TASK_P1_CFG_REG	GPIO selection register 1 for ETM	0x00A4	R/W
GPIO_EXT_ETM_TASK_P2_CFG_REG	GPIO selection register 2 for ETM	0x00A8	R/W
GPIO_EXT_ETM_TASK_P3_CFG_REG	GPIO selection register 3 for ETM	0x00AC	R/W
GPIO_EXT_ETM_TASK_P4_CFG_REG	GPIO selection register 4 for ETM	0x00B0	R/W
GPIO_EXT_ETM_TASK_P5_CFG_REG	GPIO selection register 5 for ETM	0x00B4	R/W
GPIO_EXT_ETM_TASK_P6_CFG_REG	GPIO selection register 6 for ETM	0x00B8	R/W
GPIO_EXT_ETM_TASK_P7_CFG_REG	GPIO selection register 7 for ETM	0x00BC	R/W
GPIO_EXT_ETM_TASK_P8_CFG_REG	GPIO selection register 8 for ETM	0x00C0	R/W
GPIO_EXT_ETM_TASK_P9_CFG_REG	GPIO selection register 9 for ETM	0x00C4	R/W
GPIO_EXT_ETM_TASK_P10_CFG_REG	GPIO selection register 10 for ETM	0x00C8	R/W
GPIO_EXT_ETM_TASK_P11_CFG_REG	GPIO selection register 11 for ETM	0x00CC	R/W
GPIO_EXT_ETM_TASK_P12_CFG_REG	GPIO selection register 12 for ETM	0x00D0	R/W
GPIO_EXT_ETM_TASK_P13_CFG_REG	GPIO selection register 13 for ETM	0x00D4	R/W
Version Register			
GPIO_EXT_VERSION_REG	Version control register	0x00FC	R/W

10.19.4 LP GPIO Matrix Register Summary

The addresses in this section are relative to LP GPIO matrix base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Clock Enable Register			
LP_GPIO_CLK_EN_REG	LP GPIO clock gate register	0x0000	R/W
Configuration Registers			
LP_GPIO_OUT_REG	LP GPIO output register	0x0008	R/W/WTC
LP_GPIO_OUT_W1TS_REG	LP GPIO output set register	0x000C	WT
LP_GPIO_OUT_W1TC_REG	LP GPIO output clear register	0x0010	WT
LP_GPIO_ENABLE_REG	LP GPIO output enable register	0x0014	R/W/WTC
LP_GPIO_ENABLE_W1TS_REG	LP GPIO output enable set register	0x0018	WT
LP_GPIO_ENABLE_W1TC_REG	LP GPIO output enable clear register	0x001C	WT
LP_GPIO_STATUS_REG	LP GPIO interrupt status register	0x0020	R/W/WTC
LP_GPIO_STATUS_W1TS_REG	LP GPIO interrupt status set register	0x0024	WT
LP_GPIO_STATUS_W1TC_REG	LP GPIO interrupt status clear register	0x0028	WT

Name	Description	Address	Access
LP_GPIO_STATUS_NEXT_REG	LP GPIO interrupt source register	0x002C	RO
LP_GPIO_IN_REG	LP GPIO input register	0x0030	RO
LP_GPIO_PIN0_REG	LP GPIO0 configuration register	0x0034	varies
LP_GPIO_PIN1_REG	LP GPIO1 configuration register	0x0038	varies
LP_GPIO_PIN2_REG	LP GPIO2 configuration register	0x003C	varies
LP_GPIO_PIN3_REG	LP GPIO3 configuration register	0x0040	varies
LP_GPIO_PIN4_REG	LP GPIO4 configuration register	0x0044	varies
LP_GPIO_PIN5_REG	LP GPIO5 configuration register	0x0048	varies
LP_GPIO_PIN6_REG	LP GPIO6 configuration register	0x004C	varies
LP_GPIO_PIN7_REG	LP GPIO7 configuration register	0x0050	varies
LP_GPIO_PIN8_REG	LP GPIO8 configuration register	0x0054	varies
LP_GPIO_PIN9_REG	LP GPIO9 configuration register	0x0058	varies
LP_GPIO_PIN10_REG	LP GPIO10 configuration register	0x005C	varies
LP_GPIO_PIN11_REG	LP GPIO11 configuration register	0x0060	varies
LP_GPIO_PIN12_REG	LP GPIO12 configuration register	0x0064	varies
LP_GPIO_PIN13_REG	LP GPIO13 configuration register	0x0068	varies
LP_GPIO_PIN14_REG	LP GPIO14 configuration register	0x006C	varies
LP_GPIO_PIN15_REG	LP GPIO15 configuration register	0x0070	varies
LP_GPIO_FUNC0_IN_SEL_CFG_REG	Configuration register for input signal 0	0x0074	R/W
LP_GPIO_FUNC1_IN_SEL_CFG_REG	Configuration register for input signal 1	0x0078	R/W
LP_GPIO_FUNC2_IN_SEL_CFG_REG	Configuration register for input signal 2	0x007C	R/W
LP_GPIO_FUNC3_IN_SEL_CFG_REG	Configuration register for input signal 3	0x0080	R/W
LP_GPIO_FUNC4_IN_SEL_CFG_REG	Configuration register for input signal 4	0x0084	R/W
LP_GPIO_FUNC5_IN_SEL_CFG_REG	Configuration register for input signal 5	0x0088	R/W
LP_GPIO_FUNC6_IN_SEL_CFG_REG	Configuration register for input signal 6	0x008C	R/W
LP_GPIO_FUNC7_IN_SEL_CFG_REG	Configuration register for input signal 7	0x0090	R/W
LP_GPIO_FUNC8_IN_SEL_CFG_REG	Configuration register for input signal 8	0x0094	R/W
LP_GPIO_FUNC9_IN_SEL_CFG_REG	Configuration register for input signal 9	0x0098	R/W
LP_GPIO_FUNC10_IN_SEL_CFG_REG	Configuration register for input signal 10	0x009C	R/W
LP_GPIO_FUNC11_IN_SEL_CFG_REG	Configuration register for input signal 11	0x00A0	R/W
LP_GPIO_FUNC12_IN_SEL_CFG_REG	Configuration register for input signal 12	0x00A4	R/W
LP_GPIO_FUNC13_IN_SEL_CFG_REG	Configuration register for input signal 13	0x00A8	R/W
LP_GPIO_FUNC0_OUT_SEL_CFG_REG	Configuration register for LP GPIO0 output	0x00F4	R/W
LP_GPIO_FUNC1_OUT_SEL_CFG_REG	Configuration register for LP GPIO1 output	0x00F8	R/W
LP_GPIO_FUNC2_OUT_SEL_CFG_REG	Configuration register for LP GPIO2 output	0x00FC	R/W
LP_GPIO_FUNC3_OUT_SEL_CFG_REG	Configuration register for LP GPIO3 output	0x0100	R/W
LP_GPIO_FUNC4_OUT_SEL_CFG_REG	Configuration register for LP GPIO4 output	0x0104	R/W
LP_GPIO_FUNC5_OUT_SEL_CFG_REG	Configuration register for LP GPIO5 output	0x0108	R/W
LP_GPIO_FUNC6_OUT_SEL_CFG_REG	Configuration register for LP GPIO6 output	0x010C	R/W
LP_GPIO_FUNC7_OUT_SEL_CFG_REG	Configuration register for LP GPIO7 output	0x0110	R/W
LP_GPIO_FUNC8_OUT_SEL_CFG_REG	Configuration register for LP GPIO8 output	0x0114	R/W
LP_GPIO_FUNC9_OUT_SEL_CFG_REG	Configuration register for LP GPIO9 output	0x0118	R/W
LP_GPIO_FUNC10_OUT_SEL_CFG_REG	Configuration register for LP GPIO10 output	0x011C	R/W

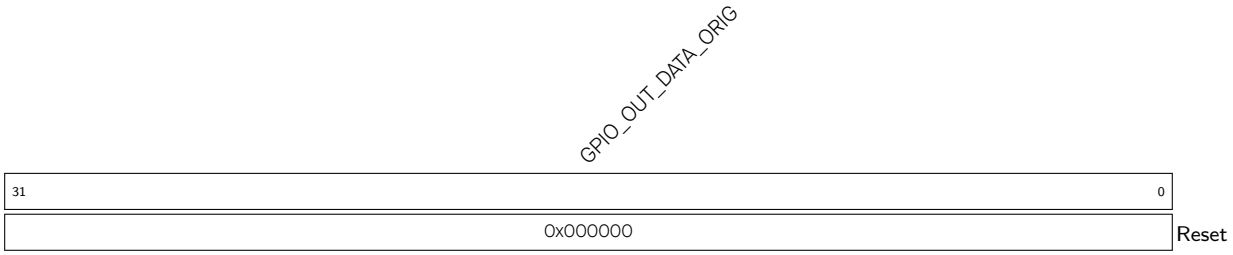
Name	Description	Address	Access
LP_GPIO_FUNC11_OUT_SEL_CFG_REG	Configuration register for LP GPIO11 output	0x0120	R/W
LP_GPIO_FUNC12_OUT_SEL_CFG_REG	Configuration register for LP GPIO12 output	0x0124	R/W
LP_GPIO_FUNC13_OUT_SEL_CFG_REG	Configuration register for LP GPIO13 output	0x0128	R/W
LP_GPIO_FUNC14_OUT_SEL_CFG_REG	Configuration register for LP GPIO14 output	0x012C	R/W
LP_GPIO_FUNC15_OUT_SEL_CFG_REG	Configuration register for LP GPIO15 output	0x0130	R/W
Version Register			
LP_GPIO_VER_DATE_REG	Version control register	0x0004	R/W

10.19.5 LP IO MUX Register Summary

The addresses in this section are relative to LP IO MUX base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

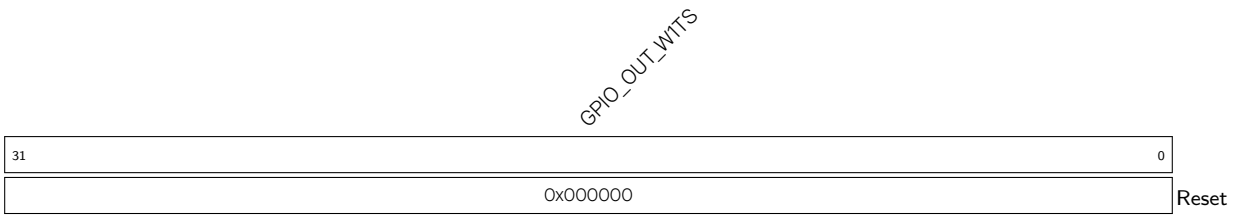
Name	Description	Address	Access
Clock Enable Register			
LP_IOMUX_CLK_EN_REG	LP IO MUX clock gate register	0x0000	R/W
Configuration Registers			
LP_IOMUX_PAD0_REG	LP IO MUX configuration register for GPIO0	0x0008	R/W
LP_IOMUX_PAD1_REG	LP IO MUX configuration register for GPIO1	0x000C	R/W
LP_IOMUX_PAD2_REG	LP IO MUX configuration register for GPIO2	0x0010	R/W
LP_IOMUX_PAD3_REG	LP IO MUX configuration register for GPIO3	0x0014	R/W
LP_IOMUX_PAD4_REG	LP IO MUX configuration register for GPIO4	0x0018	R/W
LP_IOMUX_PAD5_REG	LP IO MUX configuration register for GPIO5	0x001C	R/W
LP_IOMUX_PAD6_REG	LP IO MUX configuration register for GPIO6	0x0020	R/W
LP_IOMUX_PAD7_REG	LP IO MUX configuration register for GPIO7	0x0024	R/W
LP_IOMUX_PAD8_REG	LP IO MUX configuration register for GPIO8	0x0028	R/W
LP_IOMUX_PAD9_REG	LP IO MUX configuration register for GPIO9	0x002C	R/W
LP_IOMUX_PAD10_REG	LP IO MUX configuration register for GPIO10	0x0030	R/W
LP_IOMUX_PAD11_REG	LP IO MUX configuration register for GPIO11	0x0034	R/W
LP_IOMUX_PAD12_REG	LP IO MUX configuration register for GPIO12	0x0038	R/W
LP_IOMUX_PAD13_REG	LP IO MUX configuration register for GPIO13	0x003C	R/W
LP_IOMUX_PAD14_REG	LP IO MUX configuration register for GPIO14	0x0040	R/W
LP_IOMUX_PAD15_REG	LP IO MUX configuration register for GPIO15	0x0044	R/W
LP_IOMUX_LP_PAD_HOLD_REG	LP GPIO PAD hold control register	0x004C	R/W
LP_IOMUX_LP_PAD_HYS_REG	LP GPIO PAD hysteresis control register	0x0050	R/W
Version Register			
LP_IOMUX_VER_DATE_REG	Version control register	0x0004	R/W



10.20 Registers

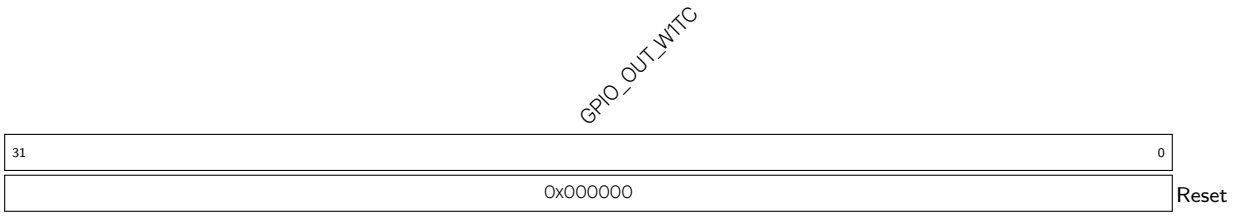
10.20.1 HP GPIO Matrix Registers

The addresses in this section are relative to HP GPIO matrix base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.



For how to program reserved fields, please refer to Section IX .

Register 10.1. GPIO_OUT_REG (0x0004)



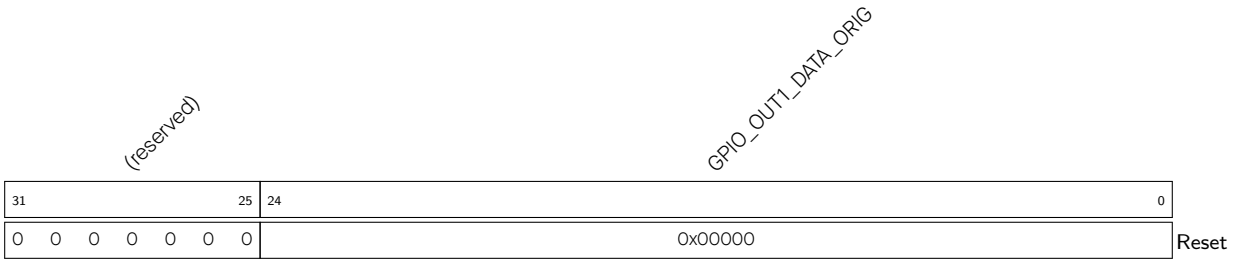
GPIO_OUT_DATA_ORIG Configures the output value of GPIO0 ~ GPIO31 output in simple GPIO output mode.
0: Low level
1: High level
The value of bit0 ~ bit31 correspond to the output value of GPIO0 ~ GPIO31 respectively. (R/W/SC/WTC)

Register 10.2. GPIO_OUT_W1TS_REG (0x0008)

GPIO_OUT_W1TS Configures whether or not to set the output register GPIO_OUT_REG of GPIO0 ~ GPIO31.
0: Not set
1: The corresponding bit in GPIO_OUT_REG will be set to 1
Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31. Recommended operation: use this register to set GPIO_OUT_REG.
(WT)

Register 10.3. GPIO_OUT_W1TC_REG (0x000C)

GPIO_OUT_W1TC Configures whether or not to clear the output register GPIO_OUT_REG of GPIO0 ~ GPIO31 output.



0: Not clear

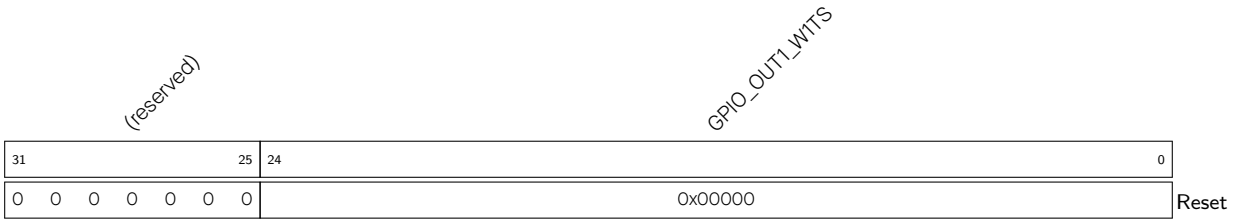
1: The corresponding bit in GPIO_OUT_REG will be cleared.

Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31. Recommended operation: use this register to clear GPIO_OUT_REG.

(WT)

Register 10.4. GPIO_OUT1_REG (0x0010)

GPIO_OUT1_DATA_ORIG Configures the output value of GPIO32 ~ GPIO54 output in simple GPIO output mode.



0: Low level

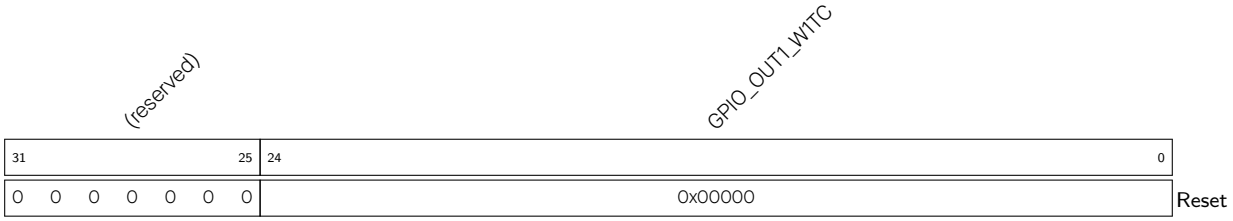
1: High level

The value of bit0 ~ bit22 correspond to the output value of GPIO32 ~ GPIO54 respectively.

(R/W/SC/WTC)

Register 10.5. GPIO_OUT1_W1TS_REG (0x0014)

GPIO_OUT1_W1TS Configures whether or not to set the output register GPIO_OUT1_REG of GPIO32 ~ GPIO54.



0: Not set

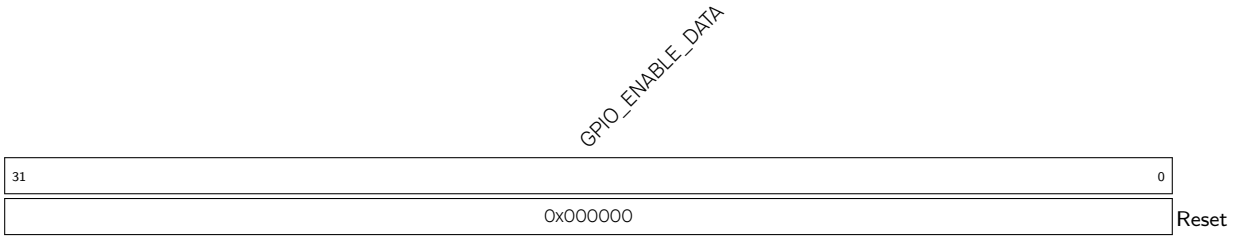
1: The corresponding bit in GPIO_OUT1_REG will be set to 1

Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54. Recommended operation: use this register to set GPIO_OUT1_REG.

(WT)

Register 10.6. GPIO_OUT1_W1TC_REG (0x0018)

GPIO_OUT1_W1TC Configures whether or not to clear the output register GPIO_OUT1_REG of GPIO32 ~ GPIO54 output.



0: Not clear

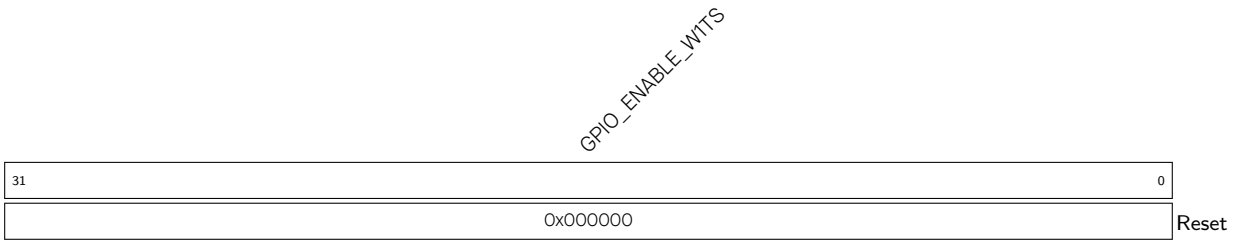
1: The corresponding bit in GPIO_OUT1_REG will be cleared.

Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54. Recommended operation: use this register to clear GPIO_OUT_REG.

(WT)

Register 10.7. GPIO_ENABLE_REG (0x0020)

GPIO_ENABLE_DATA Configures whether or not to enable the output of GPIO0 ~ GPIO31.



0: Not enable

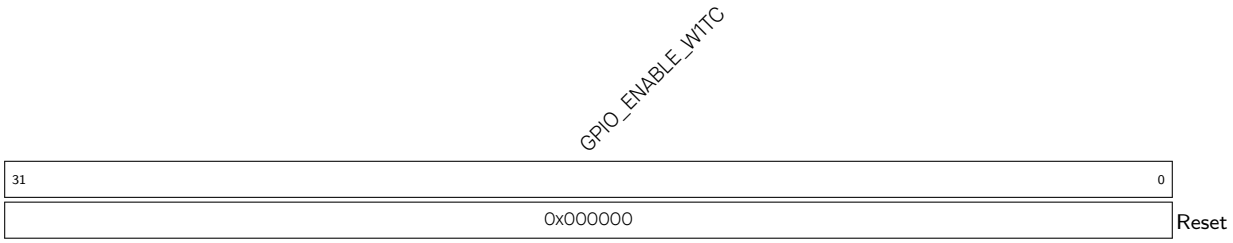
1: Enable

Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31

(R/W/WTC)

Register 10.8. GPIO_ENABLE_W1TS_REG (0x0024)

GPIO_ENABLE_W1TS Configures whether or not to set the output enable register GPIO_ENABLE_REG of GPIO0 ~ GPIO31.



0: Not set

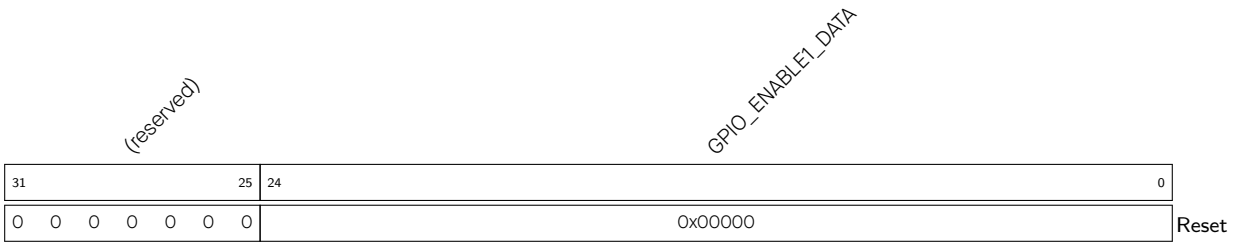
1: The corresponding bit in GPIO_ENABLE_REG will be set to 1

Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31. Recommended operation: use this register to set GPIO_ENABLE_REG.

(WT)

Register 10.9. GPIO_ENABLE_W1TC_REG (0x0028)

GPIO_ENABLE_W1TC Configures whether or not to clear the output enable register GPIO_ENABLE_REG of GPIO0 ~ GPIO31.



0: Not clear

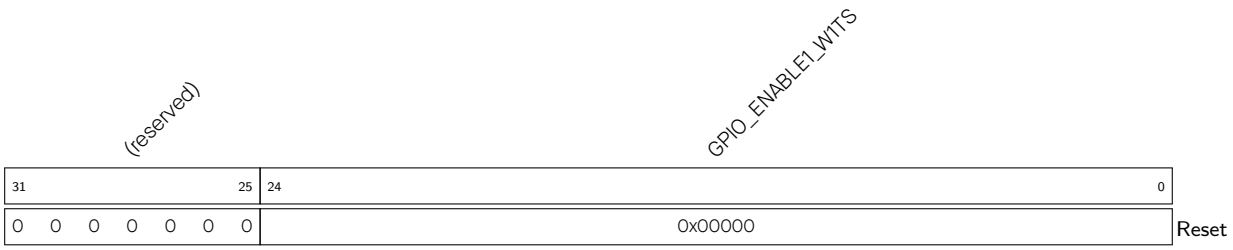
1: The corresponding bit in GPIO_ENABLE_REG will be cleared

Bit0 ~ bit31 are corresponding to GPIO0 ~ 31. Recommended operation: use this register to clear GPIO_ENABLE_REG.

(WT)

Register 10.10. GPIO_ENABLE1_REG (0x002C)

GPIO_ENABLE1_DATA Configures whether or not to enable the output of GPIO32 ~ GPIO54.



0: Not enable

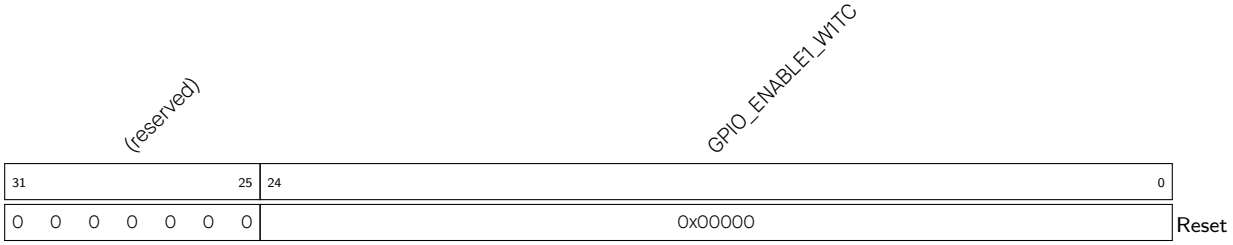
1: Enable

Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54.

(R/W/WTC)

Register 10.11. GPIO_ENABLE1_W1TS_REG (0x0030)

GPIO_ENABLE1_W1TS Configures whether or not to set the output enable register GPIO_ENABLE1_REG of GPIO32 ~ GPIO54.



0: Not set

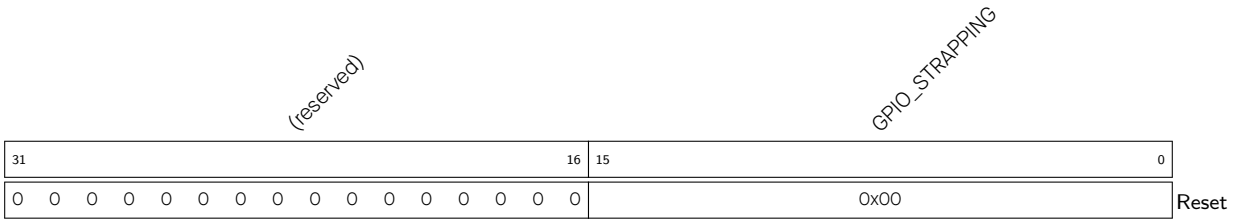
1: The corresponding bit in GPIO_ENABLE1_REG will be set to 1

Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54. Recommended operation: use this register to set GPIO_ENABLE1_REG.

(WT)

Register 10.12. GPIO_ENABLE1_W1TC_REG (0x0034)

GPIO_ENABLE1_W1TC Configures whether or not to clear the output enable register GPIO_ENABLE1_REG of GPIO32 ~ GPIO54.



0: Not clear

1: The corresponding bit in GPIO_ENABLE1_REG will be cleared

Bit0 ~ bit22 are corresponding to GPIO32 ~ 54. Recommended operation: use this register to clear GPIO_ENABLE1_REG.

(WT)

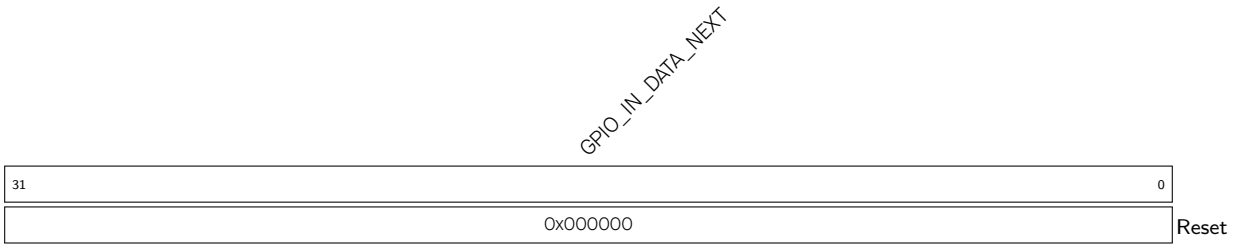
Register 10.13. GPIO_STRAP_REG (0x0038)

GPIO_STRAPPING Represents the values of GPIO strapping pins.

bit0: GPIO38

bit1: GPIO37

bit2: GPIO36



bit3: GPIO35

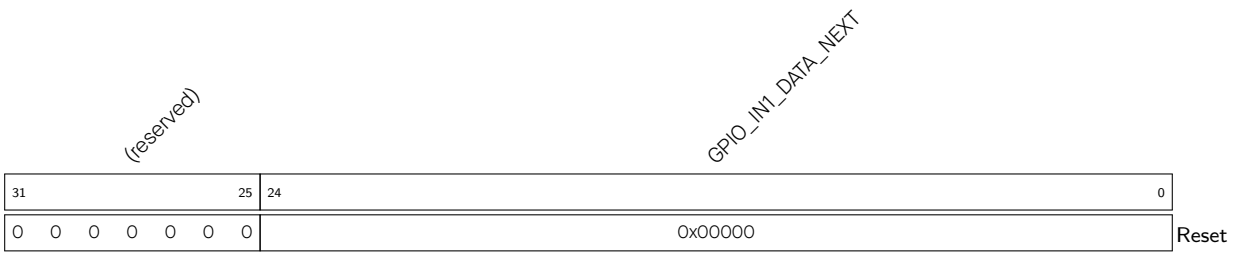
bit4: GPIO34

bit5 ~ bit15: invalid

For more information about the functions controlled by strapping pins, see *ESP32-P4 Datasheet* > Section *Strapping Pins*. (RO)

Register 10.14. GPIO_IN_REG (0x003C)

GPIO_IN_DATA_NEXT Represents the input value of GPIO0 ~ GPIO31. Each bit represents a pin input value:



0: Low level

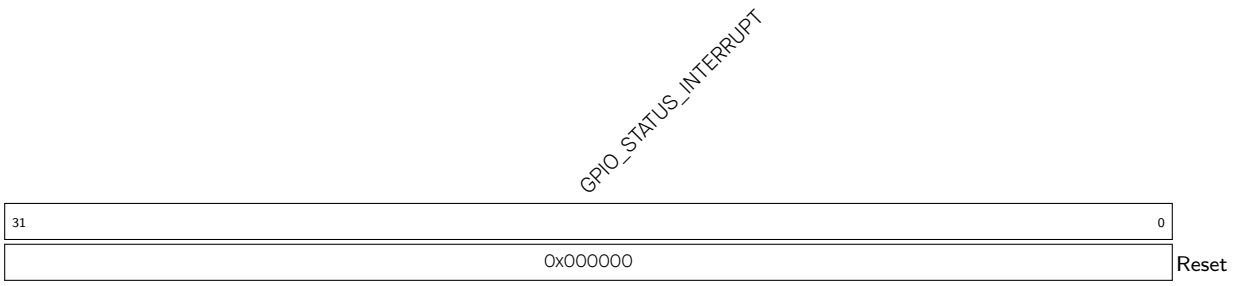
1: High level

Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31.

(RO)

Register 10.15. GPIO_IN1_REG (0x0040)

GPIO_IN1_DATA_NEXT Represents the input value of GPIO32 ~ GPIO54. Each bit represents a pin input value:



0: Low level

1: High level

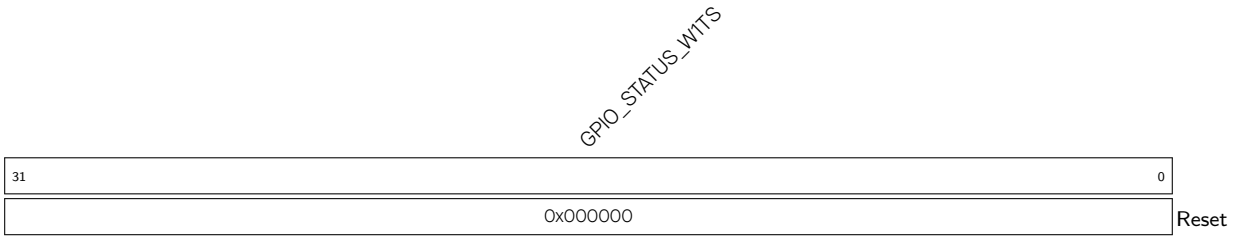
Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54.

(RO)

Register 10.16. GPIO_STATUS_REG (0x0044)

GPIO_STATUS_INTERRUPT The interrupt status of GPIO0 ~ GPIO31, can be configured by the software.

Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31.



Each bit represents the status of its corresponding GPIO:

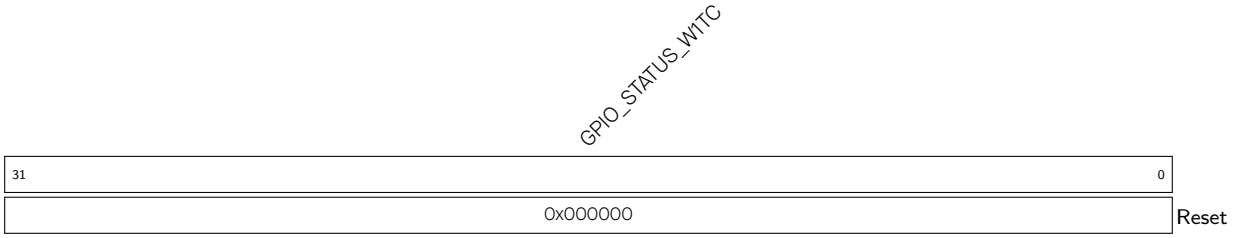
0: Represents the GPIO does not generate the interrupt configured by GPIO_PIN*n*_INT_TYPE, or this bit is configured to 0 by the software.

1: Represents the GPIO generates the interrupt configured by GPIO_PIN*n*_INT_TYPE, or this bit is configured to 1 by the software.

(R/W/WTC)

Register 10.17. GPIO_STATUS_W1TS_REG (0x0048)

GPIO_STATUS_W1TS Configures whether or not to set the interrupt status register GPIO_STATUS_INTERRUPT of GPIO0 ~ GPIO31.



Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31.

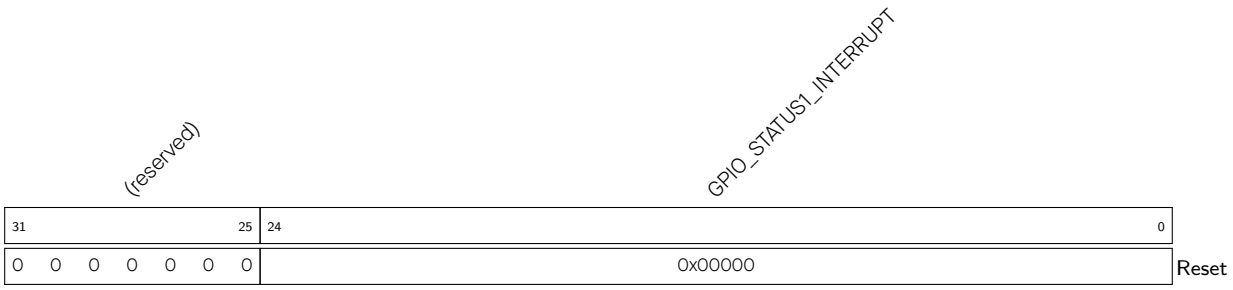
If the value 1 is written to a bit here, the corresponding bit in GPIO_STATUS_INTERRUPT will be set to 1.

Recommended operation: use this register to set GPIO_STATUS_INTERRUPT.

(WT)

Register 10.18. GPIO_STATUS_W1TC_REG (0x004C)

GPIO_STATUS_W1TC Configures whether or not to clear the interrupt status register GPIO_STATUS_INTERRUPT of GPIO0 ~ GPIO31.



Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31.

If the value 1 is written to a bit here, the corresponding bit in GPIO_STATUS_INTERRUPT will be cleared.

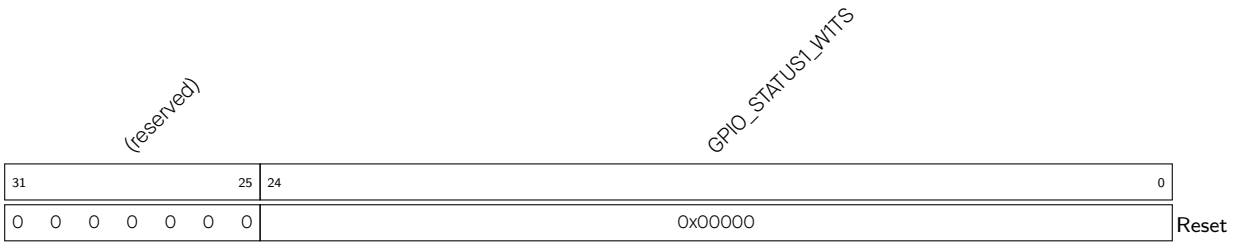
Recommended operation: use this register to clear GPIO_STATUS_INTERRUPT.

(WT)

Register 10.19. GPIO_STATUS1_REG (0x0050)

GPIO_STATUS1_INTERRUPT The interrupt status of GPIO32 ~ GPIO54, can be configured by the software.

Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54.



Each bit represents the status of its corresponding GPIO:

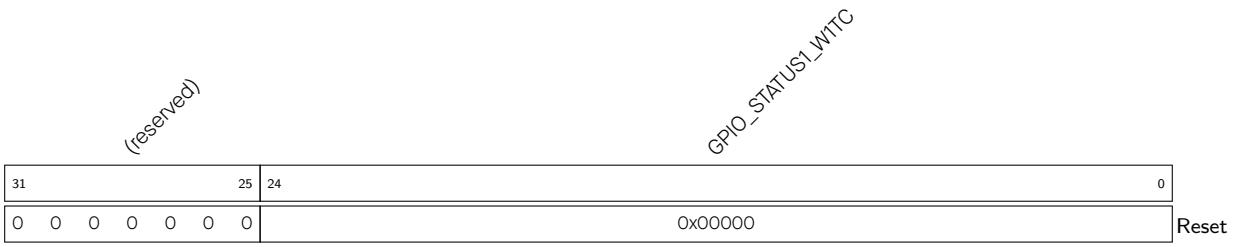
0: Represents the GPIO does not generate the interrupt configured by GPIO_PIN*n*_INT_TYPE, or this bit is configured to 0 by the software.

1: Represents the GPIO generates the interrupt configured by GPIO_PIN*n*_INT_TYPE, or this bit is configured to 1 by the software.

(R/W/WTC)

Register 10.20. GPIO_STATUS1_W1TS_REG (0x0054)

GPIO_STATUS1_W1TS Configures whether or not to set the interrupt status register GPIO_STATUS1_INTERRUPT of GPIO32 ~ GPIO54.



Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54.

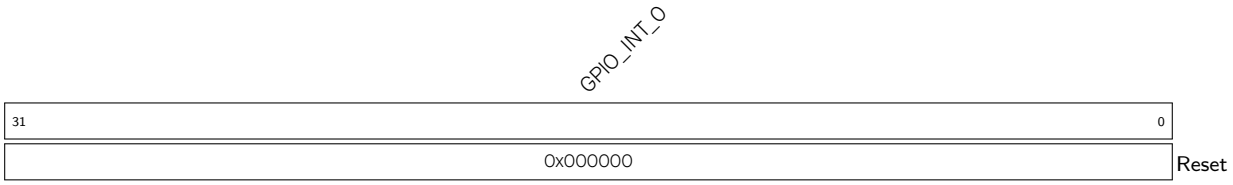
If the value 1 is written to a bit here, the corresponding bit in GPIO_STATUS1_INTERRUPT will be set to 1.

Recommended operation: use this register to set GPIO_STATUS1_INTERRUPT.

(WT)

Register 10.21. GPIO_STATUS1_W1TC_REG (0x0058)

GPIO_STATUS1_W1TC Configures whether or not to clear the interrupt status register GPIO_STATUS1_INTERRUPT of GPIO32 ~ GPIO54.



Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54.

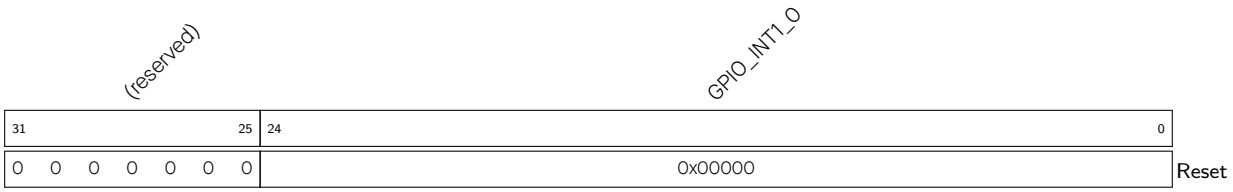
If the value 1 is written to a bit here, the corresponding bit in GPIO_STATUS1_INTERRUPT will be cleared.

Recommended operation: use this register to clear GPIO_STATUS1_INTERRUPT.

(WT)

Register 10.22. GPIO_INTR_0_REG (0x005C)

GPIO_INT_0 Represents the CPU interrupt 0 status of GPIO0 ~ GPIO31. Each bit represents:



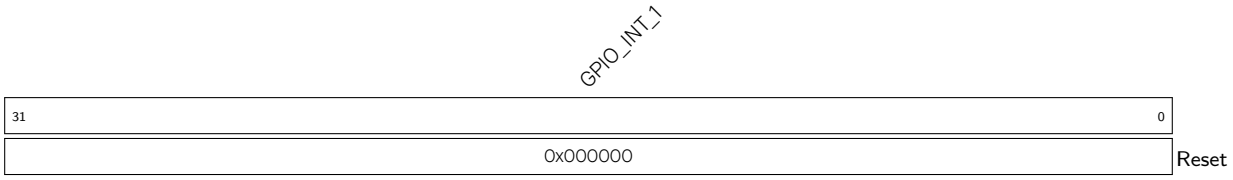
0: Represents CPU interrupt is not enabled, or the GPIO does not generate the interrupt configured by GPIO_PIN*n*_INT_TYPE.

1: Represents the GPIO generates an interrupt configured by GPIO_PIN*n*_INT_TYPE after the CPU interrupt is enabled.

Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31. This interrupt status is corresponding to the bit in GPIO_STATUS_REG when assert (high) enable signal (bit13 of GPIO_PIN*n*_REG).

(RO)

Register 10.23. GPIO_INTR1_0_REG (0x0060)



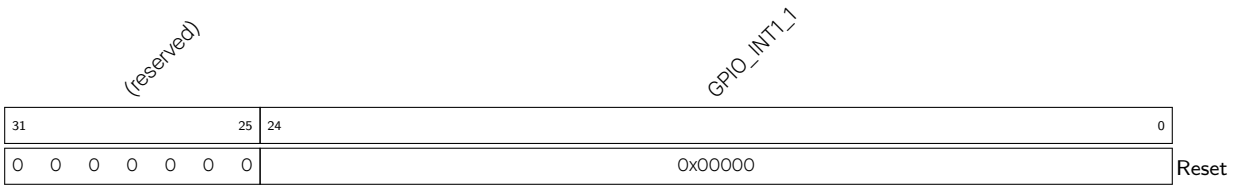
GPIO_INT1_0 Represents the CPU interrupt 0 status of GPIO32 ~ GPIO54. Each bit represents:

0: Represents CPU interrupt is not enabled, or the GPIO does not generate the interrupt configured by GPIO_PIN*n*_INT_TYPE.

1: Represents the GPIO generates an interrupt configured by GPIO_PIN*n*_INT_TYPE after the CPU interrupt is enabled.

Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54. This interrupt status is corresponding to the bit in GPIO_STATUS1_REG when assert (high) enable signal (bit13 of GPIO_PIN*n*_REG). (RO)

Register 10.24. GPIO_INTR_1_REG (0x0064)



GPIO_INT_1 Represents the CPU interrupt 1 status of GPIO0 ~ GPIO31. Each bit represents:

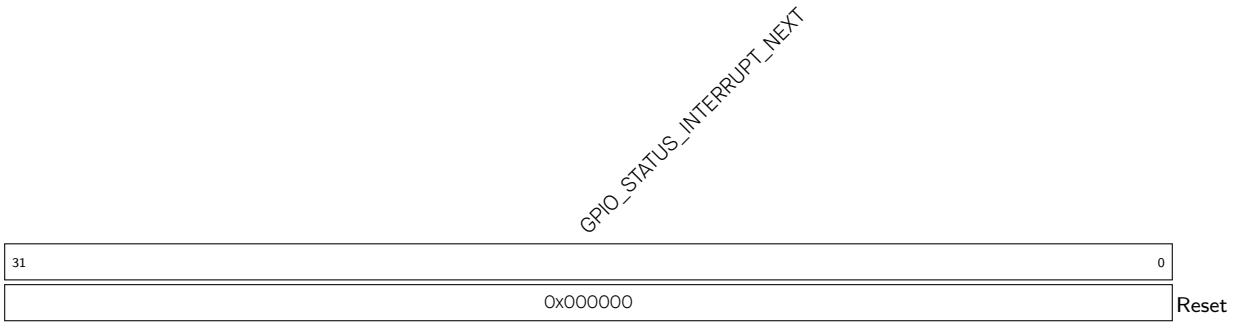
0: Represents CPU interrupt is not enabled, or the GPIO does not generate the interrupt configured by GPIO_PIN*n*_INT_TYPE.

1: Represents the GPIO generates an interrupt configured by GPIO_PIN*n*_INT_TYPE after the CPU interrupt is enabled.

Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31. This interrupt status is corresponding to the bit in GPIO_STATUS_REG when assert (high) enable signal (bit14 of GPIO_PIN*n*_REG). (RO)

Register 10.25. GPIO_INTR1_1_REG (0x0068)

GPIO_INT1_1 Represents the CPU interrupt 1 status of GPIO32 ~ GPIO54. Each bit represents:



0: Represents CPU interrupt is not enabled, or the GPIO does not generate the interrupt configured by GPIO_PIN*n*_INT_TYPE.

1: Represents the GPIO generates an interrupt configured by GPIO_PIN*n*_INT_TYPE after the CPU interrupt is enabled.

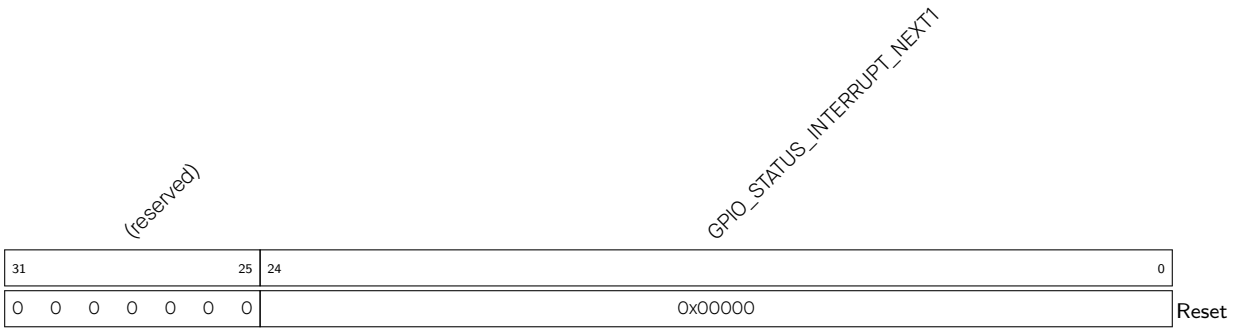
Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54. This interrupt status is corresponding to the bit in GPIO_STATUS1_REG when assert (high) enable signal (bit14 of GPIO_PIN*n*_REG).

(RO)

Register 10.26. GPIO_STATUS_NEXT_REG (0x006C)

GPIO_STATUS_INTERRUPT_NEXT Represents the interrupt source signal of GPIO0 ~ GPIO31.

Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31. Each bit represents:



0: The GPIO does not generate the interrupt configured by GPIO_PIN*n*_INT_TYPE.

1: The GPIO generates an interrupt configured by GPIO_PIN*n*_INT_TYPE.

The interrupt could be rising edge interrupt, falling edge interrupt, level sensitive interrupt and any edge interrupt.

(RO)

Register 10.27. GPIO_STATUS_NEXT1_REG (0x0070)

GPIO_STATUS_INTERRUPT_NEXT1 Represents the interrupt source signal of GPIO32 ~ GPIO54. Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54. Each bit represents:

0: The GPIO does not generate the interrupt configured by GPIO_PIN*n*_INT_TYPE.

1: The GPIO generates an interrupt configured by GPIO_PIN*n*_INT_TYPE.

The interrupt could be rising edge interrupt, falling edge interrupt, level sensitive interrupt and any edge interrupt.

(RO)

Register 10.28. GPIO_PIN*n*_REG (*n*: 0 - 54) (0x0074+0x4**n*)

GPIO_PIN*n*_SYNC2_BYPASS Configures whether or not to synchronize GPIO input data on either edge of HP IO MUX operating clock for the second-level synchronization.

0: Not synchronize

1: Synchronize on falling edge

2: Synchronize on rising edge

3: Synchronize on rising edge

(R/W)

GPIO_PIN*n*_PAD_DRIVER Configures to select pin drive mode.

0: Normal output

1: Open drain output

(R/W)

GPIO_PIN*n*_SYNC1_BYPASS Configures whether or not to synchronize GPIO input data on either edge of HP IO MUX operating clock for the first-level synchronization.

0: Not synchronize

1: Synchronize on falling edge

2: Synchronize on rising edge

3: Synchronize on rising edge

(R/W)

GPIO_PIN*n*_INT_TYPE Configures GPIO interrupt type.

0: GPIO interrupt disabled

1: Rising edge trigger

2: Falling edge trigger

3: Any edge trigger

4: Low level trigger

5: High level trigger

(R/W)

GPIO_PIN*n*_WAKEUP_ENABLE Configures whether or not to enable GPIO wake-up function.

0: Disable

1: Enable

This function only wakes up the CPU from Light-sleep.

(R/W)

Continued on the next page...

Register 10.28. GPIO_PIN*n*_REG (*n*: 0 - 54) (0x0074+0x4**n*)

Continued from the previous page...

GPIO_PIN*n*_INT_ENA Configures whether or not to enable CPU interrupt or CPU non-maskable interrupt.

bit13: Configures whether or not to enable CPU interrupt 0:

0: Disable

1: Enable

bit14: Configures whether or not to enable CPU interrupt 1:

0: Disable

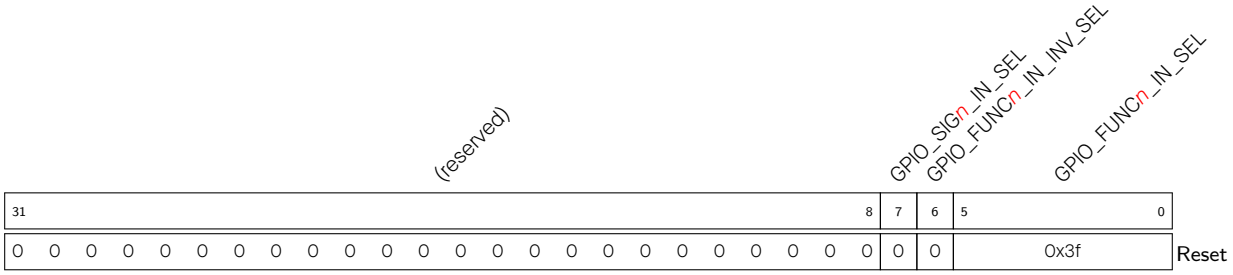
1: Enable

bit15: invalid

bit16: Configures whether or not to enable CPU interrupt 2:

0: Disable

1: Enable



bit17: Configures whether or not to enable CPU interrupt 3:

0: Disable

1: Enable

(R/W)

Register 10.29. GPIO_FUNC*n*_IN_SEL_CFG_REG (*n*: 0 - 255) (0x015C+4n*)**

GPIO_FUNC*n*_IN_SEL Configures to select a pin from the 55 GPIO pins to connect the input signal *n*.

0: Select GPIO0

1: Select GPIO1

.....

53: Select GPIO53

54: Select GPIO54

55 ~ 61: invalid

Or

62: A constantly low input

63: A constantly high input

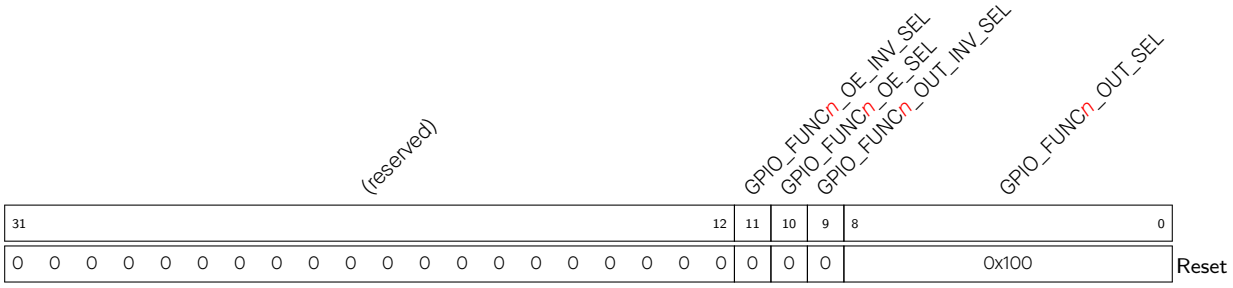
(R/W)

GPIO_FUNC*n*_IN_INV_SEL Configures whether or not to invert the input value.

0: Not invert

1: Invert

(R/W)



GPIO_SIG*n*_IN_SEL Configures whether or not to route signals via HP GPIO matrix.

0: Bypass HP GPIO matrix, i.e., connect signals directly to peripheral configured in HP IO MUX.

1: Route signals via HP GPIO matrix.

(R/W)

Register 10.30. GPIO_FUNC*n*_OUT_SEL_CFG_REG (*n*: 0 - 54) (0x0558+0x4**n*)

GPIO_FUNC*n*_OUT_SEL Configures to select a signal *Y* (0 <= *Y* < 256) from 256 peripheral signals to be output to GPIO*n*.

0: Select signal 0

1: Select signal 1

.....

254: Select signal 254

255: Select signal 255

Or

256: Bit*n* of GPIO_OUT_REG and GPIO_OUT1_REG are selected as the output value, GPIO_ENABLE_REG and GPIO_ENABLE1_REG are selected as the output enable.

257 ~ 511: invalid

For the detailed signal list, see Table 10.12-1.

(R/W/SC)

GPIO_FUNC*n*_OUT_INV_SEL Configures whether or not to invert the output value.

0: Not invert

1: Invert

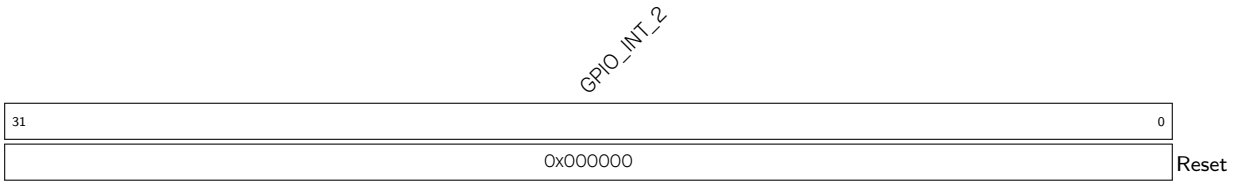
(R/W/SC)

GPIO_FUNC*n*_OE_SEL Configures to select the source of output enable signal.

0: Use output enable signal from peripheral.

1: Force the output enable signal to be sourced from bit*n* (*n*: 0 ~ 31) of GPIO_ENABLE_REG and bit*n*-32 (*n*: 32 ~ 54) of GPIO_ENABLE1_REG.

(R/W)



GPIO_FUNC*n*_OE_INV_SEL Configures whether or not to invert the output enable signal.

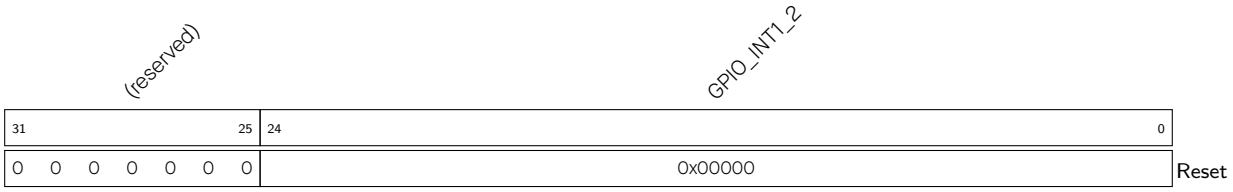
0: Not invert

1: Invert

(R/W)

Register 10.31. GPIO_INTR_2_REG (0x063C)

GPIO_INT_2 Represents the CPU interrupt 2 status of GPIO0 ~ GPIO31. Each bit represents:



0: Represents CPU interrupt is not enabled, or the GPIO does not generate the interrupt configured by GPIO_PIN*n*_INT_TYPE.

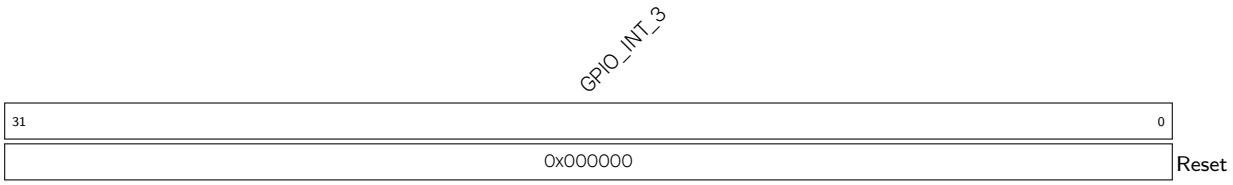
1: Represents the GPIO generates an interrupt configured by GPIO_PIN*n*_INT_TYPE after the CPU interrupt is enabled.

Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31. This interrupt status is corresponding to the bit in GPIO_STATUS_REG when assert (high) enable signal (bit16 of GPIO_PIN*n*_REG).

(RO)

Register 10.32. GPIO_INTR1_2_REG (0x0640)

GPIO_INT1_2 Represents the CPU interrupt 2 status of GPIO32 ~ GPIO54. Each bit represents:



0: Represents CPU interrupt is not enabled, or the GPIO does not generate the interrupt configured by GPIO_PIN*n*_INT_TYPE.

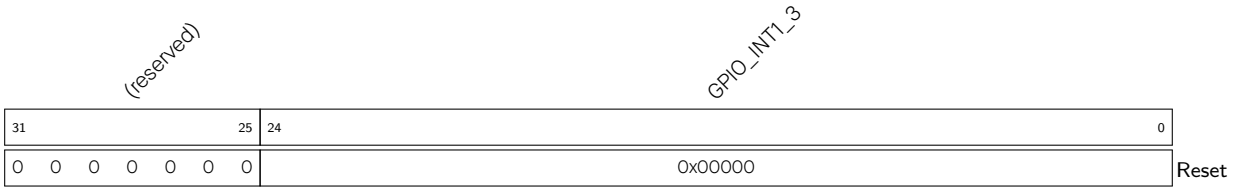
1: Represents the GPIO generates an interrupt configured by GPIO_PIN*n*_INT_TYPE after the CPU interrupt is enabled.

Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54. This interrupt status is corresponding to the bit in GPIO_STATUS1_REG when assert (high) enable signal (bit16 of GPIO_PIN*n*_REG).

(RO)

Register 10.33. GPIO_INTR_3_REG (0x0644)

GPIO_INT_3 Represents the CPU interrupt 3 status of GPIO0 ~ GPIO31. Each bit represents:



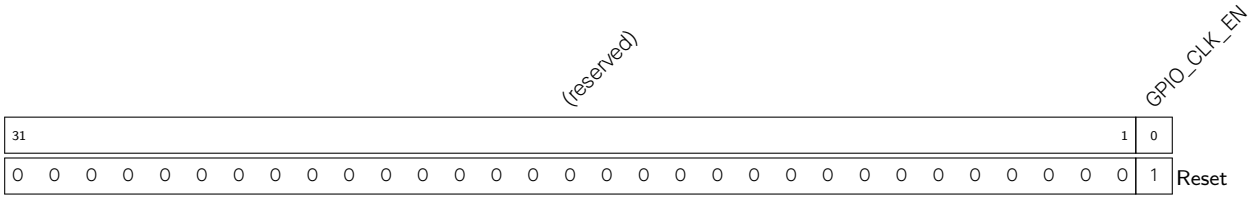
0: Represents CPU interrupt is not enabled, or the GPIO does not generate the interrupt configured by GPIO_PIN*n*_INT_TYPE.

1: Represents the GPIO generates an interrupt configured by GPIO_PIN*n*_INT_TYPE after the CPU interrupt is enabled.

Bit0 ~ bit31 are corresponding to GPIO0 ~ GPIO31. This interrupt status is corresponding to the bit in GPIO_STATUS_REG when assert (high) enable signal (bit17 of GPIO_PIN*n*_REG).

(RO)

Register 10.34. GPIO_INTR1_3_REG (0x0648)



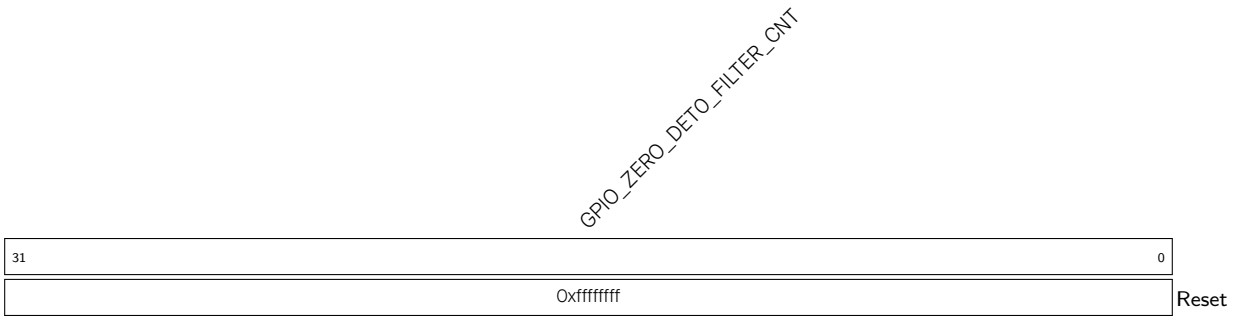
GPIO_INT1_3 Represents the CPU interrupt 3 status of GPIO32 ~ GPIO54. Each bit represents:

0: Represents CPU interrupt is not enabled, or the GPIO does not generate the interrupt configured by GPIO_PIN*n*_INT_TYPE.

1: Represents the GPIO generates an interrupt configured by GPIO_PIN*n*_INT_TYPE after the CPU interrupt is enabled.

Bit0 ~ bit22 are corresponding to GPIO32 ~ GPIO54. This interrupt status is corresponding to the bit in GPIO_STATUS1_REG when assert (high) enable signal (bit17 of GPIO_PIN*n*_REG).

Register 10.35. GPIO_CLOCK_GATE_REG (0x064C)



GPIO_CLK_EN Configures whether or not to enable clock gate.

0: Not enable

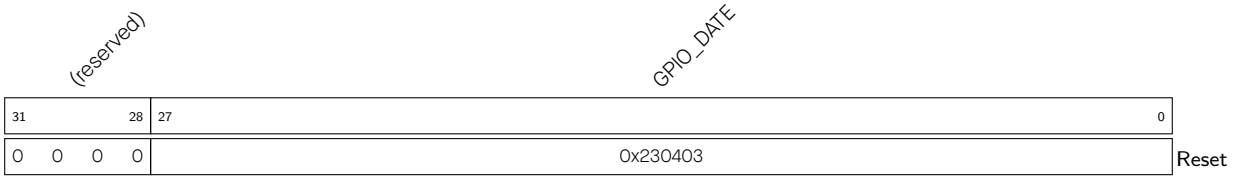
1: Enable, the clock is free running.

(R/W)

Register 10.36. GPIO_ZERO_DET0_FILTER_CNT_REG (0x0710)

GPIO_ZERO_DET0_FILTER_CNT Configures to change GPIO analog comparator0 zero detect filter's threshold.

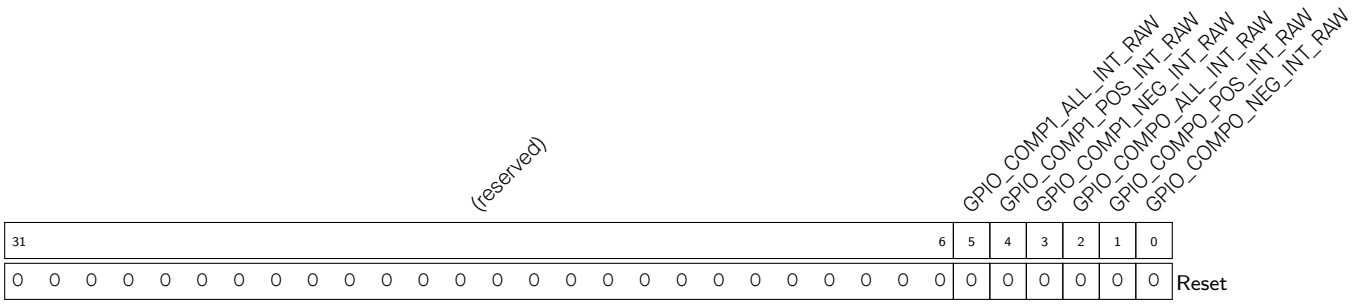
Interrupts in GPIO_ZERO_DET0_FILTER_CNT iomux_core_clk cycles after one interrupt will be fillterred, and not be seen by CPU. (R/W)



Register 10.37. GPIO_ZERO_DET1_FILTER_CNT_REG (0x0714)

GPIO_ZERO_DET1_FILTER_CNT Configures to change GPIO analog comparator1 zero detect filter's threshold.

Interrupts in GPIO_ZERO_DET0_FILTER_CNT iomux_core_clk cycles after one interrupt will be fillterred, and not be seen by CPU. (R/W)



Register 10.38. GPIO_DATE_REG (0x07FC)

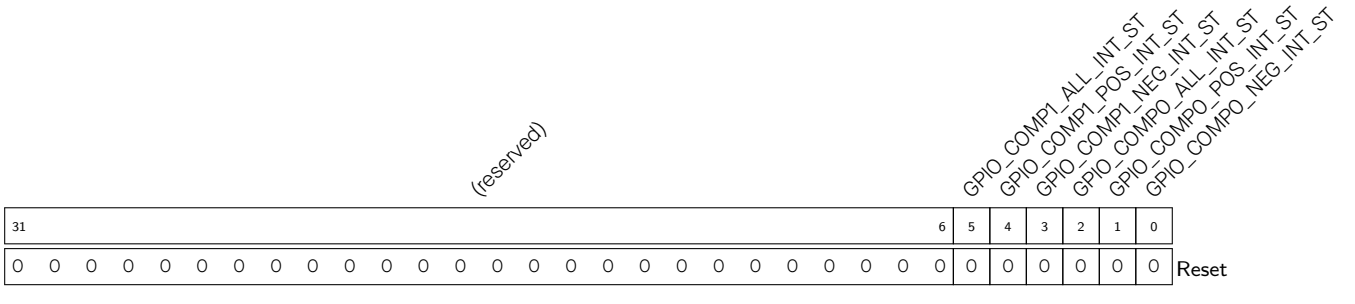
GPIO_DATE Version control register.

(R/W)

Register 10.39. GPIO_INT_RAW_REG (0x0700)

GPIO_COMPO_NEG_INT_RAW The raw interrupt status of GPIO_COMPO_NEG_INT. (R/WTC/SS)

GPIO_COMPO_POS_INT_RAW The raw interrupt status of GPIO_COMPO_POS_INT. (R/WTC/SS)



GPIO_COMPO_ALL_INT_RAW The raw interrupt status of GPIO_COMPO_ALL_INT. (R/WTC/SS)

GPIO_COMP1_NEG_INT_RAW The raw interrupt status of GPIO_COMP1_NEG_INT. (R/WTC/SS)

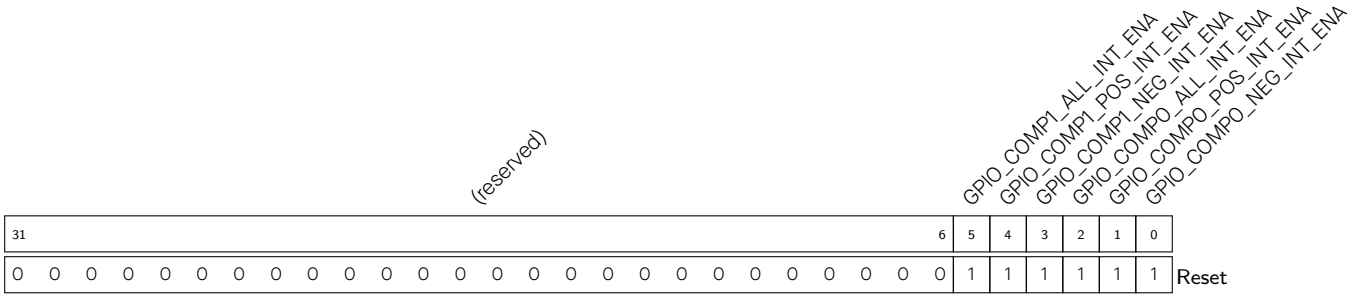
GPIO_COMP1_POS_INT_RAW The raw interrupt status of GPIO_COMP1_POS_INT. (R/WTC/SS)

GPIO_COMP1_ALL_INT_RAW The raw interrupt status of GPIO_COMP1_ALL_INT. (R/WTC/SS)

Register 10.40. GPIO_INT_ST_REG (0x0704)

GPIO_COMPO_NEG_INT_ST The masked interrupt status of GPIO_COMPO_NEG_INT. (RO)

GPIO_COMPO_POS_INT_ST The masked interrupt status of GPIO_COMPO_POS_INT. (RO)



GPIO_COMPO_ALL_INT_ST The masked interrupt status of GPIO_COMPO_ALL_INT. (RO)

GPIO_COMP1_NEG_INT_ST The masked interrupt status of GPIO_COMP1_NEG_INT. (RO)

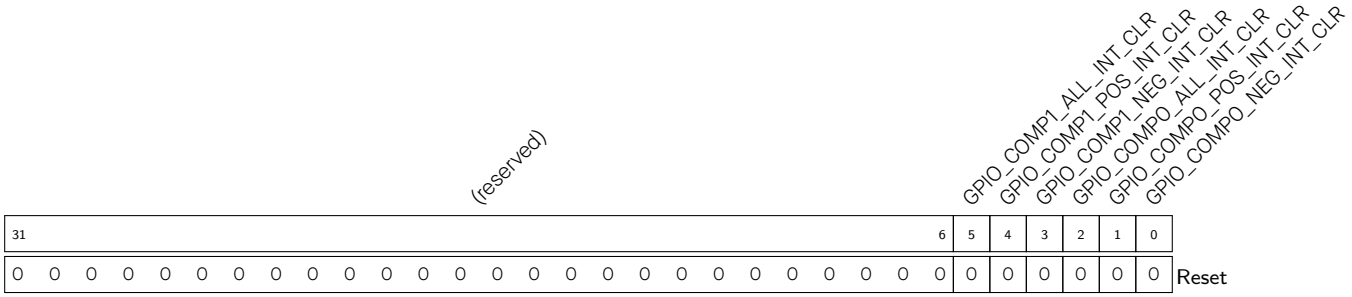
GPIO_COMP1_POS_INT_ST The masked interrupt status of GPIO_COMP1_POS_INT. (RO)

GPIO_COMP1_ALL_INT_ST The masked interrupt status of GPIO_COMP1_ALL_INT. (RO)

Register 10.41. GPIO_INT_ENA_REG (0x0708)

GPIO_COMP0_NEG_INT_ENA Write 1 to enable GPIO_COMP0_NEG_INT. (R/W)

GPIO_COMP0_POS_INT_ENA Write 1 to enable GPIO_COMP0_POS_INT. (R/W)



GPIO_COMP0_ALL_INT_ENA Write 1 to enable GPIO_COMP0_ALL_INT. (R/W)

GPIO_COMP1_NEG_INT_ENA Write 1 to enable GPIO_COMP1_NEG_INT. (R/W)

GPIO_COMP1_POS_INT_ENA Write 1 to enable GPIO_COMP1_POS_INT. (R/W)

GPIO_COMP1_ALL_INT_ENA Write 1 to enable GPIO_COMP1_ALL_INT. (R/W)

Register 10.42. GPIO_INT_CLR_REG (0x070C)

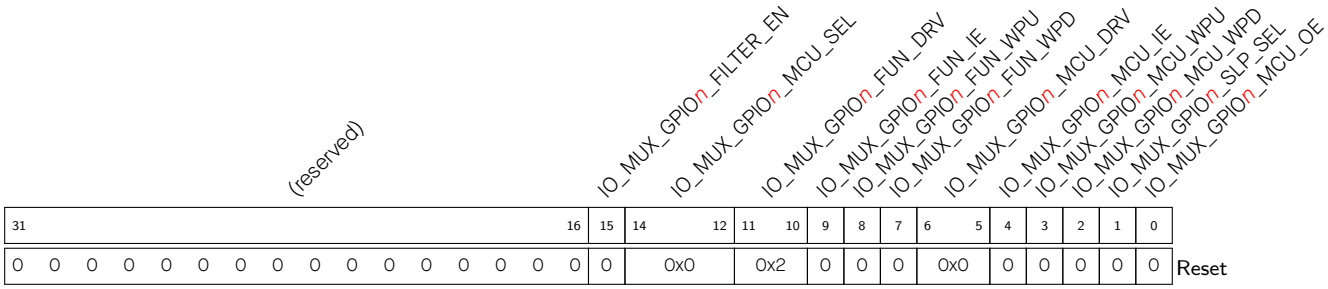
GPIO_COMP0_NEG_INT_CLR Write 1 to clear GPIO_COMP0_NEG_INT. (WT)

GPIO_COMP0_POS_INT_CLR Write 1 to clear GPIO_COMP0_POS_INT. (WT)

GPIO_COMP0_ALL_INT_CLR Write 1 to clear GPIO_COMP0_ALL_INT. (WT)

GPIO_COMP1_NEG_INT_CLR Write 1 to clear GPIO_COMP1_NEG_INT. (WT)

GPIO_COMP1_POS_INT_CLR Write 1 to clear GPIO_COMP1_POS_INT. (WT)



GPIO_COMP1_ALL_INT_CLR Write 1 to clear GPIO_COMP1_ALL_INT. (WT)

10.20.2 HP IO MUX Registers

The addresses in this section are relative to the HP IO MUX base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

For how to program reserved fields, please refer to Section IX .

Register 10.43. IO_MUX_GPIO*n*_REG (*n*: 0 - 54) (0x0004+4**n*)

IO_MUX_GPIO*n*_MCU_OE Configures whether or not to enable the output of GPIO*n* in sleep mode.

0: Disable

1: Enable

(R/W)

IO_MUX_GPIO*n*_SLP_SEL Configures whether or not to enter sleep mode for GPIO*n*.

0: Not enter

1: Enter

(R/W)

IO_MUX_GPIO*n*_MCU_WPD Configure whether or not to enable pull-down resistor of GPIO*n* during sleep mode.

0: Disable

1: Enable

(R/W)

IO_MUX_GPIO*n*_MCU_WPU Configures whether or not to enable pull-up resistor of GPIO*n* during sleep mode.

0: Disable

1: Enable

(R/W)

IO_MUX_GPIO*n*_MCU_IE Configures whether or not to enable the input of GPIO*n* during sleep mode.

0: Disable

1: Enable

(R/W)

IO_MUX_GPIO*n*_MCU_DRV Configures the drive strength of GPIO*n* during sleep mode.

0: ~5 mA

1: ~10 mA

2: ~20 mA

3: ~40 mA

(R/W)

Continued on the next page...

Register 10.43. IO_MUX_GPIO*n*_REG (*n*: 0 - 54) (0x0004+4**n*)

Continued from the previous page...

IO_MUX_GPIO*n*_FUN_WPD Configures whether or not to enable pull-down resistor of GPIO*n*.

0: Disable

1: Enable

(R/W)

IO_MUX_GPIO*n*_FUN_WPU Configures whether or not enable pull-up resistor of GPIO*n*.

0: Disable

1: Enable

(R/W)

IO_MUX_GPIO*n*_FUN_IE Configures whether or not to enable input of GPIO*n*.

0: Disable

1: Enable

(R/W)

IO_MUX_GPIO*n*_FUN_DRV Configures the drive strength of GPIO*n*.

0: ~5 mA

1: ~10 mA

2: ~20 mA

3: ~40 mA

(R/W)

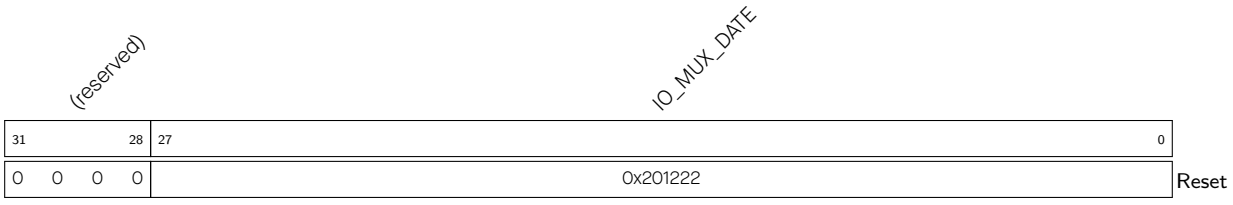
IO_MUX_GPIO*n*_MCU_SEL Configures to select IO MUX function for this pin.

0: Select Function 0

1: Select Function 1

.....

(R/W)



IO_MUX_GPIO*n*_FILTER_EN Configures whether or not to enable filter for pin input signals.

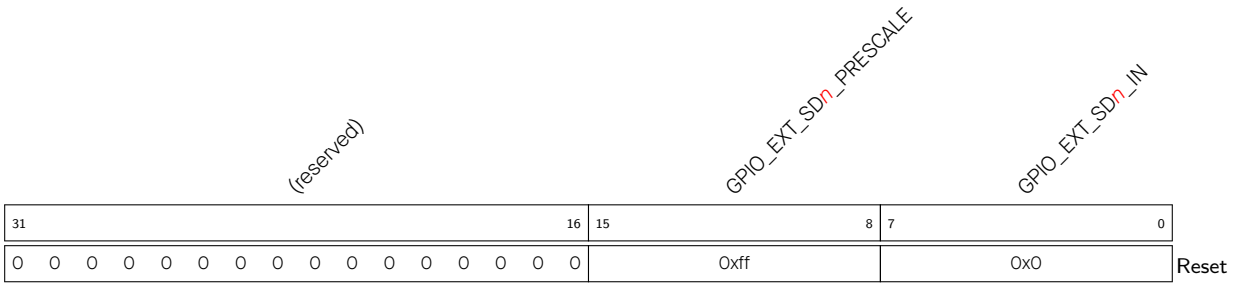
0: Disable

1: Enable

(R/W)

Register 10.44. IO_MUX_DATE_REG (0x0104)

IO_MUX_DATE Version control register.



(R/W)

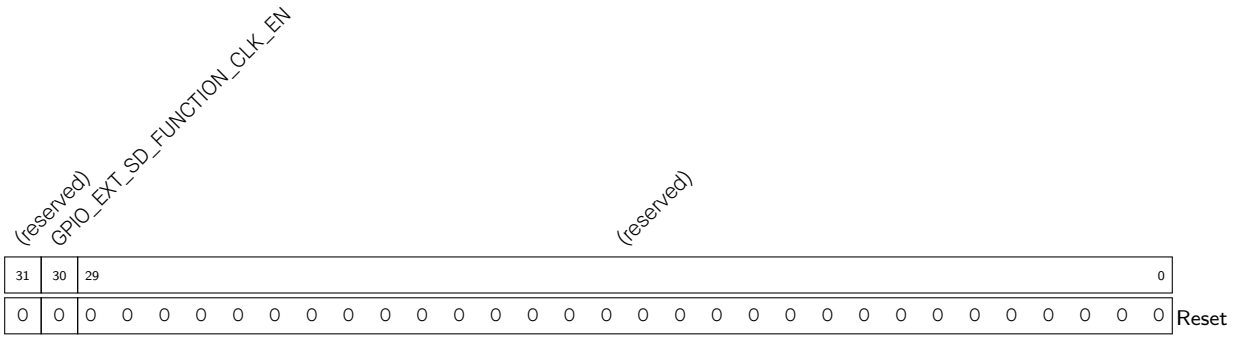
10.20.3 GPIO EXT Registers

The addresses in this section are relative to (HP GPIO matrix base address + 0x0F00). GPIO base address is provided in Table 9.3-2 in Chapter 9 *System and Memory*.

For how to program reserved fields, please refer to Section IX .

Register 10.45. GPIO_EXT_SIGMADELTA*n*_REG (*n*: 0 - 7) (0x0000+0x4n*)**

GPIO_EXT_SD*n*_IN (*n*: 0 - 7) Configures the duty cycle of sigma delta modulation output. (R/W)



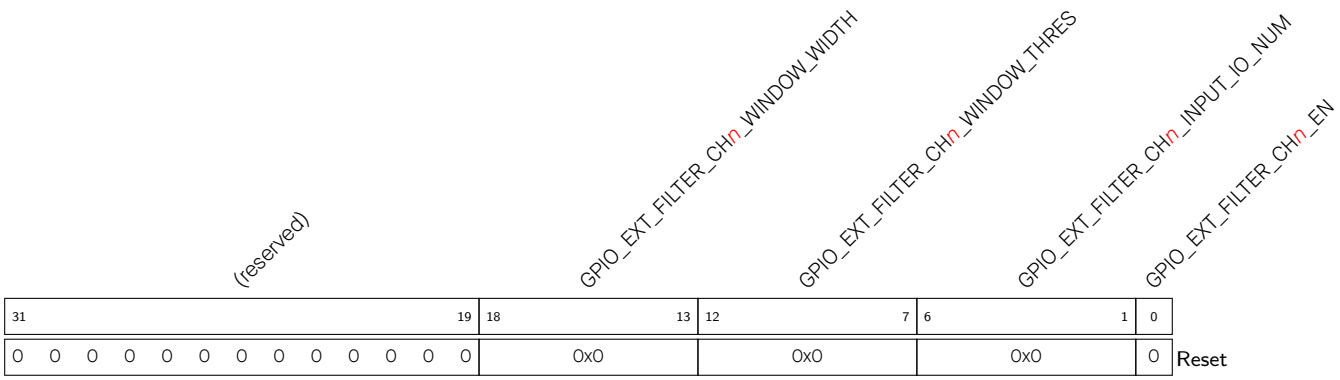
GPIO_EXT_SD*n*_PRESCALE (*n*: 0 - 7) Configures the divider value to divide HP IO MUX operating clock. Can be 0 ~ 255.

0: Do not divide

1 ~ 255: The clock is divided by 2 ~ 256

(R/W)

Register 10.46. GPIO_EXT_SIGMADELTA_MISC_REG (0x0024)



GPIO_EXT_SD_FUNCTION_CLK_EN Configures whether or not to enable the clock for sigma delta modulation.

0: Not enable

1: Enable

(R/W)

Register 10.47. GPIO_EXT_GLITCH_FILTER_CH*n*_REG (*n*: 0 - 7) (0x0030+0x4n*)**

GPIO_EXT_FILTER_CH*n*_EN Configures whether or not to enable channel *n* of Glitch Filter.

0: Not enable

1: Enable

(R/W)

GPIO_EXT_FILTER_CH*n*_INPUT_IO_NUM Configures to select the input GPIO for Glitch Filter.

0: Select GPIO0

1: Select GPIO1

.....

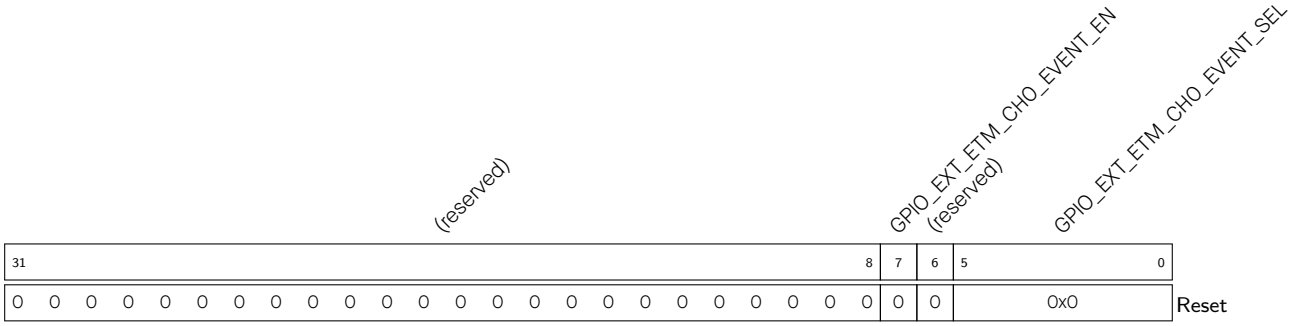
53: Select GPIO53

54: Select GPIO54

(R/W)

GPIO_EXT_FILTER_CH*n*_WINDOW_THRES Configures the window threshold for Glitch Filter. The window threshold should be less than or equal to GPIO_EXT_FILTER_CH*n*_WINDOW_WIDTH.

Measurement unit: HP IO MUX operating clock cycle



(R/W)

GPIO_EXT_FILTER_CH*n*_WINDOW_WIDTH Configures the window width for Glitch Filter. The effective value of window width is 0 ~ 62. 63 is a reserved value and can not be used.

Measurement unit: HP IO MUX operating clock cycle

(R/W)

Register 10.48. GPIO_EXT_ETM_EVENT_CH*n*_CFG_REG (*n*: 0 - 7) (0x0060+0x4n*)**

GPIO_EXT_ETM_CH*n*_EVENT_SEL Configures to select GPIO for ETM event channel.

0: Select GPIO0

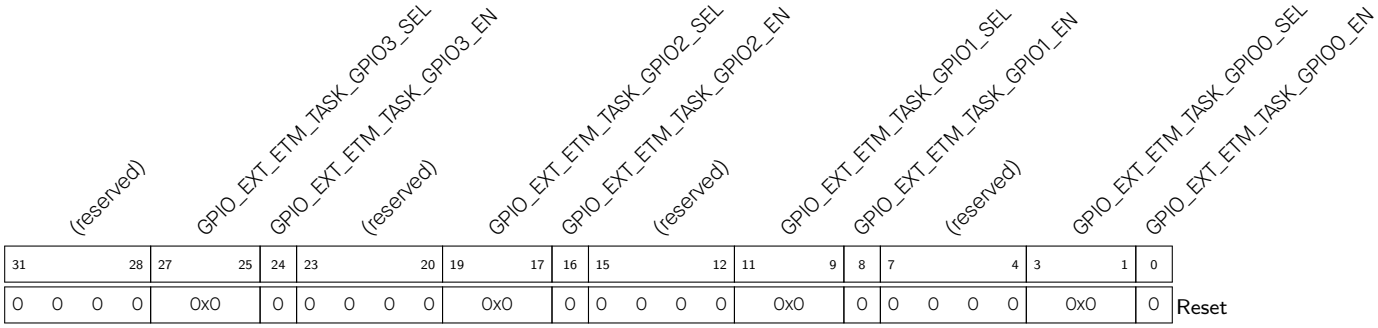
1: Select GPIO1

.....

53: Select GPIO53

54: Select GPIO54

(R/W)



GPIO_EXT_ETM_CH*n*_EVENT_EN Configures whether or not to enable ETM event send.

0: Not enable

1: Enable

(R/W)

Register 10.49. GPIO_EXT_ETM_TASK_P0_CFG_REG (0x00A0)

GPIO_EXT_ETM_TASK_GPIO*n*_EN (*n*: 0 - 3) Configures whether or not to enable GPIO*n* to response ETM task.

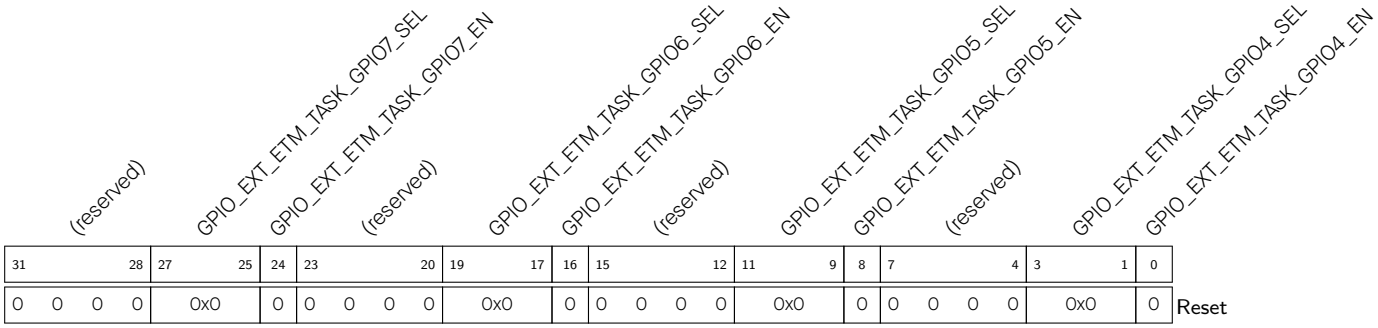
0: Not enable

1: Enable

(R/W)

GPIO_EXT_ETM_TASK_GPIO*n*_SEL (*n*: 0 - 3) Configures to select an ETM task channel for GPIO*n*.

0: Select channel 0



1: Select channel 1

.....

7: Select channel 7

(R/W)

Register 10.50. GPIO_EXT_ETM_TASK_P1_CFG_REG (0x00A4)

GPIO_EXT_ETM_TASK_GPIO*n*_EN (*n*: 4 - 7) Configures whether or not to enable GPIO*n* to response ETM task.

0: Not enable

1: Enable

(R/W)

GPIO_EXT_ETM_TASK_GPIO*n*_SEL (*n*: 4 - 7) Configures to select an ETM task channel for GPIO*n*.

0: Select channel 0

1: Select channel 1

.....

7: Select channel 7

(R/W)

Register 10.51. GPIO_EXT_ETM_TASK_P2_CFG_REG (0x00A8)

GPIO_EXT_ETM_TASK_GPIO*n*_EN (*n*: 8 - 11) Configures whether or not to enable GPIO*n* to response ETM task.

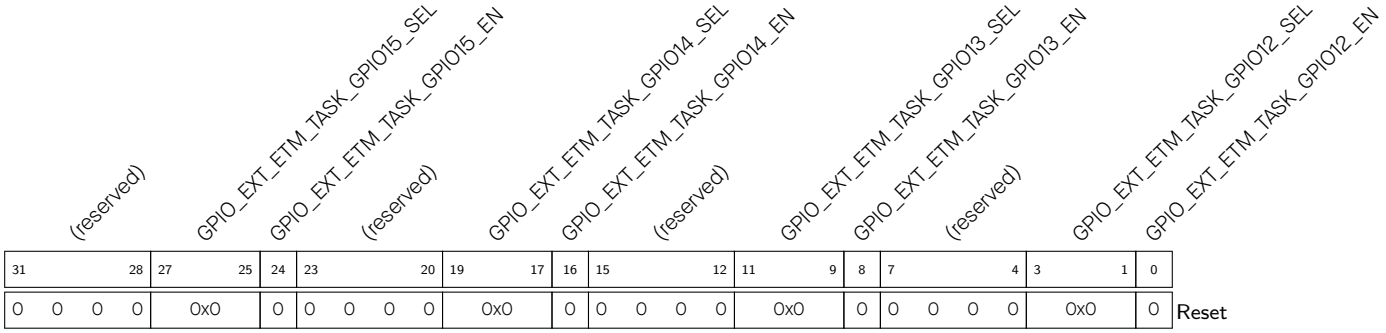
0: Not enable

1: Enable

(R/W)

GPIO_EXT_ETM_TASK_GPIO*n*_SEL (*n*: 8 - 11) Configures to select an ETM task channel for GPIO*n*.

0: Select channel 0



1: Select channel 1

.....

7: Select channel 7

(R/W)

Register 10.52. GPIO_EXT_ETM_TASK_P3_CFG_REG (0x00AC)

GPIO_EXT_ETM_TASK_GPIO*n*_EN (*n*: 12 - 15) Configures whether or not to enable GPIO*n* to response ETM task.

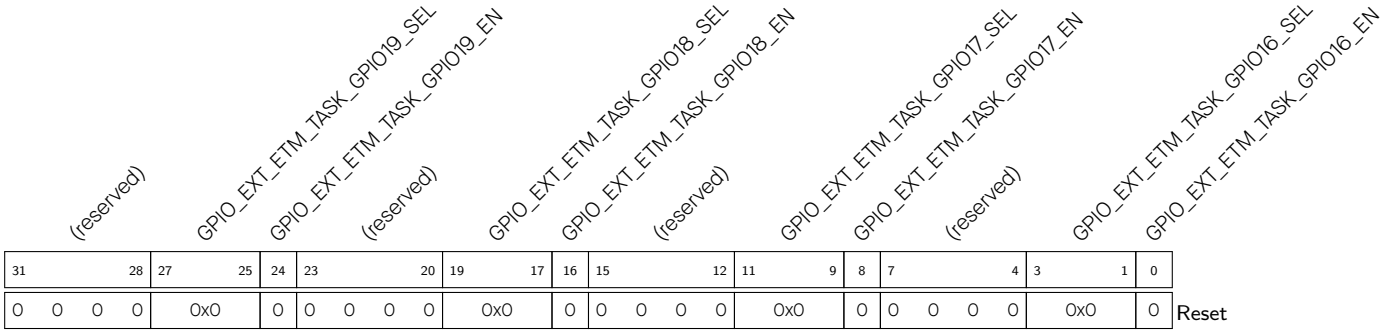
0: Not enable

1: Enable

(R/W)

GPIO_EXT_ETM_TASK_GPIO*n*_SEL (*n*: 12 - 15) Configures to select an ETM task channel for GPIO*n*.

0: Select channel 0



1: Select channel 1

.....

7: Select channel 7

(R/W)

Register 10.53. GPIO_EXT_ETM_TASK_P4_CFG_REG (0x00B0)

GPIO_EXT_ETM_TASK_GPIO*n*_EN (*n*: 16 - 19) Configures whether or not to enable GPIO*n* to response ETM task.

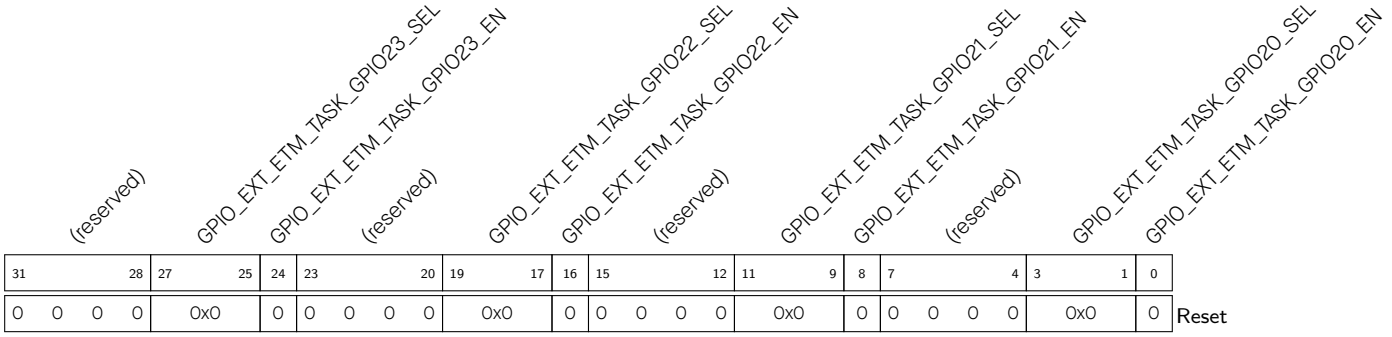
0: Not enable

1: Enable

(R/W)

GPIO_EXT_ETM_TASK_GPIO*n*_SEL (*n*: 16 - 19) Configures to select an ETM task channel for GPIO*n*.

0: Select channel 0



1: Select channel 1

.....

7: Select channel 7

(R/W)

Register 10.54. GPIO_EXT_ETM_TASK_P5_CFG_REG (0x00B4)

GPIO_EXT_ETM_TASK_GPIO*n*_EN (*n*: 20 - 23) Configures whether or not to enable GPIO*n* to response ETM task.

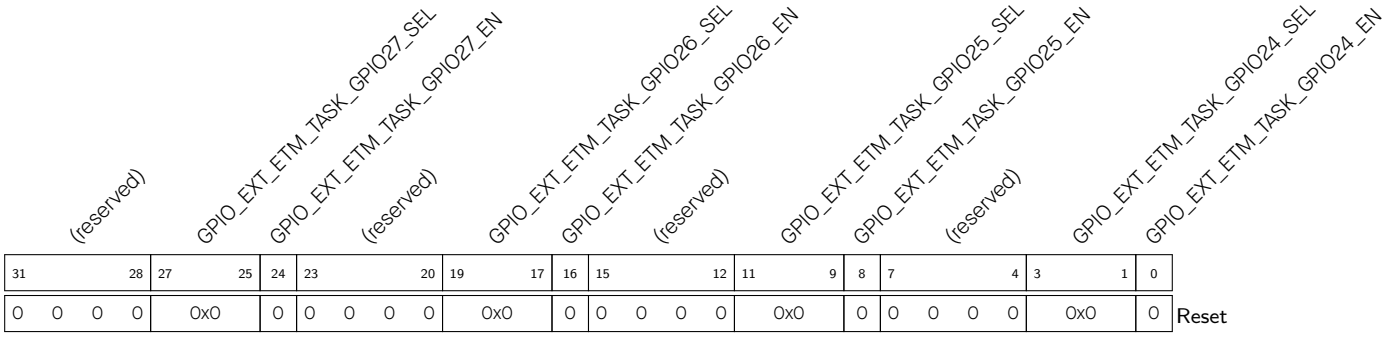
0: Not enable

1: Enable

(R/W)

GPIO_EXT_ETM_TASK_GPIO*n*_SEL (*n*: 20 - 23) Configures to select an ETM task channel for GPIO*n*.

0: Select channel 0



1: Select channel 1

.....

7: Select channel 7

(R/W)

Register 10.55. GPIO_EXT_ETM_TASK_P6_CFG_REG (0x00B8)

GPIO_EXT_ETM_TASK_GPIO*n*_EN (*n*: 24 - 27) Configures whether or not to enable GPIO*n* to response ETM task.

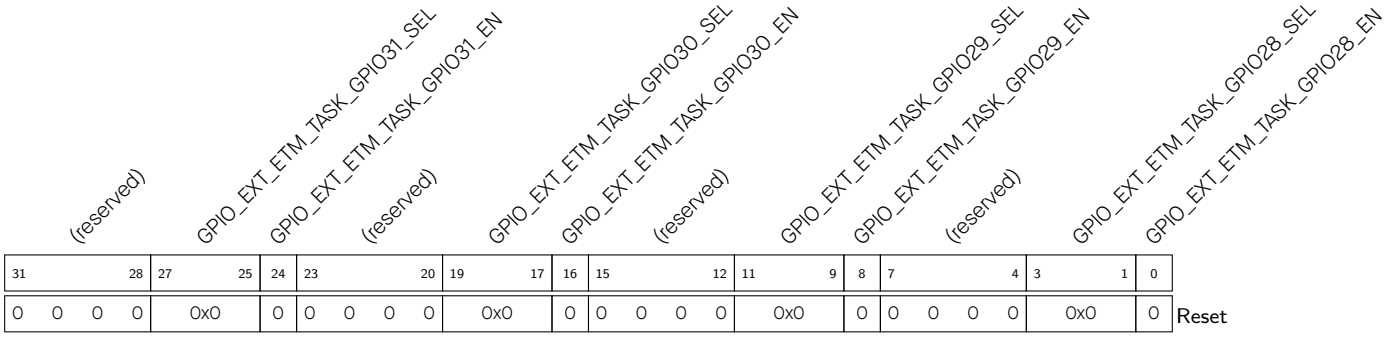
0: Not enable

1: Enable

(R/W)

GPIO_EXT_ETM_TASK_GPIO*n*_SEL (*n*: 24 - 27) Configures to select an ETM task channel for GPIO*n*.

0: Select channel 0



1: Select channel 1

.....

7: Select channel 7

(R/W)

Register 10.56. GPIO_EXT_ETM_TASK_P7_CFG_REG (0x00BC)

GPIO_EXT_ETM_TASK_GPIO*n*_EN (*n*: 28 - 31) Configures whether or not to enable GPIO*n* to response ETM task.

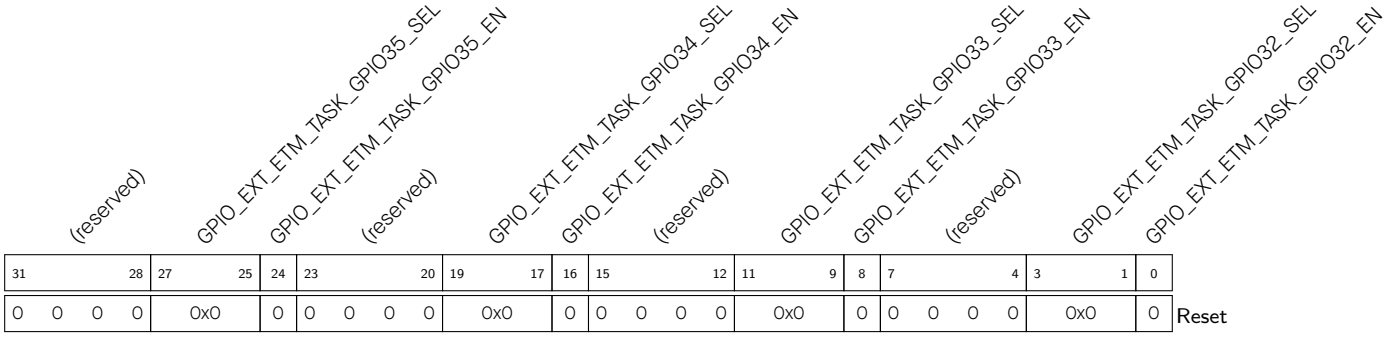
0: Not enable

1: Enable

(R/W)

GPIO_EXT_ETM_TASK_GPIO*n*_SEL (*n*: 28 - 31) Configures to select an ETM task channel for GPIO*n*.

0: Select channel 0



1: Select channel 1

.....

7: Select channel 7

(R/W)

Register 10.57. GPIO_EXT_ETM_TASK_P8_CFG_REG (0x00C0)

GPIO_EXT_ETM_TASK_GPIO*n*_EN (*n*: 32 - 35) Configures whether or not to enable GPIO*n* to response ETM task.

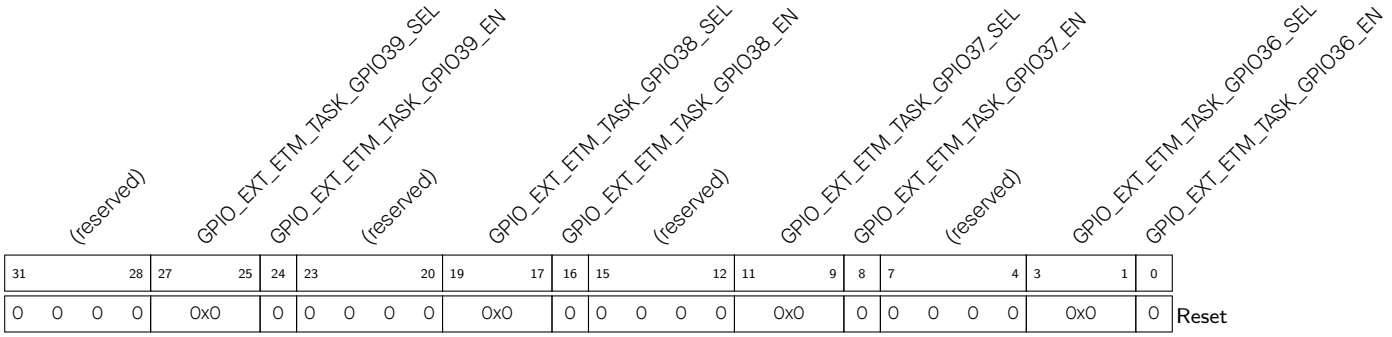
0: Not enable

1: Enable

(R/W)

GPIO_EXT_ETM_TASK_GPIO*n*_SEL (*n*: 32 - 35) Configures to select an ETM task channel for GPIO*n*.

0: Select channel 0



1: Select channel 1

.....

7: Select channel 7

(R/W)

Register 10.58. GPIO_EXT_ETM_TASK_P9_CFG_REG (0x00C4)

GPIO_EXT_ETM_TASK_GPIO*n*_EN (*n*: 36 - 39) Configures whether or not to enable GPIO*n* to response ETM task.

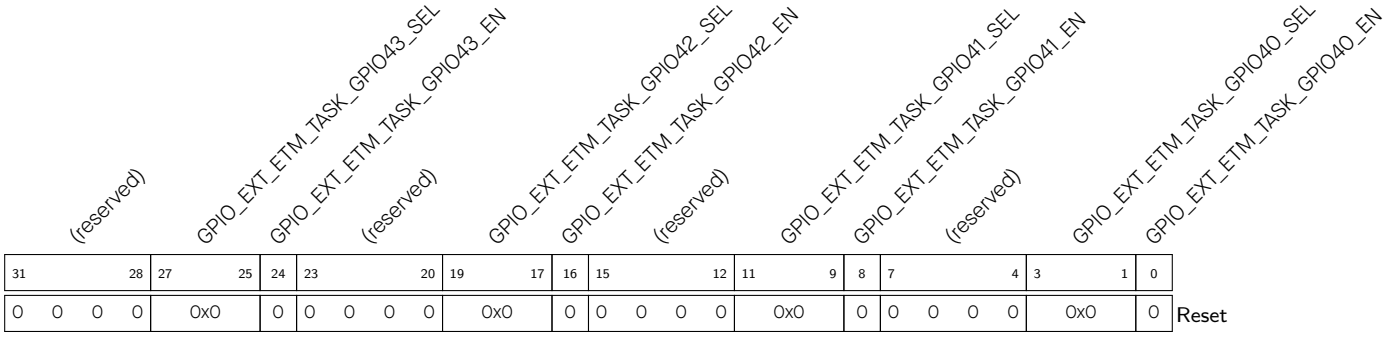
0: Not enable

1: Enable

(R/W)

GPIO_EXT_ETM_TASK_GPIO*n*_SEL (*n*: 36 - 39) Configures to select an ETM task channel for GPIO*n*.

0: Select channel 0



1: Select channel 1

.....

7: Select channel 7

(R/W)

Register 10.59. GPIO_EXT_ETM_TASK_P10_CFG_REG (0x00C8)

GPIO_EXT_ETM_TASK_GPIO*n*_EN (*n*: 40 - 43) Configures whether or not to enable GPIO*n* to response ETM task.

0: Not enable

1: Enable

(R/W)

GPIO_EXT_ETM_TASK_GPIO*n*_SEL (*n*: 40 - 43) Configures to select an ETM task channel for GPIO*n*.

0: Select channel 0

1: Select channel 1

.....

7: Select channel 7

(R/W)

Register 10.60. GPIO_EXT_ETM_TASK_P11_CFG_REG (0x00CC)

GPIO_EXT_ETM_TASK_GPIO*n*_EN (*n*: 44 - 47) Configures whether or not to enable GPIO*n* to response ETM task.

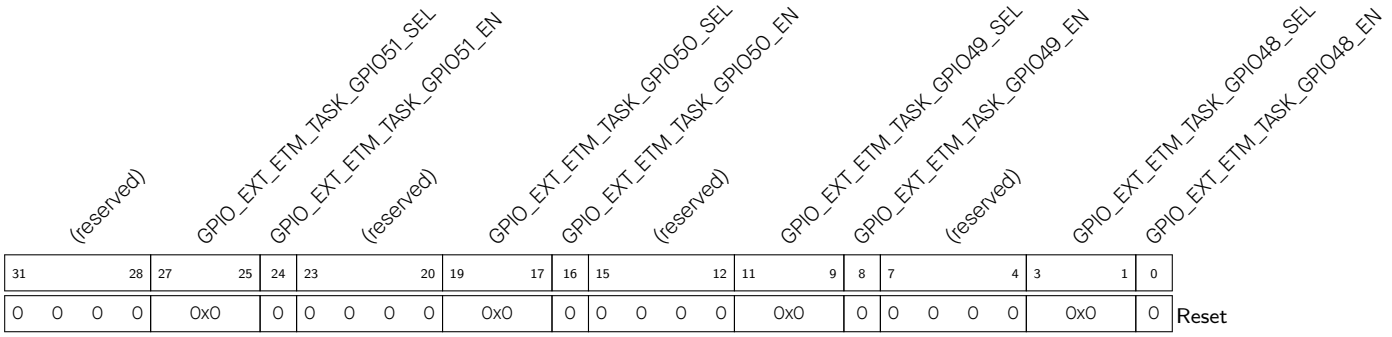
0: Not enable

1: Enable

(R/W)

GPIO_EXT_ETM_TASK_GPIO*n*_SEL (*n*: 44 - 47) Configures to select an ETM task channel for GPIO*n*.

0: Select channel 0



1: Select channel 1

.....

7: Select channel 7

(R/W)

Register 10.61. GPIO_EXT_ETM_TASK_P12_CFG_REG (0x00D0)

GPIO_EXT_ETM_TASK_GPIO*n*_EN (*n*: 48 - 51) Configures whether or not to enable GPIO*n* to response ETM task.

0: Not enable

1: Enable

(R/W)

GPIO_EXT_ETM_TASK_GPIO*n*_SEL (*n*: 48 - 51) Configures to select an ETM task channel for GPIO*n*.

0: Select channel 0

1: Select channel 1

.....

7: Select channel 7

(R/W)

Register 10.62. GPIO_EXT_ETM_TASK_P13_CFG_REG (0x00D4)

GPIO_EXT_ETM_TASK_GPIO*n*_EN (*n*: 52 - 54) Configures whether or not to enable GPIO*n* to response ETM task.

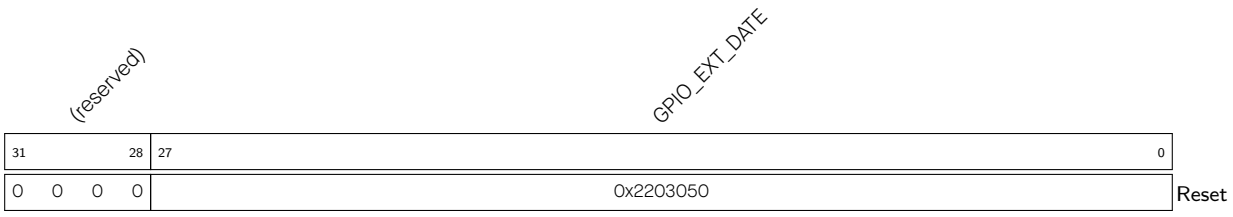
0: Not enable

1: Enable

(R/W)

GPIO_EXT_ETM_TASK_GPIO*n*_SEL (*n*: 52 - 54) Configures to select an ETM task channel for GPIO*n*.

0: Select channel 0



1: Select channel 1

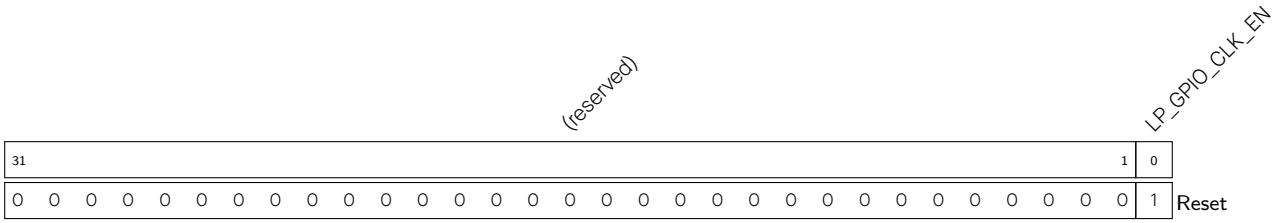
.....

7: Select channel 7

(R/W)

Register 10.63. GPIO_EXT_VERSION_REG (0x00FC)

GPIO_EXT_DATE Version control register.



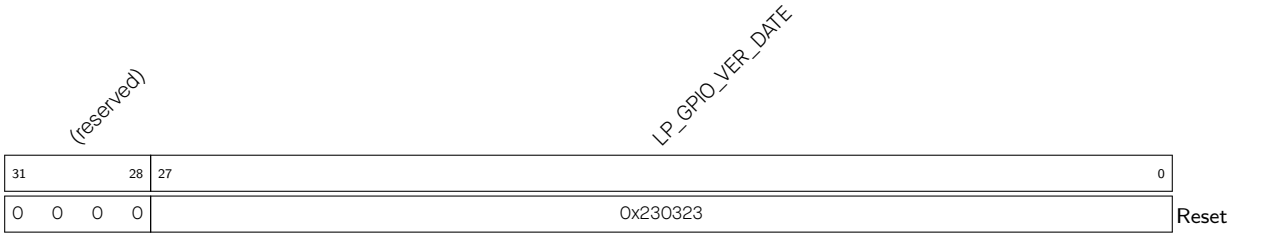
(R/W)

10.20.4 LP GPIO Matrix Registers

The addresses in this section are relative to LP GPIO matrix base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

For how to program reserved fields, please refer to Section IX .

Register 10.64. LP_GPIO_CLK_EN_REG (0x0000)

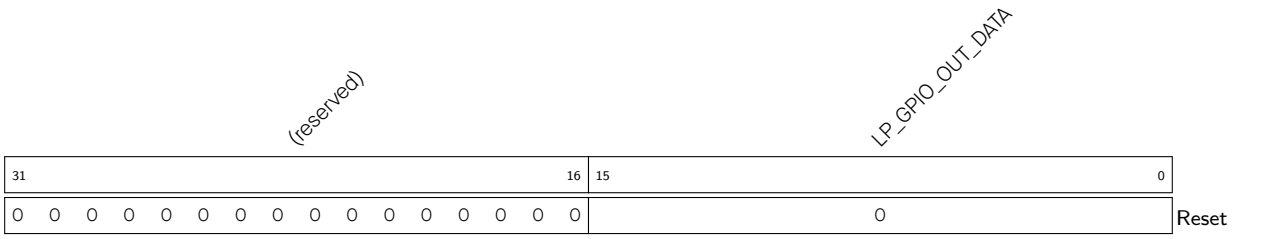


LP_GPIO_CLK_EN Configures whether or not to enable clock gate.

0: Not enable

1: Enable, the clock is free running.

(R/W)



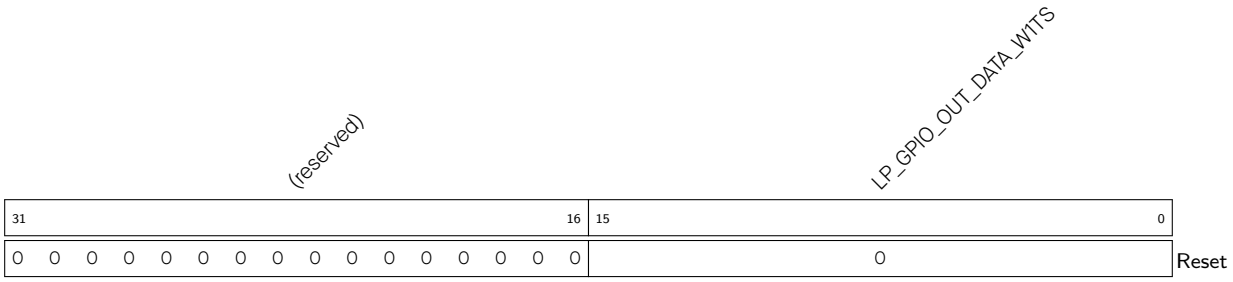
Register 10.65. LP_GPIO_VER_DATE_REG (0x0004)

LP_GPIO_VER_DATE Version control register.

(R/W)

Register 10.66. LP_GPIO_OUT_REG (0x0008)

LP_GPIO_OUT_DATA Configures the output value of GPIO0 ~ GPIO15 output in simple GPIO output mode.



0: Low level

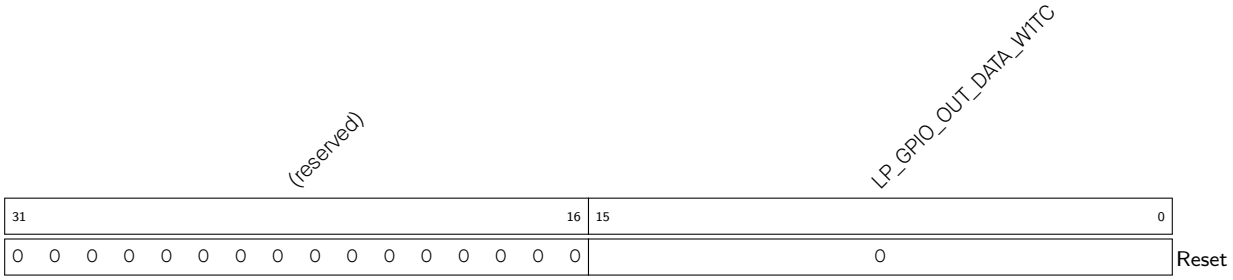
1: High level

The value of bit0 ~ bit15 correspond to the output value of GPIO0 ~ GPIO15 respectively. Bit16 ~ bit31 are invalid.

(R/W/WTC)

Register 10.67. LP_GPIO_OUT_W1TS_REG (0x000C)

LP_GPIO_OUT_DATA_W1TS Configures whether or not to set the output register LP_GPIO_OUT_REG of GPIO0 ~ GPIO15.



0: Not set

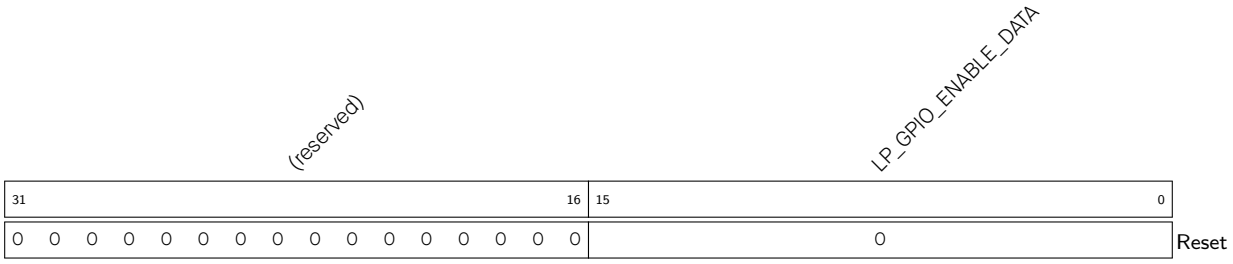
1: The corresponding bit in LP_GPIO_OUT_REG will be set to 1

Bit0 ~ bit15 are corresponding to GPIO0 ~ GPIO15. Bit16 ~ bit31 are invalid. Recommended operation: use this register to set LP_GPIO_OUT_REG.

(WT)

Register 10.68. LP_GPIO_OUT_W1TC_REG (0x0010)

LP_GPIO_OUT_DATA_W1TC Configures whether or not to clear the output register LP_GPIO_OUT_REG of GPIO0 ~ GPIO15 output.



0: Not clear

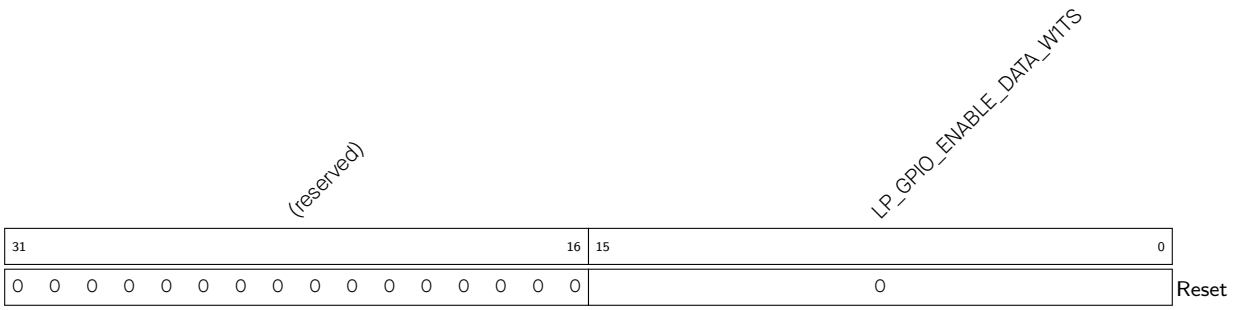
1: The corresponding bit in LP_GPIO_OUT_REG will be cleared.

Bit0 ~ bit15 are corresponding to GPIO0 ~ GPIO15. Bit16 ~ bit31 are invalid. Recommended operation: use this register to clear LP_GPIO_OUT_REG.

(WT)

Register 10.69. LP_GPIO_ENABLE_REG (0x0014)

LP_GPIO_ENABLE_DATA Configures whether or not to enable the output of GPIO0 ~ GPIO15.



0: Not enable

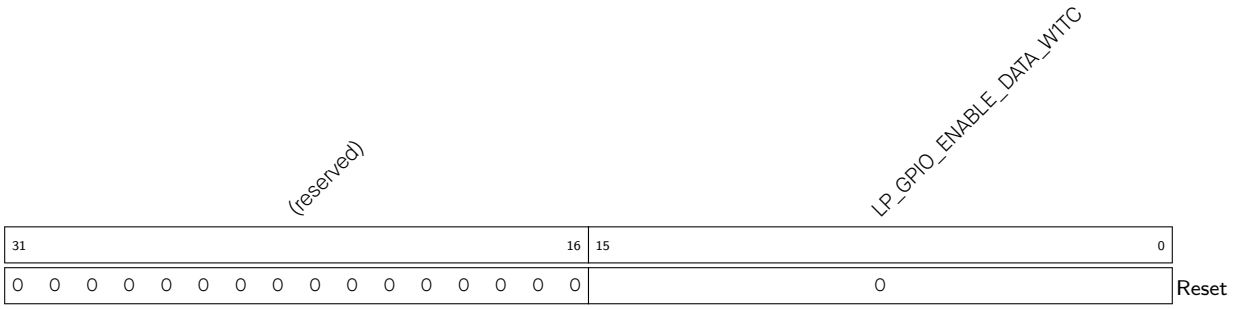
1: Enable

Bit0 ~ bit15 are corresponding to GPIO0 ~ GPIO15. Bit16 ~ bit31 are invalid.

(R/W/WTC)

Register 10.70. LP_GPIO_ENABLE_W1TS_REG (0x0018)

LP_GPIO_ENABLE_DATA_W1TS Configures whether or not to set the output enable register LP_GPIO_ENABLE_REG of GPIO0 ~ GPIO15.



0: Not set

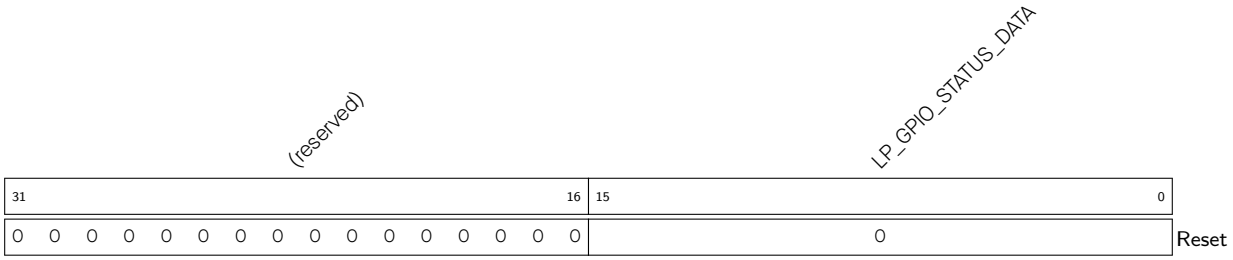
1: The corresponding bit in LP_GPIO_ENABLE_REG will be set to 1

Bit0 ~ bit15 are corresponding to GPIO0 ~ GPIO15. Bit16 ~ bit31 are invalid. Recommended operation: use this register to set LP_GPIO_ENABLE_REG.

(WT)

Register 10.71. LP_GPIO_ENABLE_W1TC_REG (0x001C)

LP_GPIO_ENABLE_DATA_W1TC Configures whether or not to clear the output enable register LP_GPIO_ENABLE_REG of GPIO0 ~ GPIO15.



0: Not clear

1: The corresponding bit in LP_GPIO_ENABLE_REG will be cleared

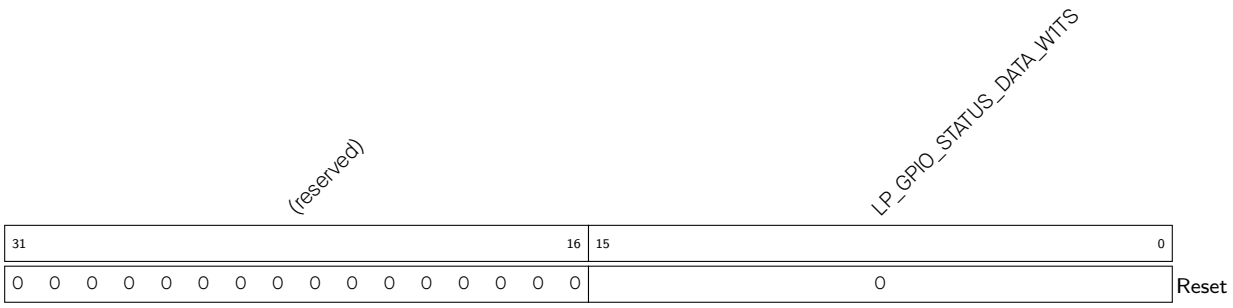
Bit0 ~ bit15 are corresponding to GPIO0 ~ 15. Bit16 ~ bit31 are invalid. Recommended operation: use this register to clear LP_GPIO_ENABLE_REG.

(WT)

Register 10.72. LP_GPIO_STATUS_REG (0x0020)

LP_GPIO_STATUS_DATA The interrupt status of GPIO0 ~ GPIO15, can be configured by the software.

Bit0 ~ bit15 are corresponding to GPIO0 ~ GPIO15. Bit16 ~ bit31 are invalid.



Each bit represents the status of its corresponding GPIO:

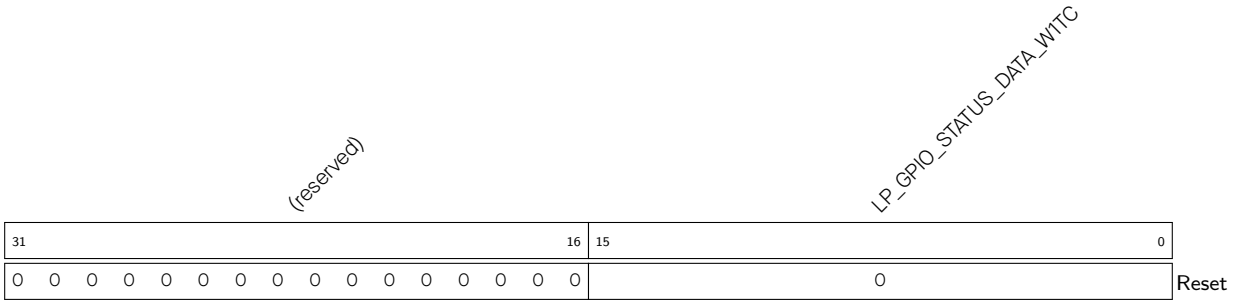
0: Represents the GPIO does not generate the interrupt configured by LP_GPIO_PIN*n*_INT_TYPE, or this bit is configured to 0 by the software.

1: Represents the GPIO generates the interrupt configured by LP_GPIO_PIN*n*_INT_TYPE, or this bit is configured to 1 by the software.

(R/W/WTC)

Register 10.73. LP_GPIO_STATUS_W1TS_REG (0x0024)

LP_GPIO_STATUS_DATA_W1TS Configures whether or not to set the interrupt status register LP_GPIO_STATUS_DATA of GPIO0 ~ GPIO15.



Bit0 ~ bit15 are corresponding to GPIO0 ~ GPIO15. Bit16 ~ bit31 are invalid.

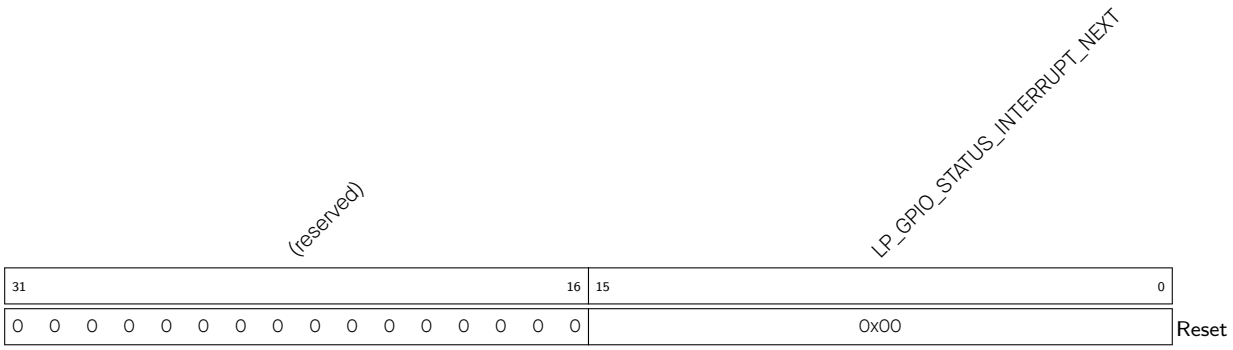
If the value 1 is written to a bit here, the corresponding bit in LP_GPIO_STATUS_DATA will be set to 1.

Recommended operation: use this register to set LP_GPIO_STATUS_DATA.

(WT)

Register 10.74. LP_GPIO_STATUS_W1TC_REG (0x0028)

LP_GPIO_STATUS_DATA_W1TC Configures whether or not to clear the interrupt status register LP_GPIO_STATUS_DATA of GPIO0 ~ GPIO15.



Bit0 ~ bit15 are corresponding to GPIO0 ~ GPIO15. Bit16 ~ bit31 are invalid.

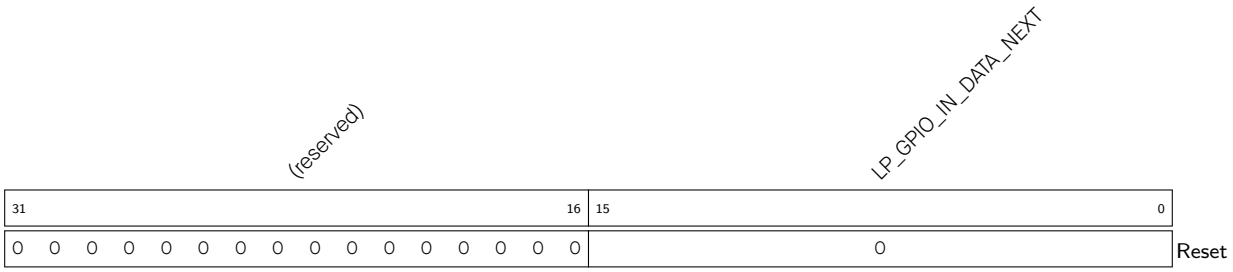
If the value 1 is written to a bit here, the corresponding bit in LP_GPIO_STATUS_DATA will be cleared.

Recommended operation: use this register to clear LP_GPIO_STATUS_DATA.

(WT)

Register 10.75. LP_GPIO_STATUS_NEXT_REG (0x002C)

LP_GPIO_STATUS_INTERRUPT_NEXT Represents the interrupt source signal of GPIO0 ~ GPIO15. Bit0 ~ bit15 are corresponding to GPIO0 ~ 15. Bit16 ~ bit31 are invalid. Each bit represents:



0: The GPIO does not generate the interrupt configured by LP_GPIO_PIN*n*_INT_TYPE.

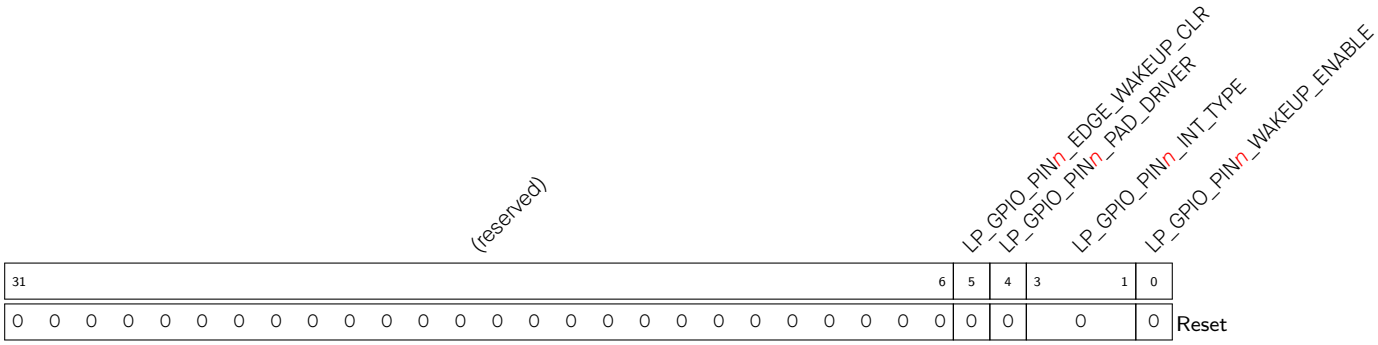
1: The GPIO generates an interrupt configured by LP_GPIO_PIN*n*_INT_TYPE.

The interrupt could be rising edge interrupt, falling edge interrupt, level sensitive interrupt and any edge interrupt.

(RO)

Register 10.76. LP_GPIO_IN_REG (0x0030)

LP_GPIO_IN_DATA_NEXT Represents the input value of GPIO0 ~ GPIO15. Each bit represents a pin input value:



0: Low level

1: High level

Bit0 ~ bit15 are corresponding to GPIO0 ~ GPIO15. Bit16 ~ bit31 are invalid.

(RO)

Register 10.77. LP_GPIO_PIN*n*_REG (*n*: 0 - 15) (0x0034+4n*)**

LP_GPIO_PIN*n*_WAKEUP_ENABLE Configures whether or not to enable GPIO wake-up function.

0: Disable

1: Enable

This function only wakes up system from Deep-sleep.

(R/W)

LP_GPIO_PIN*n*_INT_TYPE Configures GPIO interrupt type.

0: GPIO interrupt disabled

1: Rising edge trigger

2: Falling edge trigger

3: Any edge trigger

4: Low level trigger

5: High level trigger

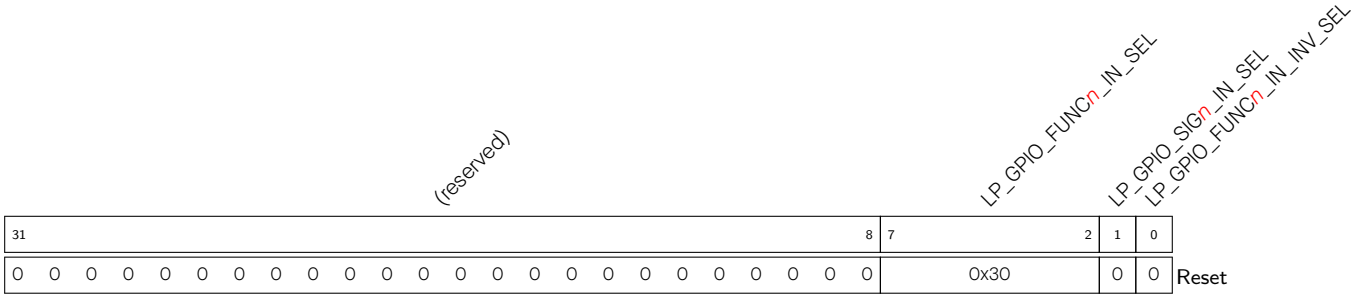
(R/W)

LP_GPIO_PIN*n*_PAD_DRIVER Configures to select pin drive mode.

0: Normal output

1: Open drain output

(R/W)



LP_GPIO_PIN*n*_EDGE_WAKEUP_CLR Configures to clear edge-triggered GPIO wake-up source in PMU.

1: The corresponding bit in LP_PMU_xxx will be cleared.

0: No effect.

(WT)

Register 10.78. LP_GPIO_FUNC*n*_IN_SEL_CFG_REG (*n*: 0 - 15) (0x0074+4n*)**

LP_GPIO_FUNC*n*_IN_INV_SEL Configures whether or not to invert the input value.

0: Not invert

1: Invert

(R/W)

LP_GPIO_SIG*n*_IN_SEL Configures whether or not to route signals via LP GPIO matrix.

0: Bypass LP GPIO matrix, i.e., connect signals directly to peripheral configured in LP IO MUX.

1: Route signals via LP GPIO matrix.

(R/W)

LP_GPIO_FUNC*n*_IN_SEL Configures to select a pin from the 16 LP GPIO pins to connect the input signal *n*.

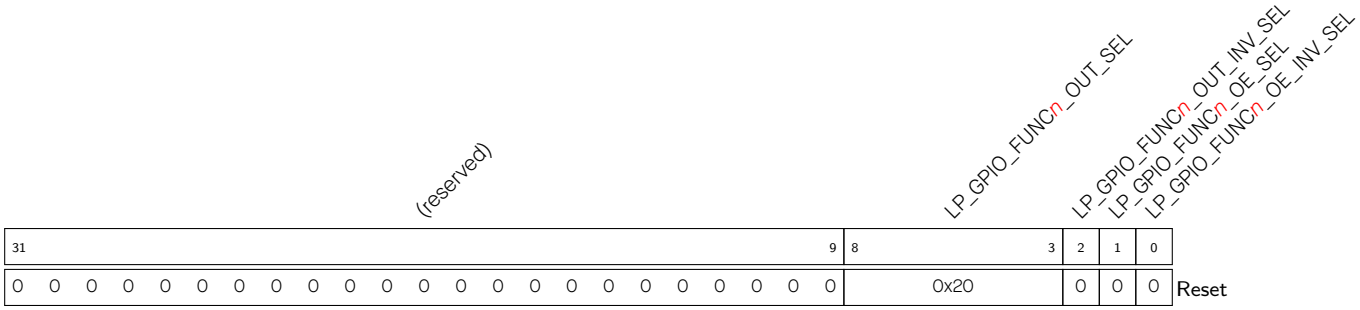
0: Select GPIO0

1: Select GPIO1

.....

14: Select GPIO14

15: Select GPIO15



16 ~ 31: Invalid

32 ~ 47: A constantly low input

48 ~ 63: A constantly high input

(R/W)

Register 10.79. LP_GPIO_FUNC*n*_OUT_SEL_CFG_REG (*n*: 0 - 15) (0x00F4+4**n*)

LP_GPIO_FUNC*n*_OE_INV_SEL Configures whether or not to invert the output enable signal.

0: Not invert

1: Invert

(R/W)

LP_GPIO_FUNC*n*_OE_SEL Configures to select the source of output enable signal.

0: Use output enable signal from peripheral.

1: Force the output enable signal to be sourced from bit*n* of LP_GPIO_ENABLE_REG.

(R/W)

LP_GPIO_FUNC*n*_OUT_INV_SEL Configures whether or not to invert the output value.

0: Not invert

1: Invert

(R/W)

LP_GPIO_FUNC*n*_OUT_SEL Configures to select a signal *Y* (0 <= *Y* < 32) from 31 peripheral signals to be output to GPIO*n*.

0: Select signal 0

1: Select signal 1

.....

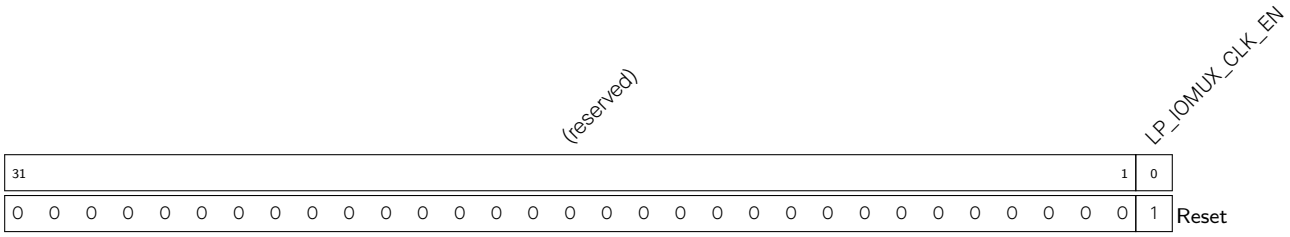
30: Select signal 30

31: Select signal 31

Or

32: Bit*n* of LP_GPIO_OUT_REG and LP_GPIO_ENABLE_REG are selected as the output value and output enable.

For the detailed signal list, see Table 10.13-1.



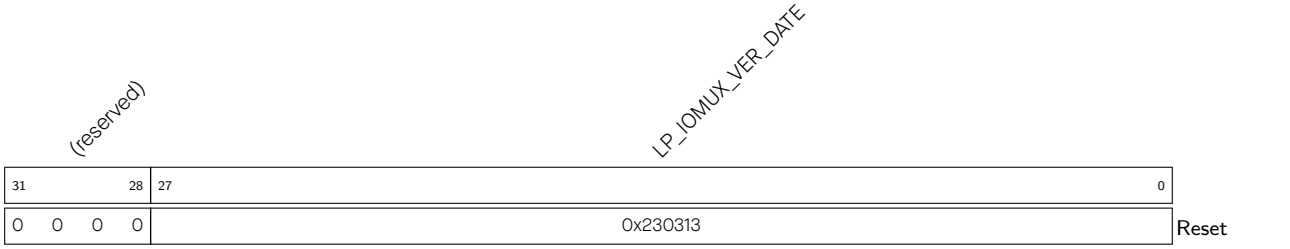
(R/W)

10.20.5 LP IO MUX Registers

The addresses in this section are relative to LP IO MUX base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

For how to program reserved fields, please refer to Section IX .

Register 10.80. LP_IOMUX_CLK_EN_REG (0x0000)

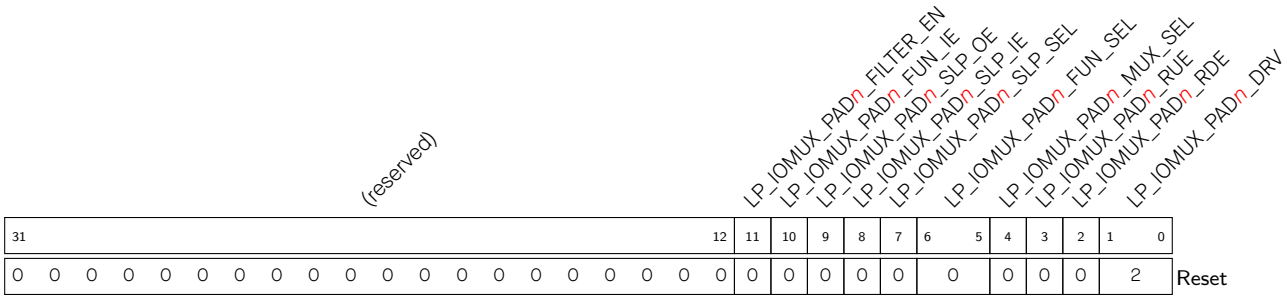


LP_IOMUX_CLK_EN Configures whether or not to enable clock gate.

0: Not enable

1: Enable, the clock is free running.

(R/W)



Register 10.81. LP_IOMUX_VER_DATE_REG (0x0004)

LP_IOMUX_VER_DATE Version control register.

(R/W)

Register 10.82. LP_IOMUX_PADn_REG (n = 0 - 15) (0x0008+4*n)

LP_IOMUX_PADn_DRV Configures the drive strength of GPIOn.

0: ~5 mA

1: ~10 mA

2: ~20 mA

3: ~40 mA

(R/W)

LP_IOMUX_PADn_RDE Configures whether or not enable pull-down resistor of GPIOn.

0: Disable

1: Enable

(R/W)

LP_IOMUX_PADn_RUE Configures whether or not to enable pull-up resistor of GPIOn.

0: Disable

1: Enable

(R/W)

LP_IOMUX_PADn_MUX_SEL Configures to decide GPIOn is used by HP IO MUX or LP IO MUX.

0: GPIOn is used by HP IO MUX

1: GPIOn is used by LP IO MUX

(R/W)

LP_IOMUX_PADn_FUN_SEL Configures to select LP IO MUX function for this signal.

0: Select Function 0

1: Select Function 1

.....

(R/W)

LP_IOMUX_PADn_SLP_SEL Configures whether or not to enter sleep mode for GPIOn.

0: Not enter

1: Enter

(R/W)

LP_IOMUX_PADn_SLP_IE Configures whether or not to enable the input of GPIOn during sleep mode.

0: Disable

1: Enable

(R/W)

Continued on the next page...

Register 10.83. LP_IOMUX_PAD*n*_REG (*n* = 0 - 15) (0x0008+4**n*)

Continued from the previous page...

LP_IOMUX_PAD*n*_SLP_OE Configures whether or not to enable the output of GPIO*n* in sleep mode.

0: Disable

1: Enable

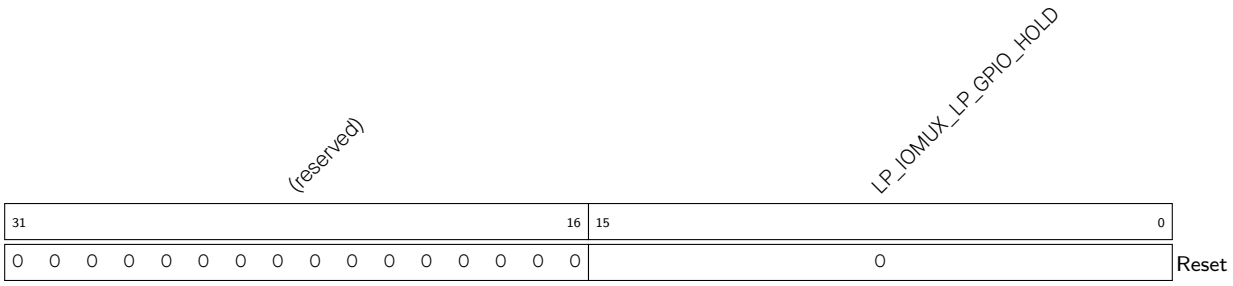
(R/W)

LP_IOMUX_PAD*n*_FUN_IE Configures whether or not to enable input of GPIO*n*.

0: Disable

1: Enable

(R/W)



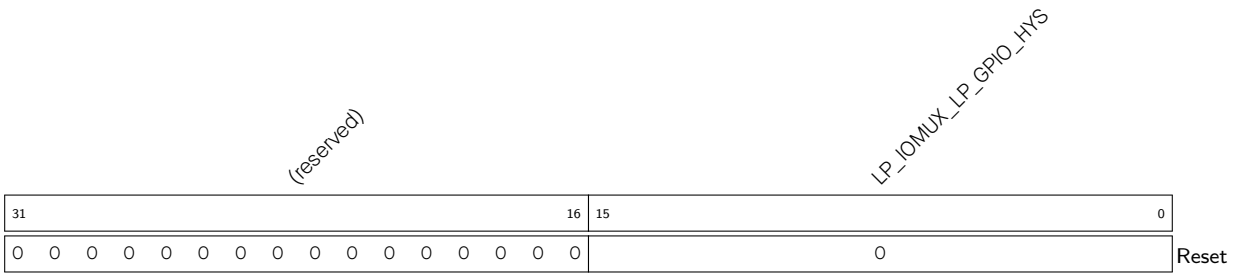
LP_IOMUX_PAD*n*_FILTER_EN Configures whether or not to enable filter for pin input signals.

0: Disable

1: Enable

(R/W)

Register 10.84. LP_IOMUX_LP_PAD_HOLD_REG (0x004C)



LP_IOMUX_LP_GPIO_HOLD Configures whether or not to enable hold function of GPIO*n*.

0: Disable

1: Enable

(R/W)

Register 10.85. LP_IOMUX_LP_PAD_HYS_REG (0x0050)

LP_IOMUX_LP_GPIO_HYS Configures whether or not to enable hysteresis function of GPIO*n*.

0: Disable

1: Enable

Bit0 bit15 are corresponding to GPIO0 GPIO15.

(R/W)

Chapter 11

Reset and Clock

11.1 Reset

11.1.1 Overview

ESP32-P4 provides four types of reset that occur at different levels, namely CPU Reset, Core Reset, System Reset, and Chip Reset. All reset types mentioned above (except Chip Reset) preserve the data stored in internal memory. Figure 11.1-1 shows the scopes of affected subsystems by each type of reset.

11.1.2 Architectural Overview

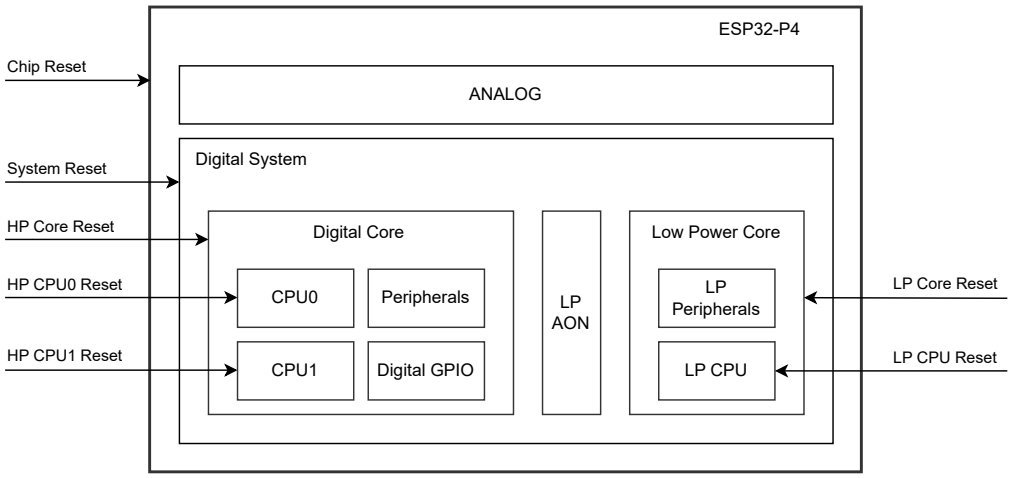


Figure 11.1-1. Reset Types

ESP32-P4's Digital System consists of High Performance System (HP system) that includes Digital Core and HP memory, and Low Power System (LP system) that includes the Low Power Always On (LP AON) system, LP Core, and LP memory. See Figure 11.1-1 for details (note that HP memory and LP memory would not be reset, so they are not shown in the figure).

11.1.3 Features

- Four reset types:
  - CPU Reset: resets CPU core. HP CPU0, HP CPU1, and LP CPU can be reset independently:
    * HP CPU0 will be automatically released from reset after chip power-up, and start execution from CPU Reset Vector (0x30100000).

    * HP CPU1 is at reset by default after chip power-up, and needs to be manually released from reset by writing 0 to HP_SYS_CLKRST_RST_EN_CORE1_GLOBAL. Once released from reset, HP CPU1 will start execution from CPU Reset Vector (0x30100000).
    * LP CPU is at reset after chip power-up, and needs to be manually released from reset by configuring the power management unit (PMU). Once released from reset, LP CPU will start execution from LP_SYSTEM_LP_CPU_BOOT_ADDR (0x50100000 by default). For details, see Chapter 15 *Low-Power Management*.
  - Core Reset: resets the whole digital system except for LP AON. HP core and LP core can be reset independently: HP Core Reset resets HP CPU0, HP CPI1, HP peripherals, HP GPIO, etc., and LP Core Reset resets LP CPU and LP peripherals.
  - System Reset: resets the whole digital system, including the LP system.
  - Chip Reset: resets the whole chip.
- Software reset and hardware reset:
  - Software Reset: triggered via software by configuring the corresponding registers of CPU, see Chapter 15 *Low-Power Management*.
  - Hardware Reset: triggered directly by the hardware.

11.1.4 Functional Description

CPU will be reset immediately when any type of reset above occurs. After the reset is released, users can retrieve reset source codes by reading the following fields:

- HP CPU0: LP_CLKRST_HPCORE0_RESET_CAUSE
- HP CPU1: LP_CLKRST_HPCORE1_RESET_CAUSE
- LP CPU: LP_CLKRST_LPCORE_RESET_CAUSE

Table 11.1-1 and Table 11.1-2 list possible reset sources and the types of reset they trigger.

Table 11.1-1. HP CPU Reset Source

Code	Source	Reset Type	Note
0x01	Chip reset[1]	Chip Reset	—
0x03	Software system reset	HP Core Reset	Triggered by configuring LP_SYSTEM_SYS_SW_RST
0x05	PMU core reset	HP Core Reset	See Chapter 15 *Low-Power Management*
0x07	MWDT core reset[2]	HP Core Reset	See Chapter 18 *Watchdog Timers (WDT)*
0x09	RWDT core reset	HP Core Reset	See Chapter 18 *Watchdog Timers (WDT)*
0x0B	MWDT CPU reset	HP CPU0/1 Reset	See Chapter 18 *Watchdog Timers (WDT)*
0x0C	Software CPU reset	HP CPU0/1 Reset	Triggered by configuring LP_CLKRST_HPCORE0_SW_RESET or LP_CLKRST_HPCORE1_SW_RESET
0x0D	RWDT CPU reset	HP CPU0/1 Reset	See Chapter 18 *Watchdog Timers (WDT)*

Cont'd on next page

Table 11.1-1 – cont'd from previous page

Code	Source	Reset Type	Note
0x0F	Brown-out system reset	Chip Reset or System Reset	Triggered by the brown-out detector. Once brown-out status is detected, the detector will trigger System Reset or Chip Reset, depending on the register configuration. See Chapter 15 *Low-Power Management*
0x10	RWDT system reset	System Reset	See Chapter 18 *Watchdog Timers (WDT)*
0x12	Super Watchdog reset	System Reset	See Chapter 18 *Watchdog Timers (WDT)*
0x13	Power glitch reset	System Reset	See Chapter 25 *Brown-out Detector*
0x1B	PSDET reset	System Reset	See Chapter 26 *Power Supply Detector (PSDET)*
0x14	eFuse reset	HP Core Reset	Triggered by eFuse CRC error
0x16	USB (JTAG) reset	HP Core Reset	Triggered when external USB host sends a specific command to the JTAG interface of USB Serial/JTAG Controller. See Chapter 54 *USB Serial/JTAG Controller (USB_SERIAL_JTAG)*
0x17	USB (UART) reset	HP Core Reset	Triggered when external USB host sends a specific command to the serial interface of USB Serial/JTAG Controller. See Chapter 54 *USB Serial/JTAG Controller (USB_SERIAL_JTAG)*
0x18	JTAG CPU reset	HP CPU0/1 Reset	Triggered when a "GDB Resetting CPU" instruction is received
0x1A	Lockup reset	HP CPU0/1 Reset	Triggered when the CPU enters lockup. HP CPU0 and HP CPU1 can be reset in lockup state by configuring LP_CLKRST_HPCOREx_LOCKUP_RESET_EN

- Chip Reset can be triggered by the following sources:
  - Chip power-up
  - Brown-out detector
- The HP system contains two watchdog timers called Main System Watchdog Timers (MWDT), and the MWDT that can trigger reset can be configured via HP_SYS_CLKRST_HPCORE0_WDT_RESET_SOURCE_SEL and HP_SYS_CLKRST_HPCORE0_WDT_RESET_SOURCE_SEL for HP CPU0 and HP CPU1 respectively.

Table 11.1-2. LP CPU Reset Source

Code	Source	Reset Type	Note
0x01	Chip reset	Chip Reset	—
0x09	PMU LP Peripheral reset	LP Core Reset	See Chapter 15 *Low-Power Management*
0x0A	PMU LP CPU reset[1]	LP CPU Reset	See Chapter 15 *Low-Power Management*
0x0F	Brown-out system reset	Chip Reset or System Reset	Triggered by the brown-out detector
0x10	RWDT system reset	System Reset	See Chapter 18 *Watchdog Timers (WDT)*
0x12	Super Watchdog reset	System Reset	See Chapter 18 *Watchdog Timers (WDT)*

Cont'd on next page

Table 11.1-2 – cont'd from previous page

Code	Source	Reset Type	Note
0x13	Power glitch reset	System Reset	See Chapter 25 *Brown-out Detector*
0x14	Software LP CPU reset	LP CPU Reset	Triggered by configuring LPPERI_RST_EN_LP_CORE

[1] LP CPU is reset by PMU after chip power-up. To retrieve the correct reset source code (0x01) when the LP CPU runs for the first time, the source code for PMU LP CPU reset (0x0A) will be masked. After the CPU's first run, clear LP_CLKRST_LPCORE_RESET_CAUSE_PMU_LP_CPU_MASK to unmask the 0x0A source code.

11.1.5 Peripheral Reset

Peripherals can be reset individually by configuring corresponding registers, or globally by Core Reset, System Reset, or Chip Reset.

ESP32-P4 has three groups of peripheral reset registers, prefixed with HP_SYS_CLKRST, LP_CLKRST, and LPPERI. See Section 11.4 *Register Summary* for detailed information.

11.2 Clock

11.2.1 Overview

ESP32-P4 clocks are mainly sourced from oscillator (OSC, including Resistor-Capacitor circuit), crystal (XTAL), and PLL circuit, and then processed by the dividers or selectors, which allows most functional modules to select their working clock according to their power consumption and performance requirements. Figure 11.2-1 shows the HP and LP system clock structure, including the main clock path and typical peripheral clock generator circuit. ESP32-P4 has a large number of peripherals, and limited by space, not all peripheral clocks are shown in the figure.

11.2.2 Architectural Overview

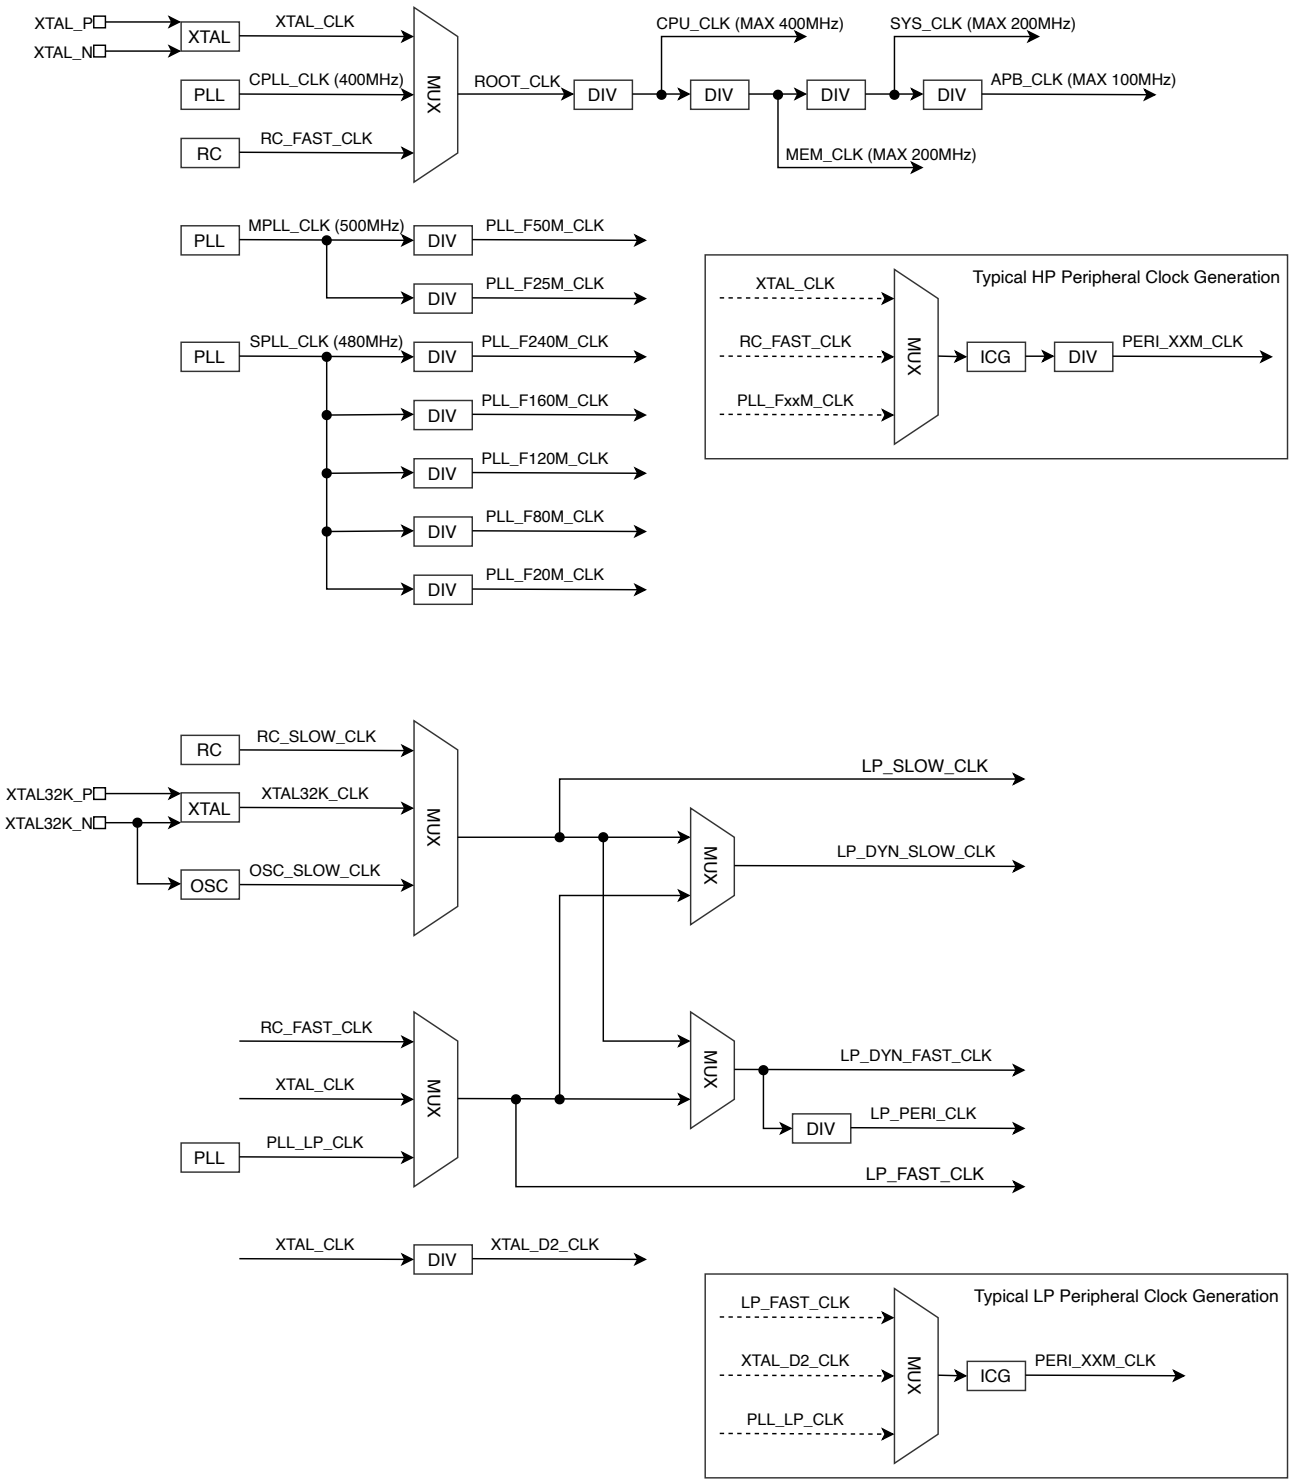

Figure 11.2-1. HP and LP System Clock

11.2.3 Features

ESP32-P4 clocks can be classified into two types depending on their frequencies:

- High speed clocks for devices working at a higher frequency, such as HP CPU0/1 and digital peripherals

  - CPLL_CLK: internal 360 MHz PLL clock. Its reference clock is XTAL_CLK
  - MPLL_CLK: internal 500 MHz PLL clock. Its reference clock is XTAL_CLK
  - SPLL_CLK: internal 480 MHz PLL clock. Its reference clock is XTAL_CLK
- Slow speed clocks for LP system and some peripherals working in low-power mode
  - XTAL32K_CLK: external 32 kHz crystal clock
  - RC_SLOW_CLK: internal 150 kHz slow RC oscillator
  - OSC_SLOW_CLK: external slow clock input through XTAL_32K_N, with a frequency of 32 kHz by default. After configuring this GPIO, also configure the Hold function (see Chapter 10 *GPIO Matrix and IO MUX* > 10.9 *Pin Hold Feature*)
  - XTAL_CLK: 40 MHz external crystal clock
  - RC_FAST_CLK: internal fast RC oscillator with adjustable frequency (20 MHz by default)
  - PLL_LP_CLK: internal PLL clock with a frequency of 8 MHz by default. Its reference clock can be XTAL32K_CLK

11.2.4 Functional Description

11.2.4.1 HP System Clock

As Figure 11.2-1 shows, XTAL_CLK, CPLL_CLK, and RC_FAST_CLK are the multiplexer inputs to generate ROOT_CLK. For selecting which input, see Table 11.2-1.

Table 11.2-1. ROOT_CLK Clock Source

LP_CLKRST_HP_ROOT_CLK_SRC_SEL	Clock Source
0	XTAL_CLK
1	CPLL_CLK
2	RC_FAST_CLK

ROOT_CLK is then divided by a series of dividers, and sequentially derives:

- CPU_CLK, which drives HP CPUs and their logic
- MEM_CLK, which drives the internal memories (L2 Cache, L2MEM, ROM) and their logic
- SYS_CLK, which is the HP high-speed bus clock that drives the AXI and AHB bus logic
- APB_CLK, which is the HP low-speed bus clock that drives the APB bus logic

The above four derived clocks are synchronous SoC clocks, asynchronous to peripheral clocks described in Section 11.2.4.3 *Peripheral Clocks*. Peripheral clocks are asynchronous with each other unless otherwise stated.

The maximum frequencies allowed for these SoC clocks are as follows. Software should ensure that the frequencies of these clocks do not exceed the maximum frequency.

- CPU_CLK: 360 MHz
- MEM_CLK: 200 MHz

- SYS_CLK: 200 MHz
- APB_CLK: 100 MHz

Each module has an individual clock gate for the SoC clock it uses. For example, users can enable the clock for HP CPU0 and disable the clock for HP CPU1 by setting the HP_SYS_CLKRST_CORE0_CPU_CLK_EN bit and clearing the HP_SYS_CLKRST_CORE1_CPU_CLK_EN bit. "CPU_CLK" in bit names indicates that the corresponding clock belongs to the CPU_CLK group shown in Figure 11.2-1.

The internal PLL clocks of ESP32-P4, namely MPLL_CLK and SPLL_CLK, generate reference clocks for peripherals through a set of parallel clock dividers.

Besides these two PLL clocks, there are two additional PLL clocks dedicated to specific modules:

- SDIO_PLL, which generates three clocks:
  - SDIO_PLL0_CLK, used for SDIO's high-speed SDIO_SLF_CLK (internal signal clock) and the source of SDIO's low-speed clock
  - SDIO_PLL1_CLK, users for SDIO's high-speed SDIO_DRV_CLK (output signal driving clock)
  - SDIO_PLL2_CLK, used for SDIO's high-speed SDIO_SAM_CLK (input signal sampling clock)
- APLL_CLK, which is dedicated to I2S

A typical peripheral clock generation circuit consists of a clock selector, a clock gating unit, and a divider. In high-performance mode, the peripheral can select a high-speed clock source without division for higher processing speed. In low-power mode, the peripheral can select a low-speed clock source or divide it by a large divisor to lower power consumption. When the peripheral is disabled, its clock can be directly disabled.

Note:
Updates to HP_SYS_CLKRST_ROOT_CLK_CTRL0/1/2/3_REG will take effect only after HP_SYS_CLKRST_SOC_CLK_DIV_UPDATE is set.

11.2.4.2 LP System Clock

The LP system can operate when most other clocks are disabled. LP system clocks include LP_SLOW_CLK, LP_FAST_CLK, LP_DYN_SLOW_CLK, LP_DYN_FAST_CLK, and XTAL_D2_CLK.

The clock sources for LP_SLOW_CLK and LP_FAST_CLK are low-frequency clocks:

- LP_SLOW_CLK has four clock sources, see Table 11.2-2:

Table 11.2-2. LP_SLOW_CLK Clock Source Selection

LP_CLKRST_SLOW_CLK_SEL	Clock Source
0	RC_SLOW_CLK
1	XTAL32K_CLK
2	Invalid
3	OSC_SLOW_CLK

- LP_FAST_CLK has three clock sources, see Table 11.2-3:

Table 11.2-3. LP_FAST_CLK Clock Source Selection

LP_CLKRST_FAST_CLK_SEL	Clock Source
0	RC_FAST_CLK
1	XTAL_CLK
2	PLL_LP_CLK

LP_DYN_SLOW_CLK and LP_DYN_FAST_CLK can be derived from LP_SLOW_CLK or LP_FAST_CLK depending on the chip's power mode (see Chapter 15 *Low-Power Management*), and should be able to operate in all power modes to drive LP AON modules. These two clocks are always synchronous with each other.

- In Active mode, select LP_FAST_CLK as the clock source. In this case, LP_DYN_SLOW_CLK has the same frequency with LP_SLOW_CLK, and the same phase with LP_FAST_CLK;
- In Deep-sleep mode, select the clock source according to PMU configurations. If the LP CPU is off, LP_SLOW_CLK is the clock source, and has the same frequency and phase as LP_DYN_FAST_CLK in this case; if the LP CPU is on, LP_FAST_CLK is the clock source.

LP_PERI_CLK is derived from LP_DYN_FAST_CLK and drives all the buses for LP peripherals.

XTAL_D2_CLK is derived from XTAL_CLK divided by 2.

11.2.4.3 Peripheral Clocks

Table 11.2-4, Table 11.2-5, Table 11.2-6, and Table 11.2-7 list the derived HP/LP clock sources and HP clocks/LP clocks for each peripheral.

Table 11.2-4. Derived HP Clock sources

Derived Clock	Source Clock							Derived Clock						
	RC_FAST_CLK	XTAL_CLK	CPLL_CLK	MPLL_CLK	SPLL_CLK	APLL_CLK	SDIO_PLL0_CLK	ROOT_CLK	CPU_CLK	MEM_CLK	SYS_CLK	PLL_F80M_CLK	PLL_F160M_CLK	PLL_F240M_CLK

Note:
To protect the encryption and decryption peripherals from DPA (Differential Power Analysis) attacks, a random divider strategy is implemented for its function clock. Four security levels are available, depending on the range of the random divider. Users can select the security level by configuring HP_SYS_CLKRST_SEC_DPA_CFG_SEL.
If HP_SYS_CLKRST_SEC_DPA_CFG_SEL is set to 1, the security level is determined by the configuration of HP_SYS_CLKRST_SEC_DPA_LEVEL. Otherwise, the security level is determined by the value of EFUSE_SEC_DPA_LEVEL.

11.3 Programming Procedures

11.3.1 HP System Clock Configuration

- Configure the clock divisor for CPU_CLK: HP_SYS_CLKRST_CPU_CLK_DIV_NUM for the integral part, HP_SYS_CLKRST_CPU_CLK_DIV_NUMERATOR for the numerator of the fractional part, and HP_SYS_CLKRST_CPU_CLK_DIV_DENOMINATOR for the denominator of the fractional part.
  Write 1 to HP_SYS_CLKRST_SOC_CLK_DIV_UPDATE to apply the frequency divisor configurations for CPU_CLK.
- Configure the clock divisor for MEM_CLK: HP_SYS_CLKRST_MEM_CLK_DIV_NUM for the integral part, HP_SYS_CLKRST_MEM_CLK_DIV_NUMERATOR for the numerator of the fractional part, and HP_SYS_CLKRST_MEM_CLK_DIV_DENOMINATOR for the denominator of the fractional part.
  Write 1 to HP_SYS_CLKRST_SOC_CLK_DIV_UPDATE to apply the frequency divisor configurations for MEM_CLK.
- Configure the clock divisor for SYS_CLK: HP_SYS_CLKRST_SYS_CLK_DIV_NUM for the integral part, HP_SYS_CLKRST_SYS_CLK_DIV_NUMERATOR for the numerator of the fractional part, and HP_SYS_CLKRST_SYS_CLK_DIV_DENOMINATOR for the denominator of the fractional part.
  Write 1 to HP_SYS_CLKRST_SOC_CLK_DIV_UPDATE to apply the frequency divisor configurations for SYS_CLK.
- Configure the clock divisor for APB_CLK: HP_SYS_CLKRST_APB_CLK_DIV_NUM for the integral part, HP_SYS_CLKRST_APB_CLK_DIV_NUMERATOR for the numerator of the fractional part, and HP_SYS_CLKRST_APB_CLK_DIV_DENOMINATOR for the denominator of the fractional part.
  Write 1 to HP_SYS_CLKRST_SOC_CLK_DIV_UPDATE to apply the frequency divisor configurations for APB_CLK.
- Configure the clock source for ROOT_CLK via LP_CLKRST_HP_ROOT_CLK_SRC_SEL.

Notice:

1. It is recommended to first configure the frequency divisors for the SoC clocks and apply the configurations, and then configure the clock source for ROOT_CLK.
2. Before changing the clock source for ROOT_CLK, software needs to ensure that the configured clock divisors do not result in clock frequencies exceeding the allowed maximum frequencies.
3. Writing 1 to HP_SYS_CLKRST_SOC_CLK_DIV_UPDATE will apply the frequency divisor configurations for CPU_CLK, MEM_CLK, SYS_CLK, and APB_CLK at one go, but it is not recommended to do so. It would be better to apply the configuration for each clock individually.
4. When switching from a high divisor to a low divisor, the recommended configuration order is APB_CLK

→ SYS_CLK → MEM_CLK → CPU_CLK. When switching from a low divisor to a high divisor, the recommended configuration order is CPU_CLK → MEM_CLK → SYS_CLK → APB_CLK. This helps to prevent high-frequency clock glitches.

11.3.2 LP System Clock Configuration

- Configure the clock source of LP_SLOW_CLK via LP_CLKRST_SLOW_CLK_SEL
- Configure the clock source of LP_FAST_CLK via LP_CLKRST_FAST_CLK_SEL
- Configure the clock divisor of LP_PERI_CLK via LP_CLKRST_LP_PERI_DIV_NUM

11.3.3 Peripheral Clock Reset and Configuration

Notice:

ESP32-P4 features low power consumption. This is why some peripheral clocks are gated (disabled) by default. Before using any of these peripherals, it is mandatory to enable the clock for the given peripheral by setting the corresponding CLK_EN bit to 1, and release the peripheral from the reset state to make it operational by setting the RST_EN bit to 0.

The clocks of most peripherals can be classified into two types:

- Bus clock: used to configure peripheral registers.
- Function clock: such as UART's reference clock, used by peripherals to operate.

The function clock of most peripherals can be selected from multiple clock sources. In the description of the gating registers, it will be stated whether a register is a bus clock (SYS_CLK, APB_CLK) gating register or a function clock gating register.

Bus clock enable/disable registers, function clock enable/disable registers, clock source selection registers, and clock frequency division registers are grouped into the HP_SYS_CLKRST, LP_CLKRST, and LPPERI modules. Except for EMA, SDMMAC, USB Serial/JTAG, USB 2.0 Full-Speed OTG, and USB 2.0 High-Speed OTG, whose reset configuration registers are in the LP_CLKRST module, all the other HP clock and reset registers are in the HP_SYS_CLKRST module. For more information, see Section 11.4 *Register Summary*.

When changing the clock configuration, it is recommended to turn off the corresponding clock gate first, update the clock divider configurations, clock sources, and other configurations, and then turn it on again.

When a peripheral is not working, users can turn off its function clock by configuring related registers. Turning off the peripheral's function clock does not affect the rest of the system.

Take I2C clock configuration as an example.

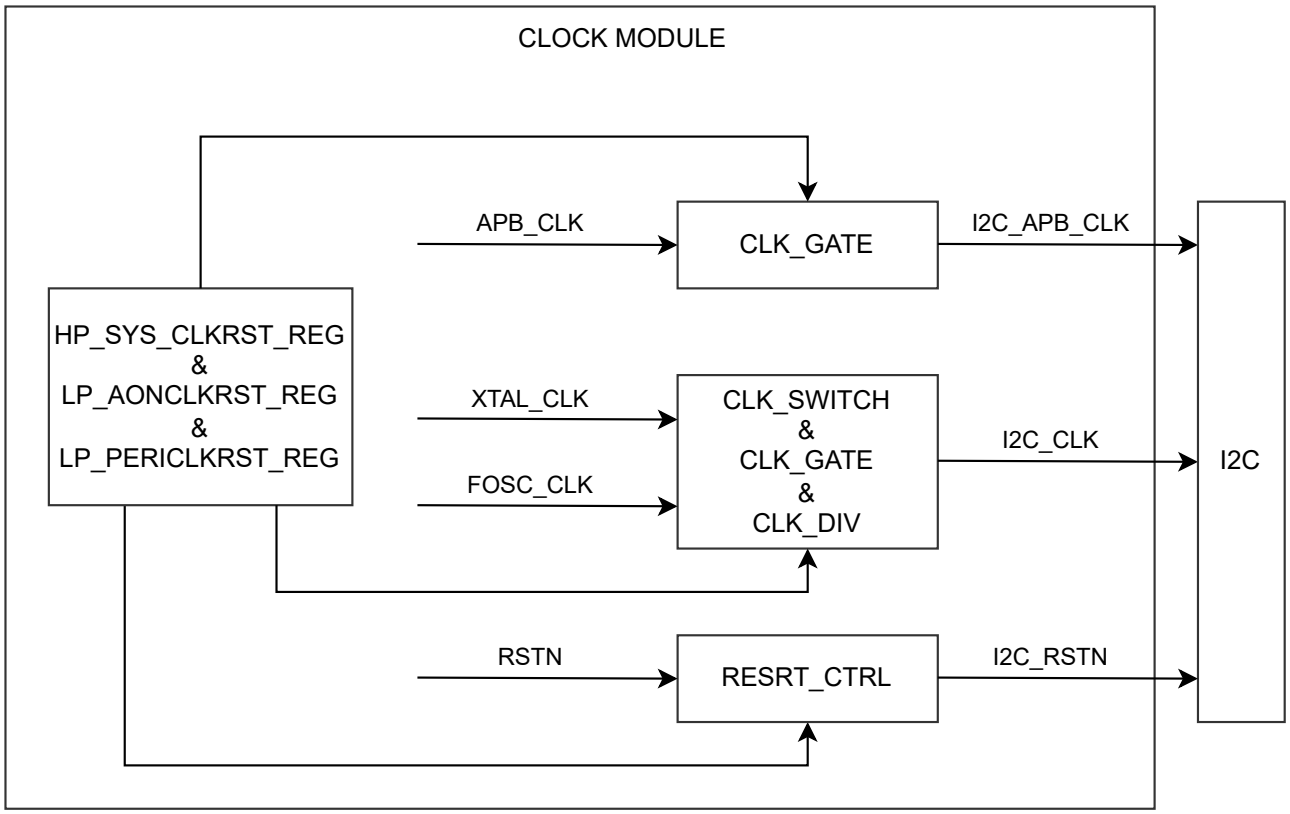

Figure 11.3-1. Clock Configuration Example

Figure 11.3-1 shows the clock structure of I2C. The clock structure of other peripherals is similar to this one. CLK_SWITCH is used to select a clock output and CLK_GATE to turn on/off the clock.

In scenarios that require low power consumption, when the peripheral is not in use, in addition to turning off the function clock, the bus clock of the peripheral can also be turned off to further lower power consumption.

Note that if you turn off the bus clock first, the functional clock may continue working. Therefore, when turning off clocks, it is recommended to turn off the functional clock first and then the bus clock; when turning on clocks, it is recommended to turn on the bus clock first and then the functional clock.

Note:
In this chapter, all divisor configuration registers are configured with the actual divisor minus 1.

11.4 Register Summary

11.4.1 Reset and Clock (HP_SYS_CLKRST) Register Summary

The addresses in this section are relative to HP_SYS_CLKRST base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Clock gate enable register			
HP_SYS_CLKRST_CLK_EN0_REG	Register clock gate enable register	0x0000	R/W
HP_SYS_CLKRST_CLK_FORCE_ON_CTRL0_REG	System and peripheral clock gate configuration register	0x00B4	R/W
Root clock configuration register			
HP_SYS_CLKRST_ROOT_CLK_CTRL0_REG	Root clock configuration register 0	0x0004	varies
HP_SYS_CLKRST_ROOT_CLK_CTRL1_REG	Root clock configuration register 1	0x0008	R/W
HP_SYS_CLKRST_ROOT_CLK_CTRL2_REG	Root clock configuration register 2	0x000C	R/W
HP_SYS_CLKRST_ROOT_CLK_CTRL3_REG	Root clock configuration register 3	0x0010	R/W
Bus clock configuration register			
HP_SYS_CLKRST_SOC_CLK_CTRL0_REG	Bus clock configuration register 0	0x0014	R/W
HP_SYS_CLKRST_SOC_CLK_CTRL1_REG	Bus clock configuration register 1	0x0018	R/W
HP_SYS_CLKRST_SOC_CLK_CTRL2_REG	Bus clock configuration register 2	0x001C	R/W
HP_SYS_CLKRST_SOC_CLK_CTRL3_REG	Bus clock configuration register 3	0x0020	R/W
Reference clock configuration register			
HP_SYS_CLKRST_REF_CLK_CTRL0_REG	Reference clock configuration register 0	0x0024	R/W
HP_SYS_CLKRST_REF_CLK_CTRL1_REG	Reference clock configuration register 1	0x0028	R/W
HP_SYS_CLKRST_REF_CLK_CTRL2_REG	Reference clock configuration register 2	0x002C	R/W
Peripheral clock configuration register			
HP_SYS_CLKRST_PERI_CLK_CTRL00_REG	Peripheral clock configuration register	0x0030	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL01_REG	Peripheral clock configuration register	0x0034	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL02_REG	Peripheral clock configuration register	0x0038	varies
HP_SYS_CLKRST_PERI_CLK_CTRL03_REG	Peripheral clock configuration register	0x003C	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL10_REG	Peripheral clock configuration register	0x0040	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL11_REG	Peripheral clock configuration register	0x0044	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL12_REG	Peripheral clock configuration register	0x0048	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL13_REG	Peripheral clock configuration register	0x004C	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL14_REG	Peripheral clock configuration register	0x0050	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL15_REG	Peripheral clock configuration register	0x0054	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL16_REG	Peripheral clock configuration register	0x0058	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL17_REG	Peripheral clock configuration register	0x005C	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL18_REG	Peripheral clock configuration register	0x0060	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL19_REG	Peripheral clock configuration register	0x0064	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL110_REG	Peripheral clock configuration register	0x0068	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL111_REG	Peripheral clock configuration register	0x006C	R/W

Name	Description	Address	Access
HP_SYS_CLKRST_PERI_CLK_CTRL112_REG	Peripheral clock configuration register	0x0070	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL113_REG	Peripheral clock configuration register	0x0074	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL114_REG	Peripheral clock configuration register	0x0078	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL115_REG	Peripheral clock configuration register	0x007C	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL116_REG	Peripheral clock configuration register	0x0080	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL117_REG	Peripheral clock configuration register	0x0084	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL118_REG	Peripheral clock configuration register	0x0088	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL119_REG	Peripheral clock configuration register	0x008C	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL120_REG	Peripheral clock configuration register	0x0090	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL20_REG	Peripheral clock configuration register	0x0094	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL21_REG	Peripheral clock configuration register	0x0098	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL22_REG	Peripheral clock configuration register	0x009C	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL23_REG	Peripheral clock configuration register	0x00A0	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL24_REG	Peripheral clock configuration register	0x00A4	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL25_REG	Peripheral clock configuration register	0x00A8	R/W
HP_SYS_CLKRST_PERI_CLK_CTRL26_REG	Peripheral clock configuration register	0x00AC	R/W
DPA clock configuration register			
HP_SYS_CLKRST_DPA_CTRL0_REG	DPA clock configuration register	0x00B8	R/W
Analog PLL calibration configuration register			
HP_SYS_CLKRST_ANA_PLL_CTRL0_REG	Analog PLL calibration configuration register	0x00BC	varies
Peripheral reset register			
HP_SYS_CLKRST_HP_RST_EN0_REG	Peripheral reset register 0	0x00C0	R/W
HP_SYS_CLKRST_HP_RST_EN1_REG	Peripheral reset register 1	0x00C4	R/W
HP_SYS_CLKRST_HP_RST_EN2_REG	Peripheral reset register 2	0x00C8	R/W
HP_SYS_CLKRST_HP_FORCE_NORST0_REG	Peripheral reset disable register register 0	0x00CC	R/W
HP_SYS_CLKRST_HP_FORCE_NORST1_REG	Peripheral reset disable register register 1	0x00D0	R/W
HP CPU WDT reset configuration register			
HP_SYS_CLKRST_HPWDT_CORE0_RST_CTRL0_REG	HP CPU0 WDT reset configuration register	0x00D4	R/W
HP_SYS_CLKRST_HPWDT_CORE1_RST_CTRL0_REG	HP CPU1 WDT reset configuration register	0x00D8	R/W
HP_SYS_CLKRST_HPCORE_WDT_RESET_SOURCE0_REG	HP CPU WDT reset source configuration register	0x00EC	R/W
CPU clock status register			
HP_SYS_CLKRST_CPU_SRC_FREQ0_REG	CPU source clock frequency register	0x00DC	RO
HP_SYS_CLKRST_CPU_CLK_STATUS0_REG	CPU clock status register	0x00E0	RO
WAITI Signal Control Register			
HP_SYS_CLKRST_CPU_WAITI_CTRL0_REG	WAITI signal control resister	0x00F4	R/W

11.4.2 LP Always on Clock and Reset (LP_CLKRST) Register Summary

The addresses in this section are relative to LP_CLKRST base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Configuration registers			
LP_CLKRST_LP_CLK_CONF_REG	LP root clock configuration register	0x0000	R/W
LP_CLKRST_LP_CLK_EN_REG	LP always on peripheral clock configuration register	0x0008	R/W
LP_CLKRST_LP_RST_EN_REG	LP always on peripheral reset configuration register	0x000C	R/W
LP_CLKRST_RESET_CAUSE_REG	HP CPU and LP CPU reset cause register	0x0010	varies
LP_CLKRST_HPCPU_RESET_CTRL0_REG	HP CPU reset configuration register 0	0x0014	varies
LP_CLKRST_HPCPU_RESET_CTRL1_REG	HP CPU reset configuration register 1	0x0018	R/W
LP_CLKRST_FOSC_CNTL_REG	RC_FAST_CLK frequency configuration register	0x001C	R/W
LP_CLKRST_XTAL32K_REG	XTAL32K_CLK configuration register	0x0030	R/W
LP_CLKRST_HP_CLK_CTRL_REG	HP clock control register	0x0040	R/W
LP_CLKRST_HP_USB_CLKRST_CTRL0_REG	USB clock and reset control register 0	0x0044	R/W
LP_CLKRST_HP_USB_CLKRST_CTRL1_REG	USB clock and reset control register 1	0x0048	R/W
LP_CLKRST_HP_SDMMC_EMAC_RST_CTRL_REG	SDMMC and EMAC reset control register	0x004C	R/W
Version register			
LP_CLKRST_DATE_REG	Version control register	0x03FC	R/W

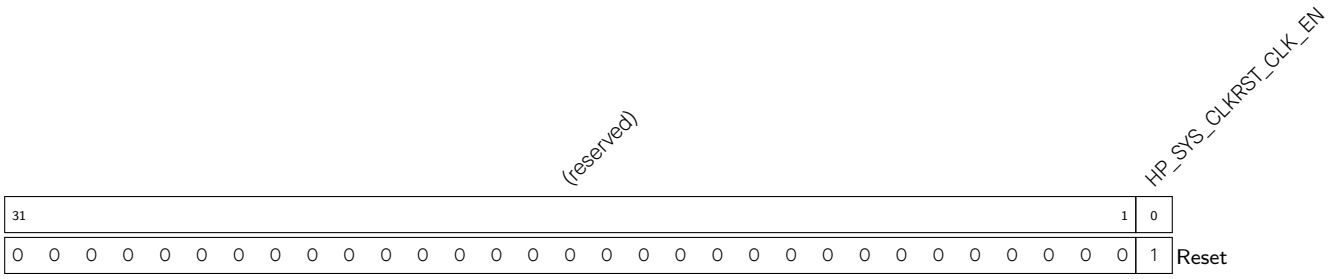
11.4.3 LP Peripheral Clock and Reset (LPPERI) Register Summary

The addresses in this section are relative to LPPERI base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Configuration registers			
LPPERI_CLK_EN_REG	LP peripheral bus clock configuration register	0x0000	R/W
LPPERI_CORE_CLK_SEL_REG	LP peripheral function clock configuration register	0x0004	R/W
LPPERI_RESET_EN_REG	LP peripheral reset configuration register	0x0008	varies
LPPERI_CPU_REG	LP CPU access configuration register	0x000C	R/W
LPPERI_MEM_CTRL_REG	LP UART miscellaneous control register	0x0028	varies
LPPERI_ADC_CTRL_REG	LP ADC clock configuration register	0x002C	R/W
LPPERI_LP_I2S_RXCLK_DIV_NUM_REG	LP I2S RX clock configuration register	0x0030	R/W
LPPERI_LP_I2S_RXCLK_DIV_XYZ_REG	LP I2S RX clock configuration register	0x0034	R/W
Version register			

Name	Description	Address	Access
LPPERI_DATE_REG	Version control register	0x03FC	R/W



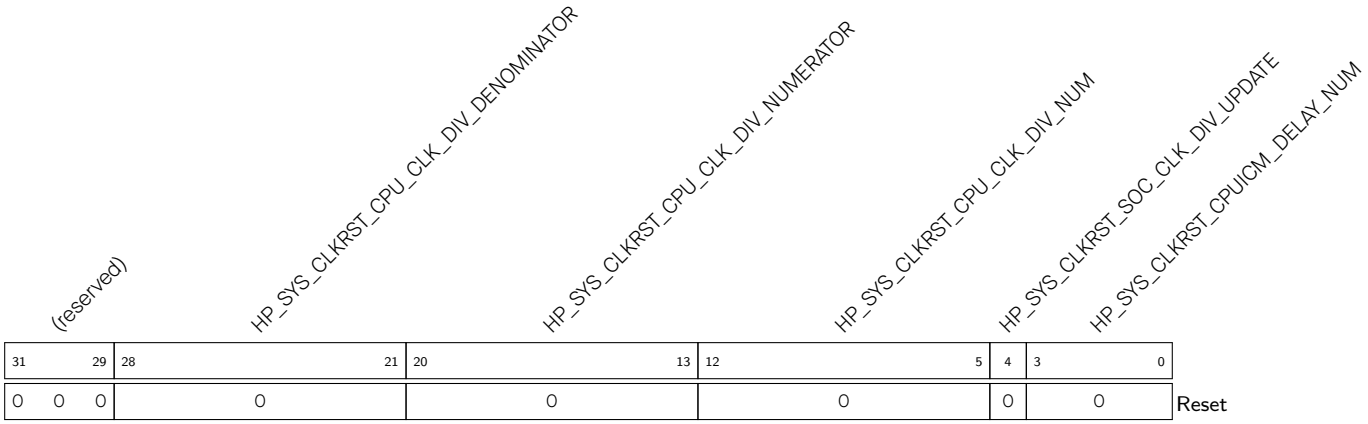
11.5 Registers

11.5.1 Reset and Clock (HP_SYS_CLKRST) Registers

The addresses in this section are relative to HP_SYS_CLKRST base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

For how to program reserved fields, please refer to Section Programming Reserved Register Field.

Register 11.1. HP_SYS_CLKRST_CLK_EN0_REG (0x0000)



HP_SYS_CLKRST_CLK_EN Configures resister clock gating.

0: Support clock only when application writes registers

1: Force on clock gating for registers

(R/W)

Register 11.2. HP_SYS_CLKRST_ROOT_CLK_CTRL0_REG (0x0004)

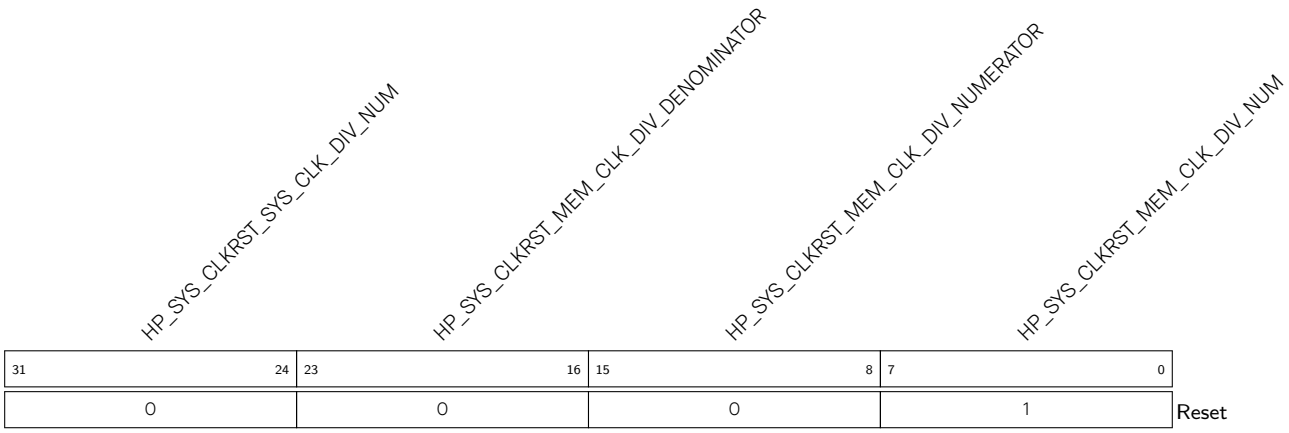
HP_SYS_CLKRST_CPUICM_DELAY_NUM Configures the time required from entering WFI mode to the actual shutdown of the CPU clock.

Measurement unit: clock cycles. (R/W)

HP_SYS_CLKRST_SOC_CLK_DIV_UPDATE Configures whether to update the divisors for CPU_CLK, MEM_CLK, SYS_CLK, APB_CLK.

0: Not update

1: Update



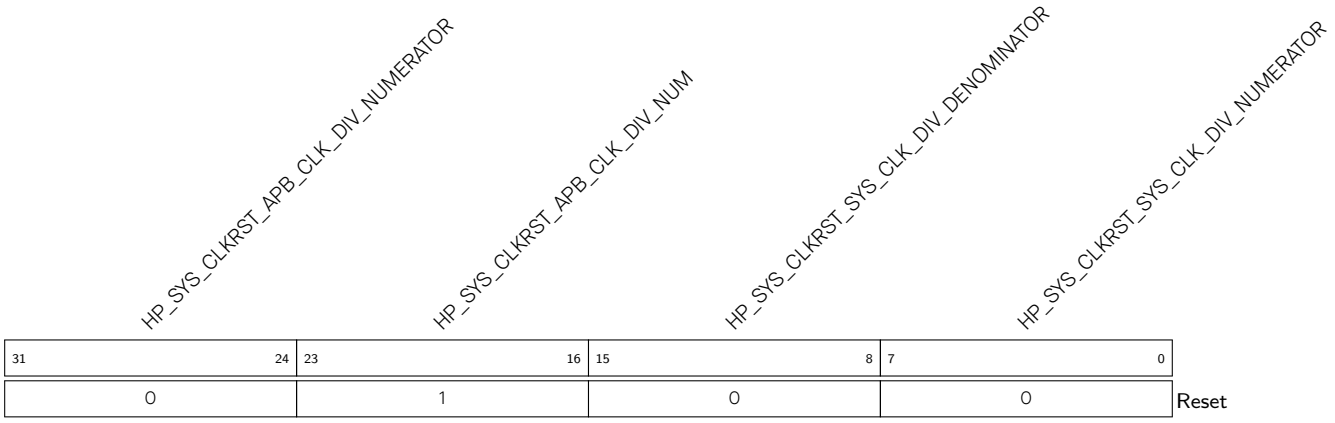
(WT)

HP_SYS_CLKRST_CPU_CLK_DIV_NUM Configures the integer part of the CPU_CLK clock divisor. (R/W)

HP_SYS_CLKRST_CPU_CLK_DIV_NUMERATOR Configures the numerator of the divisor's fractional part for CPU_CLK. (R/W)

HP_SYS_CLKRST_CPU_CLK_DIV_DENOMINATOR Configures the denominator of the divisor's fractional part for CPU_CLK. (R/W)

Register 11.3. HP_SYS_CLKRST_ROOT_CLK_CTRL1_REG (0x0008)



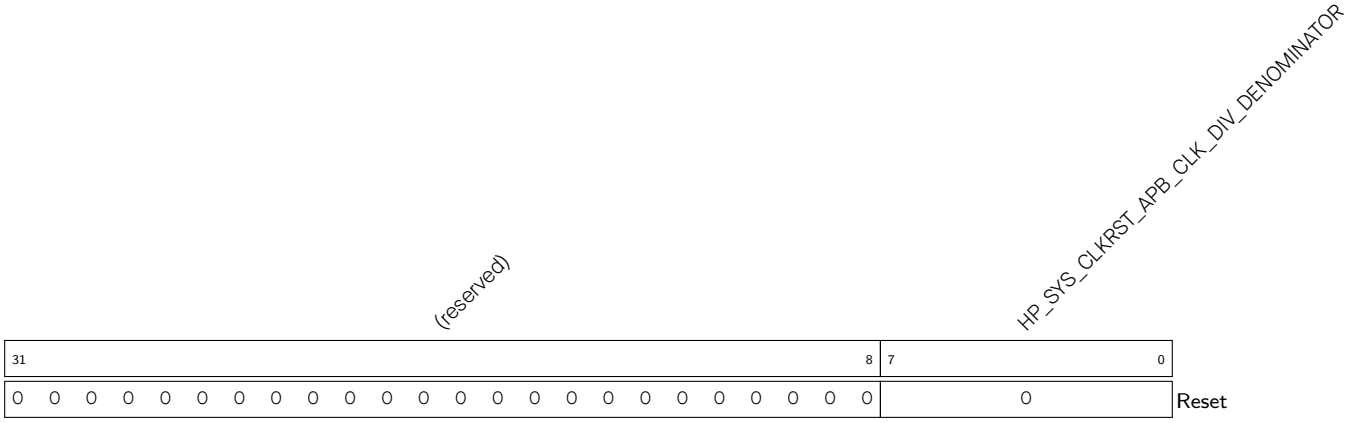
HP_SYS_CLKRST_MEM_CLK_DIV_NUM Configures the integer part of the MEM_CLK clock divisor. (R/W)

HP_SYS_CLKRST_MEM_CLK_DIV_NUMERATOR Configures the numerator of the divisor's fractional part for MEM_CLK. (R/W)

HP_SYS_CLKRST_MEM_CLK_DIV_DENOMINATOR Configures the denominator of the divisor's fractional part for MEM_CLK . (R/W)

HP_SYS_CLKRST_SYS_CLK_DIV_NUM Configures the integer part of the SYS_CLK clock divisor. (R/W)

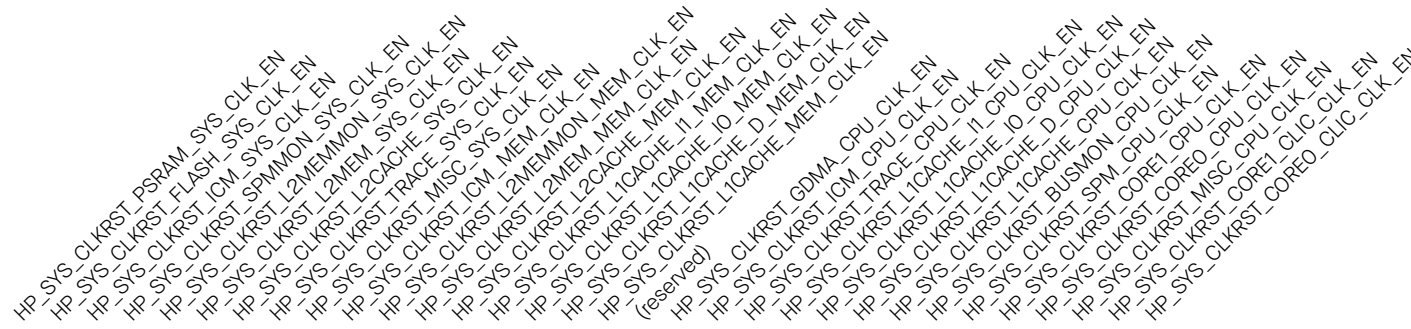
Register 11.4. HP_SYS_CLKRST_ROOT_CLK_CTRL2_REG (0x000C)



HP_SYS_CLKRST_SYS_CLK_DIV_NUMERATOR Configures the numerator of the divisor's fractional part for SYS_CLK. (R/W)

HP_SYS_CLKRST_SYS_CLK_DIV_DENOMINATOR Configures the denominator of the divisor's fractional part for SYS_CLK. (R/W)

HP_SYS_CLKRST_APB_CLK_DIV_NUM Configures the integer part of the APB_CLK fclock divisor. (R/W)



HP_SYS_CLKRST_APB_CLK_DIV_NUMERATOR Configures the numerator of the divisor's fractional part for APB_CLK. (R/W)

Register 11.5. HP_SYS_CLKRST_ROOT_CLK_CTRL3_REG (0x0010)

HP_SYS_CLKRST_APB_CLK_DIV_DENOMINATOR Configures the denominator of the divisor's fractional part for APB_CLK. (R/W)

Register 11.6. HP_SYS_CLKRST_SOC_CLK_CTRL0_REG (0x0014)

31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
1	1	1	0	0	1	1	0	1	1	0	1	1	1	1	1	1	0	0	1	0	1	1	1	1	0	1	0	1	1	1	1	Reset

HP_SYS_CLKRST_COREO_CLIC_CLK_EN Configures whether to enable the bus clock of HP CPU0 CLIC.

0: Disable

1: Enable

(R/W)

HP_SYS_CLKRST_CORE1_CLIC_CLK_EN Configures whether to enable the bus clock of HP CPU1 CLIC.

0: Disable

1: Enable

(R/W)

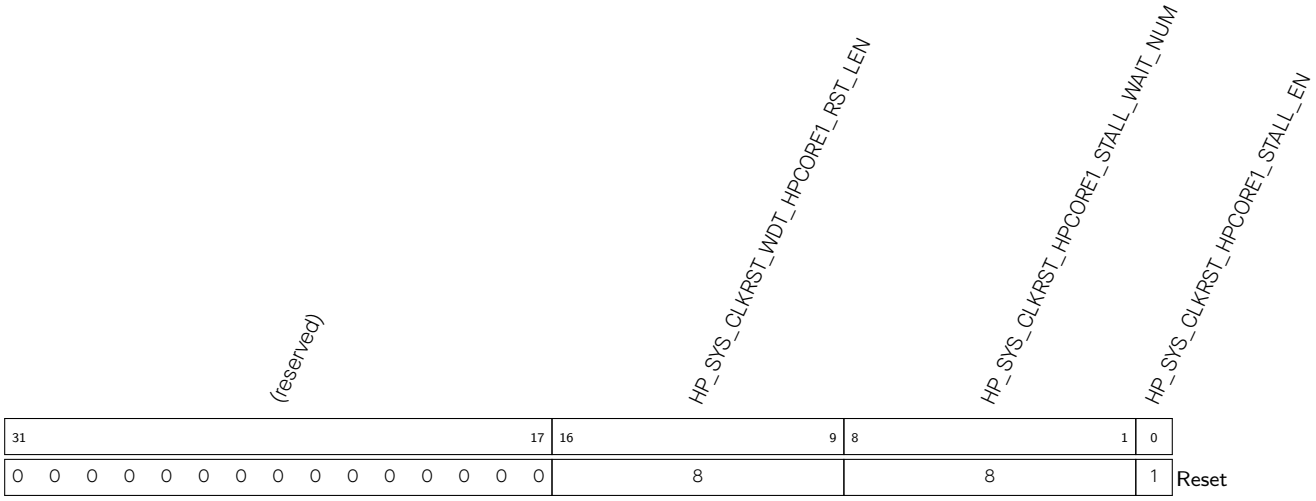
Register 11.53. HP_SYS_CLKRST_HPWDT_CORE0_RST_CTRL0_REG (0x00D4)

HP_SYS_CLKRST_HPCORE0_STALL_EN Configures the behavior when MWDT triggers HP CPU0 reset.

0: Immediately reset HP CPU0

1: Stall HP CPU0 first

(R/W)



HP_SYS_CLKRST_HPCORE0_STALL_WAIT_NUM Configures the duration of HP CPU0 stall when MWDT triggers HP CPU0 reset and HP_SYS_CLKRST_HPCORE0_STALL_EN is set to 1.

Measurement unit: Clock cycles. (R/W)

HP_SYS_CLKRST_WDT_HPCORE0_RST_LEN Configures the duration of the reset when MWDT triggers HP CPU0 reset.

Measurement unit: Clock cycles. (R/W)

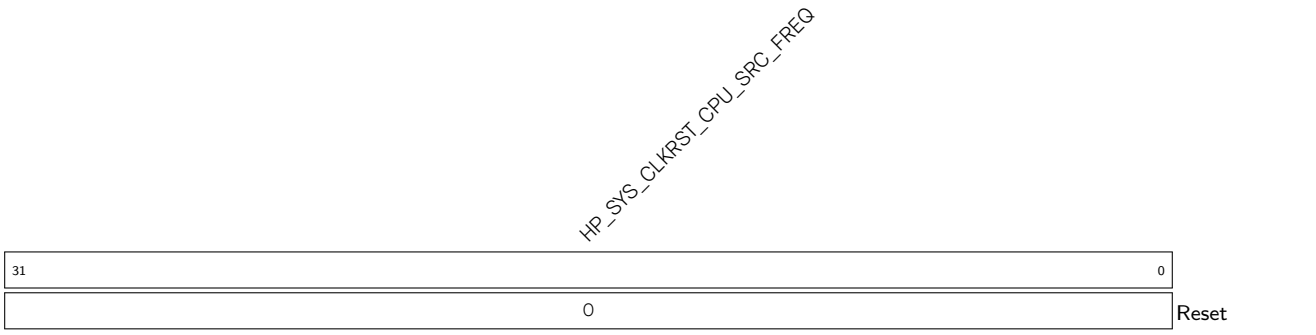
Register 11.54. HP_SYS_CLKRST_HPWDT_CORE1_RST_CTRL0_REG (0x00D8)

HP_SYS_CLKRST_HPCORE1_STALL_EN Configures the behavior when MWDT triggers HP CPU1 reset.

0: Immediately reset HP CPU1

1: Stall HP CPU1 first

(R/W)



HP_SYS_CLKRST_HPCORE1_STALL_WAIT_NUM Configures the duration of HP CPU1 stall when MWDT triggers HP CPU1 reset and HP_SYS_CLKRST_HPCORE1_STALL_EN is set to 1.

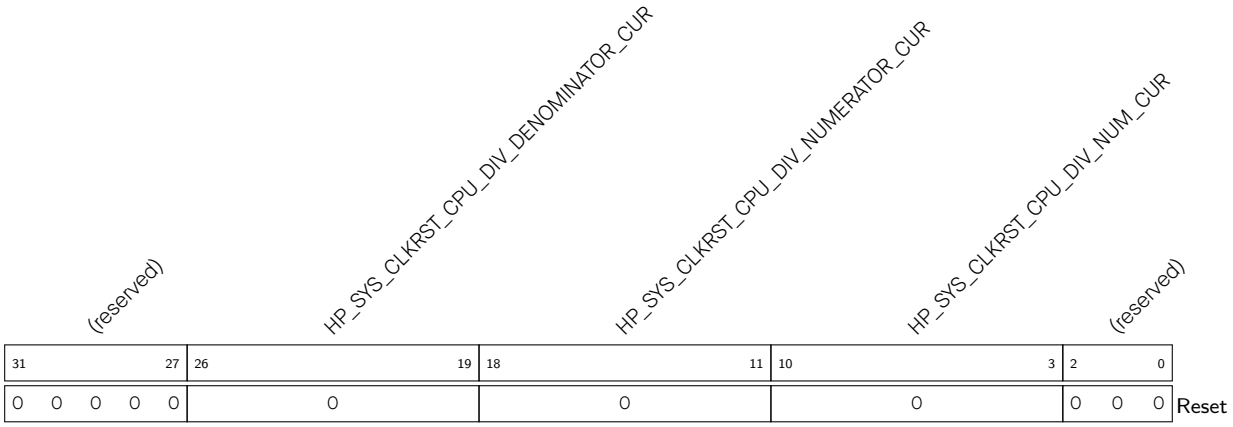
Measurement unit: Clock cycles. (R/W)

HP_SYS_CLKRST_WDT_HPCORE1_RST_LEN Configures the duration of the reset when MWDT triggers HP CPU1 reset.

Measurement unit: Clock cycles. (R/W)

Register 11.55. HP_SYS_CLKRST_CPU_SRC_FREQ0_REG (0x00DC)

HP_SYS_CLKRST_CPU_SRC_FREQ Represents the CPU source clock frequency.



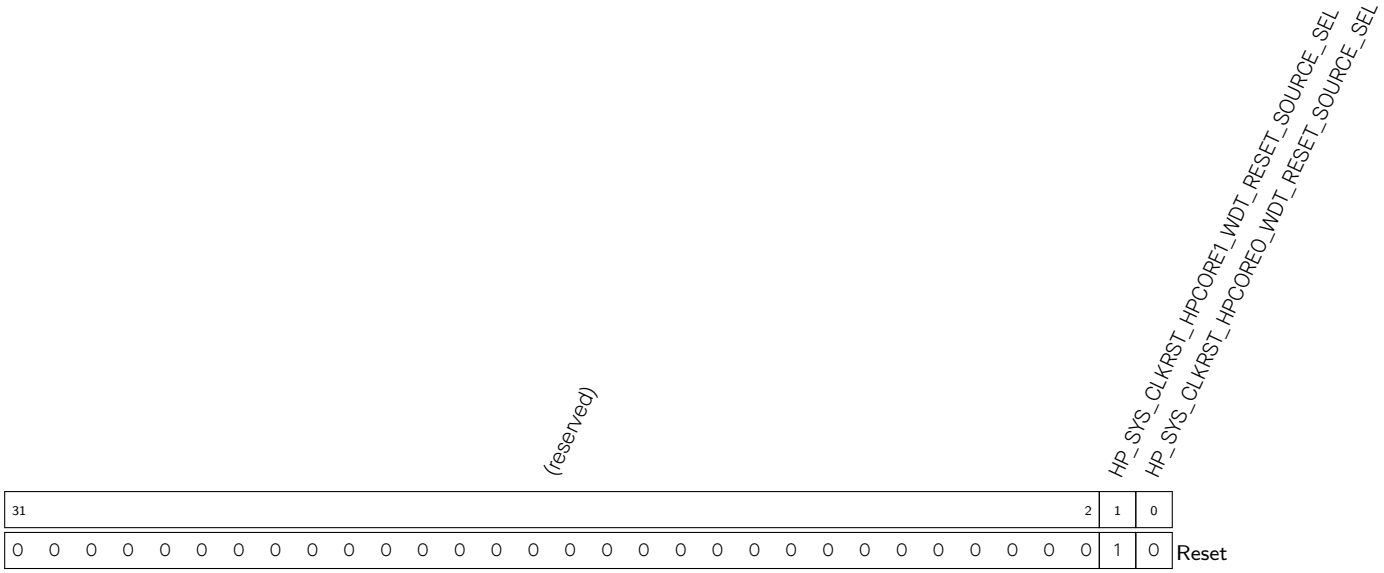
80: RC_FAST_CLK

160: XTAL_CLK

1600: CPLL_CLK

(RO)

Register 11.56. HP_SYS_CLKRST_CPU_CLK_STATUS0_REG (0x00E0)



HP_SYS_CLKRST_CPU_DIV_NUM_CUR Represents the integer part of the current CPU_CLK clock divisor. (RO)

HP_SYS_CLKRST_CPU_DIV_NUMERATOR_CUR Represents the current numerator of the divisor's fractional part for the CPU_CLK. (RO)

HP_SYS_CLKRST_CPU_DIV_DENOMINATOR_CUR Represents the current denominator of the divisor's fractional part for the CPU_CLK. (RO)

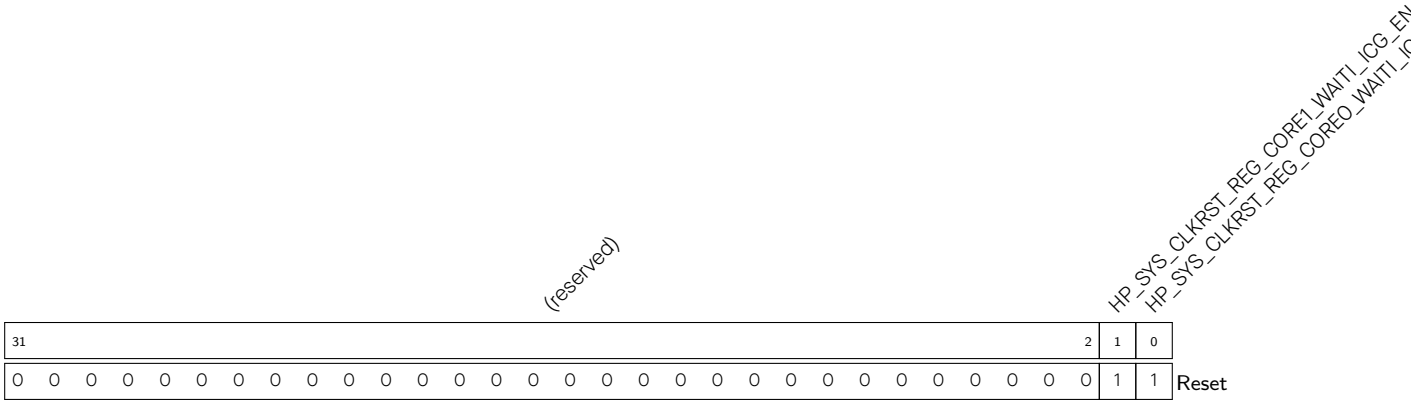
Register 11.57. HP_SYS_CLKRST_HPCORE_WDT_RESET_SOURCE0_REG (0x00EC)

HP_SYS_CLKRST_HPCORE0_WDT_RESET_SOURCE_SEL Configures the MWDT used to trigger the HP CPU0 reset.

0: MWDT0

1: MWDT1

(R/W)



HP_SYS_CLKRST_HPCORE1_WDT_RESET_SOURCE_SEL Configures the MWDT used to trigger the HP CPU1 reset.

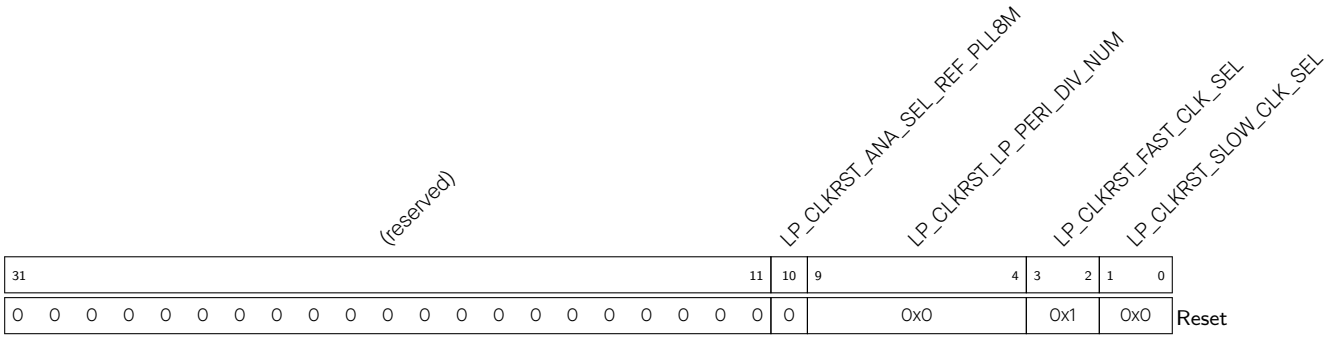
0: MWDT0

1: MWDT1

(R/W)

Register 11.58. HP_SYS_CLKRST_CPU_WAITI_CTRL0_REG (0x00F4)

HP_SYS_CLKRST_REG_CORE0_WAITI_ICG_EN Configures whether CPU Core0's WAITI signal is used to control the clock gate. 0: Do not use the WAITI signal to control the clock gate. 1: Use the WAITI signal to control the clock gate. If this bit is set for both Core0 and Core1, the related clock is gated only when both Core0's and Core1's WAITI signals are active. (R/W)



HP_SYS_CLKRST_REG_CORE1_WAITI_ICG_EN Configures whether CPU Core1's WAITI signal is used to control the clock gate. 0: Do not use the WAITI signal to control the clock gate. 1: Use the WAITI signal to control the clock gate. If this bit is set for both Core0 and Core1, the related clock is gated only when both Core0's and Core1's WAITI signals are active. (R/W)

11.5.2 LP Always on Clock and Reset (LP_CLKRST) Registers

The addresses in this section are relative to LP_CLKRST base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

For how to program reserved fields, please refer to Section Programming Reserved Register Field.

Register 11.59. LP_CLKRST_LP_CLK_CONF_REG (0x0000)

LP_CLKRST_SLOW_CLK_SEL Configures the clock source of LP_SLOW_CLK.

0: RC_SLOW_CLK

1: XTAL32K_CLK

2: Invalid

3: OSC_SLOW_CLK

(R/W)

LP_CLKRST_FAST_CLK_SEL Configures the clock source of LP_FAST_CLK.

0: RC_FAST_CLK

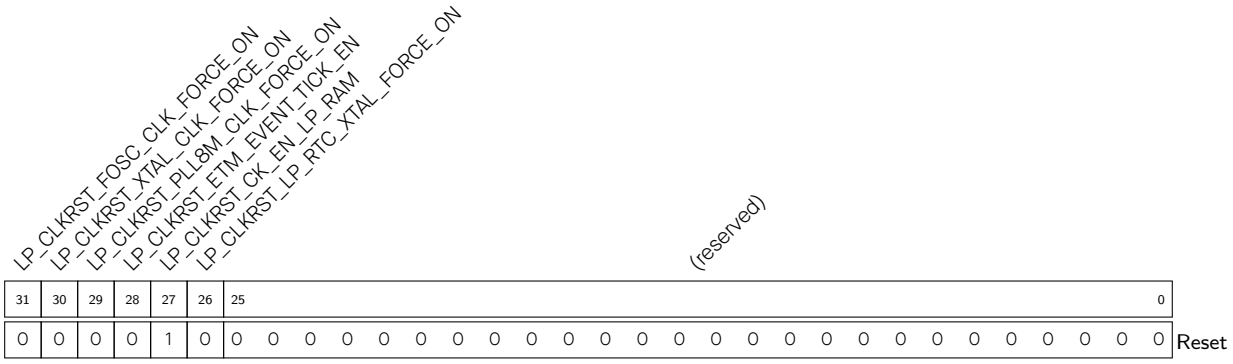
1: XTAL_CLK

2: PLL_LP_CLK

3: Invalid

(R/W)

LP_CLKRST_LP_PERI_DIV_NUM Configures the clock divisor for LP_PERI_CLK. (R/W)



LP_CLKRST_ANA_SEL_REF_PLL8M Configures the reference clock of PLL_LP_CLK.

0: Invalid

1: XTAL32K_CLK

(R/W)

Register 11.60. LP_CLKRST_LP_CLK_EN_REG (0x0008)

LP_CLKRST_LP_RTC_XTAL_FORCE_ON Configures whether to force on the XTAL_CLK control of LP CALI.

0: Controlled by hardware

1: Force on, bypassing hardware control

(R/W)

LP_CLKRST_CK_EN_LP_RAM Configurewhether to enable the clock of LP RAM.

0: Disable

1: Enable

(R/W)

LP_CLKRST_ETM_EVENT_TICK_EN Configures whether to enable the ETM event timer.

0: Disable

1: Enable

(R/W)

LP_CLKRST_PLL8M_CLK_FORCE_ON Configures whether to force on PLL_LP_CLK as LP_FAST_CLK source.

0: Controlled by hardware

1: Force on, bypassing hardware control

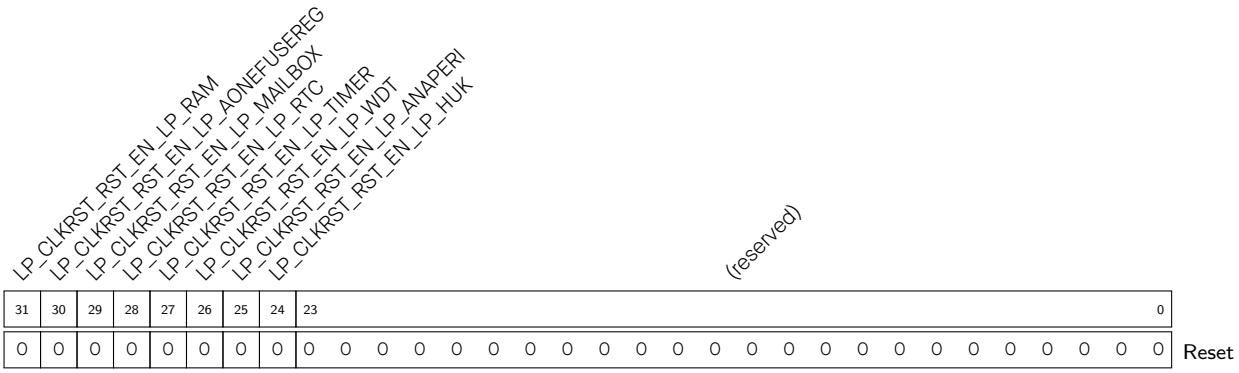
(R/W)

LP_CLKRST_XTAL_CLK_FORCE_ON Configures whether to force on XTAL_CLK as LP_FAST_CLK source.

0: Controlled by hardware

1: Force on, bypassing hardware control

(R/W)



LP_CLKRST_FOSC_CLK_FORCE_ON Configures whether to force on RC_FAST_CLK as LP_FAST_CLK source.

0: Controlled by hardware

1: Force on, bypassing hardware control

(R/W)

Register 11.61. LP_CLKRST_LP_RST_EN_REG (0x000C)

LP_CLKRST_RST_EN_LP_HUK Configures whether to reset LP HUK.

0: Release from reset

1: Reset

(R/W)

LP_CLKRST_RST_EN_LP_ANAPERI Configures whether to reset LP analog peripherals.

0: Release from reset

1: Reset

(R/W)

LP_CLKRST_RST_EN_LP_WDT Configures whether to reset RWDT.

0: Release from reset

1: Reset

(R/W)

LP_CLKRST_RST_EN_LP_TIMER Configures whether to reset LP timer.

0: Release from reset

1: Reset

(R/W)

LP_CLKRST_RST_EN_LP_RTC Configures whether to reset the LP clock calibration module.

0: Release from reset

1: Reset

(R/W)

LP_CLKRST_RST_EN_LP_MAILBOX Configures whether to reset LP Mailbox.

0: Release from reset

1: Reset

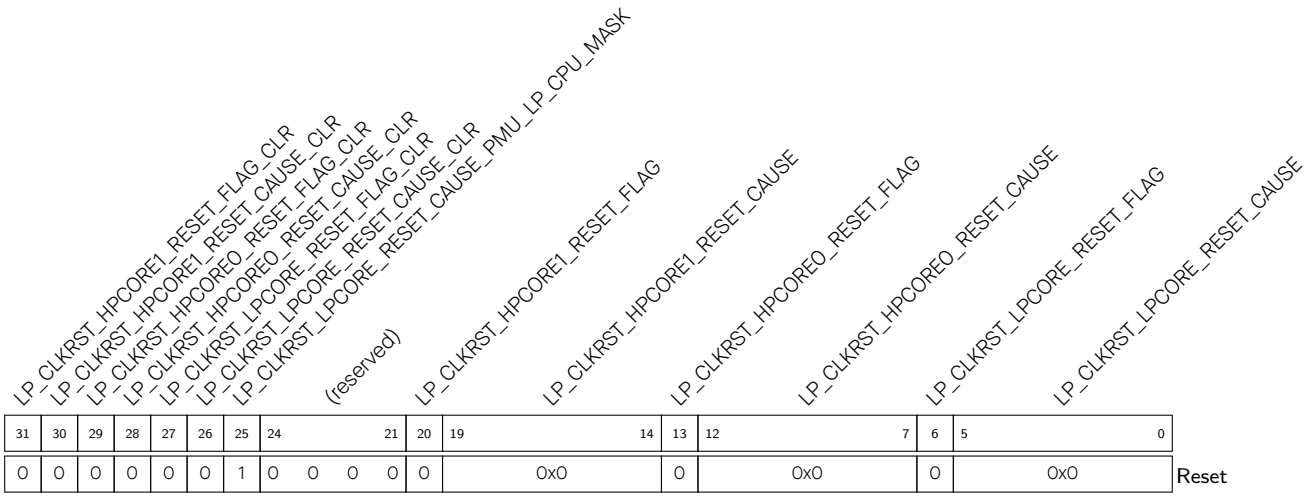
(R/W)

LP_CLKRST_RST_EN_LP_AONEFUSEREG Configures whether to reset LP eFuse.

0: Release from reset

1: Reset

(R/W)



LP_CLKRST_RST_EN_LP_RAM Configures whether to reset LP RAM.

0: Release from reset

1: Reset

(R/W)

Register 11.62. LP_CLKRST_RESET_CAUSE_REG (0x0010)

LP_CLKRST_LPCORE_RESET_CAUSE Represents the reset source of LP CPU.

0x01: Chip reset
0x09: PMU LP Peripheral reset
0x0A: PMU LP CPU reset
0x0F: Brown-out system reset
0x10: RWDT system reset
0x12: Super watchdog reset
0x13: Power glitch reset
0x14: Software LP CPU reset
(RO)

LP_CLKRST_LPCORE_RESET_FLAG Represents the reset flag of LP CPU.

0: Not reset
1: Reset
(RO)

Register 11.62. LP_CLKRST_RESET_CAUSE_REG (0x0010)

Continued from the previous page...

LP_CLKRST_HPCORE0_RESET_CAUSE Represents the reset source of HP CPU0.

0x01: Chip reset
0x03: Software system reset
0x05: PMU core reset
0x07: MWDT core reset
0x09: RWDT core reset
0x0B: MWDT CPU reset
0x0C: Software CPU reset
0x0D: RWDT CPU reset
0x0F: Brown-out system reset
0x10: RWDT system reset
0x12: Super watchdog reset
0x13: Power glitch reset
0x14: eFuse reset
0x16: USB (JTAG) reset
0x17: USB (UART) reset
0x18: JTAG CPU reset
0x1A: Lockup reset
0x1B: PSDET reset
(RO)

LP_CLKRST_HPCORE0_RESET_FLAG Represents the reset flag of HP CPU0.

0: Not reset
1: Reset
(RO)

Continued on the next page...

Register 11.62. LP_CLKRST_RESET_CAUSE_REG (0x0010)

Continued from the previous page...

LP_CLKRST_HPCORE1_RESET_CAUSE Represents the reset source of HP CPU1.

0x01: Chip reset
0x03: Software system reset
0x05: PMU core reset
0x07: MWDT core reset
0x09: RWDT core reset
0x0B: MWDT CPU reset
0x0C: Software CPU reset
0x0D: RWDT CPU reset
0x0F: Brown-out system reset
0x10: RWDT system reset
0x12: Super watchdog reset
0x13: Power glitch reset
0x14: eFuse reset
0x16: USB (JTAG) reset
0x17: USB (UART) reset
0x18: JTAG CPU reset
0x1A: Lockup reset
(RO)

LP_CLKRST_HPCORE1_RESET_FLAG Represents the reset flag of HP CPU1.

0: Not reset
1: Reset
(RO)

LP_CLKRST_LPCORE_RESET_CAUSE_PMU_LP_CPU_MASK Configures whether to mask the reset source code 0x0A of PMU LP CPU reset.

0: Not mask
1: Mask
(R/W)

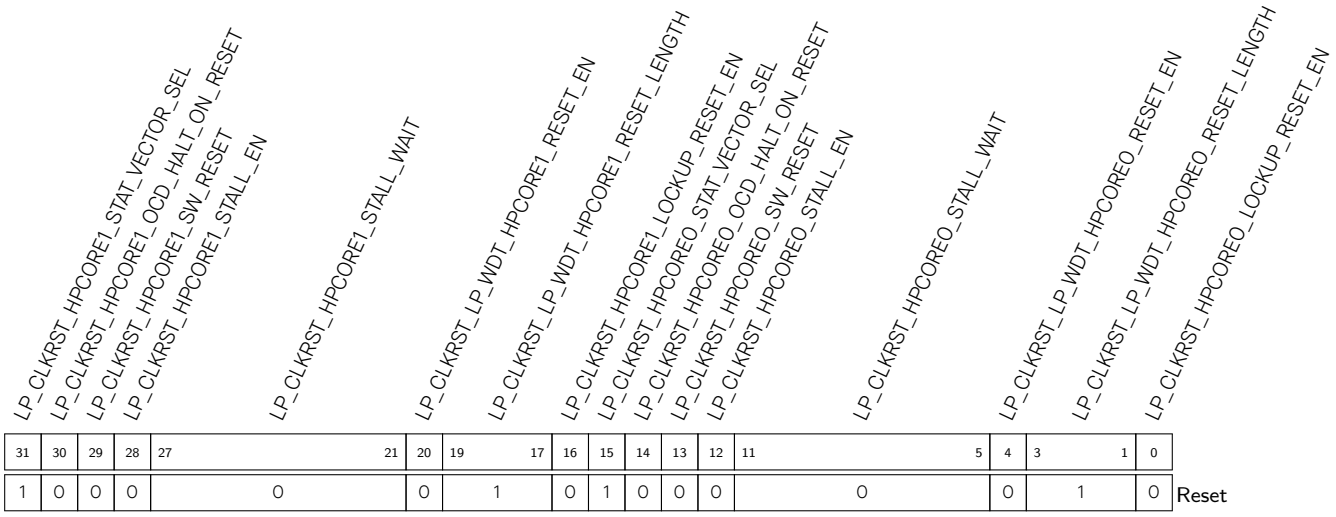
Continued on the next page...

Register 11.62. LP_CLKRST_RESET_CAUSE_REG (0x0010)

Continued from the previous page...

LP_CLKRST_LPCORE_RESET_CAUSE_CLR Write 1 to clear LP_CLKRST_LPCORE_RESET_CAUSE. (WT)

LP_CLKRST_LPCORE_RESET_FLAG_CLR Write 1 to clear LP_CLKRST_LPCORE_RESET_FLAG. (WT)



LP_CLKRST_HPCORE0_RESET_CAUSE_CLR Write 1 to clear LP_CLKRST_HPCORE0_RESET_CAUSE. (WT)

LP_CLKRST_HPCORE0_RESET_FLAG_CLR Write 1 to clear LP_CLKRST_HPCORE0_RESET_FLAG. (WT)

LP_CLKRST_HPCORE1_RESET_CAUSE_CLR Write 1 to clear LP_CLKRST_HPCORE1_RESET_CAUSE. (WT)

LP_CLKRST_HPCORE1_RESET_FLAG_CLR Write 1 to clear LP_CLKRST_HPCORE1_RESET_FLAG. (WT)

Register 11.63. LP_CLKRST_HPCPU_RESET_CTRL0_REG (0x0014)

LP_CLKRST_HPCORE0_LOCKUP_RESET_EN Configures whether to enable Lockup to trigger HP CPU0 reset.
0: Disable
1: Enable
(R/W)

LP_CLKRST_LP_WDT_HPCORE0_RESET_LENGTH Configures the duration of the reset when RWDT and software trigger HP CPU0 reset.
Measurement unit: Clock cycles. (R/W)

LP_CLKRST_LP_WDT_HPCORE0_RESET_EN Configures whether to enable RWDT to trigger HP CPU0 reset.
0: Disable
1: Enable
(R/W)

LP_CLKRST_HPCORE0_STALL_WAIT Configures the time HP CPU0 stalls when RWDT and software trigger HP CPU0 reset.
Measurement unit: Clock cycles. (R/W)

LP_CLKRST_HPCORE0_STALL_EN Configures the behavior when RWDT and software trigger HP CPU0 reset.
0: Immediately reset HP CPU0
1: Stall HP CPU0 first
(R/W)

LP_CLKRST_HPCORE0_SW_RESET Write 1 to trigger HP CPU0 software reset. (WT)

LP_CLKRST_HPCORE0_OCD_HALT_ON_RESET Configures whether HP CPU0 halts at the first instruction after released from reset.
0: No halt
1: Halt
(R/W)

Continued on the next page...

Register 11.63. LP_CLKRST_HPCPU_RESET_CTRL0_REG (0x0014)

Continued from the previous page...

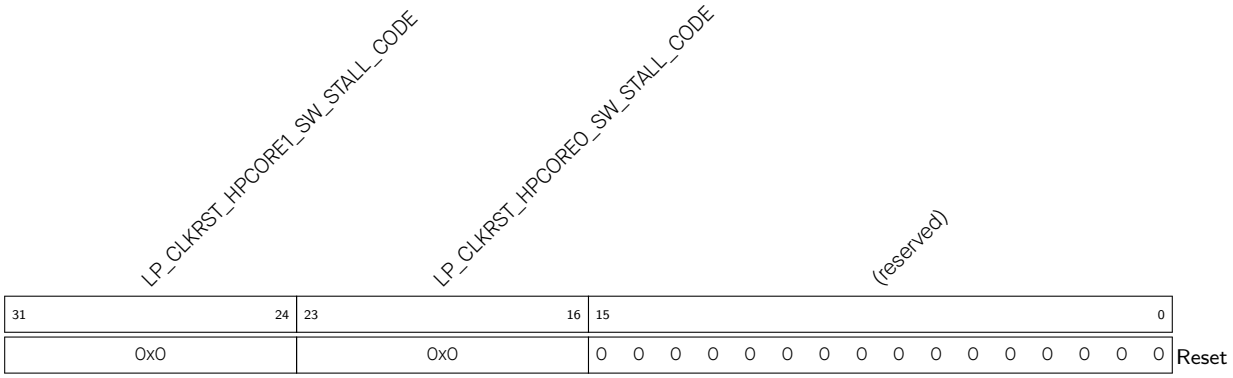
LP_CLKRST_HPCORE0_STAT_VECTOR_SEL Configures the address from which the HP CPU0 starts.
0: From LP SPM RAM (0x50108000)
1: From HP SPM ROM (0x4FC00000)
(R/W)

LP_CLKRST_HPCORE1_LOCKUP_RESET_EN Configures whether to enable Lockup to trigger HP CPU1 reset.
0: Disable
1: Enable
(R/W)

LP_CLKRST_LP_WDT_HPCORE1_RESET_LENGTH Configures the duration of the reset when RWDT and software trigger HP CPU1 reset.
Measurement unit: Clock cycles. (R/W)

LP_CLKRST_LP_WDT_HPCORE1_RESET_EN Configures whether to enable RWDT to trigger HP CPU1 reset.
0: Disable
1: Enable
(R/W)

LP_CLKRST_HPCORE1_STALL_WAIT Configures the time HP CPU1 stalls when RWDT and software trigger HP CPU1 reset.
Measurement unit: Clock cycles. (R/W)

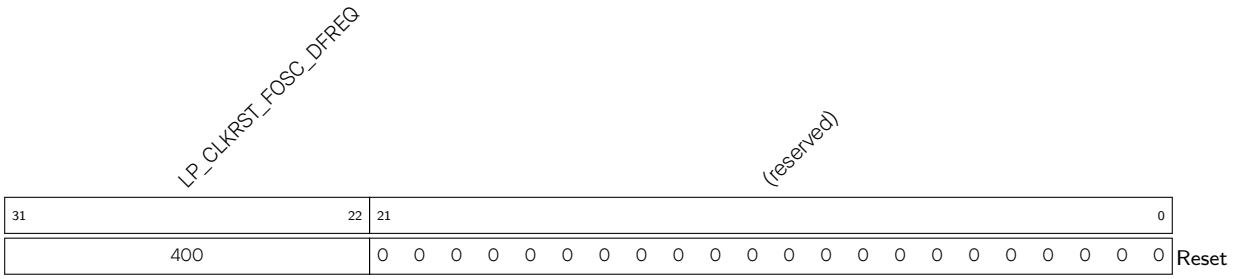


LP_CLKRST_HPCORE1_STALL_EN Configures the behavior when RWDT and software trigger HP CPU1 reset.
0: Immediately reset HP CPU1
1: Stall HP CPU1 first
(R/W)

LP_CLKRST_HPCORE1_SW_RESET Write 1 to trigger HP CPU1 software reset. (WT)

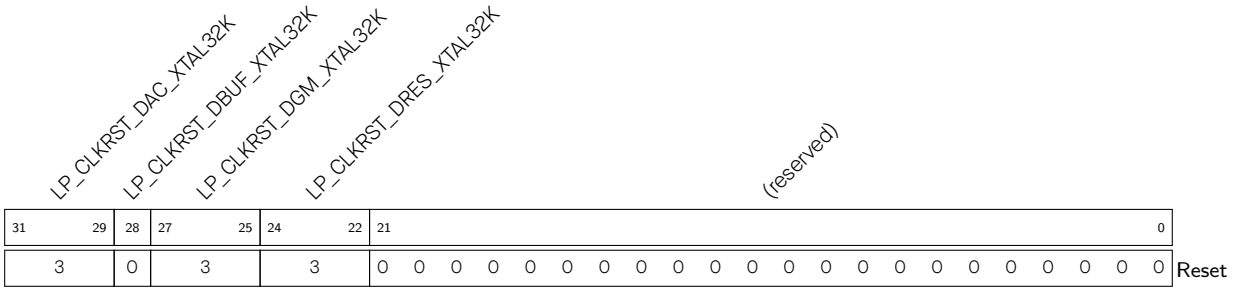
LP_CLKRST_HPCORE1_OCD_HALT_ON_RESET Configures whether HP CPU1 halts at the first instruction after released from reset.
0: No halt
1: Halt
(R/W)

LP_CLKRST_HPCORE1_STAT_VECTOR_SEL Configures the address from which the HP CPU1 starts.
0: From LP SPM RAM (0x50108000)
1: From HP SPM ROM (0x4FC00000)
(R/W)



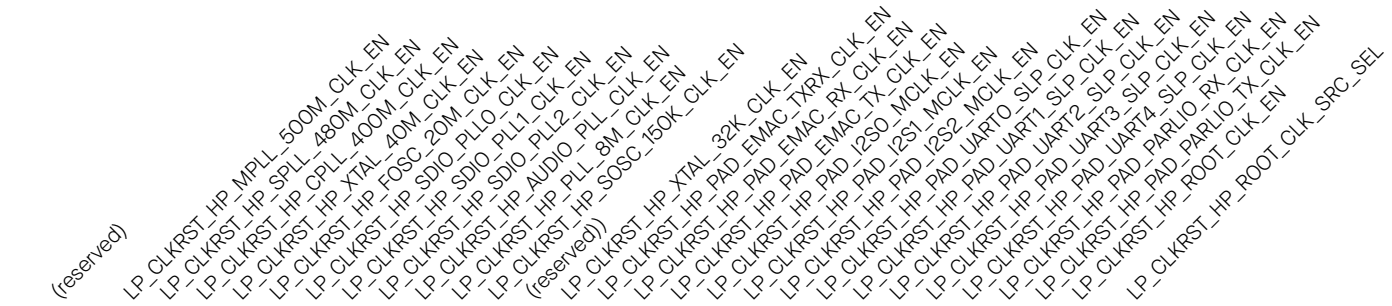
Register 11.64. LP_CLKRST_HPCPU_RESET_CTRL1_REG (0x0018)

LP_CLKRST_HPCORE0_SW_STALL_CODE Configures the threshold for HP CPU0 stall triggered by software. (R/W)



LP_CLKRST_HPCORE1_SW_STALL_CODE Configures the threshold for HP CPU1 stall triggered by software. (R/W)

Register 11.65. LP_CLKRST_FOSC_CNTL_REG (0x001C)



LP_CLKRST_FOSC_DFREQ Configures the frequency of RC_FAST_CLK. (R/W)

Register 11.66. LP_CLKRST_XTAL32K_REG (0x0030)

LP_CLKRST_DAC_XTAL32K
LP_CLKRST_DBUF_XTAL32K

Register 11.70. LP_CLKRST_HP_SDMMC_EMAC_RST_CTRL_REG (0x004C)

LP_CLKRST_RST_EN_SDMMC Configures whether to reset SDMMC.

0: Release from reset

1: Reset

(R/W)

LP_CLKRST_FORCE_NORST_SDMMC Configures whether SDMMC can be reset.

0: Can be reset

1: Force not to be reset

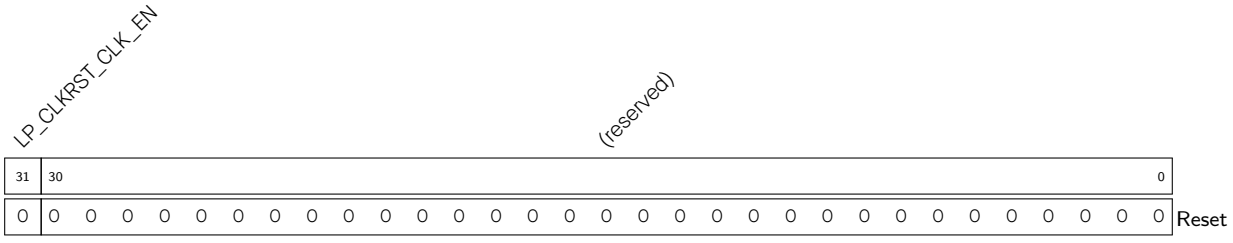
(R/W)

LP_CLKRST_RST_EN_EMAC Configures whether to reset EMAC.

0: Release from reset

1: Reset

(R/W)



LP_CLKRST_FORCE_NORST_EMAC Configures whether EMAC can be reset.

0: Can be reset

1: Force not to be reset

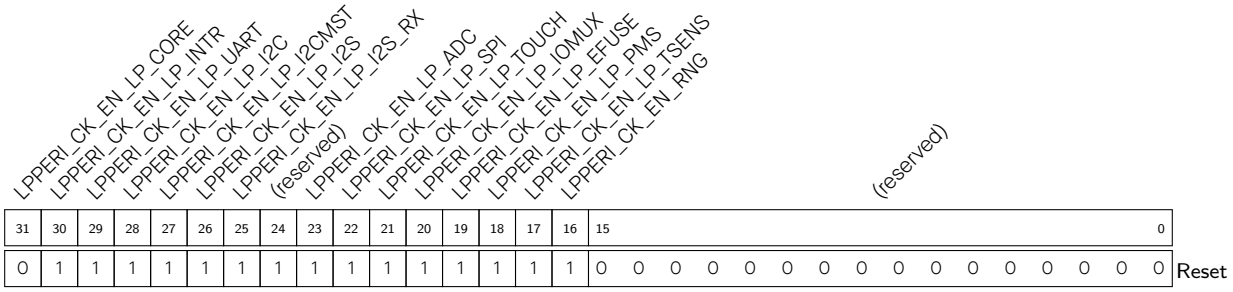
(R/W)

Register 11.71. LP_CLKRST_DATE_REG (0x03FC)

LP_CLKRST_CLK_EN Configures resister clock gating.

0: Support clock only when application writes registers

1: Force on clock gating for registers



(R/W)

11.5.3 LP Peripheral Clock and Reset (LPPERI) Registers

The addresses in this section are relative to LPPERI base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

For how to program reserved fields, please refer to Section Programming Reserved Register Field.

Register 11.72. LPPERI_CLK_EN_REG (0x0000)

LPPERI_CK_EN_RNG Configures whether to enable LP RNG clock.

0: Disable

1: Enable

(R/W)

LPPERI_CK_EN_LP_TSENS Configures whether to enable LP temperature sensor clock.

0: Disable

1: Enable

(R/W)

LPPERI_CK_EN_LP_PMS Configures whether to enable LP PMS clock.

0: Disable

1: Enable

(R/W)

LPPERI_CK_EN_LP_EFUSE Configures whether to enable LP eFuse clock.

0: Disable

1: Enable

(R/W)

LPPERI_CK_EN_LP_IOMUX Configures whether to enable LP IO MUX clock.

0: Disable

1: Enable

(R/W)

LPPERI_CK_EN_LP_TOUCH Configures whether to enable LP touch sensor clock.

0: Disable

1: Enable

(R/W)

LPPERI_CK_EN_LP_SPI Configures whether to enable LP SPI clock.

0: Disable

1: Enable

(R/W)

LPPERI_CK_EN_LP_ADC Configures whether to enable LP ADC clock.

0: Disable

1: Enable

(R/W)

LPPERI_CK_EN_LP_I2S_RX Configures whether to enable LP I2S RX clock.

0: Disable

1: Enable

(R/W)

LPPERI_CK_EN_LP_I2S Configures whether to enable LP I2S clock.

0: Disable

1: Enable

(R/W)

LPPERI_CK_EN_LP_I2CMST Configures whether to enable LP I2C master clock.

0: Disable

1: Enable

(R/W)

LPPERI_CK_EN_LP_I2C Configures whether to enable LP I2C clock.

0: Disable

1: Enable

(R/W)

LPPERI_CK_EN_LP_UART Configures whether to enable LP UART clock.

0: Disable

1: Enable

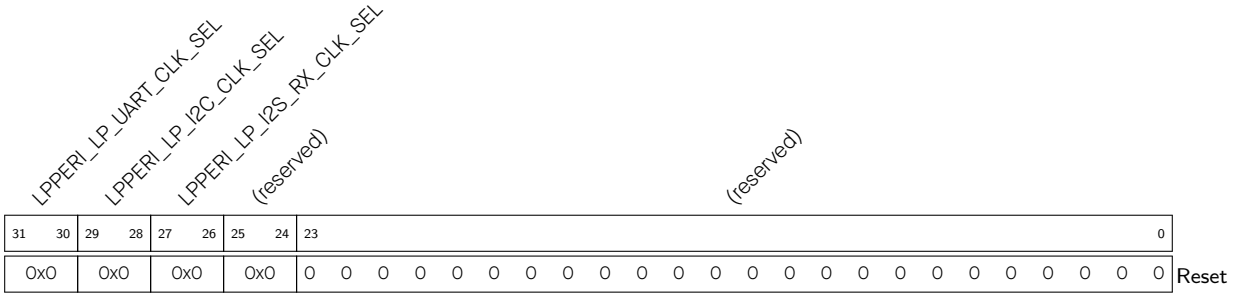
(R/W)

LPPERI_CK_EN_LP_INTR Configures whether to enable LP interrupt matrix clock.

0: Disable

1: Enable

(R/W)



LPPERI_CK_EN_LP_CORE Configures whether to force on LP CPU clock.

0: Controlled by hardware

1: Force on, bypassing hardware control

(R/W)

Register 11.73. LPPERI_CORE_CLK_SEL_REG (0x0004)

LPPERI_LP_I2S_RX_CLK_SEL Configures LP I2S RX clock source.

0: LP_FAST_CLK

1: XTAL_D2_CLK

2: PLL_LP_CLK

3: Invalid

(R/W)

LPPERI_LP_I2C_CLK_SEL Configures LP I2C clock source.

0: LP_FAST_CLK

1: XTAL_D2_CLK

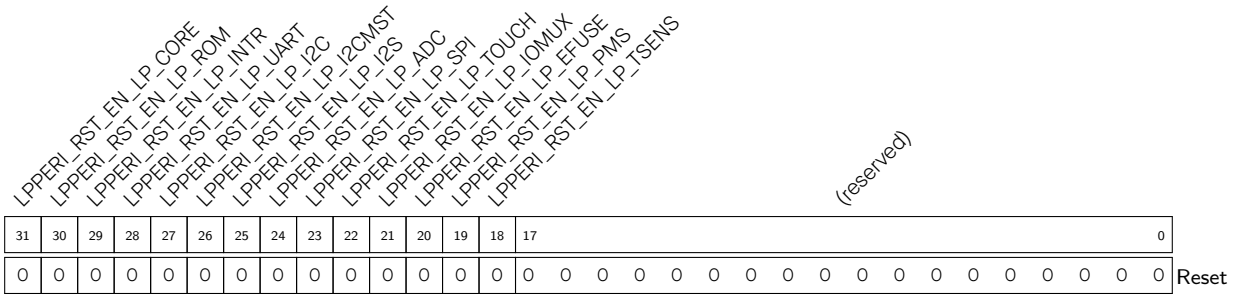
2: PLL_LP_CLK

3: Invalid

(R/W)

LPPERI_LP_UART_CLK_SEL Configures LP UART clock source.

0: RC_FAST_CLK



1: XTAL_D2_CLK

2: PLL_LP_CLK

3: Invalid

(R/W)

Register 11.74. LPPERI_RESET_EN_REG (0x0008)

LPPERI_RST_EN_LP_TSENS Configures whether to reset LP temperature sensor.

0: Release from reset

1: Reset

(R/W)

LPPERI_RST_EN_LP_PMS Configures whether to reset LP PMS.

0: Release from reset

1: Reset

(R/W)

LPPERI_RST_EN_LP_EFUSE Configures whether to reset LP eFuse.

0: Release from reset

1: Reset

(R/W)

LPPERI_RST_EN_LP_IOMUX Configures whether to reset LP IO MUX.

0: Release from reset

1: Reset

(R/W)

LPPERI_RST_EN_LP_TOUCH Configures whether to reset LP touch sensor.

0: Release from reset

1: Reset

(R/W)

LPPERI_RST_EN_LP_SPI Configures whether to reset LP SPI.

0: Release from reset

1: Reset

(R/W)

LPPERI_RST_EN_LP_ADC Configures whether to reset LP ADC.

0: Release from reset

1: Reset

(R/W)

Continued on the next page...

Register 11.74. LPPERI_RESET_EN_REG (0x0008)

Continued from the previous page...

LPPERI_RST_EN_LP_I2S Configures whether to reset LP I2S.

0: Release from reset

1: Reset

(R/W)

LPPERI_RST_EN_LP_I2CMST Configures whether to reset LP I2C master.

0: Release from reset

1: Reset

(R/W)

LPPERI_RST_EN_LP_I2C Configures whether to reset LP I2C.

0: Release from reset

1: Reset

(R/W)

LPPERI_RST_EN_LP_UART Configures whether to reset LP UART.

0: Release from reset

1: Reset

(R/W)

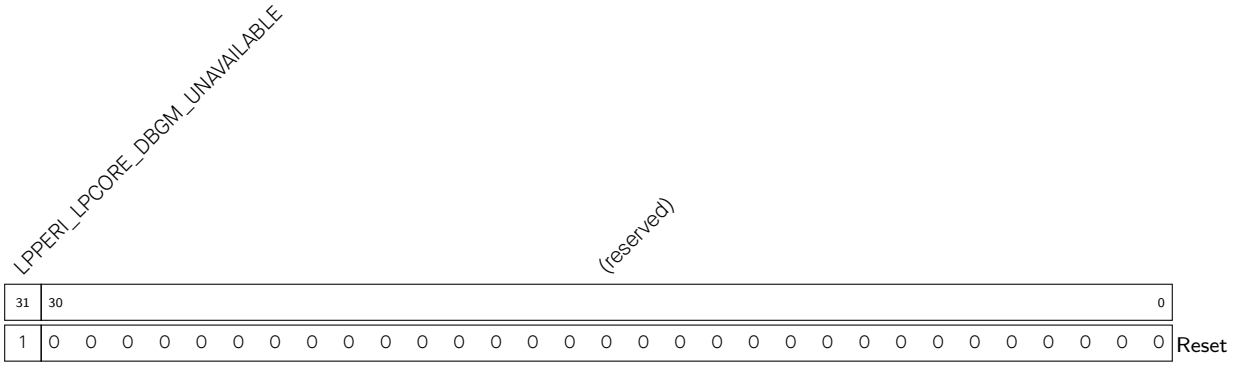
LPPERI_RST_EN_LP_INTR Configures whether to reset LP interrupt matrix.

0: Release from reset

1: Reset

(R/W)

LPPERI_RST_EN_LP_ROM Configures whether to reset LP ROM.



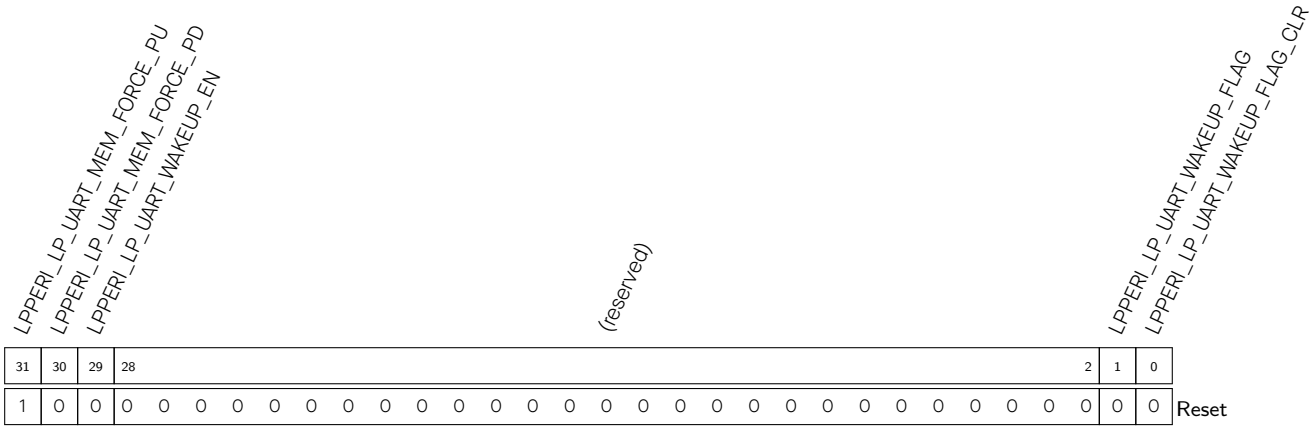
0: Release from reset

1: Reset

(R/W)

LPPERI_RST_EN_LP_CORE Writing 1 triggers LP CPU software reset. (WT)

Register 11.75. LPPERI_CPU_REG (0x000C)



LPPERI_LPCORE_DBGM_UNAVAILABLE Configures whether the LP CPU can be accessed by the HP CPU.

0: Not accessible

1: Accessible

(R/W)

Register 11.76. LPPERI_MEM_CTRL_REG (0x0028)

LPPERI_LP_UART_WAKEUP_FLAG_CLR Write 1 to clear LPPERI_LP_UART_WAKEUP_FLAG. (WT)

LPPERI_LP_UART_WAKEUP_FLAG Represents whether an LP UART wakeup has occurred.

0: No LP UART wakeup occurred

1: LP UART wakeup occurred

(R/WTC/SS)

LPPERI_LP_UART_WAKEUP_EN Configures whether to enable the LP UART wakeup function.

0: Enable

1: Disable

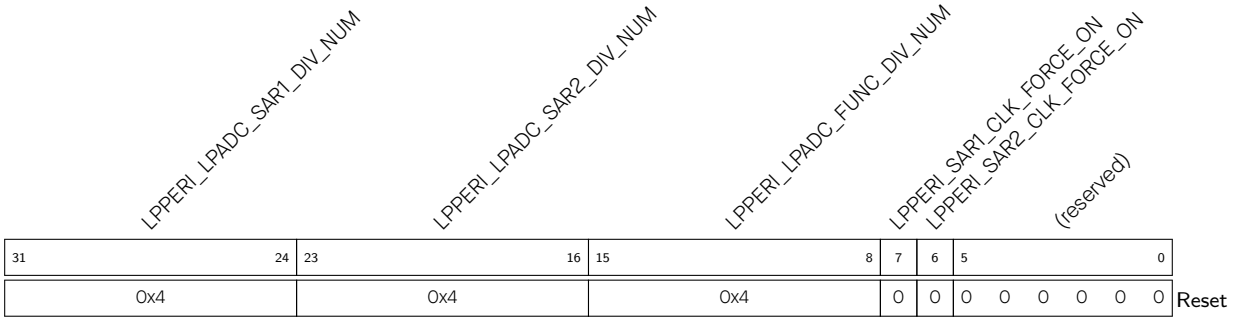
(R/W)

LPPERI_LP_UART_MEM_FORCE_PD Configures whether to force the LP UART memory to power down.

0: Do not force power down

1: Force power down

(R/W)



LPPERI_LP_UART_MEM_FORCE_PU Configures whether to force the LP UART memory to power up.

0: Do not force power up

1: Force power up

(R/W)

Register 11.77. LPPERI_ADC_CTRL_REG (0x002C)

LPPERI_SAR2_CLK_FORCE_ON Configures whether to force on the LP ADC SAR1 clock.

0: Controlled by hardware

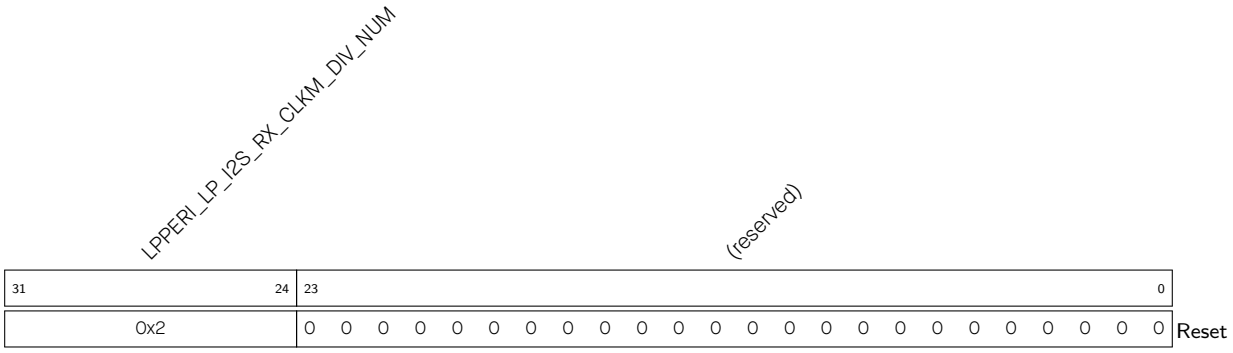
1: Force on, bypassing hardware control

(R/W)

LPPERI_SAR1_CLK_FORCE_ON Configures whether to force on the LP ADC SAR2 clock.

0: Controlled by hardware

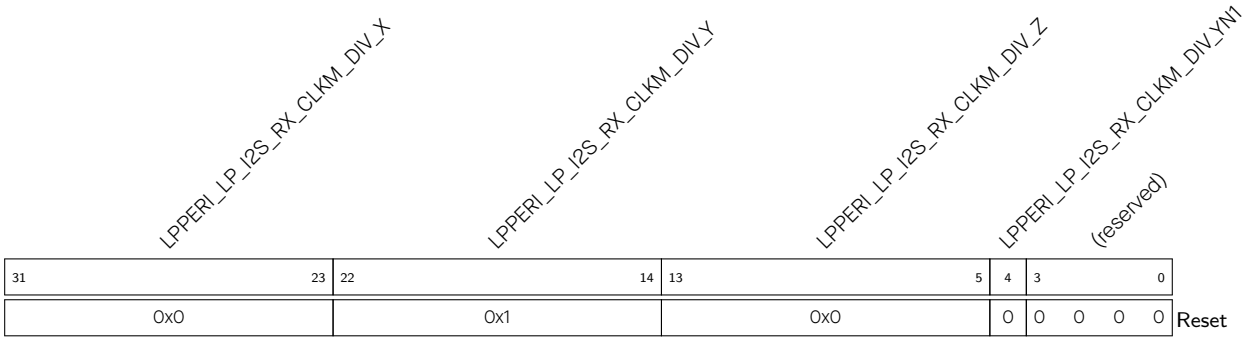
1: Force on, bypassing hardware control



(R/W)

LPPERI_LPADC_FUNC_DIV_NUM Configures the LP ADC function clock divisor. (R/W)

LPPERI_LPADC_SAR2_DIV_NUM Configures the LP ADC SAR1 clock divisor.(R/W)

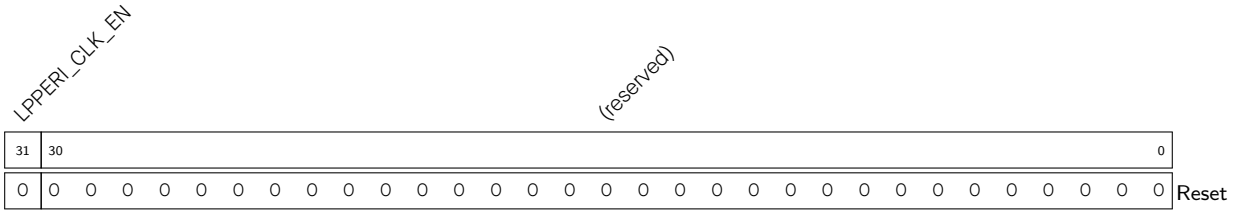


LPPERI_LPADC_SAR1_DIV_NUM Configures the LP ADC SAR2 clock divisor.(R/W)

Register 11.78. LPPERI_LP_I2S_RXCLK_DIV_NUM_REG (0x0030)

LPPERI_LP_I2S_RX_CLKM_DIV_NUM Configures the integer part of the LP I2S RX clock divisor. (R/W)

Register 11.79. LPPERI_LP_I2S_RXCLK_DIV_XYZ_REG (0x0034)



LPPERI_LP_I2S_RX_CLKM_DIV_YN1 Configures the yn1 coefficient of the LP I2S RX clock divisor. (R/W)

LPPERI_LP_I2S_RX_CLKM_DIV_Z Configures the z coefficient of the LP I2S RX clock divisor. (R/W)

LPPERI_LP_I2S_RX_CLKM_DIV_Y Configures the y coefficient of the LP I2S RX clock divisor. (R/W)

LPPERI_LP_I2S_RX_CLKM_DIV_X Configures the x coefficient of the LP I2S RX clock divisor. (R/W)

Register 11.80. LPPERI_DATE_REG (0x03FC)

LPPERI_CLK_EN Configures resister clock gating.

0: Support clock only when application writes registers

1: Force on clock gating for registers

(R/W)

Chapter 12

Chip Boot Control

12.1 Overview

Chip boot process and some chip functions are determined on power-on or hardware reset using strapping pins and eFuse bits. The following functionality can be determined:

- chip boot mode
- enable or disable of ROM messages printing
- source of JTAG signals

ESP32-P4 has five strapping pins:

- GPIO34
- GPIO35
- GPIO36
- GPIO37
- GPIO38

During Chip Reset (see Chapter 11 *Reset and Clock*), hardware samples and stores the voltage level of strapping pins as strapping bit of "0" or "1" in latches, and holds these bits until the chip is powered down. Software can read the latch status (strapping value) from GPIO_STRAPPING.

12.2 Functional Description

This section provides description of the chip functions and the patterns of the strapping pins and eFuse values to invoke each function.

Notice:

Only documented patterns should be used. If an undocumented pattern is used, it may trigger unexpected behaviors.

12.2.1 Default Configuration

By default, GPIO35 is connected to the chip's internal pull-up resistor. If GPIO35 is not connected or is connected to an external high-impedance circuit, the internal weak pull-up determines the default input level of this strapping pin (see Table 12.2-1).

Table 12.2-1. Default Configuration of Strapping Pins

Strapping Pin	Default Configuration
GPIO34	Floating
GPIO35	Pull-up
GPIO36	Floating
GPIO37	Floating
GPIO38	Floating

To change the strapping bit values, users can apply external pull-down/pull-up resistors, or use host MCU GPIOs to control the voltage level of these pins when powering on ESP32-P4. After the reset is released, the strapping pins work as normal-function pins.

12.2.2 Boot Mode Control

The values of GPIO35, GPIO36, GPIO37 and GPIO38 at reset determine the boot mode after the reset is released. Table 12.2-2 shows the strapping pin values of GPIO35, GPIO36, GPIO37 and GPIO38 and the associated boot modes.

Table 12.2-2. Boot Mode Control

Boot Mode	GPIO35	GPIO36	GPIO37	GPIO38
SPI Boot mode (default)	1	x[1]	x	x
Joint Download Boot mode[2]	0	1	x	x
SPI Download Boot mode[3]	0	0	0	1
Invalid Combination[4]	0	0	1	x
	0	0	0	0

[1] x: values that have no effect on the result and can therefore be ignored.

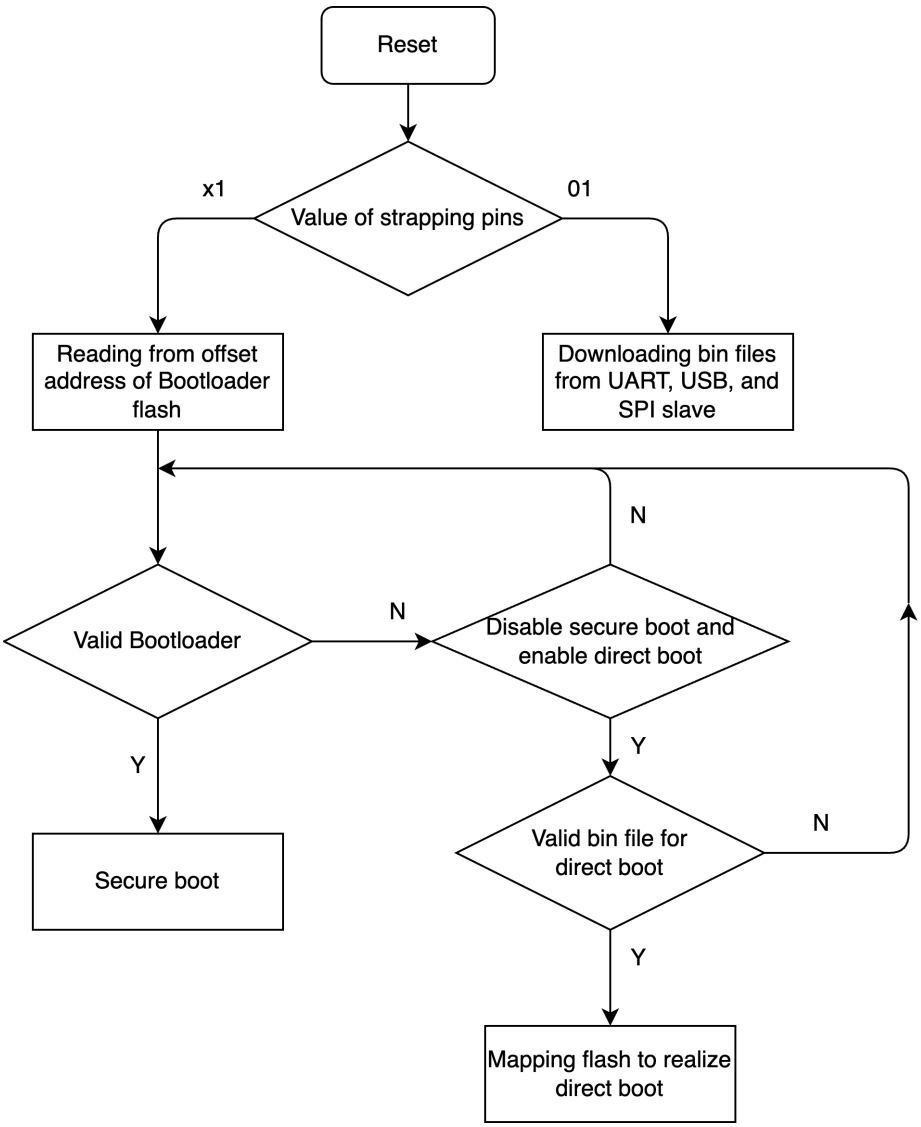
[2] Joint Download Boot mode: Joint Download Boot mode supports the following download methods:

- USB-Serial-JTAG Download Boot
- UART Download Boot
- SPI Slave Download Boot
- USB 2.0 OTG Download Boot

[3] SPI Download Boot mode: GPIO37 and GPIO38 need to be reserved only when using SPI Download Boot mode. GPIO37 and GPIO38 are floating by default and are in a high-impedance state at reset.

[4] Invalid Combination: This combination can trigger unexpected behavior and should be avoided.

In SPI Boot mode, the ROM bootloader loads and executes the program from SPI flash to boot the system. SPI Boot mode can be further classified as follows:



- Normal flash Boot: supports Secure Boot. The ROM bootloader loads the program from flash into L2MEM and executes it. In most practical scenarios, this program is the 2nd stage bootloader, which later boots the target application.

- Direct Boot: does not support Secure Boot and programs run directly from flash. To enable this mode, make sure that the first two words of the bin file downloaded to flash are 0xaedb041d. For more detailed process, see Figure 12.2-1.

In Joint Download Boot mode, users can download binary files into flash using UART0, SPI slave, USB 2.0 OTG or USB Serial/JTAG interface. It is also possible to download binary files into L2MEM and execute it from L2MEM.

In SPI Download Boot mode, users can download binary files into flash using SPI interface. It is also possible to download binary files into L2MEM and execute it from L2MEM.

Figure 12.2-1 shows the detailed boot flow of the chip.

Note: "x1" and "01" are combination values of strapping pins GPIO35 and GPIO36, see Table 12.2-2.

Figure 12.2-1. Chip Boot Flow

The following eFuse bits allows controlling boot mode behaviors:

- EFUSE_DIS_FORCE_DOWNLOAD

  If this eFuse is 0 (default), software can force switch the chip from SPI Boot mode to Joint Download

Boot mode by setting register LPSYSREG_FORCE_DOWNLOAD_BOOT and triggering a CPU reset. If this eFuse is 1, LPSYSREG_FORCE_DOWNLOAD_BOOT is disabled.

- EFUSE_DIS_DOWNLOAD_MODE

  If this eFuse is 1, Joint Download Boot mode is permanently disabled.

- EFUSE_ENABLE_SECURITY_DOWNLOAD

  If this eFuse is 1, Joint Download Boot mode only allows reading, writing, and erasing plaintext flash and does not support any L2MEM or register operations. Ignore this eFuse if Download Boot mode is disabled.

- EFUSE_DIS_DIRECT_BOOT

  If this eFuse is 1, Direct Boot would be disabled in SPI Boot Mode.

USB Serial/JTAG Controller can also force switch the chip to Joint Download Boot mode from SPI Boot mode, and vice versa. For detailed information, please refer to Chapter *54 USB Serial/JTAG Controller (USB_SERIAL_JTAG)*.

You can set eFuse bit EFUSE_DIS_USB_SERIAL_JTAG_DOWNLOAD_MODE to disable USB Serial/JTAG Controller from force switching to Joint Download Boot mode.

12.2.3 ROM Messages Printing Control

During early SPI Boot process, the messages by the ROM code can be printed to:

- **(Default) UART0 and USB Serial/JTAG controller**
- **UART0**
- **USB Serial/JTAG controller**

EFUSE_UART_PRINT_CONTROL and GPIO36 control ROM messages printing to **UART0** as shown in Table 12.2-3 ROM Message Printing Control.

Table 12.2-3. ROM Message Printing Control

eFuse[1]	GPIO36	ROM Code Printing
0	x[2]	Always enabled
1	0	Enabled
	1	Disabled
2	0	Disabled
	1	Enabled
3	x	Always disabled

[1] eFuse: EFUSE_UART_PRINT_CONTROL

[2] x: values that have no effect on the result and can therefore be ignored.

EFUSE_DIS_USB_SERIAL_JTAG_ROM_PRINT controls the printing to **USB Serial/JTAG controller**. When this bit is 1, printing to USB Serial/JTAG controller is disabled. When this bit is 0, and USB Serial/JTAG controller is enabled via EFUSE_DIS_USB_SERIAL_JTAG, ROM messages can be printed to USB Serial/JTAG controller.

Note that if EFUSE_DIS_USB_SERIAL_JTAG_ROM_PRINT is set to 0 to print to USB, but USB Serial/JTAG Controller has been disabled, then ROM messages will not be printed to USB Serial/JTAG Controller.

12.2.4 JTAG Signal Source Control

GPIO34 controls the source of JTAG signals during the early boot process. This GPIO is used together with EFUSE_DIS_PAD_JTAG, EFUSE_DIS_USB_JTAG, and EFUSE_JTAG_SEL_ENABLE. See Table 12.2-4.

Table 12.2-4. JTAG Signal Source Control

eFuse 1[a]	eFuse 2[b]	eFuse 3[c]	GPIO34	Signal Source
0	0	0	x[d]	JTAG signals come from USB Serial/JTAG Controller.
		1	0	JTAG signals come from corresponding pins MTDI, MTCK, MTMS, and MTDO.
			1	JTAG signals come from USB Serial/JTAG Controller.
0	1	x	x	JTAG signals come from corresponding pins MTDI, MTCK, MTMS, and MTDO.
1	0	x	x	JTAG signals come from USB Serial/JTAG Controller.
1	1	x	x	JTAG is disabled.

[a] eFuse 1: EFUSE_DIS_PAD_JTAG

[b] eFuse 2: EFUSE_DIS_USB_JTAG

[c] eFuse 3: EFUSE_JTAG_SEL_ENABLE

[d] x: values that have no effect on the result and can therefore be ignored.

Chapter 13

Interrupt Matrix

13.1 Overview

The interrupt matrix embedded in ESP32-P4 independently routes peripheral interrupt sources to the ESP-RISC-V CPU's peripheral interrupts to timely inform HP CPU0 or HP CPU1 to process the coming interrupts.

Peripheral interrupt sources must be routed to HP CPU0 or HP CPU1 through the interrupt matrix for the following reasons:

- Each HP CPU has 32 interrupt inputs, but the ESP32-P4 provides 128 peripheral interrupt sources. To connect all sources to the CPUs, the interrupt matrix is required.
- The interrupt matrix allows a single peripheral interrupt source to be mapped to any HP CPU0 or HP CPU1 interrupt input, depending on application requirements.

Note:
This chapter focuses on how to map peripheral interrupt sources to HP CPU0/HP CPU1 interrupts. For more details about interrupt configuration, interrupt vectors, and interrupt handling operations recommended by the ISA, please refer to Chapter 2 *High-Performance CPU*.

13.2 Interrupt Terminology in ESP32-P4

The following terms related to interrupts are defined in the context of the *ESP32-P4 Technical Reference Manual* to help readers better understand this document:

13.2.1 Interrupt

An interrupt is an event or condition that temporarily suspends the CPU's current execution to execute an interrupt service routine (ISR). This mechanism enables the CPU to respond immediately to important events.

The *ESP32-P4 Technical Reference Manual* uses the term "interrupt" in a broader sense to refer to both interrupt signal and interrupt source.

13.2.2 Interrupt Signal/Interrupt Source

Both interrupt signal and interrupt source describe the same signal from different points in the system.

From the perspective of peripherals, interrupt signals are generated by the peripheral's internal interrupt sources and are sent to the interrupt matrix.

From the perspective of the interrupt matrix, it receives the interrupt signals sent from peripherals and considers them interrupt sources. The interrupt matrix then outputs CPU peripheral interrupt signals to the CPU.

From the perspective of the CPU, the interrupt signals from the interrupt matrix become interrupt sources and are sent to the CPU core together with the core local interrupt sources.

13.2.3 Interrupt Flow in ESP32-P4

Figure 13.2-1 shows the interrupt flow in ESP32-P4.

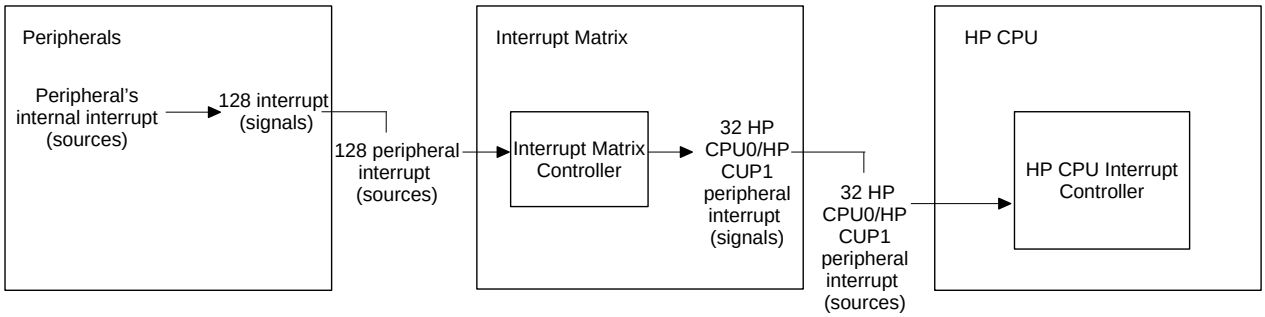


Figure 13.2-1. Interrupt Flow in ESP32-P4

13.3 Features

The interrupt matrix embedded in the ESP32-P4 has the following features:

- 128 peripheral interrupt sources accepted as input
- 32 HP CPU0 peripheral interrupts and 32 HP CPU1 peripheral interrupts generated to HP CPU as output
- Current interrupt status query for peripheral interrupt sources
- Multiple interrupt sources mapped to a single HP CPU0 or HP CPU1 interrupt (i.e., shared interrupts)
- Remapping of HP CPU0 or HP CPU1 User Mode interrupts to Machine Mode interrupts

Figure 13.3-1 shows the structure of the interrupt matrix.

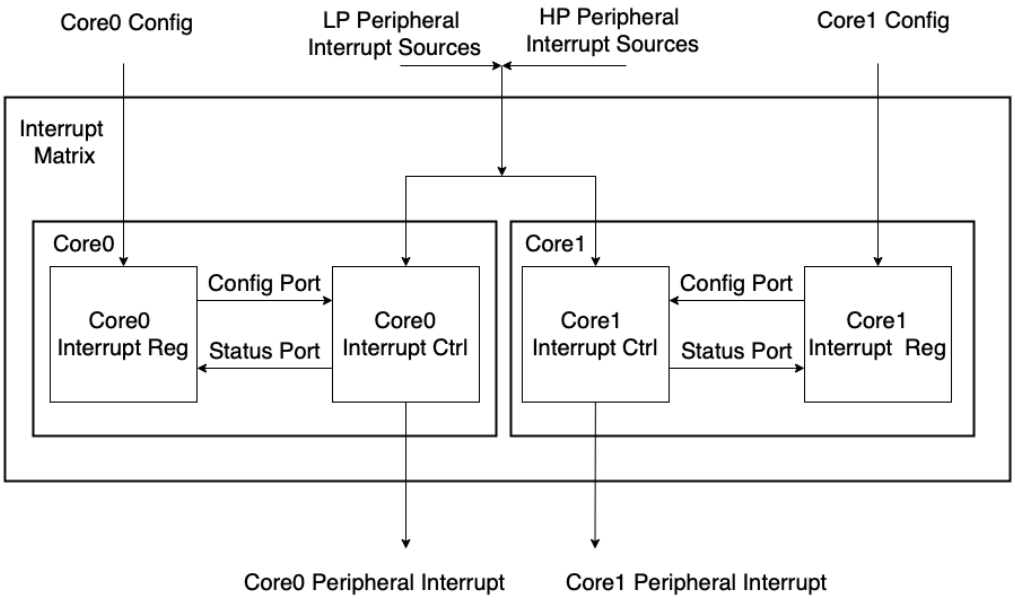

Figure 13.3-1. Interrupt Matrix Structure

All interrupts generated by the peripheral interrupt sources can be handled by HP CPU0 or HP CPU1. Users can configure HP CPU0 interrupt registers ("Core0 Interrupt Reg" module in Figure 13.3-1) to assign peripheral interrupt sources to HP CPU0, or configure HP CPU1 interrupt registers ("Core1 Interrupt Reg" module in Figure 13.3-1) to assign peripheral interrupt sources to HP CPU1. Peripheral interrupt sources can be mapped to both HP CPU0 and HP CPU1 at the same time, allowing both to receive the interrupts.

13.4 Functional Description

13.4.1 Peripheral Interrupt Sources

ESP32-P4 has 128 peripheral interrupt sources in total. Table 13.4-1 lists all these sources and their mapping/status registers.

- Column "No.": Peripheral interrupt source number, which can be 0 ~ 82, 84 ~ 98, 100 ~ 111, 113 ~ 130 (83, 99 and 112 are reserved).
- Column "Chapter": The chapter in which the interrupt source is described in detail.
- Column "Interrupt Source": Name of the peripheral interrupt source.
- Column "Interrupt Source Mapping Register": Registers used for routing the peripheral interrupt sources to HP CPU peripheral interrupts.
- Column "Interrupt Status Register": Registers used for indicating the interrupt status of peripheral interrupt sources.
  - Column "Interrupt Status Register - Bit": Bit position in status register, indicating the interrupt status.
  - Column "Interrupt Status Register - Name": Name of status registers.

The registers in column "Interrupt Source Mapping Register" and column "Interrupt Status Register" correspond to the peripheral interrupt source in column "Interrupt Source". For example, the interrupt source

mapping register for interrupt source RMT_INTR is CORE*x*_RMT_INT_MAP_REG, and its status register is CORE*x*_INTR_STATUS_REG_1_REG.

Note that CORE*x* in the table can be CORE0 (HP CPU0) or CORE1 (HP CPU1).

13.4.2 Assign Peripheral Interrupt Source to HP CPU Interrupt

In this section, the following terms are used to describe the operation of the interrupt matrix.

- *SOURCE*: Stands for a peripheral interrupt source in Table 13.4-1.
- CORE*x*_*SOURCE*_MAP: Stands for an interrupt source mapping register for the peripheral interrupt source (*SOURCE*) of HP CPU*x*.
- Num_P: The index of HP CPU interrupts, which can be 16 ~ 47.
- Interrupt_P: Stands for the HP CPU interrupt numbered as Num_P.

13.4.2.1 Assign One Peripheral Interrupt Source (*SOURCE*) to HP CPU*x*

Setting the corresponding source mapping register CORE*x*_*SOURCE*_MAP of *SOURCE* to Num_P assigns this interrupt source to Interrupt_P of HP CPU*x*.

13.4.2.2 Assign Multiple Peripheral Interrupt Sources (*SOURCE*) to HP CPU*x*

Setting the corresponding source mapping register CORE*x*_*SOURCE*_MAP of each interrupt source to the same Num_P assigns multiple sources to the same Interrupt_P of HP CPU*x*. Any of these sources can trigger CPU Interrupt_P of HP CPU*x*. In other words, the CPU Interrupt_P will be shared between these interrupt sources. When an interrupt signal is generated, HP CPU*x* should check the interrupt status registers to determine which peripheral generated the interrupt. For more information, see Chapter 2 *High-Performance CPU*.

13.4.2.3 Disable HP CPU*x* Peripheral Interrupt Source (*SOURCE*)

Writing 0 to the CORE*x*_*SOURCE*_MAP register disables the corresponding interrupt source.

13.4.3 Query Current Interrupt Status of HP CPU*x* Peripheral Interrupt Source

After enabling peripheral interrupt sources, users can query the current interrupt status of HP CPU*x* peripheral interrupt sources by reading the bit value in CORE*x*_INTR_STATUS_*n* (read only). For the mapping between CORE*x*_INTR_STATUS_*n* and peripheral interrupt sources, please refer to Table 13.4-1.

13.4.4 Interrupt Remapping

The RISC-V HP CPU*x* (x can be 0 or 1) of ESP32-P4 supports Machine Mode and User Mode.

HP CPU*x* provides a total of 32 peripheral interrupts. Each peripheral interrupt can be delegated by HP CPU*x* as either a Machine-mode interrupt or a User-mode interrupt.

Under normal conditions, when HP CPU*x* is running in Machine Mode, it can respond only to Machine-mode interrupts and cannot respond to User-mode interrupts. When HP CPU*x* is running in User Mode, it can respond to both Machine-mode and User-mode interrupts.

To allow HP CPU*x* to indirectly respond to User-mode interrupts while operating in Machine Mode, the system introduces the Interrupt Remap mechanism.

Interrupt remapping allows software to redirect HP CPU*x* interrupts originally assigned to User Mode to a single specified Machine-mode interrupt. In this way, HP CPU*x* can indirectly respond to User-mode interrupts while running in Machine Mode.

Interrupt remapping features:

- Enable interrupt remapping: Each peripheral interrupt source can be independently configured to participate in interrupt remapping. For example, setting CORE*x*_*SOURCE*_SRC_PASS_IN_SEC to 1 enables interrupt remapping for interrupt matrix source *SOURCE*.
- Specify the target Machine-mode interrupt: All remapped User-mode interrupt signals are uniformly mapped to the same specified Machine-mode interrupt. For example, writing a value n to CORE*x*_INTR_SIG_IDX_ASSERT_IN_SEC_REG selects the Machine-mode interrupt with interrupt number n as the remapping target.
- Access restrictions for remapping-related registers: the following registers and fields related to interrupt remapping are writable only when HP CPU*x* is operating in Machine Mode:
  - CORE*x*_INTR_SIG_IDX_ASSERT_IN_SEC_REG
  - CORE*x*_*SOURCE*_SRC_PASS_IN_SEC
  - CORE*x*_*SOURCE*_SRC_IN_SEC_FLAG
  - When CORE*x*_*SOURCE*_SRC_IN_SEC_FLAG is set to 1, CORE*x*_*SOURCE*_MAP is also writable only in Machine Mode.

When interrupt source *SOURCE* has been mapped to the peripheral interrupt signal *n* of CORE*x*, interrupt remapping for source *SOURCE* occurs only when all of the following conditions are met:

- CORE*x*_*SOURCE*_SRC_PASS_IN_SEC is set to 1
- CORE*x* is currently operating in Machine Mode
- The peripheral interrupt signal *n* of CORE*x* is internally delegated to User Mode by the CPU
- The target interrupt signal specified by CORE*x*_INTR_SIG_IDX_ASSERT_IN_SEC_REG is internally delegated to Machine Mode by the CPU

13.5 Register Summary

The addresses in this section are relative to the interrupt matrix HP CPU0/HP CPU1 base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

13.5.1 HP CPU0 Interrupt Matrix Register Summary

Name	Description	Address	Access
COREO_LP_RTC_INT_MAP_REG	LP_RTC_INTR mapping register	0x0000	R/W

13.6 Registers

The addresses in this section are relative to the interrupt matrix base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

For how to program reserved fields, please refer to Section *Programming Reserved Register Field*.

13.6.1 HP CPU0 Interrupt Matrix Registers

Register 13.1. COREO_*LP_RTC_INT*_MAP_REG (0x0000)

Register 13.2. COREO_*LP_WDT_INT*_MAP_REG (0x0004)

Register 13.3. COREO_*LP_TIMER_REG_O_INT*_MAP_REG (0x0008)

Register 13.4. COREO_*LP_TIMER_REG_1_INT*_MAP_REG (0x000C)

Register 13.5. COREO_*MB_HP_INT*_MAP_REG (0x0010)

Register 13.6. COREO_*MB_LP_INT*_MAP_REG (0x0014)

Register 13.7. COREO_*PMU_REG_O_INT*_MAP_REG (0x0018)

Register 13.8. COREO_*PMU_REG_1_INT*_MAP_REG (0x001C)

Register 13.9. COREO_*LP_ANAPERI_INT*_MAP_REG (0x0020)

Register 13.10. COREO_*LP_ADC_INT*_MAP_REG (0x0024)

Register 13.11. COREO_*LP_GPIO_INT*_MAP_REG (0x0028)

Register 13.12. COREO_*LP_I2C_INT*_MAP_REG (0x002C)

Register 13.13. COREO_*LP_I2S_INT*_MAP_REG (0x0030)

Register 13.14. COREO_*LP_SPI_INT*_MAP_REG (0x0034)

Register 13.15. COREO_*LP_TOUCH_INT*_MAP_REG (0x0038)

Register 13.16. COREO_*LP_TSENS_INT*_MAP_REG (0x003C)

Register 13.17. COREO_*LP_UART_INT*_MAP_REG (0x0040)

Register 13.18. COREO_*LP_EFUSE_INT*_MAP_REG (0x0044)

Register 13.19. COREO_*LP_SW_INT*_MAP_REG (0x0048)

Register 13.20. COREO_*LP_SYSREG_INT*_MAP_REG (0x004C)

Register 13.21. COREO_*LP_HUK_INT*_MAP_REG (0x0050)

Register 13.22. COREO_*SYS_ICM_INT*_MAP_REG (0x0054)

Register 13.23. COREO_*USB_DEVICE_INT*_MAP_REG (0x0058)

Register 13.24. COREO_*SDIO_HOST_INT*_MAP_REG (0x005C)

Register 13.25. COREO_*GDMA_INT*_MAP_REG (0x0060)

Register 13.26. COREO_*SPI2_INT*_MAP_REG (0x0064)

Register 13.27. COREO_*SPI3_INT*_MAP_REG (0x0068)

Register 13.28. COREO_*I2SO_INT*_MAP_REG (0x006C)

Register 13.29. COREO_*I2S1_INT*_MAP_REG (0x0070)

Register 13.30. COREO_*I2S2_INT*_MAP_REG (0x0074)

Register 13.31. COREO_*UHCI0_INT*_MAP_REG (0x0078)

Register 13.32. COREO_*UART0_INT*_MAP_REG (0x007C)

Register 13.33. COREO_*UART1_INT*_MAP_REG (0x0080)

Register 13.34. COREO_*UART2_INT*_MAP_REG (0x0084)

Register 13.35. COREO_*UART3_INT*_MAP_REG (0x0088)

Register 13.36. COREO_*UART4_INT*_MAP_REG (0x008C)

Register 13.37. COREO_*LCD_CAM_INT*_MAP_REG (0x0090)

Register 13.38. COREO_*ADC_INT*_MAP_REG (0x0094)

Register 13.39. COREO_*PWM0_INT*_MAP_REG (0x0098)

Register 13.40. COREO_*PWM1_INT*_MAP_REG (0x009C)

Register 13.41. COREO_*TWAI0_INT*_MAP_REG (0x00A0)

Register 13.42. COREO_*TWAI1_INT*_MAP_REG (0x00A4)

Register 13.43. COREO_*TWAI2_INT*_MAP_REG (0x00A8)

Register 13.44. COREO_*RMT_INT*_MAP_REG (0x00AC)

Register 13.45. COREO_*I2C0_INT*_MAP_REG (0x00B0)

Register 13.46. COREO_*I2C1_INT*_MAP_REG (0x00B4)

Register 13.47. COREO_*TIMERGRP0_T0_INT*_MAP_REG (0x00B8)

Register 13.48. COREO_*TIMERGRP0_T1_INT*_MAP_REG (0x00BC)

Register 13.49. COREO_*TIMERGRP0_WDT_INT*_MAP_REG (0x00C0)

Register 13.50. COREO_*TIMERGRP1_T0_INT*_MAP_REG (0x00C4)

Register 13.51. COREO_*TIMERGRP1_T1_INT*_MAP_REG (0x00C8)

Register 13.52. COREO_*TIMERGRP1_WDT_INT*_MAP_REG (0x00CC)

Register 13.53. COREO_*LEDC_INT*_MAP_REG (0x00D0)

Register 13.54. COREO_*SYSTIMER_TARGET0_INT*_MAP_REG (0x00D4)

Register 13.55. COREO_*SYSTIMER_TARGET1_INT*_MAP_REG (0x00D8)

Register 13.56. COREO_*SYSTIMER_TARGET2_INT*_MAP_REG (0x00DC)

Register 13.57. COREO_*AHB_PDMA_IN_CH0_INT*_MAP_REG (0x00E0)

Register 13.58. COREO_*AHB_PDMA_IN_CH1_INT*_MAP_REG (0x00E4)

Register 13.59. COREO_*AHB_PDMA_IN_CH2_INT*_MAP_REG (0x00E8)

Register 13.60. COREO_*AHB_PDMA_OUT_CH0_INT*_MAP_REG (0x00EC)

Register 13.61. COREO_*AHB_PDMA_OUT_CH1_INT*_MAP_REG (0x00F0)

Register 13.62. COREO_*AHB_PDMA_OUT_CH2_INT*_MAP_REG (0x00F4)

Register 13.63. COREO_*AXI_PDMA_IN_CH0_INT*_MAP_REG (0x00F8)

Register 13.64. COREO_*AXI_PDMA_IN_CH1_INT*_MAP_REG (0x00FC)

Register 13.65. COREO_*AXI_PDMA_IN_CH2_INT*_MAP_REG (0x0100)

Register 13.66. COREO_*AXI_PDMA_OUT_CHO_INT*_MAP_REG (0x0104)

Register 13.67. COREO_*AXI_PDMA_OUT_CH1_INT*_MAP_REG (0x0108)

Register 13.68. COREO_*AXI_PDMA_OUT_CH2_INT*_MAP_REG (0x010C)

Register 13.69. COREO_*RSA_INT*_MAP_REG (0x0110)

Register 13.70. COREO_*AES_INT*_MAP_REG (0x0114)

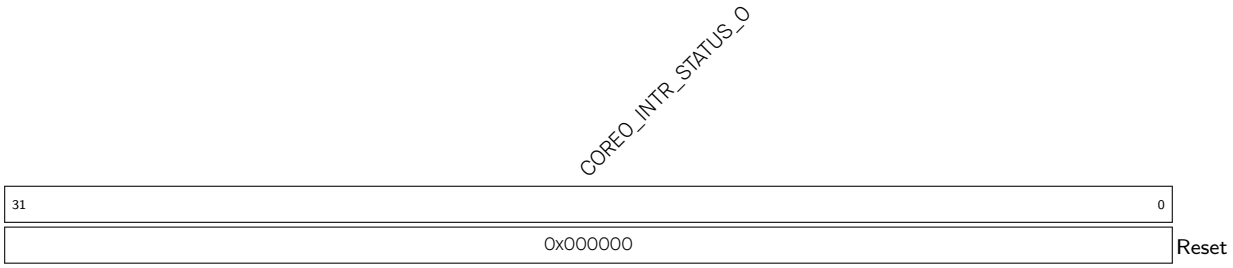
Register 13.125. COREO_*ASSIST_DEBUG_INT*_MAP_REG (0x01FC)

Register 13.126. COREO_*DMA2D_IN_CH2_INT*_MAP_REG (0x0214)

Register 13.127. COREO_*DMA2D_OUT_CH3_INT*_MAP_REG (0x0218)

Register 13.128. COREO_*AXI_PERF_MON_INT*_MAP_REG (0x021C)

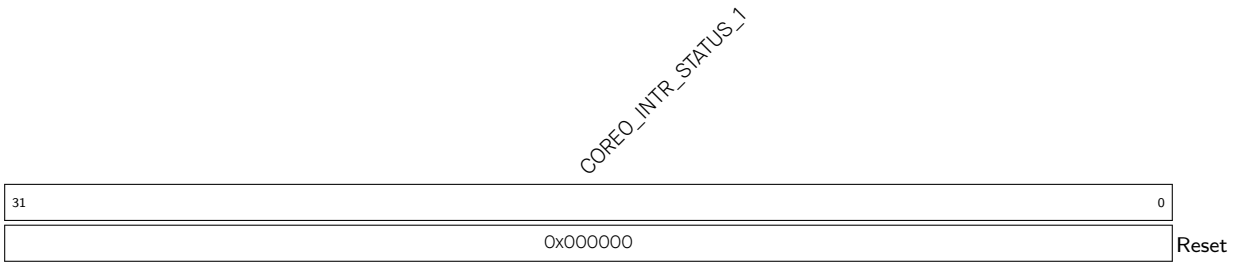
Register 13.129. COREO_*SOURCE*_MAP_REG (0x0000 - 0x01FC, 0x0214 - 0x021C)



COREO_*SOURCE*_MAP When COREO_*SOURCE*_SRC_IN_SEC_FLAG is set to 1, this register can only be written by CPU while in Machine Mode.

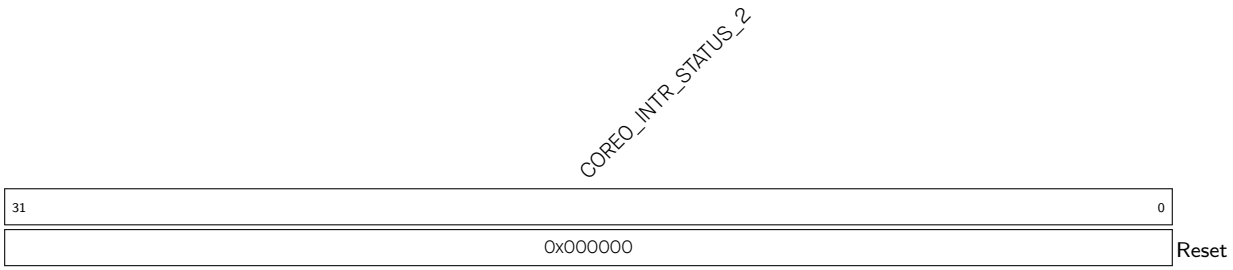
Configure this register to map the interrupt signal from the peripheral interrupt sources *Source* to one of CPU0's peripheral interrupts. The valid configuration range is 16 ~ 47.
When set to 0 ~ 15, the corresponding peripheral interrupt source is disabled (recommended value: 0).
Other values are invalid.
For the list of interrupt sources *Source*, see Table 13.4-1. (R/W)

COREO_*SOURCE*_SRC_PASS_IN_SEC Write 1 to allow the interrupt signal from interrupt source *Source* to be delegated to CPU0's Machine Mode interrupt. Writable only by the CPU in Machine Mode. (R/W)



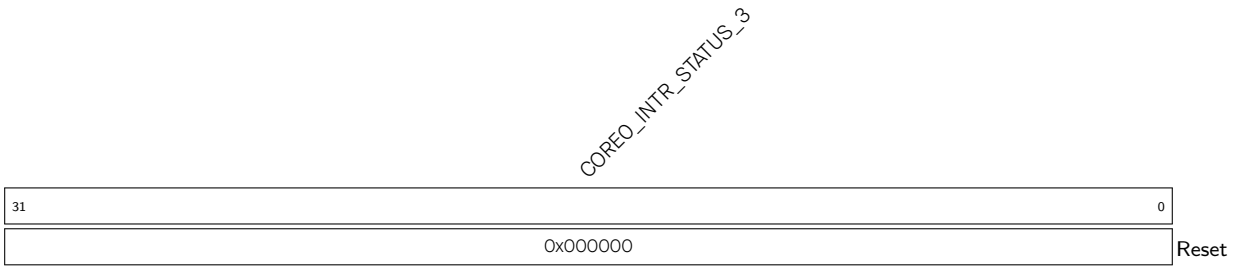
COREO_*SOURCE*_SRC_IN_SEC_FLAG Write 1 to configure the interrupt signal from interrupt source *Source* as a secure interrupt source (that is, its interrupt mapping can be configured only by the CPU running in Machine Mode). Writable only by the CPU in Machine Mode. (R/W)

Register 13.130. COREO_INTR_STATUS_REG_0_REG (0x0200)



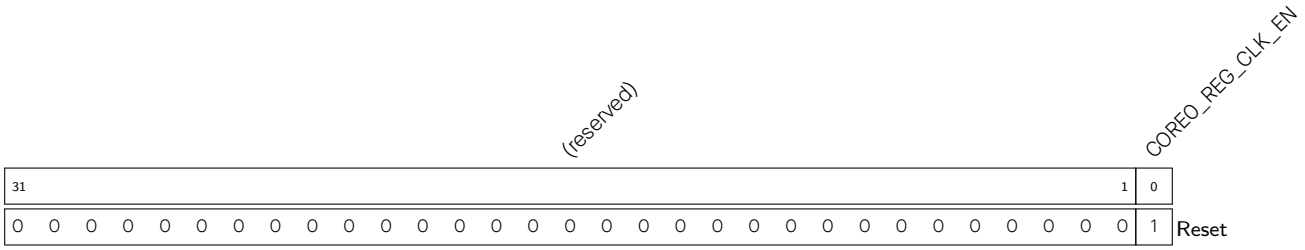
COREO_INTR_STATUS_0 Represents the status of the interrupt sources from 0 ~ 31. Each bit corresponds to one interrupt source. (RO)

Register 13.131. COREO_INTR_STATUS_REG_1_REG (0x0204)



COREO_INTR_STATUS_1 Represents the status of the interrupt sources from 32 ~ 63. Each bit corresponds to one interrupt source. (RO)

Register 13.132. COREO_INTR_STATUS_REG_2_REG (0x0208)

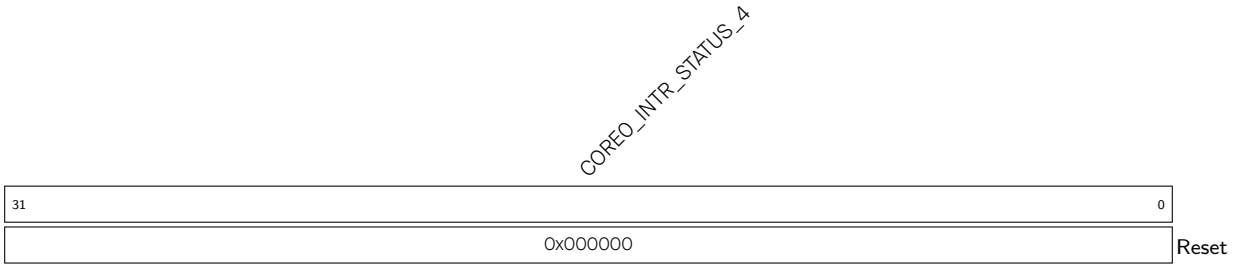


COREO_INTR_STATUS_2 Represents the status of the interrupt sources from 64 ~ 95. Each bit corresponds to one interrupt source. (RO)

Register 13.133. COREO_INTR_STATUS_REG_3_REG (0x020C)

COREO_INTR_STATUS_3 Represents the status of the interrupt sources numbered from 96 ~ 127 (99 and 112 are reserved). Each bit corresponds to one interrupt source. (RO)

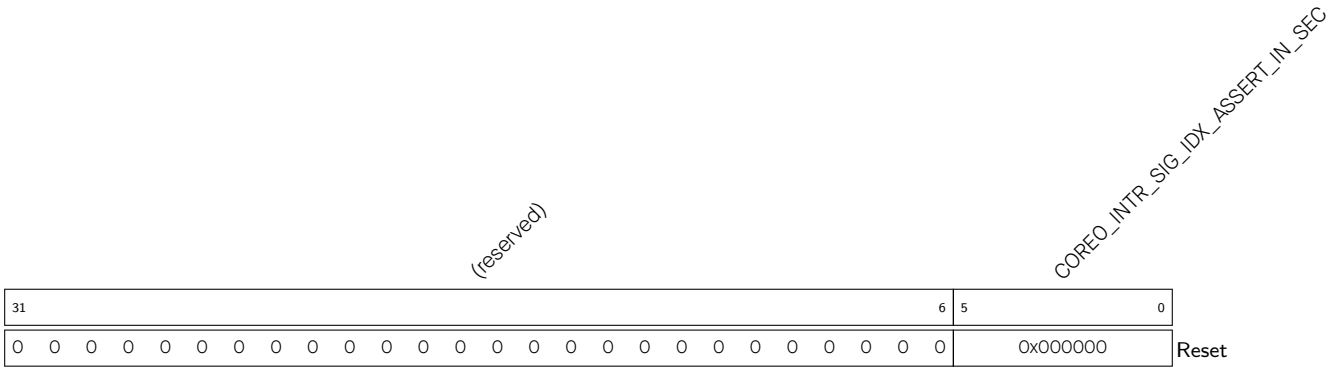
Register 13.134. COREO_CLOCK_GATE_REG (0x0210)



COREO_REG_CLK_EN Configures whether to force interrupt register clock-gate on.

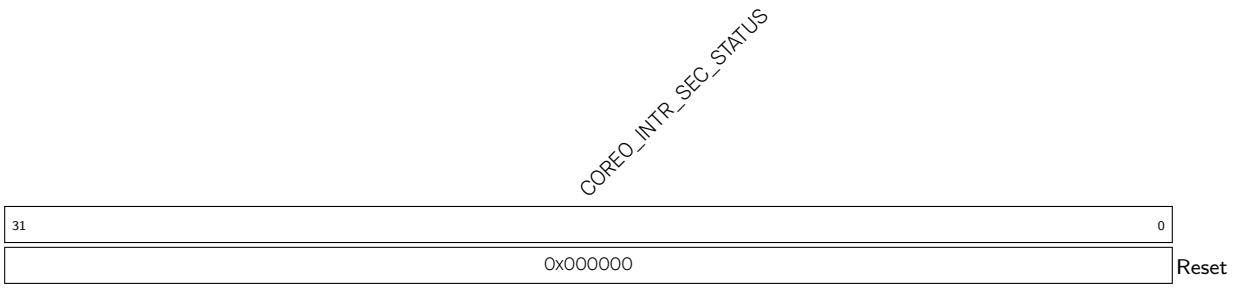
0: No effect

1: Force interrupt register clock-gate on



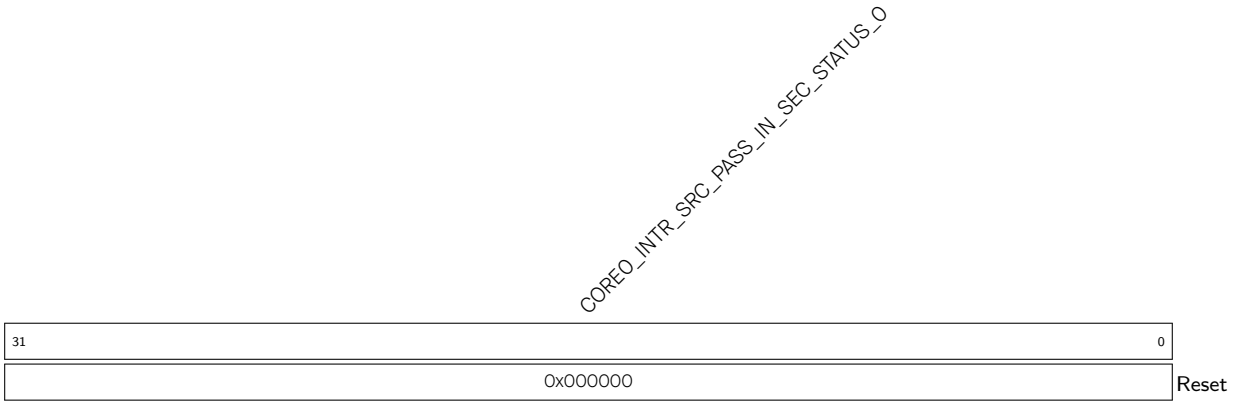
(R/W)

Register 13.135. COREO_INTR_STATUS_REG_4_REG (0x0220)



COREO_INTR_STATUS_4 Represents the status of the interrupt sources from 128 ~ 130. Each bit corresponds to one interrupt source. (RO)

Register 13.136. COREO_INTR_SIG_IDX_ASSERT_IN_SEC_REG (0x0228)

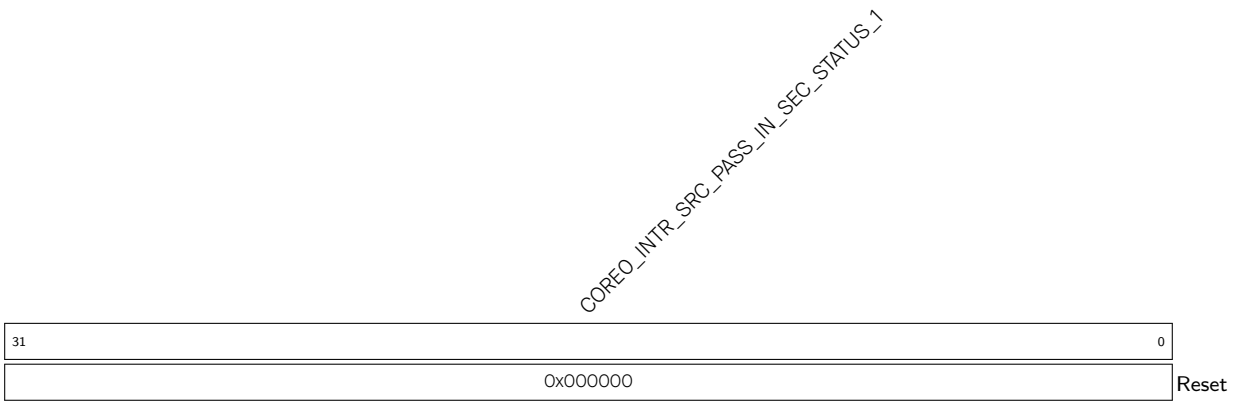


COREO_INTR_SIG_IDX_ASSERT_IN_SEC Configures which peripheral machine mode interrupt of CPU0 is used as the target for the interrupt delegation function. Valid values range from 16 ~ 47. (R/W)

Register 13.137. COREO_INTR_SEC_STATUS_REG (0x022C)

COREO_INTR_SEC_STATUS Represents status of the user mode interrupt signals that have been delegated to the machine mode interrupt when COREO is in machine mode. (RO)

Register 13.138. COREO_INTR_SRC_PASS_IN_SEC_STATUS_0_REG (0x0230)



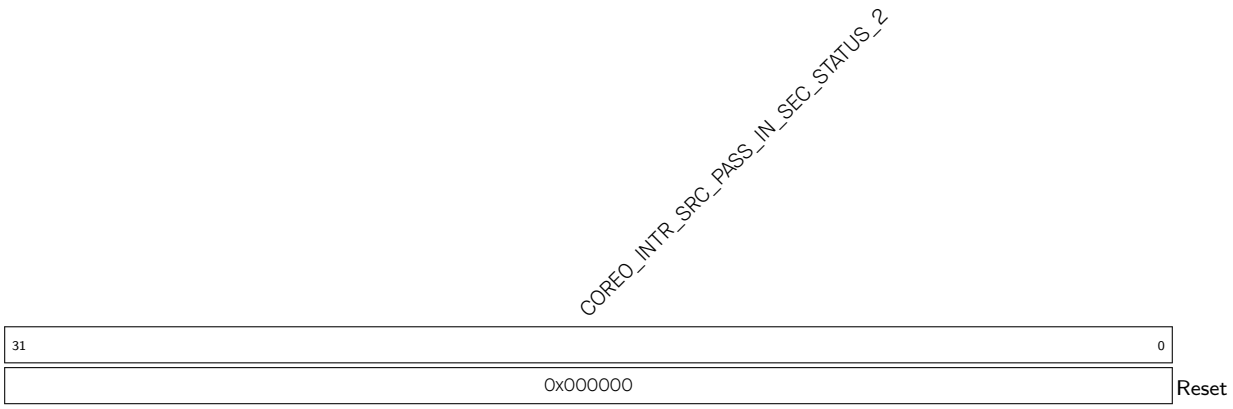
COREO_INTR_SRC_PASS_IN_SEC_STATUS_0 Represents whether interrupt source 0 ~ 31 has enabled the interrupt delegation function. Each bit corresponds to the enable status of one interrupt source.

0: Corresponding interrupt source has not enabled the interrupt delegation function.

1: Corresponding interrupt source has enabled the interrupt delegation function.

(RO)

Register 13.139. COREO_INTR_SRC_PASS_IN_SEC_STATUS_1_REG (0x0234)



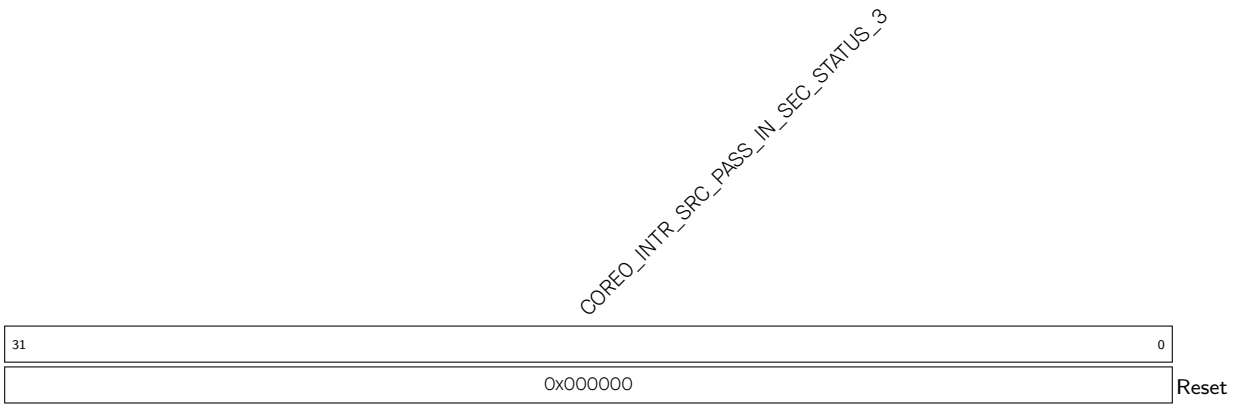
COREO_INTR_SRC_PASS_IN_SEC_STATUS_1 Represents whether interrupt sources 32 ~ 63 have enabled the interrupt delegation function. Each bit corresponds to the enable status of one interrupt source.

0: Corresponding interrupt source has not enabled the interrupt delegation function.

1: Corresponding interrupt source has enabled the interrupt delegation function.

(RO)

Register 13.140. COREO_INTR_SRC_PASS_IN_SEC_STATUS_2_REG (0x0238)



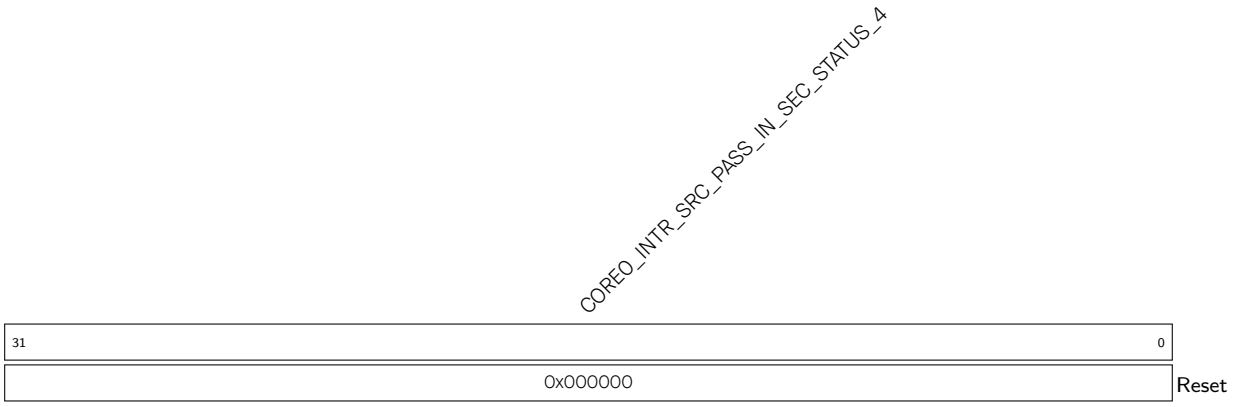
COREO_INTR_SRC_PASS_IN_SEC_STATUS_2 Represents whether interrupt source 64 ~ 95 has enabled the interrupt delegation function. Each bit corresponds to the enable status of one interrupt source.

0: Corresponding interrupt source has not enabled the interrupt delegation function.

1: Corresponding interrupt source has enabled the interrupt delegation function.

(RO)

Register 13.141. COREO_INTR_SRC_PASS_IN_SEC_STATUS_3_REG (0x023C)



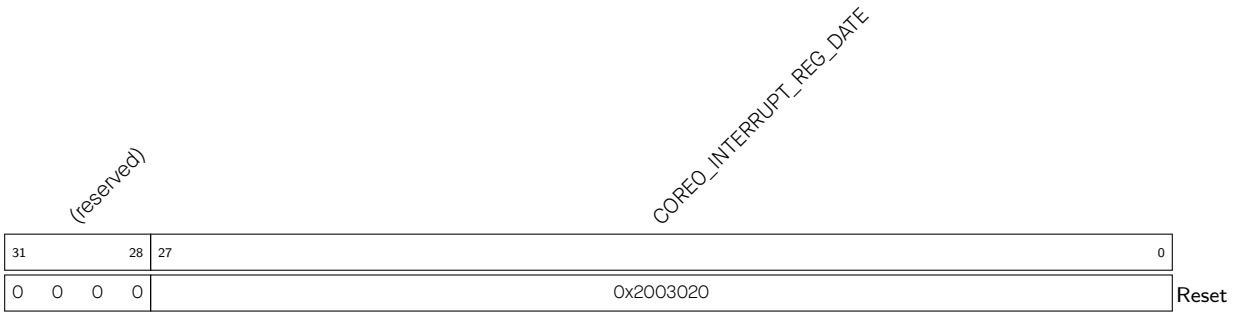
COREO_INTR_SRC_PASS_IN_SEC_STATUS_3 Represents whether interrupt source 96 ~ 127 has enabled the interrupt delegation function. Each bit corresponds to the enable status of one interrupt source.

0: Corresponding interrupt source has not enabled the interrupt delegation function.

1: Corresponding interrupt source has enabled the interrupt delegation function.

(RO)

Register 13.142. COREO_INTR_SRC_PASS_IN_SEC_STATUS_4_REG (0x0240)



COREO_INTR_SRC_PASS_IN_SEC_STATUS_4 Represents whether interrupt source 128 ~ 130 has enabled the interrupt delegation function. Each bit corresponds to the enable status of one interrupt source.

0: Corresponding interrupt source has not enabled the interrupt delegation function.

1: Corresponding interrupt source has enabled the interrupt delegation function.

(RO)

Register 13.143. COREO_INTERRUPT_REG_DATE_REG (0x03FC)

COREO_INTERRUPT_REG_DATE Version control register. (R/W)

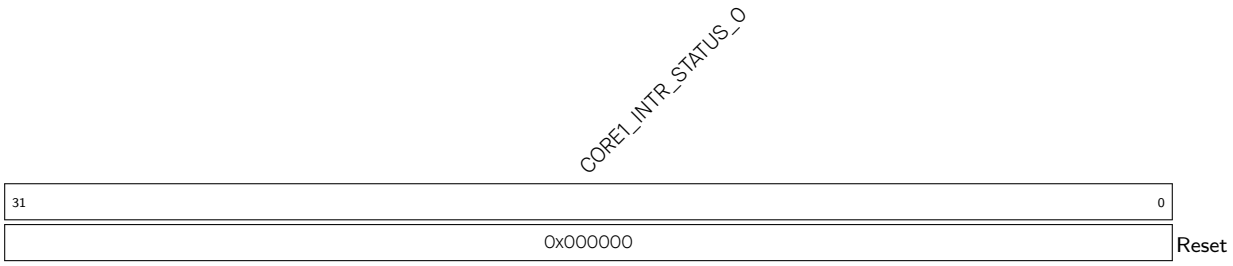
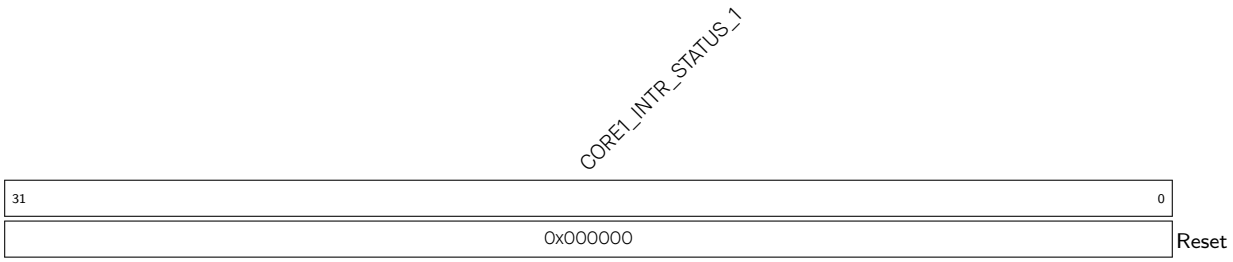
Register 13.273. CORE1_*SOURCE*_MAP_REG (0x0000 - 0x01FC, 0x0214 - 0x021C)



CORE1_*SOURCE*_MAP When CORE1_*SOURCE*_SRC_IN_SEC_FLAG is set to 1, this register can only be written by CPU while in Machine Mode.

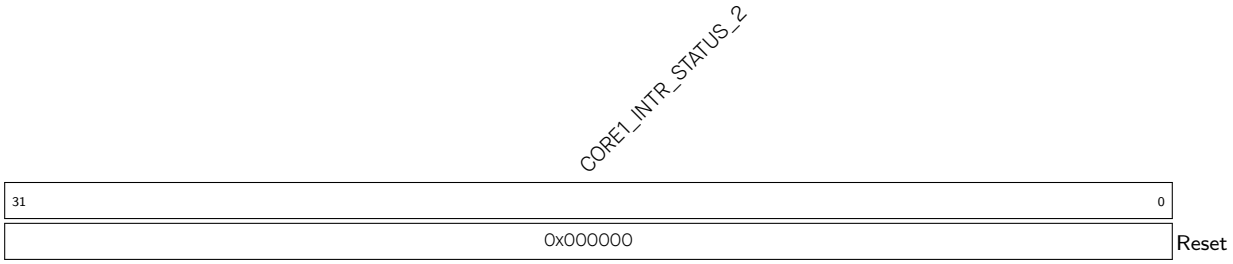
Configures this register to map the interrupt signal from the peripheral interrupt sources *Source* to one of CPU1's peripheral interrupts. The valid configuration range is 16 ~ 47.
When set to 0 ~ 15, the corresponding peripheral interrupt source is disabled (recommended value: 0).
Other values are invalid.
For the list of interrupt sources *Source*, see Table 13.4-1. (R/W)

CORE1_*SOURCE*_SRC_PASS_IN_SEC Write 1 to allow the interrupt signal from interrupt source *Source* to be delegated to CPU1's Machine Mode interrupt. Writable only by the CPU in Machine Mode. (R/W)



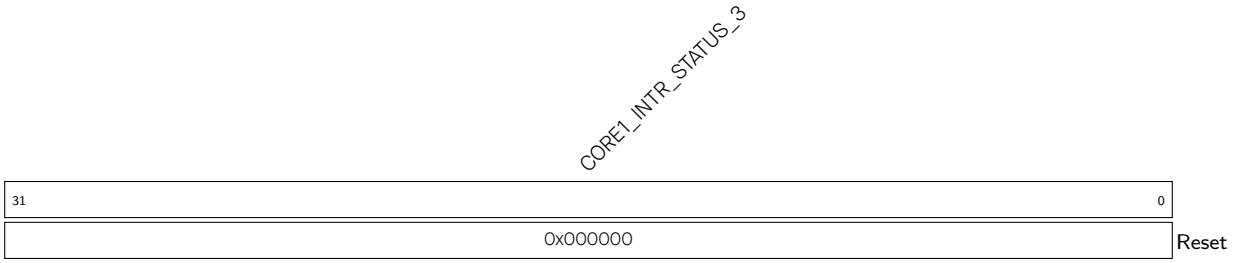
CORE1_*SOURCE*_SRC_IN_SEC_FLAG Write 1 to configure the interrupt signal from interrupt source *Source* as a secure interrupt source (that is, its interrupt mapping can be configured only by the CPU running in Machine Mode). Writable only by the CPU in Machine Mode. (R/W)

Register 13.274. CORE1_INTR_STATUS_REG_0_REG (0x0200)



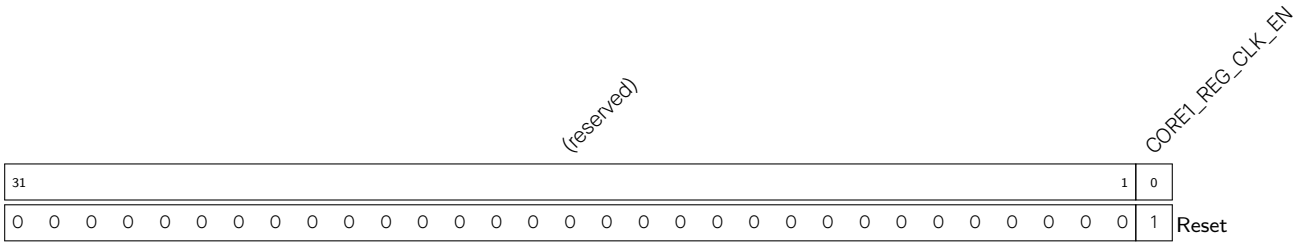
CORE1_INTR_STATUS_0 Represents the status of the interrupt sources from 0 ~ 31. Each bit corresponds to one interrupt source. (RO)

Register 13.275. CORE1_INTR_STATUS_REG_1_REG (0x0204)



CORE1_INTR_STATUS_1 Represents the status of the interrupt sources from 32 ~ 63. Each bit corresponds to one interrupt source. (RO)

Register 13.276. CORE1_INTR_STATUS_REG_2_REG (0x0208)

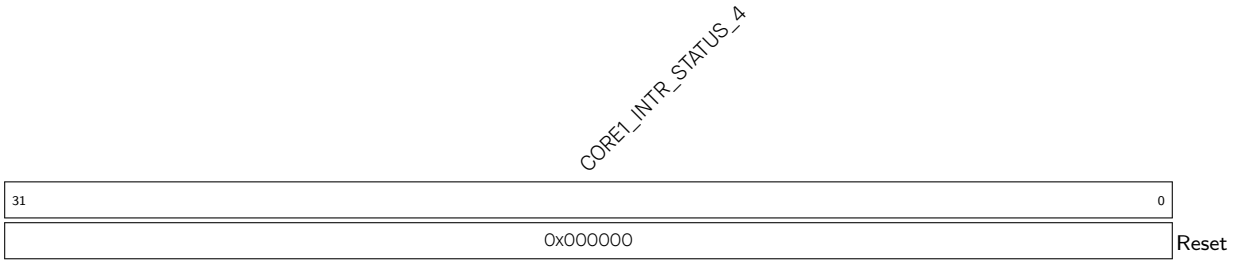


CORE1_INTR_STATUS_2 Represents the status register for interrupt sources from 64 ~ 95. Each bit corresponds to one interrupt source. (RO)

Register 13.277. CORE1_INTR_STATUS_REG_3_REG (0x020C)

CORE1_INTR_STATUS_3 Represents the status of the interrupt sources from 96 ~ 127. Each bit corresponds to one interrupt source. (RO)

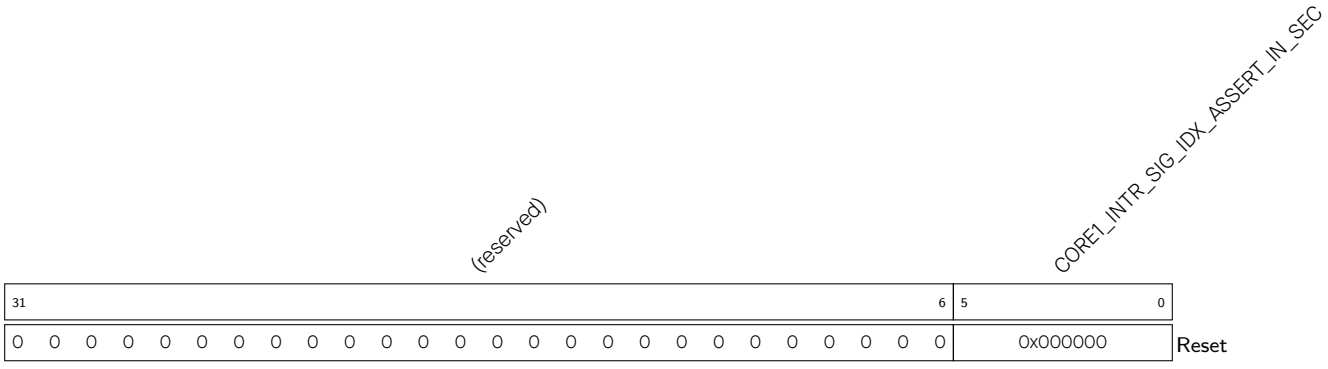
Register 13.278. CORE1_CLOCK_GATE_REG (0x0210)



CORE1_REG_CLK_EN Configures whether to force interrupt register clock-gate on.

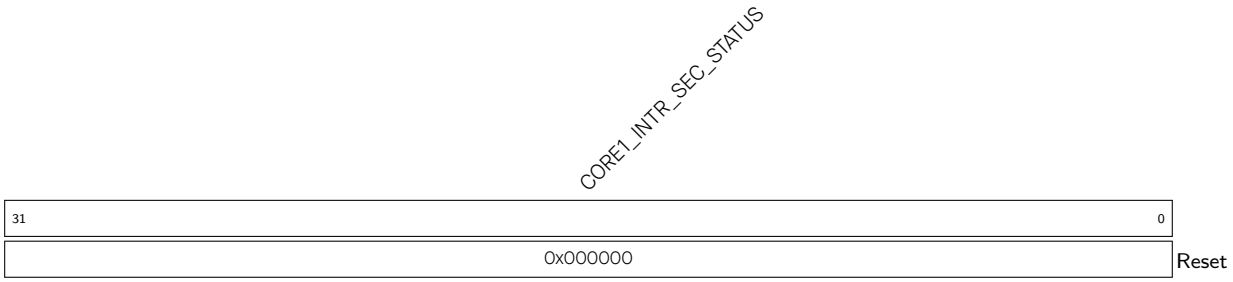
0: No effect

1: Force interrupt register clock-gate on



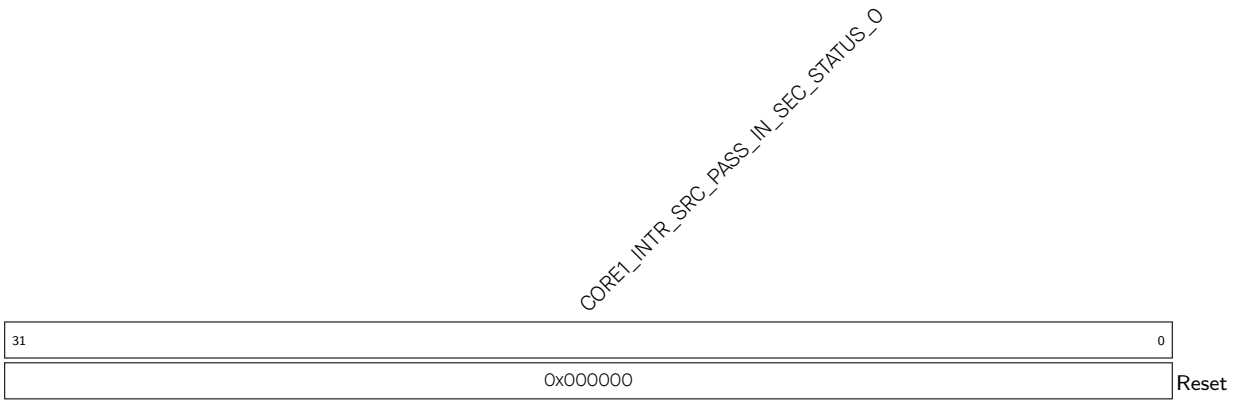
(R/W)

Register 13.279. CORE1_INTR_STATUS_REG_4_REG (0x0220)



CORE1_INTR_STATUS_4 Represents the status of the interrupt sources from 128 ~ 130. Each bit corresponds to one interrupt source. (RO)

Register 13.280. CORE1_INTR_SIG_IDX_ASSERT_IN_SEC_REG (0x0228)

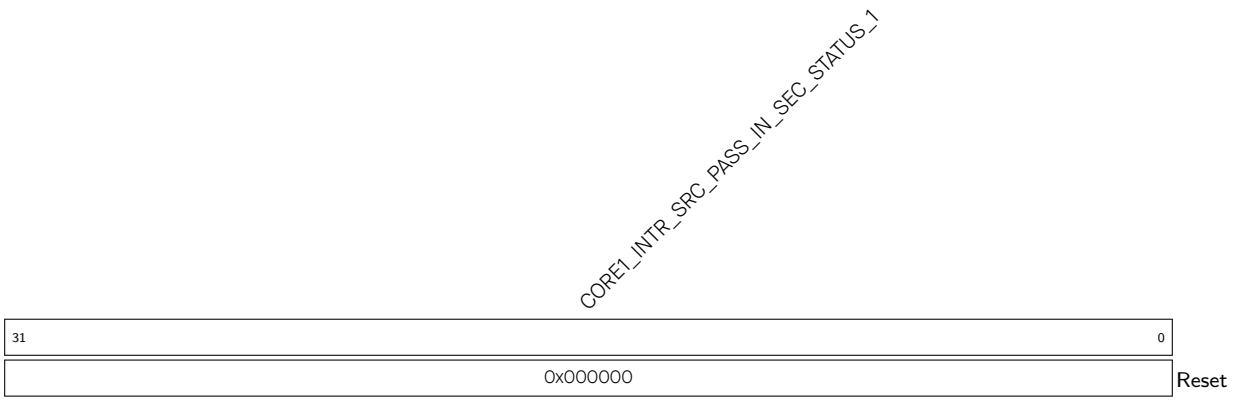


CORE1_INTR_SIG_IDX_ASSERT_IN_SEC Configures which peripheral machine mode interrupt of CPU1 is used as the target for the interrupt delegation function. Valid values range from 16 ~ 47. (R/W)

Register 13.281. CORE1_INTR_SEC_STATUS_REG (0x022C)

CORE1_INTR_SEC_STATUS Represents status of the user mode interrupt signals that have been delegated to the machine mode interrupt when CORE1 is in machine mode. (RO)

Register 13.282. CORE1_INTR_SRC_PASS_IN_SEC_STATUS_0_REG (0x0230)



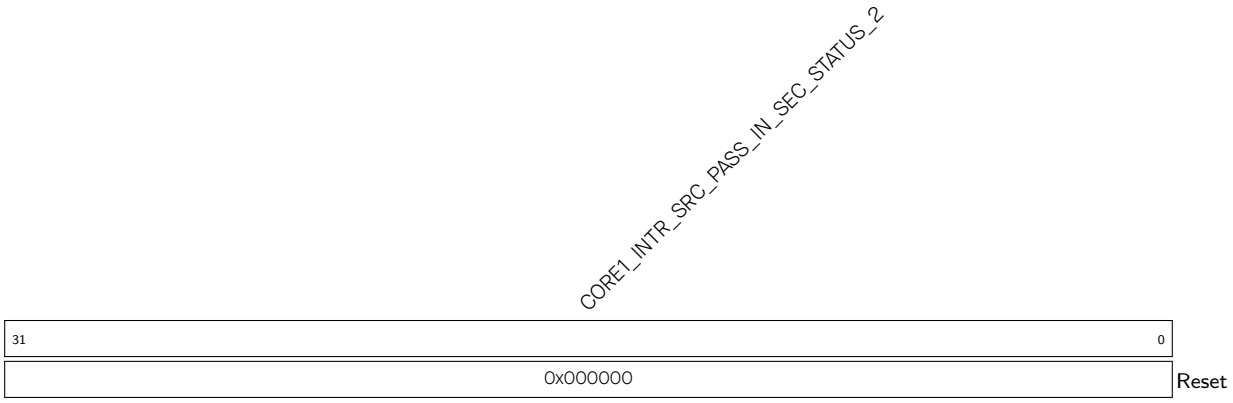
CORE1_INTR_SRC_PASS_IN_SEC_STATUS_0 Represents whether interrupt source 0 ~ 31 has enabled the interrupt delegation function. Each bit corresponds to the enable status of one interrupt source.

0: Corresponding interrupt source has not enabled the interrupt delegation function.

1: Corresponding interrupt source has enabled the interrupt delegation function.

(RO)

Register 13.283. CORE1_INTR_SRC_PASS_IN_SEC_STATUS_1_REG (0x0234)



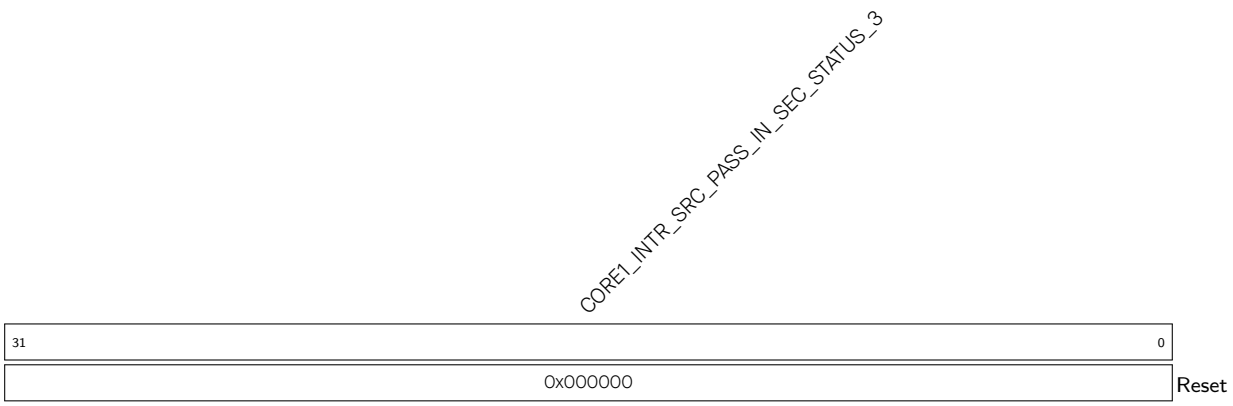
CORE1_INTR_SRC_PASS_IN_SEC_STATUS_1 Represents whether interrupt source 32 ~ 63 has enabled the interrupt delegation function. Each bit corresponds to the enable status of one interrupt source.

0: Corresponding interrupt source has not enabled the interrupt delegation function.

1: Corresponding interrupt source has enabled the interrupt delegation function.

(RO)

Register 13.284. CORE1_INTR_SRC_PASS_IN_SEC_STATUS_2_REG (0x0238)



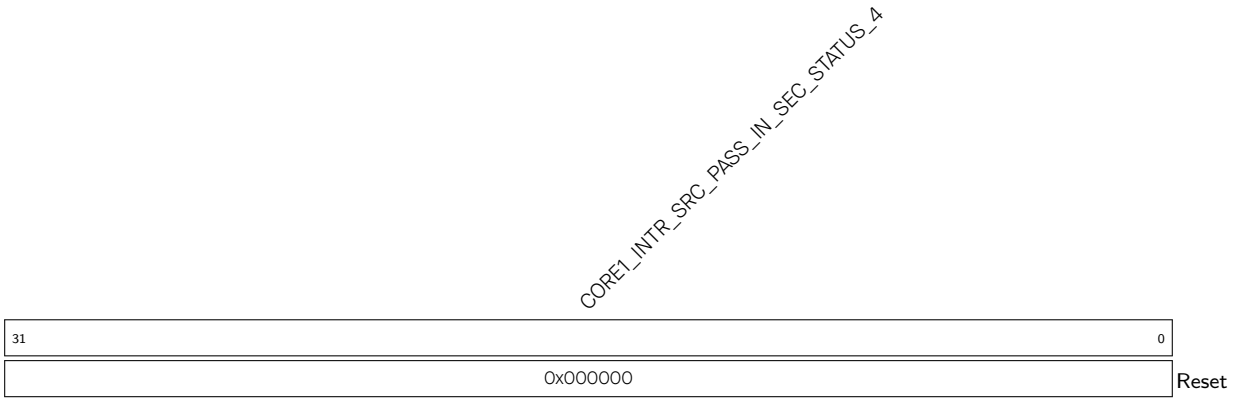
CORE1_INTR_SRC_PASS_IN_SEC_STATUS_2 Represents whether interrupt source 64 ~ 95 has enabled the interrupt delegation function. Each bit corresponds to the enable status of one interrupt source.

0: Corresponding interrupt source has not enabled the interrupt delegation function.

1: Corresponding interrupt source has enabled the interrupt delegation function.

(RO)

Register 13.285. CORE1_INTR_SRC_PASS_IN_SEC_STATUS_3_REG (0x023C)



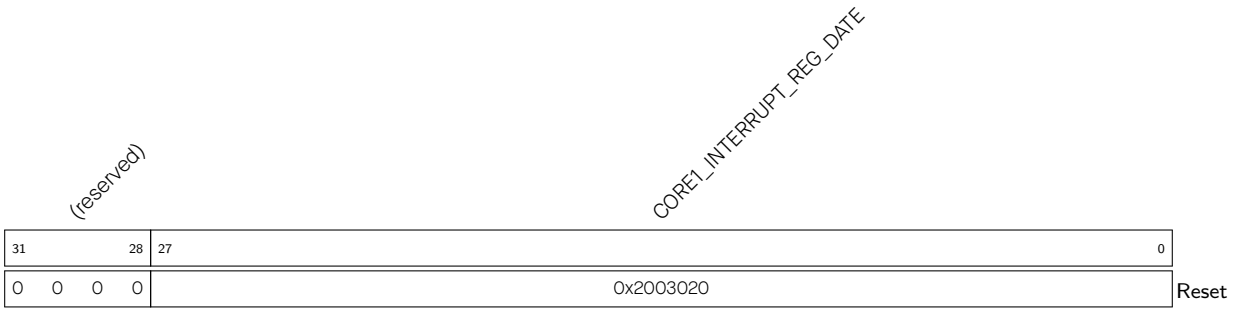
CORE1_INTR_SRC_PASS_IN_SEC_STATUS_3 Represents whether interrupt source 96 ~ 127 has enabled the interrupt delegation function. Each bit corresponds to the enable status of one interrupt source.

0: Corresponding interrupt source has not enabled the interrupt delegation function.

1: Corresponding interrupt source has enabled the interrupt delegation function.

(RO)

Register 13.286. CORE1_INTR_SRC_PASS_IN_SEC_STATUS_4_REG (0x0240)



CORE1_INTR_SRC_PASS_IN_SEC_STATUS_4 Represents whether interrupt source 128 ~ 130 has enabled the interrupt delegation function. Each bit corresponds to the enable status of one interrupt source.

0: Corresponding interrupt source has not enabled the interrupt delegation function.

1: Corresponding interrupt source has enabled the interrupt delegation function.

(RO)

Register 13.287. CORE1_INTERRUPT_REG_DATE_REG (0x03FC)

CORE1_INTERRUPT_REG_DATE Version control register. (R/W)

Chapter 14

Event Task Matrix (ETM)

14.1 Overview

The Event Task Matrix (ETM) peripheral contains 50 configurable channels. Each channel can map an event of any specified peripheral to a task of any specified peripheral. In this way, peripherals can be triggered to execute specified tasks without CPU intervention.

14.2 Features

The Event Task Matrix has the following features:

- Receive various events from multiple peripherals
- Generate various tasks for multiple peripherals
- 50 independently configurable ETM channels
- An ETM channel can be set up to receive any event, and map it to any task
- Each ETM channel can be enabled independently. If not enabled, the channel will not respond to the configured event and generate the task mapped to that event
- Support for checking event and task status
- Peripherals supporting ETM include GPIO, LED PWM, general-purpose timers, RTC Timer, system timer, MCPWM, temperature sensor, ADC, I2S, LP CPU, GDMA-AHB, GDMA-AXI, 2D DMA, and PMU

Note that the 50 ETM channels are identical regarding their features and operations. Thus, in the following sections, ETM channels are collectively referred to as channel*n* (where *n* ranges from 0 to 49).

14.3 Functional Description

14.3.1 Architecture

The Event Task Matrix has 50 independent channels. A channel can choose any event as input, and map the event to any task as output (see Section 14.3.2 and Section 14.3.3 respectively). Each channel has an individual enable bit (see Section 14.3.6).

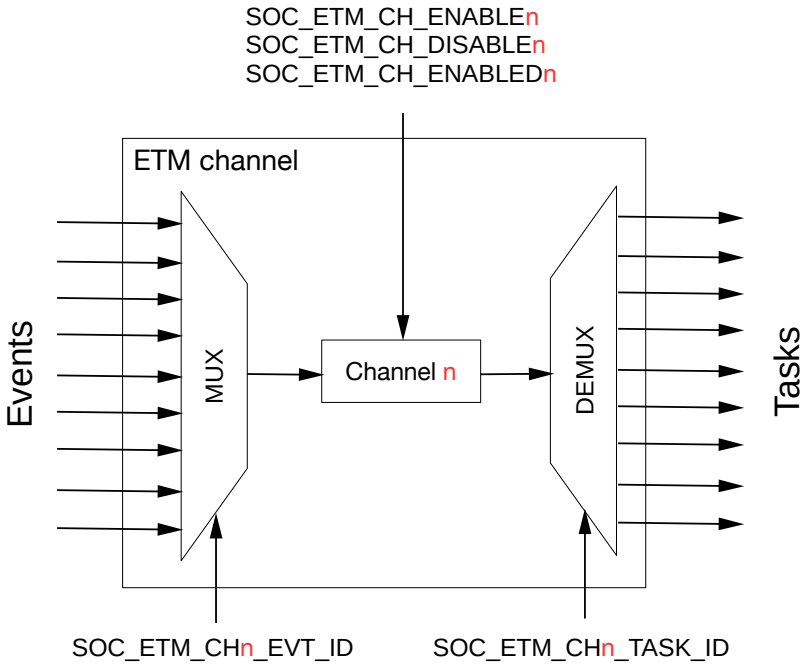


Figure 14.3-1. ETM Channel*n* Architecture

Figure 14.3-1 illustrates the structure of an ETM channel. The SOC_ETM_CH*n*_EVT_ID field configures the MUX (multiplexer) to select one of the events as the input of channel*n*. The SOC_ETM_CH*n*_TASK_ID field configures the DEMUX (demultiplexer) to map the event selected by channel*n* to one of the tasks. SOC_ETM_CH_ENABLE*n* and SOC_ETM_CH_DISABLE*n* are used to enable or disable channel*n*. SOC_ETM_CH_ENABLED*n* is used to indicate the status of the channel*n*.

14.3.2 Events

An ETM channel can be set up to choose which event to receive by configuring the SOC_ETM_CH*n*_EVT_ID field. Table 14.3-1 shows the configuration values of SOC_ETM_CH*n*_EVT_ID and their corresponding events.

Table 14.3-1. Selectable Events for ETM Channel*n*

Whenever any of these events occurs, the corresponding peripheral generates a pulse signal. As soon as the pulse signal is high, the event is considered as being received.

For more detailed descriptions of an event, please refer to the chapter for the peripheral generating this event.

14.3.3 Tasks

An ETM channel can be set up to map its event to one of the tasks by configuring the SOC_ETM_CH*n*_TASK_ID field. Table14.3-2 shows the configuration values of SOC_ETM_CH*n*_TASK_ID and

their corresponding tasks.

When a channel receives a valid event pulse signal, it generates the mapped task pulse signal.

For more detailed descriptions of a task, please refer to the chapter for the peripheral receiving this task.

Events from different channels can be optionally mapped to the same task. For example, field SOC_ETM_CH*n*_TASK_ID of multiple channels can be configured with the same value, and field SOC_ETM_CH*n*_EVT_ID can be configured with the same or different values. In this case, when the event received by any of the channels is valid, the task is generated. If events received by multiple channels are valid at the same time, the task will be generated only once.

14.3.4 Event and Task Status

The ETM module supports checking the status of events and tasks by reading registers as follows:

- Event status can be checked by reading the SOC_ETM_EVT_ST*n*_REG register. If the field corresponding to an event is 1, it indicates that the event has been received by ETM. Otherwise, it indicates that the event has not been received by ETM. The fields in the SOC_ETM_EVT_ST*n*_REG register can be cleared by writing 1 to the corresponding fields in the SOC_ETM_EVT_ST*n*_CLR_REG register.
- Task status can be checked by reading the SOC_ETM_TASK_ST*n*_REG register. If the field corresponding to a task is 1, it indicates that the task has been generated by ETM. Otherwise, it indicates that the task has not been generated by ETM. The fields in the SOC_ETM_TASK_ST*n*_REG register can be cleared by writing 1 to the corresponding fields in the SOC_ETM_TASK_ST*n*_CLR_REG register.

14.3.5 Timing Considerations

Figure 14.3-2 shows the structure of clocks that drive received events, sent tasks, and ETM channels.

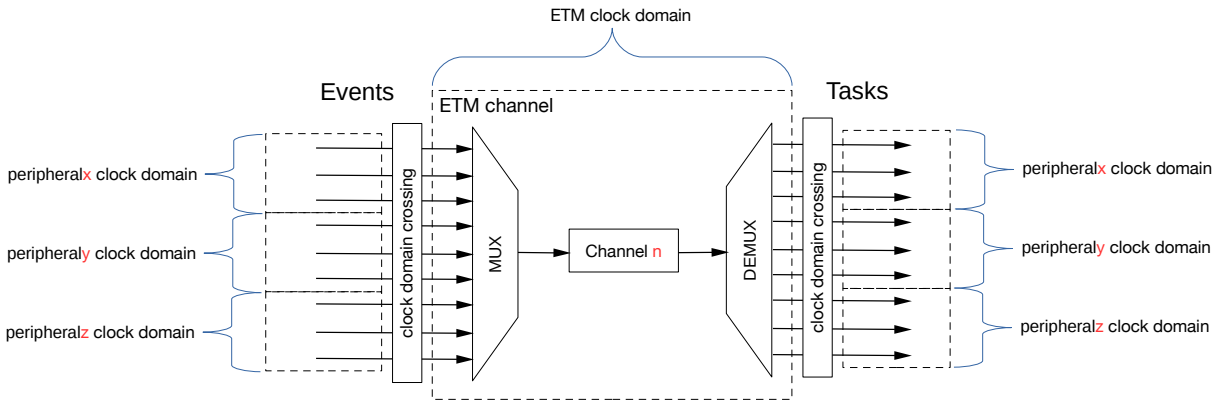

Figure 14.3-2. Event Task Matrix Clock Architecture

ETM is running at the SYS_CLK domain (see Chapter 11 *Reset and Clock*). Each event corresponds to a pulse signal generated by the corresponding peripheral in its clock domain, while each task is mapped by the ETM to a pulse signal under its corresponding peripheral clock domain. The peripherals generating events, the Event Task Matrix, and peripherals receiving tasks are not necessarily running off the same clock and as such need to be synchronized. Therefore, to avoid event loss, there should be a delay between two consecutive event pulses which is dependent on the clock of the peripheral generating the event, on the ETM's clock, and on the clock of the peripheral executing the task.

To make sure the Event Task Matrix receives every event successfully, for peripherals generating event pulses, the interval between two consecutive pulses must be greater than one ETM clock cycle, namely $ceil(\frac{peripheral_clock_frequency}{ETM_clock_frequency})$ in the unit of peripheral clock cycles.

For example, assuming that peripheral A is in the 80 MHz clock domain (REF_80M_CLK), and the ETM runs in the 40 MHz clock domain (SYS_CLK). Peripheral A generates event 1, which should be received by ETM. To receive each event 1 successfully, the interval between two consecutive event 1 must be greater than two peripheral A clock cycles (i.e., one ETM clock cycle).

Likewise, to make sure the Event Task Matrix maps the received event (i.e., event synchronized to the ETM's clock domain) successfully to a task, the interval between two consecutive event pulses in the ETM clock domain must be greater than one peripheral clock cycle, namely $ceil(\frac{ETM_clock_frequency}{peripheral_clock_frequency})$ in the unit of ETM clock cycles.

For example, assuming that peripheral B is in the 20 MHz clock domain (FOSC_20M_CLK), and the ETM runs in the 40 MHz clock domain (SYS_CLK). ETM maps an event to task 1, which should be received by peripheral B. To map each received event successfully to task 1, the interval between two consecutive events must be greater than two ETM clock cycles (i.e., one peripheral B clock cycle).

As a result, to map two consecutive events generated by peripheral A to peripheral B, the interval between these two events must be $ceil(\frac{peripheral_A_clock_frequency}{ETM_clock_frequency}) * ceil(\frac{ETM_clock_frequency}{peripheral_B_clock_frequency})$ in the unit of peripheral A clock cycles.

For example, assuming that peripheral A is in the 80 MHz clock domain (REF_80M_CLK), peripheral B is in the 20 MHz clock domain (FOSC_20M_CLK), and the ETM runs in the 40 MHz clock domain (SYS_CLK). ETM maps event 1 generated by peripheral A to task 1 received by peripheral B. To successfully map each event 1 to task 1, the interval between two consecutive event 1 must be greater than $2 * 2 = 4$ peripheral A clock

cycles.

14.3.6 Channel Control

Each ETM channel can be independently configured to be enabled or disabled. When channel*n* is enabled and receives the event configured via SOC_ETM_CH*n*_EVT_ID, it maps the event to the task configured via SOC_ETM_CH*n*_TASK_ID. When channel*n* is disabled, even if it receives the event configured via SOC_ETM_CH*n*_EVT_ID, no task will be generated.

To enable ETM channel*n*, write 1 to SOC_ETM_CH_ENABLE*n*. To disable ETM channel*n*, Write 1 to SOC_ETM_CH_DISABLE*n*.

The status of ETM channel*n* can be obtained by reading SOC_ETM_CH_ENABLED*n*. 1 indicates that channel*n* has been enabled, and 0 indicates disabled.

If SOC_ETM_CH*n*_EVT_ID or SOC_ETM_CH*n*_TASK_ID is configured to 0, ETM channel*n* will also be disabled.

The complete procedure to configure ETM channel*n* is as follows:

1. Enable the ETM's clock by writing 1 to HP_SYS_CLKRST_ETM_SYS_CLK_EN
2. Select the event to be received by channel*n* via SOC_ETM_CH*n*_EVT_ID
3. Select the task mapped to the received event via SOC_ETM_CH*n*_TASK_ID
4. Enable channel*n* by setting SOC_ETM_CH_ENABLE*n*
5. When channel*n* no longer needs to map the selected event to the selected task, disable channel*n* by setting SOC_ETM_CH_DISABLE*n*. To configure a new event and task mapping, repeat Steps 2 to 4. If no configurations, channel*n* will remain disabled
6. The whole ETM module (i.e., all ETM channels) can be reset by writing 1 and then 0 to the HP_SYS_CLKRST_RST_EN_ETM field

14.4 Register Summary

The addresses in this section are relative to Event Task Matrix base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Status register			
SOC_ETM_CH_ENA_AD0_REG	Channel status register	0x0000	R/WTC/WTS
SOC_ETM_CH_ENA_AD1_REG	Channel status register	0x000C	R/WTC/WTS
SOC_ETM_EVT_ST0_REG	Event status register	0x01A8	R/WTC/SS
SOC_ETM_EVT_ST1_REG	Event status register	0x01B0	R/WTC/SS
SOC_ETM_EVT_ST2_REG	Event status register	0x01B8	R/WTC/SS
SOC_ETM_EVT_ST3_REG	Event status register	0x01C0	R/WTC/SS
SOC_ETM_EVT_ST4_REG	Event status register	0x01C8	R/WTC/SS
SOC_ETM_EVT_ST5_REG	Event status register	0x01D0	R/WTC/SS
SOC_ETM_EVT_ST6_REG	Event status register	0x01D8	R/WTC/SS
SOC_ETM_EVT_ST7_REG	Event status register	0x01E0	R/WTC/SS
SOC_ETM_TASK_ST0_REG	Task status register	0x01E8	R/WTC/SS
SOC_ETM_TASK_ST1_REG	Task status register	0x01F0	R/WTC/SS
SOC_ETM_TASK_ST2_REG	Task status register	0x01F8	R/WTC/SS
SOC_ETM_TASK_ST3_REG	Task status register	0x0200	R/WTC/SS
SOC_ETM_TASK_ST4_REG	Task status register	0x0208	R/WTC/SS
SOC_ETM_TASK_ST5_REG	Task status register	0x0210	R/WTC/SS
SOC_ETM_TASK_ST6_REG	Task status register	0x0218	R/WTC/SS
Configuration Register			
SOC_ETM_CH_ENA_AD0_SET_REG	Channel enable register	0x0004	WT

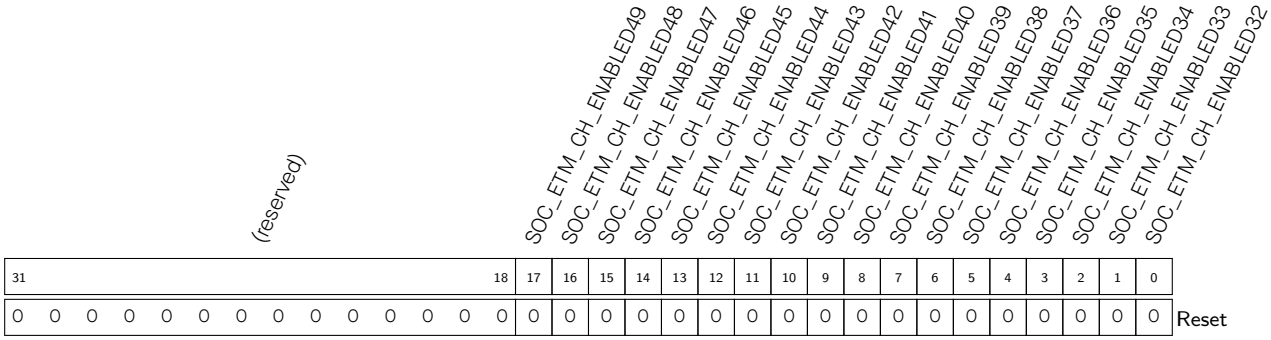
14.5 Registers

The addresses in this section are relative to Event Task Matrix base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

For how to program reserved fields, please refer to Section Programming Reserved Register Field.

Register 14.1. SOC_ETM_CH_ENA_AD0_REG (0x0000)



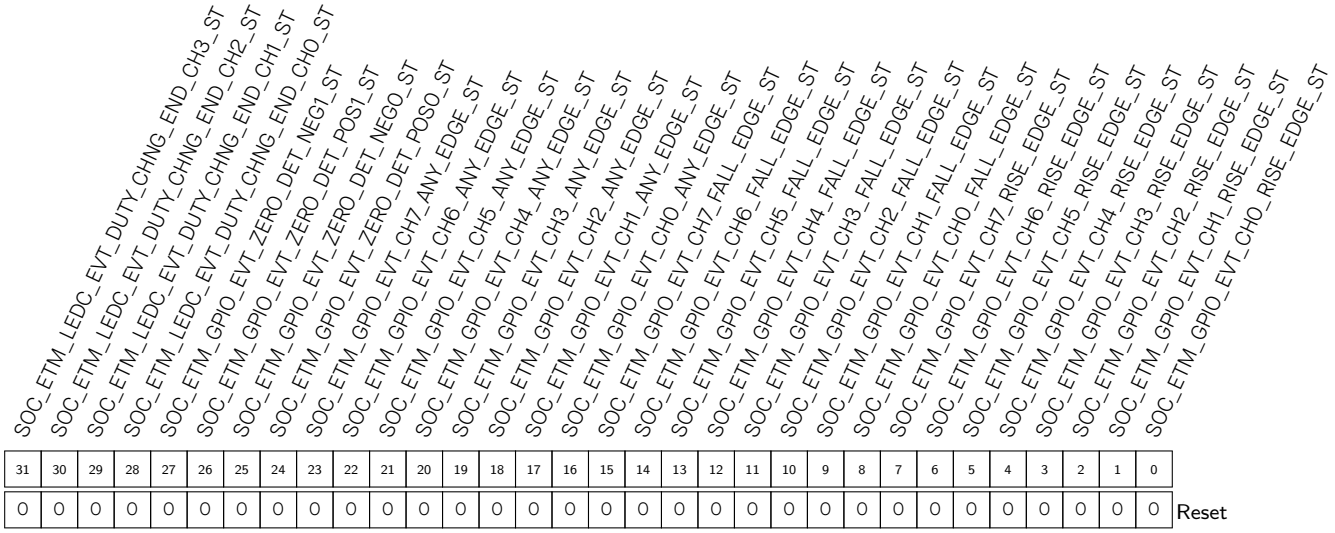
SOC_ETM_CH_ENABLED*n* (*n*: 0-31) Represents the status of channel*n*.

0: Disabled

1: Enabled

(R/WTC/SS)

Register 14.2. SOC_ETM_CH_ENA_AD1_REG (0x000C)



SOC_ETM_CH_ENABLED*n* (*n*: 32-49) Represents the status of channel*n*.

0: Disabled

1: Enabled

(R/WTC/SS)

Register 14.3. SOC_ETM_EVT_ST0_REG (0x01A8)

SOC_ETM_GPIO_EVT_CH0_RISE_EDGE_ST Represents the status of GPIO_EVT_CH0_RISE_EDGE.

0: Not received

1: Received

(R/WTC/SS)

SOC_ETM_GPIO_EVT_CH1_RISE_EDGE_ST Represents the status of GPIO_EVT_CH1_RISE_EDGE.

0: Not received

1: Received

(R/WTC/SS)

SOC_ETM_GPIO_EVT_CH2_RISE_EDGE_ST Represents the status of GPIO_EVT_CH2_RISE_EDGE.

0: Not received

1: Received

(R/WTC/SS)

SOC_ETM_GPIO_EVT_CH3_RISE_EDGE_ST Represents the status of GPIO_EVT_CH3_RISE_EDGE.

0: Not received

1: Received

(R/WTC/SS)

SOC_ETM_GPIO_EVT_CH4_RISE_EDGE_ST Represents the status of GPIO_EVT_CH4_RISE_EDGE.

0: Not received

1: Received

(R/WTC/SS)

SOC_ETM_GPIO_EVT_CH5_RISE_EDGE_ST Represents the status of GPIO_EVT_CH5_RISE_EDGE.

0: Not received

1: Received

(R/WTC/SS)

Continued on the next page...

Register 14.3. SOC_ETM_EVT_ST0_REG (0x01A8)

Continued from the previous page...

SOC_ETM_GPIO_EVT_CH6_RISE_EDGE_ST Represents the status of GPIO_EVT_CH6_RISE_EDGE.
0: Not received
1: Received
(R/WTC/SS)

SOC_ETM_GPIO_EVT_CH7_RISE_EDGE_ST Represents the status of GPIO_EVT_CH7_RISE_EDGE.
0: Not received
1: Received
(R/WTC/SS)

SOC_ETM_GPIO_EVT_CH0_FALL_EDGE_ST Represents the status of GPIO_EVT_CH0_FALL_EDGE.
0: Not received
1: Received
(R/WTC/SS)

SOC_ETM_GPIO_EVT_CH1_FALL_EDGE_ST Represents the status of GPIO_EVT_CH1_FALL_EDGE.
0: Not received
1: Received
(R/WTC/SS)

SOC_ETM_GPIO_EVT_CH2_FALL_EDGE_ST Represents the status of GPIO_EVT_CH2_FALL_EDGE.
0: Not received
1: Received
(R/WTC/SS)

SOC_ETM_GPIO_EVT_CH3_FALL_EDGE_ST Represents the status of GPIO_EVT_CH3_FALL_EDGE.
0: Not received
1: Received
(R/WTC/SS)

SOC_ETM_GPIO_EVT_CH4_FALL_EDGE_ST Represents the status of GPIO_EVT_CH4_FALL_EDGE.
0: Not received
1: Received
(R/WTC/SS)

SOC_ETM_GPIO_EVT_CH5_FALL_EDGE_ST Represents the status of GPIO_EVT_CH5_FALL_EDGE.
0: Not received
1: Received
(R/WTC/SS)

Continued on the next page...

Register 14.3. SOC_ETM_EVT_ST0_REG (0x01A8)

Continued from the previous page...

SOC_ETM_GPIO_EVT_CH6_FALL_EDGE_ST Represents the status of GPIO_EVT_CH6_FALL_EDGE.
0: Not received
1: Received

Chapter 15

Low-Power Management

15.1 Overview

ESP32-P4 features an advanced low-power management system that optimizes the chip's power consumption while maintaining its high performance.

The low-power management system employs various power-saving techniques such as sleep modes, dynamic voltage and frequency scaling, and peripheral power gating to minimize the chip's power consumption.

At the core of this low-power management system is the power management unit (PMU) hardware component. The PMU powers up and down different power domains of the chip to achieve the best balance between chip performance, power consumption, and wake-up latency.

15.2 Terminology

The following terms related to low-power management are defined in the context of the *ESP32-P4 Technical Reference Manual* to help readers better understand this document:

Low-power management	Refers to the whole system that manages the chip's power consumption.
Power management unit (PMU)	Refers to the specific hardware module that controls power up and down for power domains, clocks, and power-related logic.
Power domain	Refers to the smallest unit that can be independently powered up or down. A power domain can contain one or multiple modules within the chip.
PMU states	Refers to the states of the PMU's state machine. Users can configure the clock gating and power gating of a power domain in each of the states.
Power modes	Refers to the preset power modes that power up different domains for typical application scenarios.

15.3 Features

The PMU has the following features:

- Supports three configurable PMU states. Software can flexibly configure them according to the needs.
  - HP_ACTIVE
  - HP_SLEEP

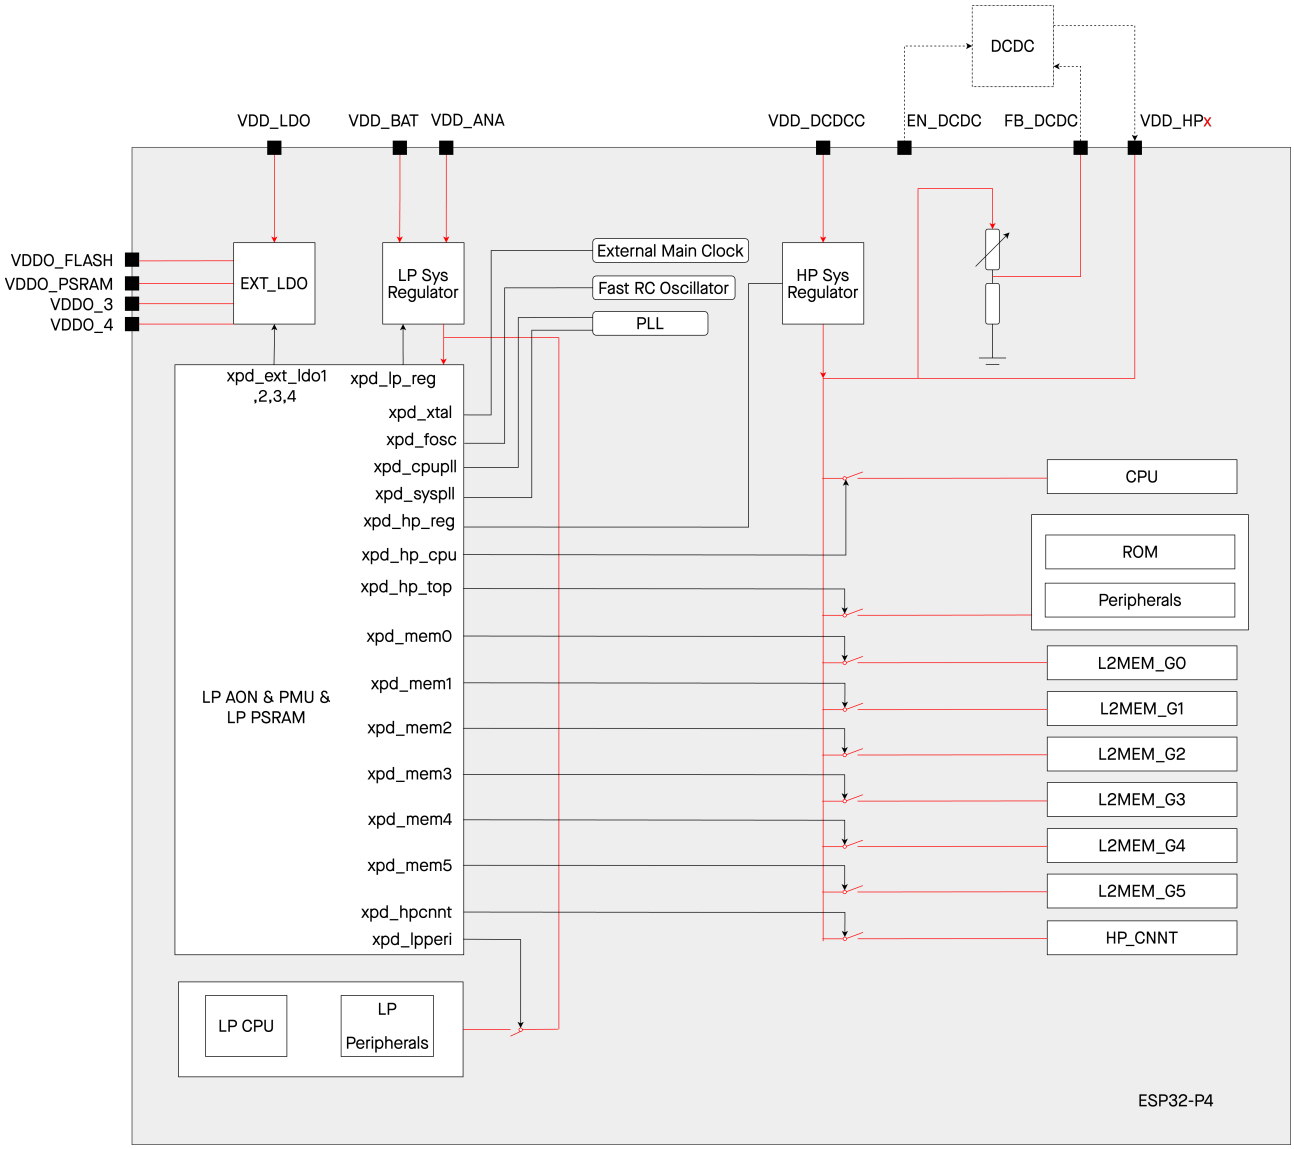
  - LP_SLEEP

- Supports five preset power modes that suit various typical usage scenarios:
  - Active
  - Light-sleep0 (This mode does not power down the peripherals, but only the CPU. The clocks are not turned off. The power consumption is high, and the wake-up latency is short.)
  - Light-sleep1 (This mode does not power down the peripherals, but only turns off the clocks. The power consumption is relatively higher and the wake-up latency shorter.)
  - Light-sleep2 (This mode powers down the peripherals and needs data backup and restoration, resulting in lower power consumption and a longer wake-up latency.)
  - Deep-sleep
- LP SRAM (32 KB): Keep power up in all modes, can store HP CPU's non-volatile data, and LP CPU's instructions and data.
- Supports a programmable retention DMA that backs up and restores the CPU and peripherals status when the chip switches between PMU states.
- Supports a power controller that controls the power and clocks depending on the power modes.

15.4 Functional Description

ESP32-P4's low-power management involves the following components:

- **Power scheme**: The power scheme of ESP32-P4 includes power regulators, digital power domains, analog power domains, etc.
- **PMU controller**: It is the core part of the PMU, controlling the power up and down of power domains, clocks, etc.
- **One RTC timer**: For more information, please refer to Chapter 19 *RTC Timer*.
- **16 LP GPIO pins (GPIO0–GPIO15)**: These pins are always powered up and are not affected by any low-power modes, which makes them suitable for working as wake-up sources when the chip is in low-power modes. These pins can also work as regular GPIOs. For more information on LP GPIOs, refer to Chapter 10 *GPIO Matrix and IO MUX*.
- **32 KB SRAM**: The 32 KB SRAM is accessible to both HP CPU and LP CPU. It works under the HP CPU clock when accessed by the HP CPU and under the LP CPU clock when accessed by the LP CPU.
- **Brownout detector**: Monitors the power of the voltage supply pins, ensuring stable chip operation and preventing the SoC from potential malfunction if it is subject to glitches or under-voltage. For more information, refer to Chapter 25 *Brown-out Detector*.



The following sections provide a detailed description of the components mentioned above.

15.4.1 Power Scheme

Figure 15.4-1 shows the power scheme of ESP32-P4 that mainly includes:

- A DCDC voltage regulation feedback system

- Two internal regulators
- Four output regulators (EXT_LDO)
- Analog power domains
- Digital power domains
- Battery power domain

–→: Control signals ––: Power lines

Figure 15.4-1. ESP32-P4 Power Scheme

15.4.1.1 Regulators

As shown in Figure 15.4-1, the analog section of ESP32-P4 includes one external DCDC with feedback regulation and two internal HP/LP system regulators, responsible for regulating the power supply for different power domains.

- The **DCDC voltage regulation feedback system** adjusts the voltage of the external DCDC.

- The **HP (high-performance) system regulator** has strong drive capability, higher power consumption, and adjustable output voltage. It is only suitable for power-up and sleep modes.
- The **LP (low-power) system regulator** regulates the power supply of low-power modules. Its output voltage is also adjustable.

The DCDC voltage regulation feedback system and the HP system regulator are responsible for powering the HP system. The external DCDC can adjust its output voltage through the internal voltage feedback system. By default, the chip is powered by the HP system regulator when powered up. After power-up is complete, it is recommended to switch to the DCDC power supply for better efficiency and load capacity.

15.4.1.2 Digital Power Domains

- The HP system contains the following digital power domains:
  - **CPU (PD_HP_CPU)**: Mainly includes the CPU and peripherals that support its operation.
  - **Peripherals + ROM (PD_TOP)**: Mainly includes the bus and HP peripherals.
  - **L2MEM_G0–G5**: It is divided into six sub-power domains, as shown in Figure 15.4-1.
  - **HP_CNNT (PD_HP_CNNT)**: Mainly includes USB and SDIO modules.

  There is an independent power switch between the regulator and each power domain, enabling up/down control of the digital power domain.
- The LP system contains the following digital power domains:
  - **LP PD peripherals (PD_LP_PERI)**: Mainly includes LP CPU and LP peripherals.
  - **LP always-on (PD_AON)**: It mainly includes LP always-on peripherals (e.g., RTC timer) and PMU controller. This power domain keeps powered up all the time.

15.4.1.3 Analog Power Domains

- The HP system contains the following analog power domains:
  - CPLL_CLK
  - SPLL_CLK
  - Audio PLL
  - SDIO PLL
- The LP system contains the following analog power domains:
  - External Main Clock
  - Fast RC Oscillator

15.4.1.4 Battery Power Domain

The battery power domain (VDD_BAT) serves as a backup power domain. When all external power supplies (VDD_ANA) are turned off, the low-power system regulators, LP_SLOW_CLK, and LP_FAST_CLK can all be powered by the VDD_BAT supply.

15.4.2 PMU

The PMU of ESP32-P4 controls power consumption-related components of each power domain, such as power and clock. PMU consists of the following major parts:

- **PMU main state machine**: It records and switches the PMU states.
- **Sleep/wake-up controller**: It sends sleep or wake-up requests to the PMU main state machine.
- **Power controllers**: They control the power and clock signals depending on the power modes of the chip. The power controllers include:
  - **Digital power controller**: It powers up or down the digital power domains.
  - **Analog power controller**: It enables the analog modules, such as the regulators, analog clocks, etc.
  - **Clock controller**: It manages the clock gating of peripherals and selects analog clock sources for digital clocks.
  - **Data backup controller**: It controls the data backup and restore process when the chip switches between PMU states.
  - **System controller**: It controls some system-level modules, such as suspending watchdog functionality in sleep mode (when the CPU is unavailable).

The PMU workflow involves the following steps:

- The sleep/wake-up controller sends sleep or wake-up requests to the PMU main state machine.
- The PMU main state machine generates power gating, clock gating, and reset signals.
- The power controllers and clock controllers power up or down different power domains and clocks based on the signals generated by the PMU main state machine, allowing the chip to enter or exit different low-power modes.

The PMU workflow is shown in Figure 15.4-2. The definitions of HP_SWITCH and LP_SWITCH are as follows:

- HP_SWITCH: The intermediate state for the HP system transitioning between HP_ACTIVE and HP_SLEEP. The hardware completes the control switching of various controllers in this state.
- LP_SWITCH: The intermediate state for the LP system transitioning between HP_SLEEP and LP_SLEEP. The hardware completes the control switching of various controllers in this state.

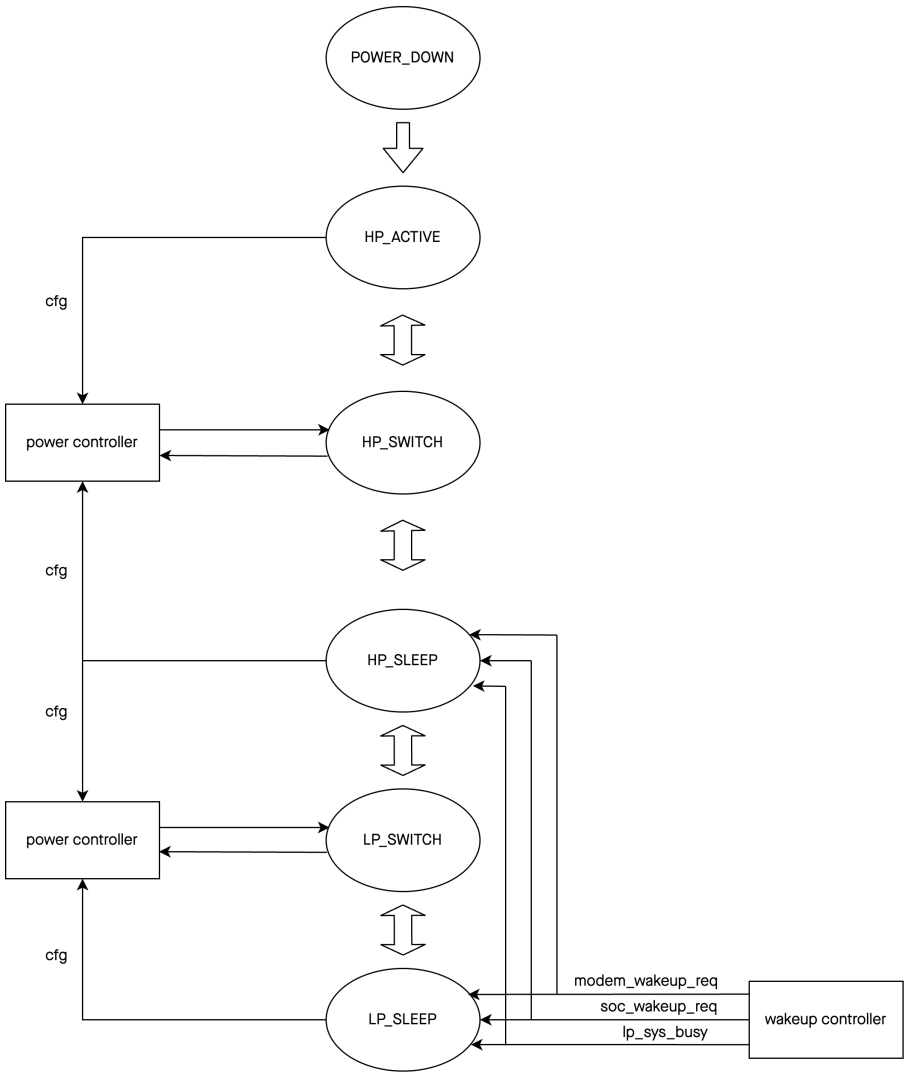


Figure 15.4-2. PMU Workflow

The following sections describe the main parts of PMU.

15.4.2.1 PMU Main State Machine

The PMU main state machine receives sleep and wake-up signals, changes the state of power and clock through the power controllers, thereby switching PMU states, and achieving a balance between performance and power consumption of the chip.

The PMU main state machine supports three PMU states, each controlled by different sleep and wake-up signals, supporting software customization of power and clocks. These PMU states allow the software to expand power modes for various application scenarios. The three PMU states are:

- **HP_ACTIVE**: The circuits on the chip are powered up to a maximum, supporting the HP system and LP system operation.
- **HP_SLEEP**: The HP system is in sleep, supporting LP peripherals operation.
- **LP_SLEEP**: The HP system and LP peripherals are in sleep, while the always-on circuits remain operational.

Note:
The division of the HP and LP systems is as follows:

- LP system (peripherals): LP RISC-V 32-bit Microprocessor, LP GPIO, LP UART, LP I2C, LP I2S, touch sensor, temperature sensor, LP ADC, LP SPI
- LP system (always-on circuits): PMU, RTC Watchdog Timer, Super Watchdog
- HP system: All peripherals except those belonging to the LP system.

For more details, please refer to *ESP32-P4 Datasheet* > *Functional Block Diagram*.

HP_ACTIVE is the operating state of the HP system, HP_SLEEP is the sleep state of the HP system, LP_SLEEP is the sleep state of the LP system. The operating state of the LP system reuses the HP_SLEEP state and is therefore also referred to as HP_SLEEP.

- If a module belongs to the HP system, its power up/down can be configured in the HP_ACTIVE/HP_SLEEP states. It reuses the HP_SLEEP state in the LP_SLEEP state.
- If a module belongs to the LP system, its power up/down can be configured in the HP_SLEEP/LP_SLEEP state. It reuses the HP_SLEEP state in the HP_ACTIVE state.

Take the HP CPU as an example. The HP CPU belongs to the HP system, so it can be configured to power up/down in the HP_ACTIVE/HP_SLEEP states through the following registers and reuse the HP_SLEEP configurations in LP_SLEEP.

- HP_ACTIVE: PMU_HP_ACTIVE_PD_HP_CPU_PD_EN
- HP_SLEEP: PMU_HP_SLEEP_PD_HP_CPU_PD_EN

Similarly, users can configure the power up and down for other power domains in different PMU states. For the configuration registers, please refer to Section 15.8.

Note:
In the following text, all such configuration registers are collectively referred to as PMU_*n1*_PD_*POWERDOMAIN*_PD_EN, where *n1* represents the three PMU states.

Once the configuration is done, the PMU uses various controllers to make these configurations effective, as described in the following sections.

15.4.2.2 Sleep/Wake-up Controller

The sleep/wake-up controller initiates sleep and wake-up requests to the PMU main state machine. ESP32-P4 supports multiple wake-up sources to wake the CPU from different power modes. Table 15.4-1 lists all the wake-up sources.

All the wake-up sources in Table 15.4-1 can wake up both the HP CPU and the LP CPU. Users can configure PMU_WAKEUP_ENA to set the target to the HP CPU, and configure PMU_LP_CPU_WAKEUP_EN to set the target to the LP CPU. Configuring both registers simultaneously can wake up both the HP CPU and the LP CPU.

Table 15.4-1. Wake-up Sources

Bit in PMU_WAKEUP_ENA/PMU_LP_CPU_WAKEUP_EN	Wake-up Sources	Source Power Domains
0	HP_SDIO	PD_HP_CNNT
1	Software wakeup	PD_LP_PERI
2	HP GPIO	PD_TOP
3	HP USB	PD_HP_CNNT
4	HP UART4	PD_TOP
5	HP UART3	PD_TOP
6	HP UART2	PD_TOP
7	HP UART1	PD_TOP
8	HP UART0	PD_TOP
9	LP GPIO	PD_LP_PERI
10	LP UART	PD_LP_PERI
11	LP TOUCH	PD_LP_PERI
12	EXT IO	PD_LP_PERI
13	RTC_TIMER_TAR0	PD_AON
14	BROWN OUT	PD_AON
15	VBAT_UNDERVOLTAGE	PD_AON
16	LP CORE EXCEPTION	PD_LP_PERI
17	ETM	PD_TOP
18	RTC_TIMER_TAR1	PD_AON
19	LP I2S	PD_LP_PERI
20	GMAC PMT	PD_HP_CNNT
21	GMAC LPI	PD_HP_CNNT
22	LP CPU	PD_AON
23	HP CPU	PD_TOP

ESP32-P4 provides a hardware mechanism that can reject sleep, meaning if some peripherals are in an uninterruptible working state and the HP CPU tries to sleep, the peripherals will send a wake-up signal to prevent the HP CPU from sleeping, thus ensuring the peripherals work normally.

The wake-up sources in Table 15.4-1 can all be configured as events to reject sleep. Users can configure the following registers to implement sleep rejection. The configuration values of PMU_SLEEP_REJECT_ENA and PMU_SLP_REJECT_CAUSE_REG and the corresponding wake-up sources are the same as shown in Table 15.4-1.

- Enable sleep rejection feature:
  - Set PMU_SLP_REJECT_EN to 1 to enable the sleep rejection feature.
  - Configure PMU_SLEEP_REJECT_ENA to select the sleep rejection signal source.
- Read PMU_SLP_REJECT_CAUSE_REG for the source of sleep rejection event.

15.4.2.3 Analog Power Controller

The analog power controller controls the power up and down of the analog circuits (including voltage regulators, high-speed clocks, and slow-speed clocks) in the PMU states.

The configuration of the regulators is as follows:

- Configure PMU_*n1*_HP_REGULATOR_XPD or PMU_*n1*_LP_REGULATOR_XPD to enable or disable the output voltage of the HP/LP sys regulator in the target PMU state. Turning off the LP sys regulator is not recommended, as it may cause the PMU itself to power down, resulting in chip malfunction.

The configuration of the high-speed clocks (XTAL_CLK and PLL clocks) is as follows:

- XTAL_CLK: Configure PMU_HP_SLEEP_XPD_XTAL to 1 to enable XTAL_CLK when the chip switches the PMU state to HP_SLEEP.

  Note: To avoid the instability in XTAL_CLK during startup, users have the option to configure PMU_WAIT_XTL_STABLE to delay the gate opening for XTAL_CLK. This delay ensures that the gate opening is enabled after PMU_WAIT_XTL_STABLE CLK_DYN_FAST_CLK cycles following the power-up of XTAL_CLK.

- CPLL_CLK: PMU can enable CPLL_CLK in different PMU states by configuring PMU_*n1*_XPD_PLL[0] to 1. For example, configuring PMU_HP_ACTIVE_XPD_PLL[0] to 1 enables the CPLL_CLK clock when the chip is in HP_ACTIVE state.
- SPLL_CLK: PMU can enable SPLL_CLK in different PMU states by configuring PMU_*n1*_XPD_PLL[1] to 1. For example, configuring PMU_HP_ACTIVE_XPD_PLL[1] to 1 enables the SPLL_CLK clock when the chip is in HP_ACTIVE state.
- Audio PLL: PMU can enable Audio PLL in different PMU states by configuring PMU_*n1*_XPD_PLL[2] to 1. For example, configuring PMU_HP_ACTIVE_XPD_PLL[2] to 1 enables the Audio PLL clock when the chip is in HP_ACTIVE state.
- SDIO PLL: PMU can enable SDIO PLL in different PMU states by configuring PMU_*n1*_XPD_PLL[3] to 1. For example, configuring PMU_HP_ACTIVE_XPD_PLL[3] to 1 enables the SDIO PLL clock when the chip is in HP_ACTIVE state.

  Note:

  - Before enabling the PLL clocks please ensure that XTAL_CLK is stable.
  - To avoid the instability in the PLL clocks during startup, users have the option to configure PMU_WAIT_PLL_STABLE to delay the gate opening for the PLL clocks. This delay ensures that the gate opening is enabled after PMU_WAIT_PLL_STABLE CLK_DYN_FAST_CLK cycles following the power-up of the PLL clocks.

Slow-speed clocks (RC_FAST_CLK and XTAL32K_CLK) operate with low power. The power up and down of the slow-speed clocks in HP_ACTIVE and HP_SLEEP states are controlled by PMU_HP_SLEEP_XPD_FOSC_CLK. In LP_SLEEP state, the power up and down of the slow-speed clocks are controlled by PMU_LP_SLEEP_XPD_FOSC_CLK.

15.4.2.4 Digital Power Controller

The digital power controller controls the power up and down of digital power domains in different PMU states. Unlike the analog power controller, the digital power controller does not directly control the regulator but instead controls the power switch connected to the regulator to power up and down the digital power domains.

The LP PD Peripherals domain can only be powered up and down while the PMU state switches between

HP_SLEEP and LP_SLEEP. The other digital power domains can only be powered up and down while the PMU state switches between HP_SLEEP and HP_ACTIVE.

When the chip switches between PMU states, if the power configuration of a power domain in the current PMU state does not match the power configuration it is about to switch to, then the power up-down process will be activated. Take the power up-to-down process of the CPU power domain as an example. Configure PMU_HP_SLEEP_PD_TOP_PD_EN to 1 or 0 to power down or up the CPU power domain in HP_SLEEP. PMU will perform the following configurations:

- Enable the digital isolation unit to ensure that the powered-down modules do not output unstable voltage levels to the powered-up modules. When a power domain loses power, the output of this module will be clamped to a fixed value.
- Enable reset. When the CPU power domain loses power, its global reset signal is set to a reset state, which persists for a period after the CPU power domain is re-powered. This mechanism guarantees a reset-to-release process for the CPU power domain during power-up, effectively mitigating any instability caused by power up-down transitions.

The following explains the power up and down of each digital power domain:

- L2MEM_G0–G5

  Configure PMU_*n1*_PD_HP_MEM_PD_EN to power up or down L2MEM_G0–G5.

- HP_CNNT

  Configure PMU_*n1*_PD_CNNT_PD_EN to power up or down HP_CNNT.

- PD_HP_CPU

  Configure PMU_*n1*_PD_HP_CPU_PD_EN to power up or down PD_HP_CPU.

- Peripherals + ROM (PD_TOP)

  Configure PMU_*n1*_PD_TOP_PD_EN to power or down PD_TOP.

  When the Peripherals domain is powered down, the following features are configurable:

  - Powering down the Peripherals domain may cause instability in GPIOs. This can be addressed by maintaining the state of the GPIOs (excluding the LP GPIOs) through PMU. For example, configuring PMU_HP_SLEEP_HP_PAD_HOLD_ALL can keep GPIOs in the same state as before Peripherals was powered down in HP_SLEEP.
  - In the HP_ACTIVE state, Memory Deep-sleep mode is supported under a standard power supply. The memory cannot be read or written in this mode, but data can be retained. Configure PMU_*n1*_HP_MEM_DSLP to enable this mode.

- LP PD Peripherals

  The LP PD Peripherals power domain remains powered up when the chip is in HP_ACTIVE state. The power state of LP PD Peripherals is configurable only in HP_SLEEP and LP_SLEEP states. The LP PD Peripherals power domain has an independent digital power switch, and its power control is not dependent on the power state of other digital power domains.

15.4.2.5 Clock Controller

The clock controller mainly controls the high-performance system clocks and LP system clocks when the chip switches between PMU states.

The high-performance system clocks include ROOT_CLK and high-performance system peripherals clocks. When the chip switches between HP_ACTIVE and HP_SLEEP states, PMU can switch, power up/down, and divide the frequency of ROOT_CLK, as well as power up/down high-performance system peripherals clocks.

- ROOT_CLK can be controlled as follows:
  - Configure PMU_*n1*_SYS_CLK_SLP_SEL to 1 to indicate that when the chip enters the corresponding PMU state, the clock source is controlled by PMU.
  - Configure PMU_*n1*_ICG_SYS_CLOCK_EN to 0 to disable ROOT_CLK in the corresponding PMU state.
  - Configure PMU_*n1*_DIG_SYS_CLK_SEL to select the clock source after the chip enters the corresponding PMU state. For details, please refer to Chapter 11 *Reset and Clock* > Table 11.2-1.
- High-performance system peripheral clocks can be controlled as follows:
  - Configure PMU_*n1*_ICG_SLP_SEL to 1 so that the clock gating in the target state is controlled by PMU. Configure this register to 0 so that the clock gating is controlled by PCR registers.
  - Configure PMU_*n1*_DIG_ICG_FUNC_EN to power up/down the function clock in the target PMU state. For detailed configuration please see Table 15.4-2.

Table 15.4-2. HP System Peripherals' Function Clocks

Bit in PMU_*n1*_DIG_ICG_FUNC_EN	Clock
bit 0	HP_CPU0_CLK
bit 1	HP_CPU1_CLK
bit 2	HP_CPU0_CLIC_CLK
bit 3	HP_CPU1_CLIC_CLK
bit 4	MISC_CPU_CLK
bit 5	MISC_SYS_CLK
bit 6	ICM_CPU_CLK
bit 7	ICM_SYS_CLK
bit 8	ICM_MEM_CLK
bit 9	ICM_APB_CLK
bit 10	SPM_CPU_CLK
bit 11	L2MEM_MEM_CLK
bit 12	L2MEM_SYS_CLK
bit 13	L1CACHE_CPU_CLK
bit 14	L1CACHE_D_CPU_CLK
bit 15	L1CACHE_I0_CPU_CLK
bit 16	L1CACHE_I1_CPU_CLK
bit 17	L1CACHE_MEM_CLK
bit 18	L1CACHE_D_MEM_CLK
bit 19	L1CACHE_I0_MEM_CLK

PMU_*n1*_DIG_ICG_FUNC_EN Bit	Clock
bit 20	L1CACHE_I1_MEM_CLK
bit 21	L2CACHE_MEM_CLK
bit 22	L2CACHE_SYS_CLK
bit 23	REGDMA_SYS_CLK
bit 24	HP_CLKRST_APB_CLK
bit 25	SYSREG_APB_CLK
bit 26	INTRMTX_CLK
bit 27	N/A
bit 28	N/A
bit 29	N/A
bit 30	N/A
bit 31	N/A

The LP system clocks are mainly used in the low-power system and include the following clocks:

- LP_SLOW_CLK
- LP_FAST_CLK
- LP_DYN_SLOW_CLK
- LP_DYN_FAST_CLK
- XTAL_D2_CLK

The clock frequency of LP_DYN_FAST_CLK is controlled by hardware as follows, depending on the PMU state (and cannot be changed by the user):

- LP_SLEEP: The LP_DYN_FAST_CLK frequency is the same as LP_SLOW_CLK.
- HP_ACTIVE, HP_SLEEP: The LP_DYN_FAST_CLK frequency is the same as LP_FAST_CLK.

15.4.2.6 Backup Controller

ESP32-P4 has a Retention DMA module that can transfer data between memory and peripherals when the chip switches between PMU states. In this way, the data is backed up when the power domain is powered down and restored when the power domain is powered up again.

Data transfer is implemented in the Peripherals power domain. PMU only generates relevant control signals. It is important to note that the data transfer control registers are directional, as unlike other control registers, these control behaviors are determined by both the original PMU state and the target PMU state.

For example, the control registers for transitioning from HP_ACTIVE to HP_SLEEP and from HP_SLEEP to HP_ACTIVE are different. The possible PMU state switches are listed below, collectively represented by *n2* in the register names:

- HP_SLEEP2ACTIVE
- HP_ACTIVE2SLEEP

The following section introduces how PMU controls the Retention DMA:

- Enable data transfer: Configure PMU_*n2*_BACKUP_EN to 1 to enable data transfer when the corresponding PMU state switch is performed.
- Enable corresponding clocks: Before data transfer starts, configure PMU_*n2*_BACKUP_CLK_SEL to select the clock source of the Retention DMA, and configure PMU_*n1*_BACKUP_ICG_FUNC_EN to enable the clock.

  After the data transfer is completed, the value of PMU_*n1*_BACKUP_ICG_FUNC_EN is determined by the configuration of PMU_*n1*_DIG_ICG_FUNC_EN in the target PMU state.
- Configure data transfer direction: Configure the highest bit of PMU_*n2*_BACKUP_MODE:
  - 1: From peripheral to memory
  - 0: From memory to peripheral
- Select linked list pointer: Configure the lower two bits of PMU_*n2*_BACKUP_MODE to select the linked list pointer, specifically:
  - 0: PAU_LINK_ADDR_0
  - 1: PAU_LINK_ADDR_1
  - 2: PAU_LINK_ADDR_2
  - 3: PAU_LINK_ADDR_3

15.4.2.7 System Controller

The system controller controls some functional modules when the chip switches PMU states, to achieve stable and low-power chip performance. Specifically, the system controller supports:

- **Pausing the watchdog function**: Configuring PMU_*n1*_DIG_PAUSE_WDT to 1 disables the RTC watchdog timer (RWDT) function when the chip switches to the corresponding target PMU state. Note that if this register is configured to 0 in any sleep mode, the watchdog function is not disabled, and RWDT will reset as the CPU does not feed the watchdog.
- **Switching GPIO to sleep mode**, where the configuration of the GPIO holds. Consider a GPIO pin working in low-drive mode as an input and a wake-up pin. Setting PMU_*n1*_HP_PAD_HOLD_ALL to 1 latches the current configuration of the GPIO pin as the sleep configuration when the chip transitions to the corresponding PMU state. For more information on the hold function of GPIO, please refer to Chapter 10 *GPIO Matrix and IO MUX* > Section 10.9.
- **Disabling UART wake-up function**: Configuring PMU_*n1*_UART_WAKEUP_EN to 0 disables the four UART wake-up modes in the corresponding PMU state. For more information on UART wake-up modes, please refer to Chapter 45 *UART Controller (UART)*.
- **Pausing CPU**: Setting PMU_*n1*_DIG_CPU_STALL to 1 suspends the CPU in the corresponding PMU state.

15.4.2.8 Battery Power Controller

As shown in Figure 15.4-1, the low-power system regulator can be powered by VDD_BAT (battery) or VDD_ANA (analog). PMU_*n1*_VDDBAT_MODE controls whether to enable the battery power. When PMU_*n1*_VDDBAT_MODE is 0, the battery power is not enabled, and the low-power system regulator is powered by VDD_ANA and can be used in Active mode or Light-sleep0/1 modes. When

PMU_*n1*_VDDBAT_MODE is 1, the battery power is enabled and can be used in Deep-sleep mode, where the main power, including VDD_ANA, is cut off, and only the LP AON & PMU power domains are powered up.

15.4.2.9 Output Regulator Control

As shown in Figure 15.4-1, ESP32-P4 has four output regulators:

- VDDO_FLASH (VO1), typically used for on-chip flash voltage regulation
- VDDO_PSRAM (VO2), typically used for on-chip PSRAM voltage regulation
- VDDO_3 (VO3) and VDDO_4 (VO4), which convert the input VDD_LDO (typically 3.3 V) into the voltages needed by peripherals such as flash, PSRAM, MIPI, and SDIO.

15.4.2.9.1 Regulator Features

The regulators support the following features:

- **Supports LDO mode and bypass mode**. LDO mode supports an output of 0.5 V – 2.7 V, while bypass mode outputs the voltage of VDD_LDO. Mode selection is controlled by a hardware state machine or a register, with the control authority managed by a register. The flash regulator (VO1) also supports eFuse control.
  - The mode control for VO1 is shown in Figure 15.4-3. In the figure, TIEH_SEL on the right being 0 selects LDO mode; being 1 selects bypass mode.

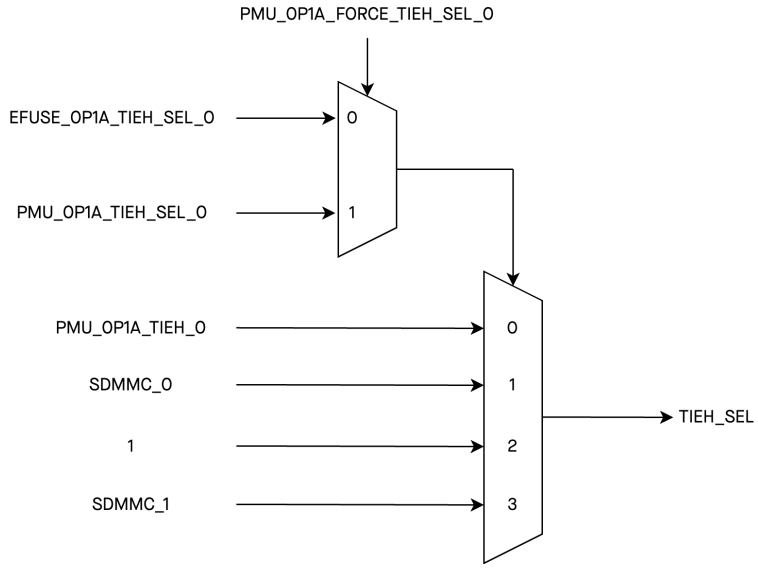

Figure 15.4-3. VO1 Mode Control

  - The mode control for VO2/3/4 is shown in Figure 15.4-4. In the figure, TIEH_SEL on the right being 0 selects LDO mode; being 1 selects bypass mode.

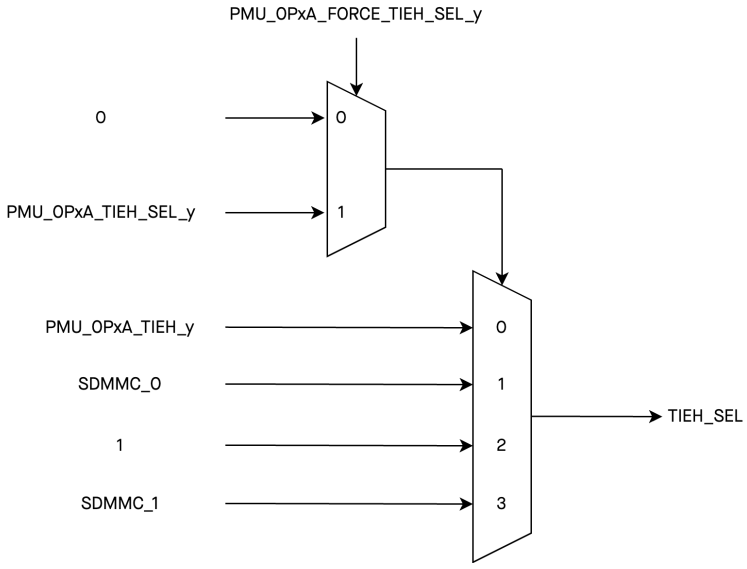

Figure 15.4-4. VO2/3/4 Mode Control

Table 15.4-3. VO2/3/4 Registers

Regulators	PMU_0PxA_FORCE_TIEH_SEL_y	PMU_0PxA_TIEH_SEL_y	PMU_0PxA_TIEH_y
VO2	PMU_0P1A_FORCE_TIEH_SEL_1	PMU_0P1A_TIEH_SEL_1	PMU_0P1A_TIEH_1
VO3	PMU_0P2A_FORCE_TIEH_SEL_0	PMU_0P2A_TIEH_SEL_0	PMU_0P2A_TIEH_0
VO4	PMU_0P2A_FORCE_TIEH_SEL_1	PMU_0P2A_TIEH_SEL_1	PMU_0P2A_TIEH_1

- **Supports LDO output voltage setting**: In LDO mode, the output voltage is configured by analog registers PMU_ANA_0PxA_DREF_y (sets Vref) and PMU_ANA_0PxA_MUL_y (sets MUL), following $V_{OUT} = \text{MUL} \times V_{REF}$. Vref supports 0.5 V–1.6 V, and MUL supports 1.0–2.75 (step 0.25). For details, see field descriptions in PMU_EXT_LDO_P0_0P1A_ANA_REG–PMU_EXT_LDO_P0_0P2A_ANA_REG.
- **Supports switch control**. Only the flash voltage regulator (VO1) supports power control by the PMU state machine, the other regulators only support power control by software. The regulator is enabled when the register in Table 15.4-4 is set to 1; otherwise, the regulator is disabled.

Table 15.4-4. Regulator Power Control

Regulator	Power Control
VO1	PMU_*n1*_REGULATOR_VO1_XPD
VO2	PMU_0P1A_XPD_1
VO3	PMU_0P2A_XPD_0
VO4	PMU_0P2A_XPD_1

- **Over-current protection**: Before powering up the regulators, users have the option to enable the over-current protection function to prevent excessive transient current that may damage the capacitor. After the capacitor charging is complete, the over-current protection should be disabled. The capacitor charging time depends on the load capacitance and voltage, following $T_{ms} = C_F \times V_V / 50$. Table 15.4-5 provides the over-current protection enable registers; when the register is set to 1, the function is enabled; otherwise, it is disabled.

Table 15.4-5. Over-Current Protection Control

Regulators	Over-Current Protection Control Registers
VO1	FSM or PMU_ANA_0P1A_EN_CUR_LIM_0
VO2	PMU_ANA_0P1A_EN_CUR_LIM_1
VO3	PMU_ANA_0P2A_EN_CUR_LIM_0
VO4	PMU_ANA_0P2A_EN_CUR_LIM_1

Due to the long power-up time, a waiting counter is provided for each regulator. Once the regulator is enabled, the counter is triggered and starts counting. The counter has two stages (stage 1/stage 2, corresponding to registers TARGET0/TARGET1), and each stage triggers different interrupts. Typically, set stage 1 (TARGET0) to over-current protection duration, and stage 2 (TARGET1) to voltage stabilization waiting time. The configuration of the counter is shown in the table below:

Table 15.4-6. Regulator Waiting Counter

Regulators	Counter Target 1	Counter Target 2
VO1	PMU_0P1A_TARGET0_0[6:0]	PMU_0P1A_TARGET1_0[7:0]
VO2	PMU_0P1A_TARGET0_1[7:0]	PMU_0P1A_TARGET1_1[7:0]
VO3	PMU_0P2A_TARGET0_0[7:0]	PMU_0P2A_TARGET1_0[7:0]
VO4	PMU_0P2A_TARGET0_1[7:0]	PMU_0P2A_TARGET1_1[7:0]

Note:

1. The bit 7 of PMU_0P1A_TARGET0_0 clears the counter. Setting bit 7 to 1 resets the counter.
2. The counter clock is derived from LP_DYN_SLOW_CLK, which is divided by a factor of 16.

15.4.2.9.2 Regulator Configuration Examples

- **Example 1: VO3 powering MIPI D-PHY (2.5 V, LDO mode)**
  On the board, the VO3 pin is connected to VDD_MIPI_DPHY that requires 2.5 V operating voltage. In this scenario, select LDO mode and set $V_{OUT} = 2.5\,\text{V}$. One valid combination is $V_{REF} = 1.0\,\text{V}$ (DREF=9) and MUL $= 2.5$ (MUL=6), i.e., PMU_ANA_0P2A_DREF_0=9, PMU_ANA_0P2A_MUL_0=6, and set PMU_0P2A_TIEH_0=0 (LDO).
- **Example 2: VO4 powering VDD_IO_5 (SD card voltage switching)**
  In reference designs, VO4 may be connected to VDD_IO_5 to supply some GPIO/SDIO pins.
  – 3.3 V output: use bypass mode (for example, set PMU_0P2A_TIEH_1=1).
  – 1.8 V output: use LDO mode and set $V_{OUT} = 1.8\,\text{V}$. One valid combination is $V_{REF} = 0.9\,\text{V}$ (DREF=8) and MUL $= 2.0$ (MUL=4), i.e., PMU_ANA_0P2A_DREF_1=8, PMU_ANA_0P2A_MUL_1=4, and set PMU_0P2A_TIEH_1=0 (LDO).

15.4.2.9.3 Software Configuration Steps

The recommended software configuration steps (example) are as follows:

1. Configure output mode: set PMU_0PxA_FORCE_TIEH_SEL_y so the register controls mode selection, then choose LDO or bypass mode via PMU_0PxA_TIEH_SEL_y/PMU_0PxA_TIEH_y (see Table 15.4-3).

2. If using LDO mode, configure output voltage: configure PMU_ANA_0PxA_DREF_y and PMU_ANA_0PxA_MUL_y to satisfy $V_{OUT} = \text{MUL} \times V_{REF}$.
3. Configure waiting counter: set stage 1 (TARGET0) to the desired over-current protection duration and stage 2 (TARGET1) to the voltage stabilization waiting time (see Table 15.4-6).
4. Enable over-current protection before power-up: set PMU_ANA_0PxA_EN_CUR_LIM_y=1 (see Table 15.4-5).
5. Enable the regulator: set PMU_0PxA_XPD_y=1 (see Table 15.4-4), then wait for the stage 1 timeout interrupt (e.g., VO3 uses PMU_0P2A_CNT_TARGET0_REACH_0_INT, VO4 uses PMU_0P2A_CNT_TARGET0_REACH_1_INT).
6. After stage 1 interrupt, disable over-current protection: clear PMU_ANA_0PxA_EN_CUR_LIM_y. If a voltage stabilization waiting time is required, wait for the stage 2 timeout interrupt (...CNT_TARGET1_REACH..._INT).

15.5 Power Modes

ESP32-P4 has three configurable PMU states. Based on the PMU states, the chip has defined five power modes for common application scenarios, as shown in Table 15.5-1.

Table 15.5-1. Preset Power Modes

Power Modes	Power Domains							
	LP always-on	LP PD peripherals	HP_CPU	TOP	HPCNNT	RC_FAST_CLK	XTAL_CLK	PLL
Active	ON	ON	ON	ON	ON	ON	ON	ON
Light-sleep0	ON	ON	OFF	ON	ON	ON	ON	ON
Light-sleep1	ON	ON	OFF	ON	ON	ON/OFF	ON/OFF	ON/OFF
Light-sleep2	ON	ON/OFF	OFF	OFF	ON	ON/OFF	ON/OFF	ON/OFF
Deep-sleep	ON	OFF	OFF	OFF	OFF	OFF	OFF	OFF

Note:

1. For power consumption data, please refer to *ESP32-P4 Datasheet*.
2. For supported wake-up sources, please refer to Table 15.4-1.

15.6 Event Task Matrix Feature

The low-power management system on ESP32-P4 supports the Event Task Matrix (ETM) function, which allows the low-power management system's ETM tasks to be triggered by any peripherals' ETM events, or the low-power management system's ETM events to trigger any peripherals' ETM tasks. This section introduces the ETM tasks and events related to the low-power management system. For more information, please refer to Chapter 14 Event Task Matrix (ETM).

The low-power management system can receive the following ETM tasks:

- PMU_TASK_SLEEP_REQ: Triggers PMU's sleep process.

The low-power management system can generate the following ETM events:

- PMU_EVT_SLEEP_WAKEUP: Indicates that PMU is woken up to the HP_ACTIVE state.

15.7 Interrupts

ESP32-P4's low-power management system can generate the following interrupt signals:

- PMU_INTR
- PMU_LP_INT

Among these interrupt signals, PMU_INTR is sent to the Interrupt Matrix, while PMU_LP_INT is sent to the LP CPU.

The interrupt signals are generated by the internal interrupt sources of each module, specifically:

PMU_INTR:

- PMU_SOC_WAKEUP_INT: Triggered when the chip is woken up to the HP_ACTIVE state.
- PMU_SOC_SLEEP_REJECT_INT: Triggered when a sleep-rejection source rejects a sleep request.
- PMU_SW_INT: Triggered when LP CPU is used as a wake-up source and wakes up the chip to HP_ACTIVE state.
- PMU_SDIO_IDLE_INT: Triggered when SDIO is in idle state.
- PMU_LP_CPU_EXC_INT: Triggered when there are LP CPU exceptions.
- PMU_0P2A_CNT_TARGET1_REACH_1_INT: Triggered when VO4 regulator's waiting counter target 1 reaches timeout.
- PMU_0P2A_CNT_TARGET0_REACH_1_INT: Triggered when VO4 regulator's waiting counter target 0 reaches timeout.
- PMU_0P2A_CNT_TARGET1_REACH_0_INT: Triggered when VO3 regulator's waiting counter target 1 reaches timeout.
- PMU_0P2A_CNT_TARGET0_REACH_0_INT: Triggered when VO3 regulator's waiting counter target 0 reaches timeout.
- PMU_0P1A_CNT_TARGET1_REACH_1_INT: Triggered when VO2 regulator's waiting counter target 1 reaches timeout.
- PMU_0P1A_CNT_TARGET0_REACH_1_INT: Triggered when VO2 regulator's waiting counter target 0 reaches timeout.
- PMU_0P1A_CNT_TARGET1_REACH_0_INT: Triggered when VO1 regulator's waiting counter target 1 reaches timeout.
- PMU_0P1A_CNT_TARGET0_REACH_0_INT: Triggered when VO1 regulator's waiting counter target 0 reaches timeout.

PMU_LP_INT:

- PMU_LP_CPU_SLEEP_REJECT_INT: Triggered when the LP sleep request is rejected.

- PMU_HP_SW_TRIGGER_INT: Triggered when HP CPU wakes up LP CPU.
- PMU_ACTIVE_SWITCH_SLEEP_START_INT: Triggered when the PMU state starts to switch from HP_ACTIVE to HP_SLEEP.
- PMU_SLEEP_SWITCH_ACTIVE_START_INT: Triggered when the PMU state starts to switch from HP_SLEEP to HP_ACTIVE.
- PMU_ACTIVE_SWITCH_SLEEP_END_INT: Triggered when the PMU state finishes switching from HP_ACTIVE to HP_SLEEP.
- PMU_SLEEP_SWITCH_ACTIVE_END_INT: Triggered when the PMU state finishes switching from HP_SLEEP to HP_ACTIVE.
- PMU_LP_CPU_WAKEUP_INT: Triggered when LP CPU is woken up.
- PMU_0P2A_CNT_TARGET1_REACH_1_LP_INT: Triggered when VO4 regulator's waiting counter target 1 reaches timeout.
- PMU_0P2A_CNT_TARGET0_REACH_1_LP_INT: Triggered when VO4 regulator's waiting counter target 0 reaches timeout.
- PMU_0P2A_CNT_TARGET1_REACH_0_LP_INT: Triggered when VO3 regulator's waiting counter target 1 reaches timeout.
- PMU_0P2A_CNT_TARGET0_REACH_0_LP_INT: Triggered when VO3 regulator's waiting counter target 0 reaches timeout.
- PMU_0P1A_CNT_TARGET1_REACH_1_LP_INT: Triggered when VO2 regulator's waiting counter target 1 reaches timeout.
- PMU_0P1A_CNT_TARGET0_REACH_1_LP_INT: Triggered when VO2 regulator's waiting counter target 0 reaches timeout.
- PMU_0P1A_CNT_TARGET1_REACH_0_LP_INT: Triggered when VO1 regulator's waiting counter target 1 reaches timeout.
- PMU_0P1A_CNT_TARGET0_REACH_0_LP_INT: Triggered when VO1 regulator's waiting counter target 0 reaches timeout.

Each interrupt source can be configured by a common set of registers that are described in Section *Interrupt Configuration Registers*. The specific registers can be found in Section 15.8 *Register Summary*.

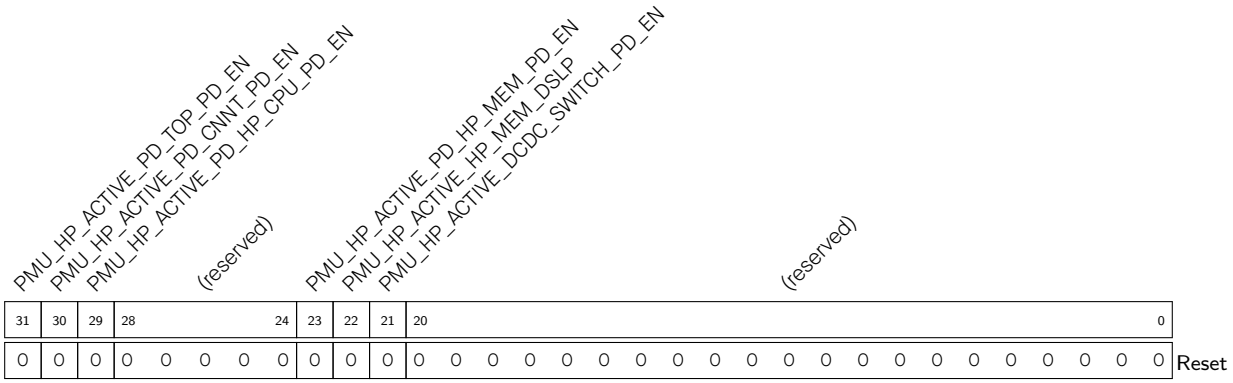
15.8 Register Summary

The addresses in this section are relative to the PMU base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

The abbreviations given in Column **Access** are explained in Section *Access Types for Registers*.

Name	Description	Address	Access
Configuration Registers			
PMU_HP_ACTIVE_DIG_POWER_REG	Digital power domain control register in HP_ACTIVE state	0x0000	R/W
PMU_HP_ACTIVE_ICG_HP_FUNC_REG	HP system peripheral's function clock control register in HP_ACTIVE state	0x0004	R/W
PMU_HP_ACTIVE_HP_SYS_CNTL_REG	System control register in HP_ACTIVE state	0x0010	R/W
PMU_HP_ACTIVE_HP_CK_POWER_REG	Clock source power control register in HP_ACTIVE state	0x0014	R/W
PMU_HP_ACTIVE_BIAS_REG	BIAS control register in HP_ACTIVE state	0x0018	R/W
PMU_HP_ACTIVE_BACKUP_REG	Backup module control register in HP_ACTIVE state	0x001C	R/W
PMU_HP_ACTIVE_BACKUP_CLK_REG	Backup module's function clock control register in HP_ACTIVE state	0x0020	R/W
PMU_HP_ACTIVE_SYSCLK_REG	System clock control register in HP_ACTIVE state	0x0024	R/W
PMU_HP_ACTIVE_HP_REGULATOR0_REG	Regulator power control register in HP_ACTIVE state	0x0028	varies
PMU_HP_ACTIVE_XTAL_REG	XTAL_CLK power control register in HP_ACTIVE state	0x0030	R/W
PMU_HP_SLEEP_DIG_POWER_REG	Digital power domain control register in HP_SLEEP state	0x0068	R/W
PMU_HP_SLEEP_ICG_HP_FUNC_REG	HP system peripheral's function clock control register in HP_SLEEP state	0x006C	R/W
PMU_HP_SLEEP_HP_SYS_CNTL_REG	System control register in HP_SLEEP state	0x0078	R/W
PMU_HP_SLEEP_HP_CK_POWER_REG	Clock source power control register in HP_SLEEP state	0x007C	R/W
PMU_HP_SLEEP_BIAS_REG	BIAS control register in HP_SLEEP state	0x0080	R/W
PMU_HP_SLEEP_BACKUP_REG	Backup module control register in HP_SLEEP state	0x0084	R/W
PMU_HP_SLEEP_BACKUP_CLK_REG	Backup module's function clock control register in HP_SLEEP state	0x0088	R/W
PMU_HP_SLEEP_SYSCLK_REG	System clock control register in HP_SLEEP state	0x008C	R/W
PMU_HP_SLEEP_HP_REGULATOR0_REG	Regulator power control register in HP_SLEEP state	0x0090	R/W

Name	Description	Address	Access
PMU_HP_SLEEP_XTAL_REG	XTAL_CLK power control register in HP_SLEEP state	0x0098	R/W
PMU_HP_SLEEP_LP_REGULATOR0_REG	LP sys regulator control register in HP_SLEEP state	0x009C	R/W
PMU_HP_SLEEP_LP_DIG_POWER_REG	LP system digital power domains control register in HP_SLEEP state	0x00A8	R/W
PMU_HP_SLEEP_LP_CK_POWER_REG	Low-speed clock power control register in HP_ACTIVE/HP_SLEEP state	0x00AC	R/W
PMU_LP_SLEEP_LP_REGULATOR0_REG	LP sys regulator control register in HP_SLEEP state	0x00B4	R/W
PMU_LP_SLEEP_XTAL_REG	XTAL_CLK power control register in LP_SLEEP state	0x00BC	R/W
PMU_LP_SLEEP_LP_DIG_POWER_REG	Digital power domain control register in LP_SLEEP state	0x00C0	R/W
PMU_LP_SLEEP_LP_CK_POWER_REG	Low-speed clock power control register in LP_SLEEP state	0x00C4	R/W
PMU_IMM_HP_CK_POWER_REG	Software control register for clock power	0x00CC	WT
PMU_IMM_SLEEP_SYSCLK_REG	Software control register for system clock	0x00D0	WT
PMU_IMM_HP_FUNC_ICG_REG	Software control register for peripheral clock	0x00D4	WT
PMU_IMM_HP_APB_ICG_REG	Software control register for APB clock	0x00D8	WT
PMU_IMM_PAD_HOLD_ALL_REG	Software control register for PAD hold function	0x00E4	varies
PMU_POWER_CK_WAIT_CNTL_REG	Clock gating wait time configuration register	0x011C	R/W
PMU_SLP_WAKEUP_CNTL0_REG	Sleep request register	0x0120	WT
PMU_SLP_WAKEUP_CNTL1_REG	Sleep reject register	0x0124	R/W
PMU_SLP_WAKEUP_CNTL2_REG	Wake up source enable register	0x0128	R/W
PMU_SLP_WAKEUP_CNTL3_REG	Minimum sleep time control register	0x012C	R/W
PMU_SLP_WAKEUP_CNTL4_REG	Sleep reject cause clear register	0x0130	WT
PMU_SLP_WAKEUP_STATUS0_REG	Wake up cause register	0x0144	RO
PMU_SLP_WAKEUP_STATUS1_REG	Reset reject cause register	0x0148	RO
PMU_HP_CK_CNTL_REG	HP system clock control register	0x0154	R/W
PMU_RF_PWC_REG	SAR ADC power up register	0x015C	R/W
PMU_INT_RAW_REG	PMU sleep/wake-up raw interrupt	0x0164	R/WTC/SS
PMU_HP_INT_ST_REG	PMU sleep/wake-up state interrupt	0x0168	RO
PMU_HP_INT_ENA_REG	PMU sleep/wake-up interrupt enable register	0x016C	R/W
PMU_HP_INT_CLR_REG	PMU sleep/wake-up interrupt clear register	0x0170	WT
PMU_LP_INT_RAW_REG	PMU sleep/wake-up raw interrupt	0x0174	R/WTC/SS
PMU_LP_INT_ST_REG	PMU sleep/wake-up state interrupt	0x0178	RO



Name	Description	Address	Access
PMU_LP_INT_ENA_REG	PMU sleep/wake-up interrupt enable register	0x017C	R/W
PMU_LP_INT_CLR_REG	PMU sleep/wake-up interrupt clear register	0x0180	varies
PMU_LP_CPU_PWR0_REG	LP CPU sleep/wake-up control register	0x0184	varies
PMU_LP_CPU_PWR1_REG	LP CPU sleep/wake-up control register	0x0188	WT
PMU_LP_CPU_PWR2_REG	LP CPU sleep/wake-up control register	0x018C	R/W
PMU_LP_CPU_PWR3_REG	LP CPU sleep/wake-up control register	0x0190	RO
PMU_LP_CPU_PWR4_REG	LP CPU sleep/wake-up control register	0x0194	R/W
PMU_LP_CPU_PWR5_REG	LP CPU sleep/wake-up control register	0x0198	RO
PMU_HP_LP_CPU_COMM_REG	LP CPU sleep/wake-up control register	0x019C	WT
PMU_EXT_LDO_P0_OP1A_REG	VO1 regulator control register	0x01B8	R/W
PMU_EXT_LDO_P0_OP1A_ANA_REG	VO1 regulator control register	0x01BC	R/W
PMU_EXT_LDO_P0_OP2A_REG	VO3 regulator control register	0x01C0	R/W
PMU_EXT_LDO_P0_OP2A_ANA_REG	VO3 regulator control register	0x01C4	R/W
PMU_EXT_LDO_P1_OP1A_REG	VO2 regulator control register	0x01D0	R/W
PMU_EXT_LDO_P1_OP1A_ANA_REG	VO2 regulator control register	0x01D4	R/W
PMU_EXT_LDO_P1_OP2A_REG	VO4 regulator control register	0x01D8	R/W
PMU_EXT_LDO_P1_OP2A_ANA_REG	VO4 regulator control register	0x01DC	R/W
PMU_EXT_WAKEUP_LV_REG	EXT wake-up level control register	0x01E8	R/W
PMU_EXT_WAKEUP_SEL_REG	EXT wake-up IO control register	0x01EC	R/W
PMU_EXT_WAKEUP_ST_REG	EXT wake-up status register	0x01F0	RO
PMU_EXT_WAKEUP_CNTL_REG	EXT wake-up control register	0x01F4	R/W
PMU_SDIO_WAKEUP_CNTL_REG	SDIO wake-up control register	0x01F8	R/W
PMU_TOUCH_PWR_CNTL_REG	TOUCH sleep/wake-up control register	0x0210	R/W
PMU_DATE_REG	Version control register	0x03FC	R/W

15.9 Registers

The addresses in this section are relative to the PMU base address provided in Table 9.3-2 in Chapter 9 *System and Memory*.

For how to program reserved fields, please refer to Section *Programming Reserved Register Field*.

Register 15.1. PMU_HP_ACTIVE_DIG_POWER_REG (0x0000)

PMU_HP_ACTIVE_DCDC_SWITCH_PD_EN Configures whether to cut off the power from external DCDC in HP_ACTIVE state.

0: Do not cut off

1: Cut off

(R/W)

PMU_HP_ACTIVE_HP_MEM_DSLP Configures whether to put L2MEM_G0–G5 into Deep-sleep mode in HP_ACTIVE state.

0: Do not put L2MEM_G0–G5 into Deep-sleep

1: Put L2MEM_G0–G5 into Deep-sleep

(R/W)

PMU_HP_ACTIVE_PD_HP_MEM_PD_EN Configures whether to power down L2MEM_G0–G5 in HP_ACTIVE state.

0: Power up

1: Power down

(R/W)

PMU_HP_ACTIVE_PD_HP_CPU_PD_EN Configures whether to power down the HP_CPU power domain in HP_ACTIVE state.

0: Power up

1: Power down

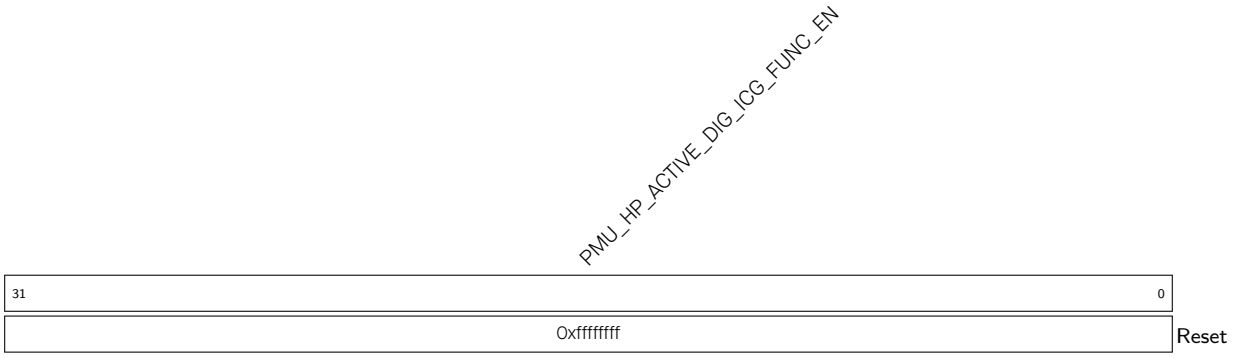
(R/W)

PMU_HP_ACTIVE_PD_CNNT_PD_EN Configures whether to power down HP_CNNT in HP_ACTIVE state.

0: Power up

1: Power down

(R/W)



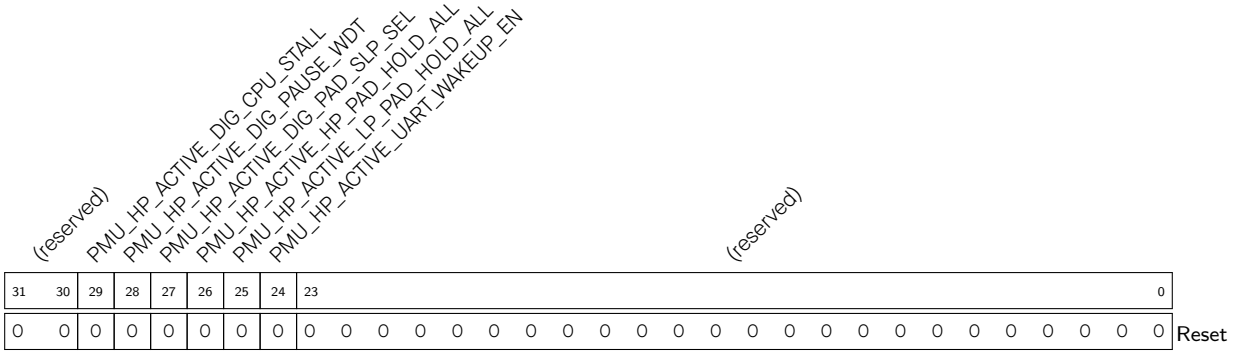
PMU_HP_ACTIVE_PD_TOP_PD_EN Configures whether to power down PD_TOP power domain in HP_ACTIVE state.

0: Power up

1: Power down

(R/W)

Register 15.2. PMU_HP_ACTIVE_ICG_HP_FUNC_REG (0x0004)



PMU_HP_ACTIVE_DIG_ICG_FUNC_EN Configures whether to enable HP system peripheral's function clock in HP_ACTIVE state. For detailed configuration please see Table 15.4-2.

0: Disable

1: Enable

(R/W)

Register 15.3. PMU_HP_ACTIVE_HP_SYS_CNTL_REG (0x0010)

PMU_HP_ACTIVE_UART_WAKEUP_EN Configures whether to enable UART wake up function in HP_ACTIVE state.

0: Disable wake-up function

1: Enable wake-up function

(R/W)

PMU_HP_ACTIVE_LP_PAD_HOLD_ALL Configures whether to hold LP GPIO's configuration in HP_ACTIVE state.

0: Do not hold

1: Hold

(R/W)

PMU_HP_ACTIVE_HP_PAD_HOLD_ALL Configures whether to hold GPIO's configuration in HP_ACTIVE state.

0: Do not hold

1: Hold

(R/W)

PMU_HP_ACTIVE_DIG_PAD_SLP_SEL Configures whether to use Light-sleep mode configuration for GPIO in HP_ACTIVE state.

0: Use normal configuration

1: Use Light-sleep mode configuration. For details please refer to Chapter 10 *GPIO Matrix and IO MUX* > Section 10.8 *Pin Functions in Light-sleep*.

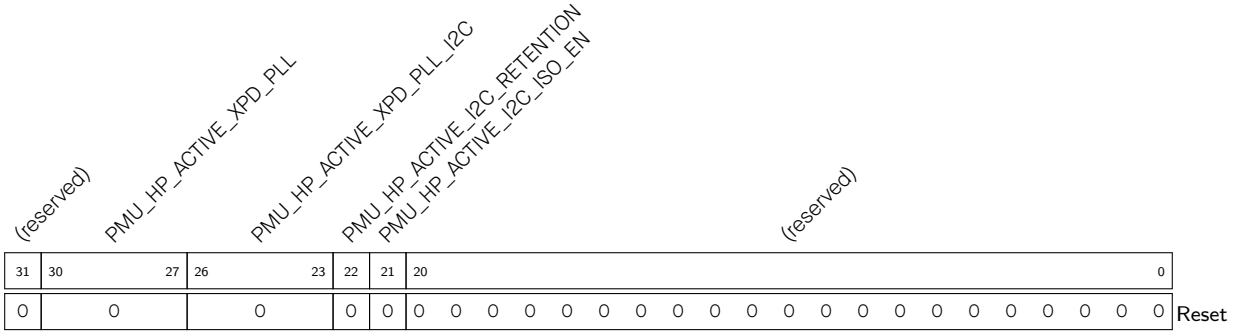
(R/W)

PMU_HP_ACTIVE_DIG_PAUSE_WDT Configures whether to pause watchdog in HP_ACTIVE state.

0: Do not pause

1: Pause

(R/W)



PMU_HP_ACTIVE_DIG_CPU_STALL Configures whether to stall the CPU in HP_ACTIVE state.

0: Do not stall

1: Stall

(R/W)

Register 15.4. PMU_HP_ACTIVE_HP_CK_POWER_REG (0x0014)

PMU_HP_ACTIVE_I2C_ISO_EN Configure whether to power up ANALOG_I2C in HP_ACTIVE state.

0: Power down

1: Power up

(R/W)

PMU_HP_ACTIVE_I2C_RETENTION Configures whether to enable ANALOG_I2C retention status in HP_ACTIVE state.

0: Disable

1: Enable

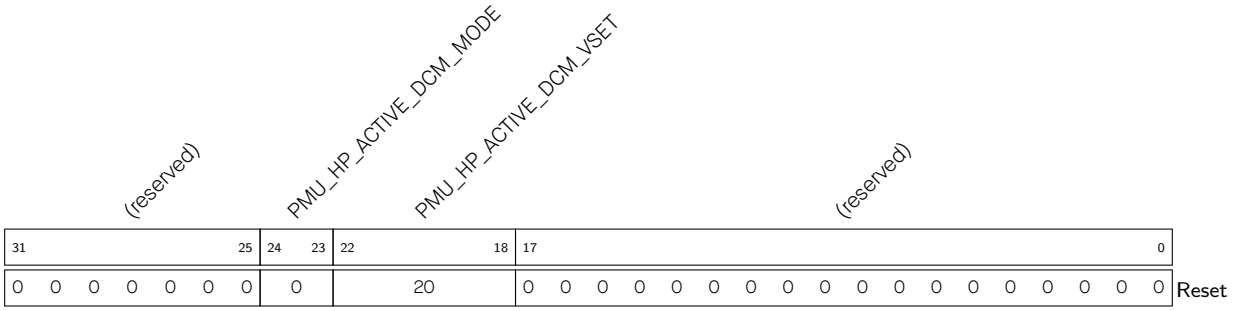
(R/W)

PMU_HP_ACTIVE_XPD_PLL_I2C Configures whether to enable PLL I2C controllers in HP_ACTIVE state. Each bit controls a PLL I2C register group.

0: Disable

1: Enable

(R/W)



PMU_HP_ACTIVE_XPD_PLL Configures whether to enable the analog power domains in HP system in HP_ACTIVE state. Bit 0 controls CPLL_CLK, bit 1 controls SPLL_CLK, bit 2 controls Audio PLL, bit 3 controls SDIO PLL.

0: Disable

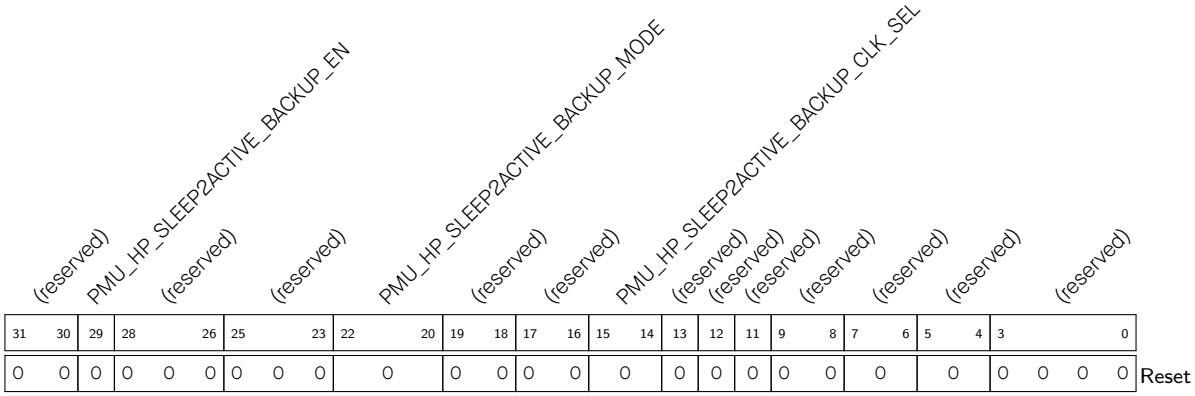
1: Enable

(R/W)

Register 15.5. PMU_HP_ACTIVE_BIAS_REG (0x0018)

PMU_HP_ACTIVE_DCM_VSET Regulates the DCDC voltage in HP_ACTIVE state. (R/W)

PMU_HP_ACTIVE_DCM_MODE Configures whether to enable DCDC status in HP_ACTIVE state.



0: Disable

1: Enable

2, 3: Reserved

(R/W)

Register 15.6. PMU_HP_ACTIVE_BACKUP_REG (0x001C)

PMU_HP_SLEEP2ACTIVE_BACKUP_CLK_SEL Configures the backup module's function clock source when PMU state switches from HP_SLEEP to HP_ACTIVE.

0: Select XTAL

1: Select PLL_CLK

2: Select RC_FAST_CLK

3: Invalid value

(R/W)

PMU_HP_SLEEP2ACTIVE_BACKUP_MODE Configures the backup direction and link list when PMU state switches switch from HP_SLEEP to HP_ACTIVE.

Highest bit:

0: From peripheral to memory

1: From memory to peripheral

Lower two bits:

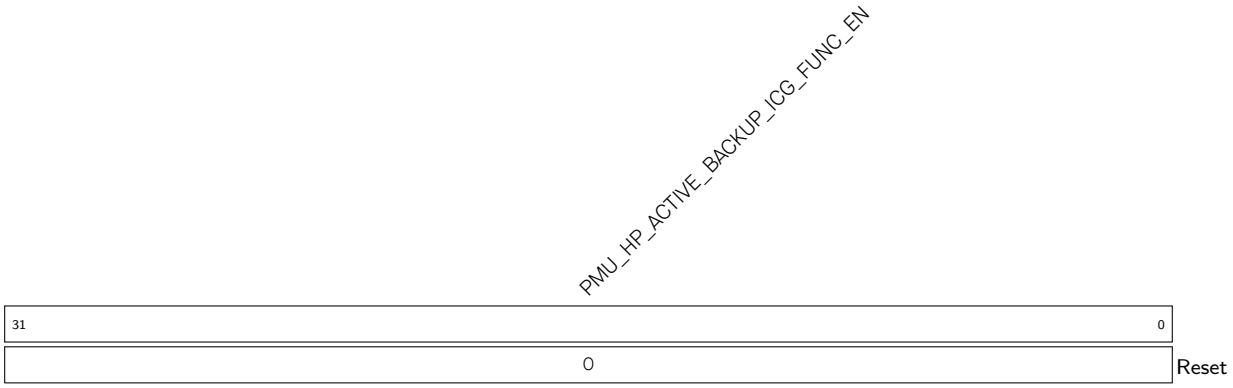
0: PAU_LINK_ADDR_0

1: PAU_LINK_ADDR_1

2: PAU_LINK_ADDR_2

3: PAU_LINK_ADDR_3

(R/W)



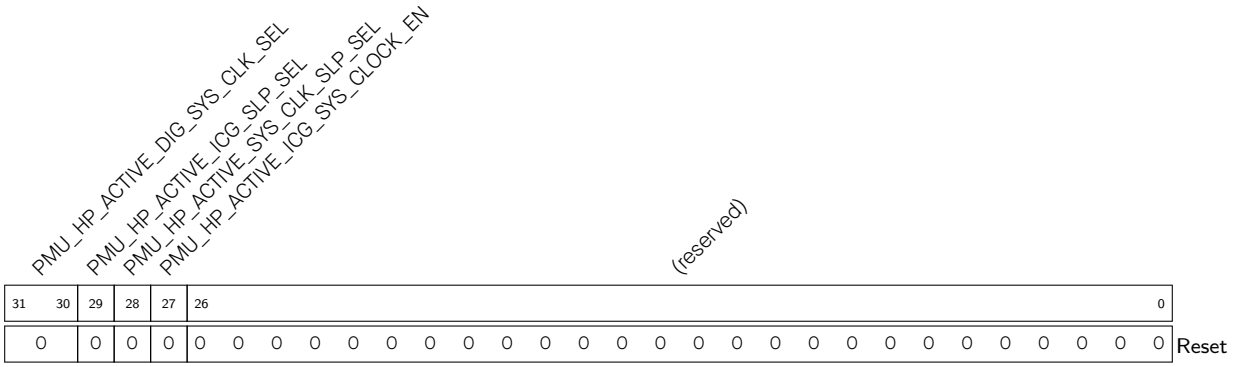
PMU_HP_SLEEP2ACTIVE_BACKUP_EN Configures whether to enable the backup flow when PMU state switches from HP_SLEEP to HP_ACTIVE.

0: Disable backup

1: Enable backup

(R/W)

Register 15.7. PMU_HP_ACTIVE_BACKUP_CLK_REG (0x0020)



PMU_HP_ACTIVE_BACKUP_ICG_FUNC_EN Configures whether to enable each peripheral's function clock when the target state is HP_ACTIVE. For details, please refer to Table 15.4-2.

0: Disable

1: Enable

(R/W)

Register 15.8. PMU_HP_ACTIVE_SYSCLK_REG (0x0024)

PMU_HP_ACTIVE_ICG_SYS_CLOCK_EN Configures whether to enable ROOT_CLK in HP_ACTIVE state.

0: Disable

1: Enable

(R/W)

PMU_HP_ACTIVE_SYS_CLK_SLP_SEL Configures whether to allow PMU to control clock source in HP_ACTIVE state.

0: Controlled by PCR registers

1: Controlled by PMU

(R/W)

PMU_HP_ACTIVE_ICG_SLP_SEL Configures whether to allow PMU to control the clock gating in HP_ACTIVE state.

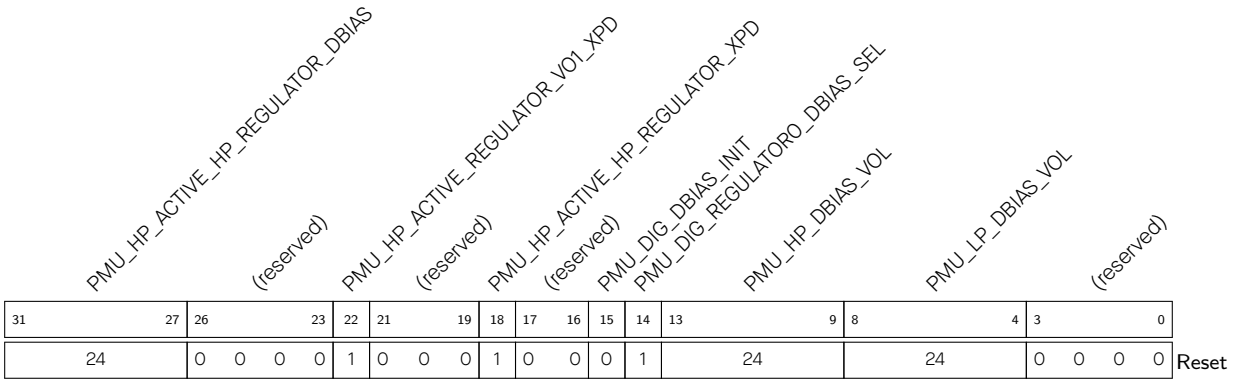
0: Controlled by PCR registers

1: Controlled by PMU

(R/W)

PMU_HP_ACTIVE_DIG_SYS_CLK_SEL Configures the source of ROOT_CLK in HP_ACTIVE state.

0: XTAL



1: PLL_CLK

2: RC_FAST_CLK

3: Invalid value

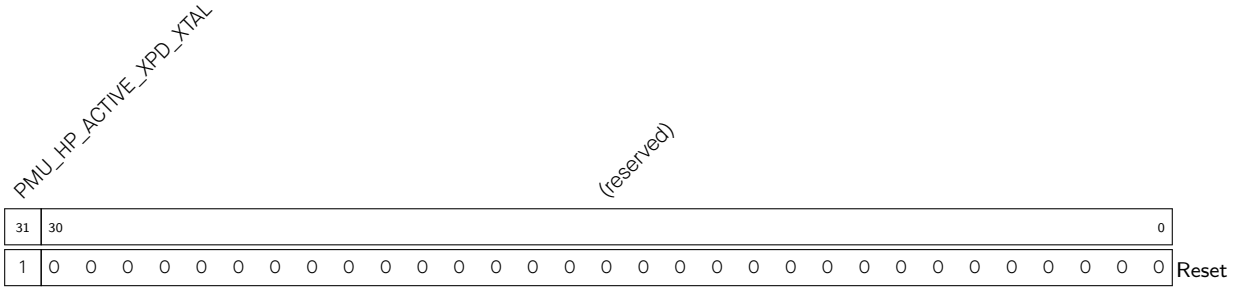
(R/W)

Register 15.9. PMU_HP_ACTIVE_HP_REGULATOR0_REG (0x0028)

PMU_LP_DBIAS_VOL Indicates the current voltage of the LP system regulator. (RO)

PMU_HP_DBIAS_VOL Indicates the current voltage of the HP system regulator. (RO)

PMU_DIG_REGULATOR0_DBIAS_SEL Configures which of the following regulates the HP system regulator voltage.
0: Regulated by Hardware automatically
1: Regulated by Software
(R/W)



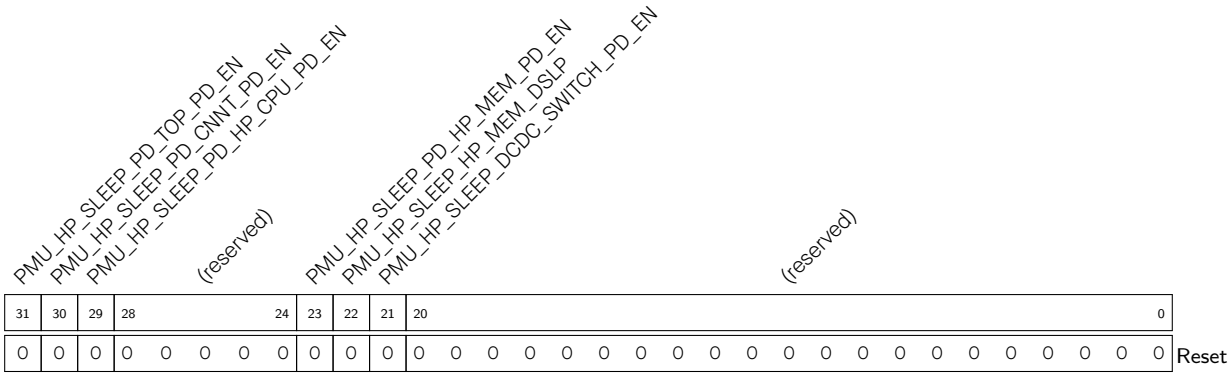
PMU_DIG_DBIAS_INIT Initializes the PVT voltage configurations. (WT)

PMU_HP_ACTIVE_HP_REGULATOR_XPD Configures whether to enable the HP sys regulator in HP_ACTIVE state.
0: Disable the HP sys regulator
1: Enable the HP sys regulator
(R/W)

PMU_HP_ACTIVE_REGULATOR_VO1_XPD Configures whether to enable VO1 regulator in HP_ACTIVE state.
0: Disable
1: Enable
(R/W)

PMU_HP_ACTIVE_HP_REGULATOR_DBIAS Regulates the voltage of the HP sys regulator in HP_ACTIVE state. The higher the value, the higher the voltage. (R/W)

Register 15.10. PMU_HP_ACTIVE_XTAL_REG (0x0030)



PMU_HP_ACTIVE_XPD_XTAL Configures whether to enable XTAL_CLK analog source in HP_ACTIVE state.

0: Disable

1: Enable

(R/W)

Register 15.11. PMU_HP_SLEEP_DIG_POWER_REG (0x0068)

PMU_HP_SLEEP_DCDC_SWITCH_PD_EN Configures whether to cut off the power from external DCDC in HP_SLEEP state.

0: Do not cut off

1: Cut off

(R/W)

PMU_HP_SLEEP_HP_MEM_DSLP Configures whether to put L2MEM_G0–G5 into Deep-sleep mode in HP_SLEEP state.

0: Do not put L2MEM_G0–G5 into Deep-sleep

1: Put L2MEM_G0–G5 into Deep-sleep

(R/W)

PMU_HP_SLEEP_PD_HP_MEM_PD_EN Configures whether to power down L2MEM_G0–G5 in HP_SLEEP state.

0: Power up

1: Power down

(R/W)

PMU_HP_SLEEP_PD_HP_CPU_PD_EN Configures whether to power down the HP_CPU power domain in HP_SLEEP state.

0: Power up

1: Power down

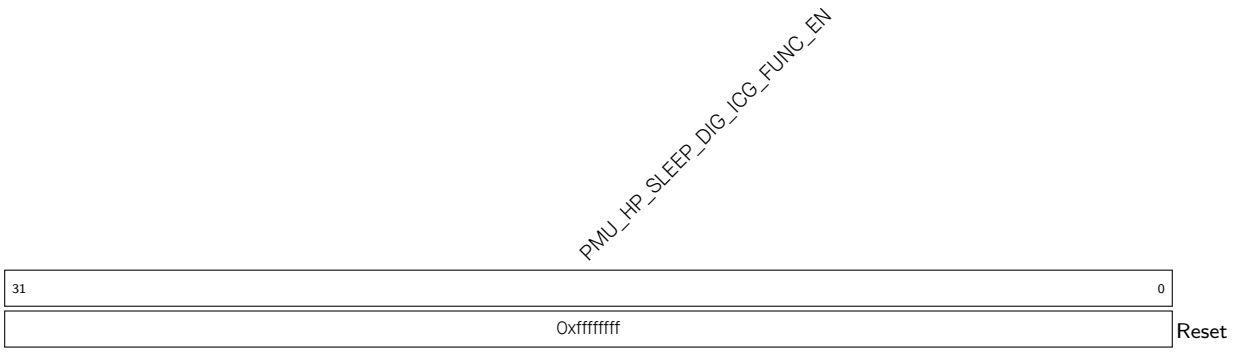
(R/W)

PMU_HP_SLEEP_PD_CNNT_PD_EN Configures whether to power down HP_CNNT in HP_SLEEP state.

0: Power up

1: Power down

(R/W)



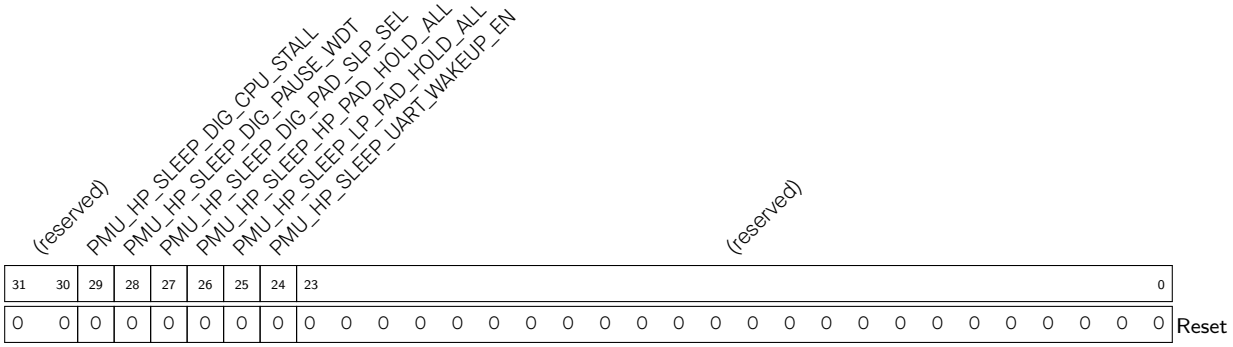
PMU_HP_SLEEP_PD_TOP_PD_EN Configures whether to power down PD_TOP power domain in HP_SLEEP state.

0: Power up

1: Power down

(R/W)

Register 15.12. PMU_HP_SLEEP_ICG_HP_FUNC_REG (0x006C)



PMU_HP_SLEEP_DIG_ICG_FUNC_EN Configures whether to enable HP system peripheral's function clock in HP_SLEEP state. For detailed configuration please see Table 15.4-2.

0: Disable

1: Enable

(R/W)

Register 15.13. PMU_HP_SLEEP_HP_SYS_CNTL_REG (0x0078)

PMU_HP_SLEEP_UART_WAKEUP_EN Configures whether to enable UART wake up function in HP_SLEEP state.

0: Disable wake-up function

1: Enable wake-up function

(R/W)

PMU_HP_SLEEP_LP_PAD_HOLD_ALL Configures whether to hold LP GPIO's configuration in HP_SLEEP state.

0: Do not hold

1: Hold

(R/W)

PMU_HP_SLEEP_HP_PAD_HOLD_ALL Configures whether to hold GPIO's configuration in HP_SLEEP state.

0: Do not hold

1: Hold

(R/W)

PMU_HP_SLEEP_DIG_PAD_SLP_SEL Configures whether to use Light-sleep mode configuration for GPIO in HP_SLEEP state.

0: Use normal configuration

1: Use Light-sleep mode configuration. For details please refer to Chapter 10 *GPIO Matrix and IO MUX* > Section 10.8 *Pin Functions in Light-sleep*.

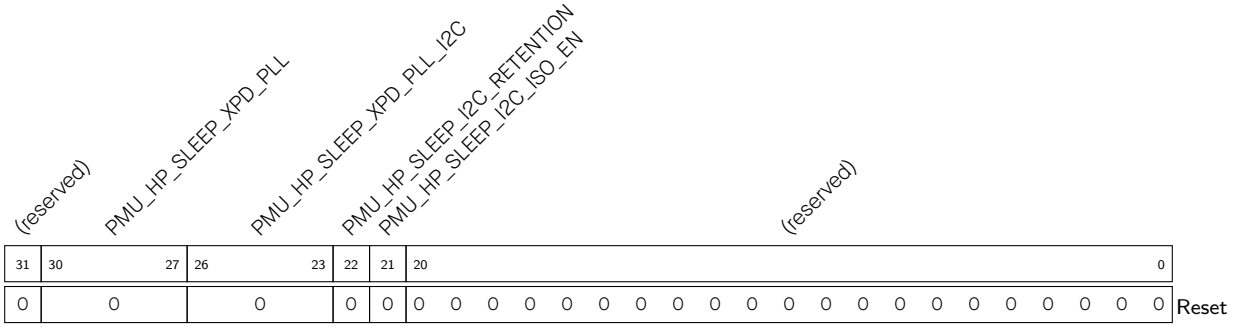
(R/W)

PMU_HP_SLEEP_DIG_PAUSE_WDT Configures whether to pause watchdog in HP_SLEEP state.

0: Do not pause

1: Pause

(R/W)



PMU_HP_SLEEP_DIG_CPU_STALL Configures whether to stall the CPU in HP_SLEEP state.

0: Do not stall

1: Stall

(R/W)

Register 15.14. PMU_HP_SLEEP_HP_CK_POWER_REG (0x007C)

PMU_HP_SLEEP_I2C_ISO_EN Configure whether to power up ANALOG_I2C in HP_SLEEP state.

0: Power down

1: Power up

(R/W)

PMU_HP_SLEEP_I2C_RETENTION Configures whether to enable ANALOG_I2C retention status in HP_SLEEP state.

0: Disable

1: Enable

(R/W)

PMU_HP_SLEEP_XPD_PLL_I2C Configures whether to enable PLL I2C controllers in HP_SLEEP state. Each bit controls a PLL I2C register group.

0: Disable

1: Enable

(R/W)

PMU_HP_SLEEP_XPD_PLL Configures whether to enable the analog power domains in HP system in HP_SLEEP state. Bit 0 controls CPLL_CLK, bit 1 controls SPLL_CLK, bit 2 controls Audio PLL, bit 3 controls SDIO PLL.

0: Disable

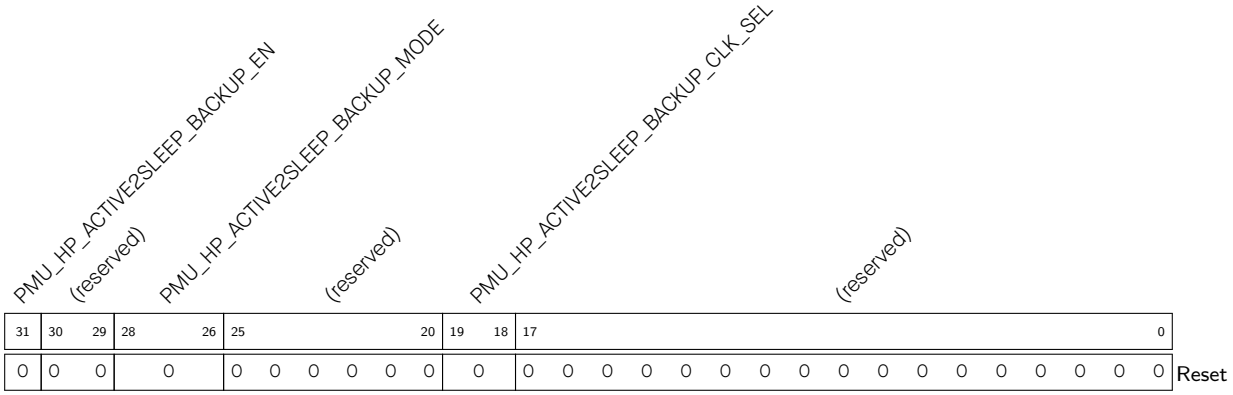
1: Enable

(R/W)

Register 15.15. PMU_HP_SLEEP_BIAS_REG (0x0080)

PMU_HP_SLEEP_DCM_VSET Regulates the DCDC voltage in HP_SLEEP state. (R/W)

PMU_HP_SLEEP_DCM_MODE Configures whether to enable DCDC status in HP_SLEEP state.



0: Disable

1: Enable

2, 3: Reserved

(R/W)

Register 15.16. PMU_HP_SLEEP_BACKUP_REG (0x0084)

PMU_HP_ACTIVE2SLEEP_BACKUP_CLK_SEL Configures the backup module function clock source when PMU state switches from HP_ACTIVE to HP_SLEEP.

0: Select XTAL

1: Select PLL_CLK

2: Select RC_FAST_CLK

3: Invalid value

(R/W)

PMU_HP_ACTIVE2SLEEP_BACKUP_MODE Configures the backup direction and link list when PMU state switches from HP_ACTIVE to HP_SLEEP.

Highest bit:

0: From memory to peripheral

1: From peripheral to memory

Lower two bits:

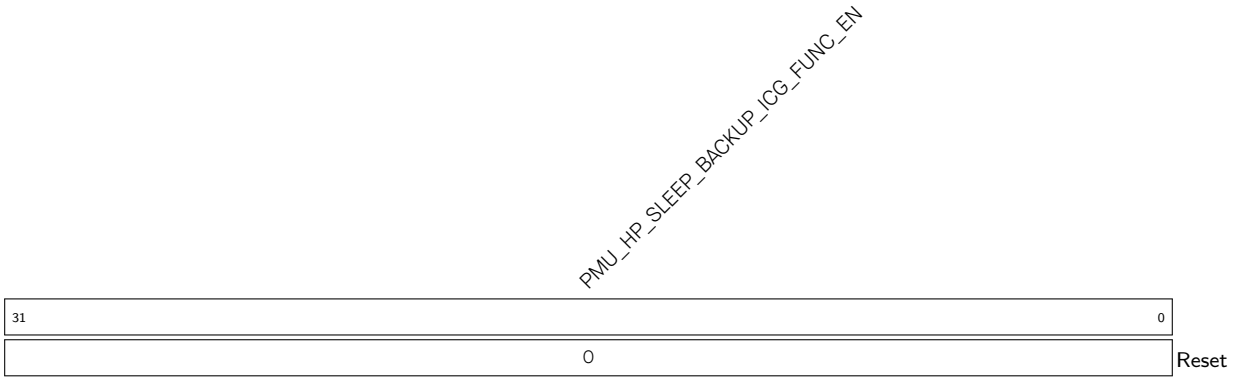
0: PAU_LINK_ADDR_0

1: PAU_LINK_ADDR_1

2: PAU_LINK_ADDR_2

3: PAU_LINK_ADDR_3

(R/W)



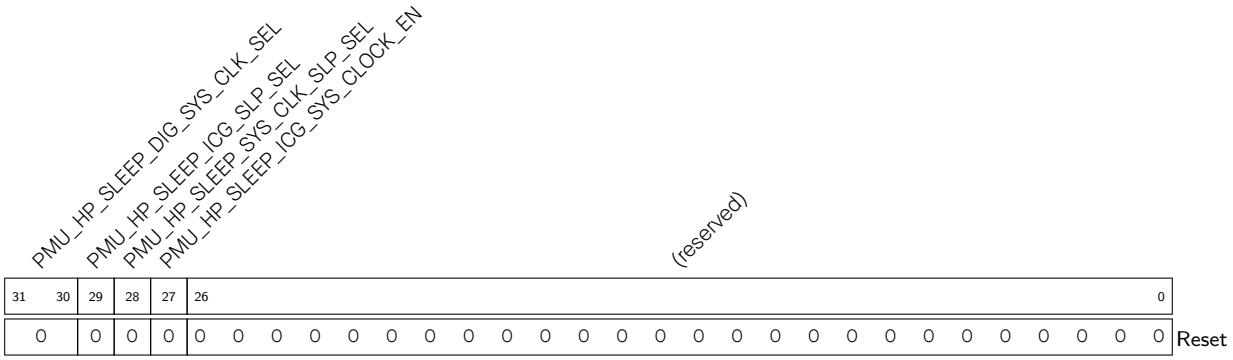
PMU_HP_ACTIVE2SLEEP_BACKUP_EN Configures whether to enable the backup flow when PMU state switches from HP_ACTIVE to HP_SLEEP.

0: Disable backup

1: Enable backup

(R/W)

Register 15.17. PMU_HP_SLEEP_BACKUP_CLK_REG (0x0088)



PMU_HP_SLEEP_BACKUP_ICG_FUNC_EN Configures whether to enable each peripheral's function clock when the target state is HP_SLEEP. For details, please refer to Table 15.4-2.

0: Disable

1: Enable

(R/W)

Register 15.18. PMU_HP_SLEEP_SYSCLK_REG (0x008C)

PMU_HP_SLEEP_ICG_SYS_CLOCK_EN Configures whether to enable ROOT_CLK in HP_SLEEP state.

0: Disable

1: Enable

(R/W)

PMU_HP_SLEEP_SYS_CLK_SLP_SEL Configures whether to allow PMU to control the clock source in HP_SLEEP state.

0: Controlled by PCR registers

1: Controlled by PMU

(R/W)

PMU_HP_SLEEP_ICG_SLP_SEL Configures whether to allow PMU to control the clock gating in HP_SLEEP state.

0: Controlled by PCR registers

1: Controlled by PMU

(R/W)

PMU_HP_SLEEP_DIG_SYS_CLK_SEL Configures the source of ROOT_CLK in HP_SLEEP state.

0: XTAL

1: PLL_CLK

2: RC_FAST_CLK

3: Invalid value

(R/W)

Register 15.19. PMU_HP_SLEEP_HP_REGULATOR0_REG (0x0090)

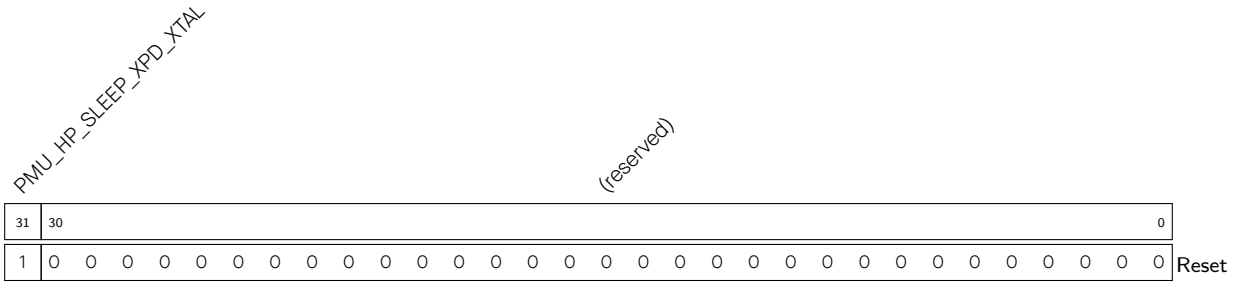
PMU_HP_SLEEP_HP_REGULATOR_XPD Configures whether to enable the HP sys regulator in HP_SLEEP state.

0: Disable

1: Enable

(R/W)

PMU_HP_SLEEP_REGULATOR_VO1_XPD Configures whether to enable VO1 regulator in HP_SLEEP state.



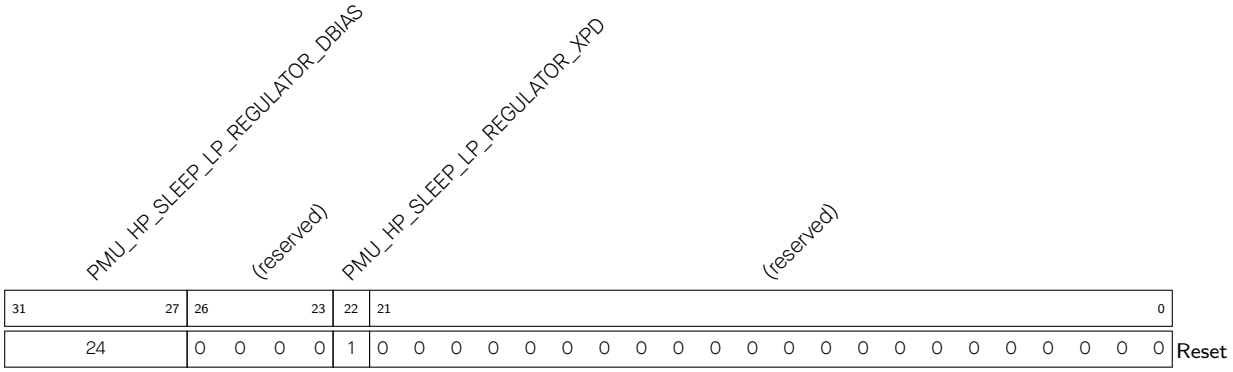
0: Disable

1: Enable

(R/W)

PMU_HP_SLEEP_HP_REGULATOR_DBIAS Regulates the voltage of the HP sys regulator in HP_SLEEP state. The higher the value, the higher the voltage. (R/W)

Register 15.20. PMU_HP_SLEEP_XTAL_REG (0x0098)



PMU_HP_SLEEP_XPD_XTAL Configures whether to enable XTAL_CLK analog source in HP_SLEEP state.

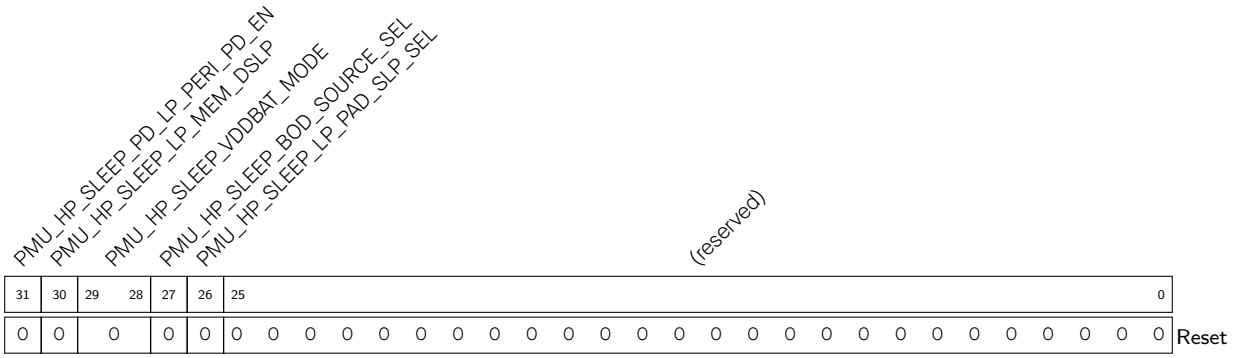
0: Disable

1: Enable

(R/W)

Register 15.21. PMU_HP_SLEEP_LP_REGULATOR0_REG (0x009C)

PMU_HP_SLEEP_LP_REGULATOR_XPD Configures whether to enable LP sys regulator in HP_ACTIVE/HP_SLEEP state.



0: Disable

1: Enable

(R/W)

PMU_HP_SLEEP_LP_REGULATOR_DBIAS Regulates the voltage of the LP sys regulator in HP_ACTIVE/HP_SLEEP state. The higher the value, the higher the voltage. (R/W)

Register 15.22. PMU_HP_SLEEP_LP_DIG_POWER_REG (0x00A8)

PMU_HP_SLEEP_LP_PAD_SLP_SEL Configures whether to enable LP GPIO function in HP_ACTIVE/HP_SLEEP state.

0: Disable

1: Enable

(R/W)

PMU_HP_SLEEP_BOD_SOURCE_SEL Configures whether to enable brown-out detection in HP_ACTIVE/HP_SLEEP. (R/W)

PMU_HP_SLEEP_VDDBAT_MODE Configures whether to enable VBAT power in HP_ACTIVE/HP_SLEEP state.

0: Disable

1: Enable

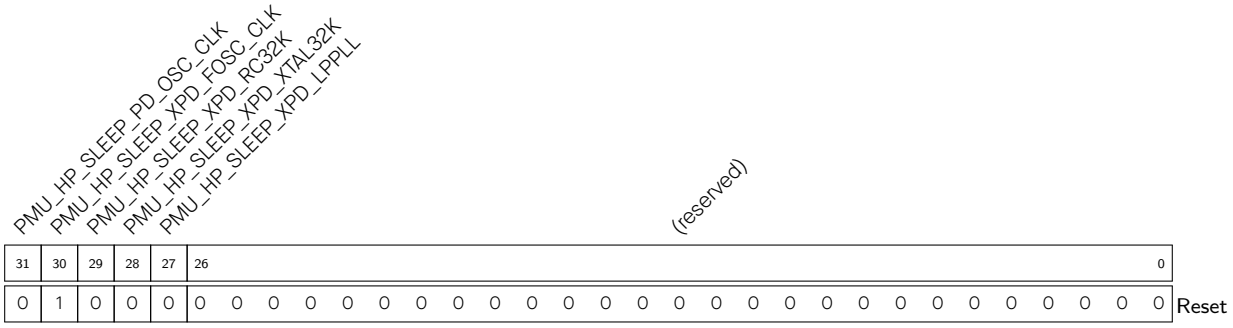
(R/W)

PMU_HP_SLEEP_LP_MEM_DSLP Configures whether to enable Memory Deep-sleep mode for the LP SRAM in HP_ACTIVE/HP_SLEEP state.

0: Disable

1: Enable

(R/W)



PMU_HP_SLEEP_PD_LP_PERI_PD_EN Configures whether to power down LP PD Peripherals in HP_ACTIVE/HP_SLEEP state.

0: Power up

1: Power down

(R/W)

Register 15.23. PMU_HP_SLEEP_LP_CK_POWER_REG (0x00AC)

PMU_HP_SLEEP_XPD_LPPLL Configures whether to enable PLL_LP_CLK in HP_ACTIVE/HP_SLEEP state.

0: Disable

1: Enable

(R/W)

PMU_HP_SLEEP_XPD_XTAL32K Configures whether to enable XTAL32K_CLK in HP_ACTIVE/HP_SLEEP state.

0: Disable

1: Enable

(R/W)

PMU_HP_SLEEP_XPD_RC32K Configures whether to enable RC32K_CLK in HP_ACTIVE/HP_SLEEP state.

0: Disable

1: Enable

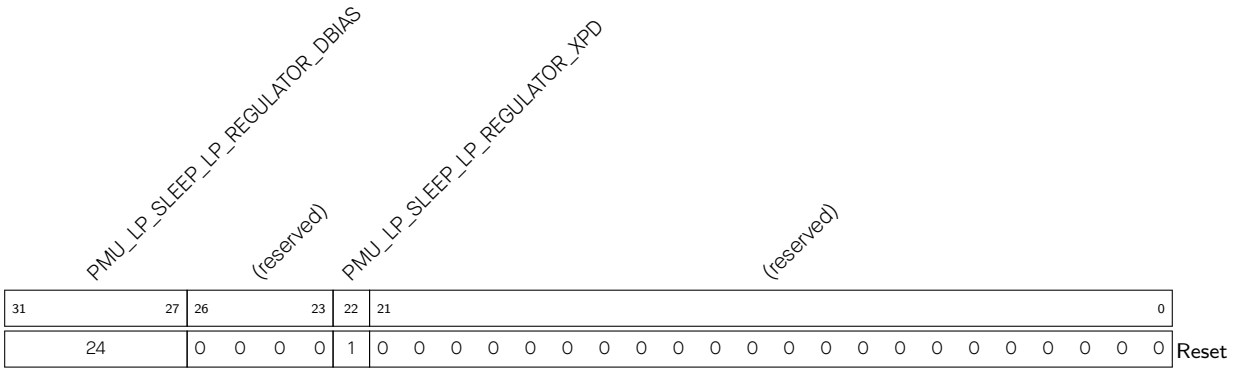
(R/W)

PMU_HP_SLEEP_XPD_FOSC_CLK Configures whether to enable RC_FAST_CLK in HP_ACTIVE/HP_SLEEP state.

0: Disable

1: Enable

(R/W)



PMU_HP_SLEEP_PD_OSC_CLK Configures whether to enable RC_SLOW_CLK in HP_ACTIVE/HP_SLEEP state.

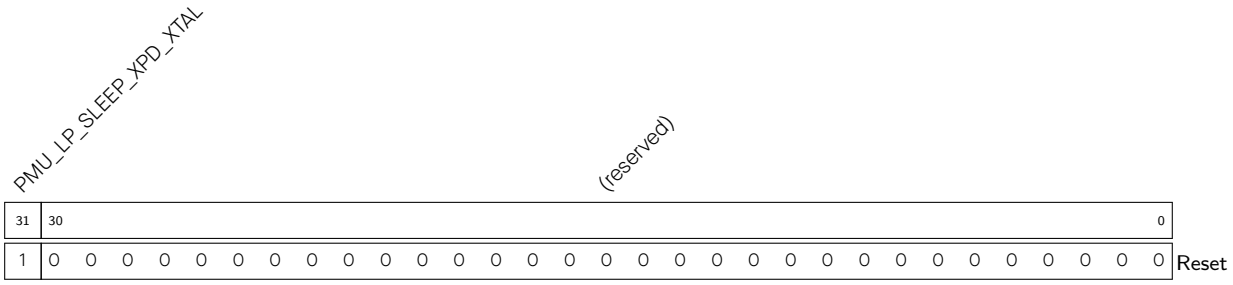
0: Disable

1: Enable

(R/W)

Register 15.24. PMU_LP_SLEEP_LP_REGULATOR0_REG (0x00B4)

PMU_LP_SLEEP_LP_REGULATOR_XPD Configures whether to enable the LP sys regulator in LP_SLEEP state.



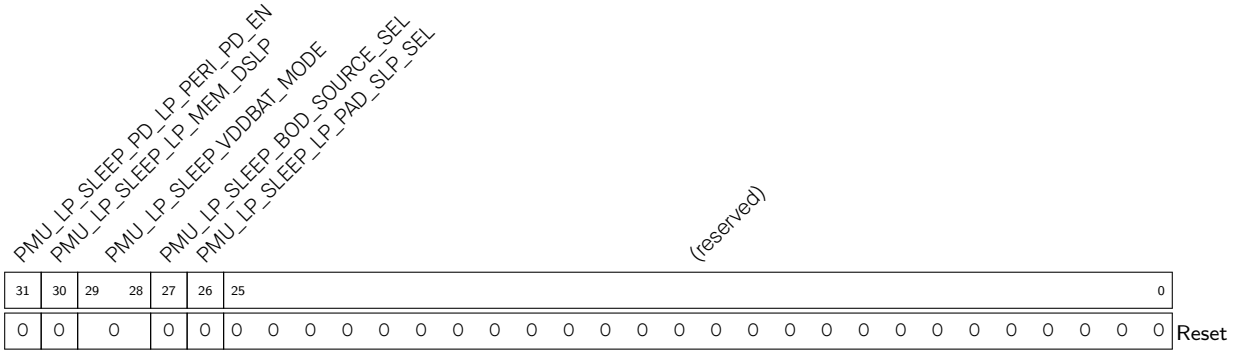
0: Disable

1: Enable

(R/W)

PMU_LP_SLEEP_LP_REGULATOR_DBIAS Regulates the voltage of the LP sys regulator in LP_SLEEP state. The higher the value, the higher the voltage. (R/W)

Register 15.25. PMU_LP_SLEEP_XTAL_REG (0x00BC)



PMU_LP_SLEEP_XPD_XTAL Configures whether to enable XTAL_CLK analog source in LP_SLEEP state.

0: Disable

1: Enable

(R/W)

Register 15.26. PMU_LP_SLEEP_LP_DIG_POWER_REG (0x00C0)

PMU_LP_SLEEP_LP_PAD_SLP_SEL Configures whether to enable LP GPIO function in LP_SLEEP state.

0: Disable

1: Enable

(R/W)

PMU_LP_SLEEP_BOD_SOURCE_SEL Configures whether to enable brown-out detection in LP_SLEEP state. (R/W)

PMU_LP_SLEEP_VDDBAT_MODE Configures whether to enable VBAT power in LP_SLEEP state.

0: Disable

1: Enable

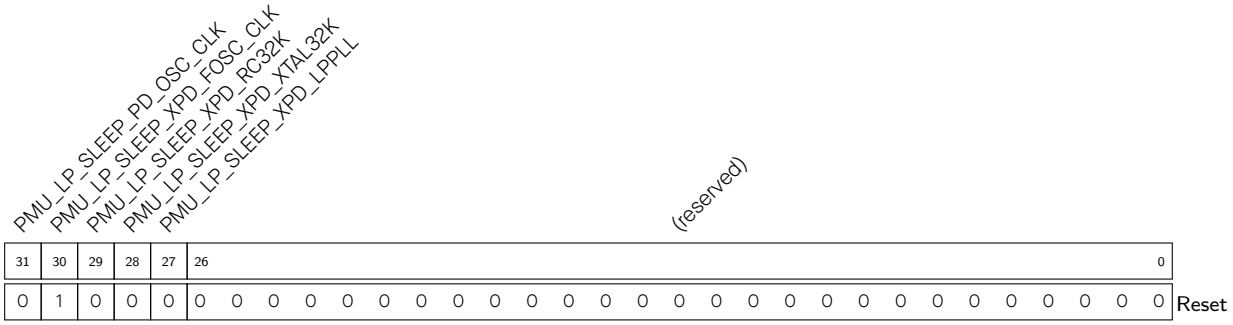
(R/W)

PMU_LP_SLEEP_LP_MEM_DSLP Configures whether to enable Memory Deep-sleep mode for the LP SRAM in LP_SLEEP state.

0: Disable

1: Enable

(R/W)



PMU_LP_SLEEP_PD_LP_PERI_PD_EN Configures whether to power down LP PD Peripherals in LP_SLEEP state.

0: Power up

1: Power down

(R/W)

Register 15.27. PMU_LP_SLEEP_LP_CK_POWER_REG (0x00C4)

PMU_LP_SLEEP_XPD_LPPLL Configures whether to enable PLL_LP_CLK in LP_SLEEP state.

0: Disable

1: Enable

(R/W)

PMU_LP_SLEEP_XPD_XTAL32K Configures whether to enable XTAL32K_CLK in LP_SLEEP state.

0: Disable

1: Enable

(R/W)

PMU_LP_SLEEP_XPD_RC32K Configures whether to enable RC32K_CLK in LP_SLEEP state.

0: Disable

1: Enable

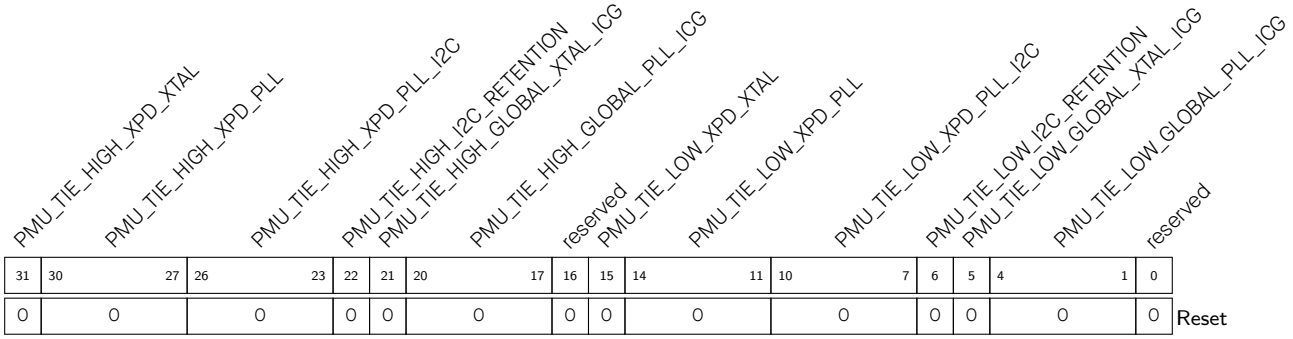
(R/W)

PMU_LP_SLEEP_XPD_FOSC_CLK Configures whether to enable RC_FAST_CLK in LP_SLEEP state.

0: Disable

1: Enable

(R/W)



PMU_LP_SLEEP_PD_OSC_CLK Configures whether to enable RC_SLOW_CLK in LP_SLEEP state.

0: Disable

1: Enable

(R/W)

Register 15.28. PMU_IMM_HP_CK_POWER_REG (0x00CC)

PMU_TIE_LOW_GLOBAL_PLL_ICG Configures whether to power down global PLL clock gating bitmap.

0: No effect

1: Power down

(WT)

PMU_TIE_LOW_GLOBAL_XTAL_ICG Configures whether to power down XTAL clock.

0: No effect

1: Power down

(WT)

PMU_TIE_LOW_I2C_RETENTION Configures whether to power down ANALOG I2C retention.

0: No effect

1: Power down

(WT)

PMU_TIE_LOW_XPD_PLL_I2C Configures whether to power down global PLL I2C clock power bitmap.

0: No effect

1: Power down

(WT)

PMU_TIE_LOW_XPD_PLL Configures whether to power down global PLL clock power bitmap.

0: No effect

1: Power down

(WT)

PMU_TIE_LOW_XPD_XTAL Configures whether to power down XTAL clock power.

0: No effect

1: Power down

(WT)

PMU_TIE_HIGH_GLOBAL_PLL_ICG Configures whether to enable PLL clock gating bitmap.

0: No effect

1: Enable

(WT)

Continued on the next page...

Register 15.28. PMU_IMM_HP_CK_POWER_REG (0x00CC)

Continued from the previous page...

PMU_TIE_HIGH_GLOBAL_XTAL_ICG Configures whether to enable global XTAL clock.

0: No effect

1: Enable

(WT)

PMU_TIE_HIGH_I2C_RETENTION Configures whether to enable ANALOG I2C retention.

0: No effect

1: Enable

(WT)

PMU_TIE_HIGH_XPD_PLL_I2C Configures whether to enable PLL I2C clock power bitmap.

0: No effect

1: Enable

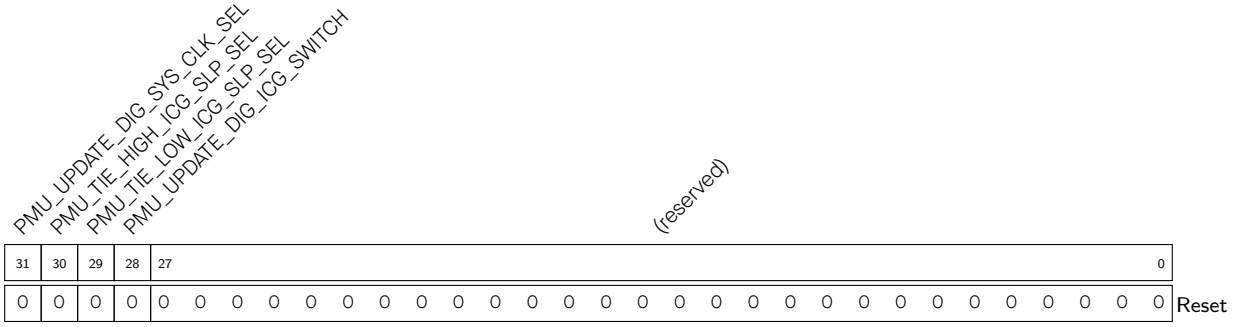
(WT)

PMU_TIE_HIGH_XPD_PLL Configures whether to enable global PLL clock power bitmap.

0: No effect

1: Enable

(WT)



PMU_TIE_HIGH_XPD_XTAL Configures whether to enable global XTAL clock power.

0: No effect

1: Enable

(WT)

Register 15.29. PMU_IMM_SLEEP_SYSCLK_REG (0x00D0)

PMU_UPDATE_DIG_ICG_SWITCH Immediately updates function clock gating status. (WT)

PMU_TIE_LOW_ICG_SLP_SEL Configures whether to disable PMU control of function clock.

0: No effect

1: Disable

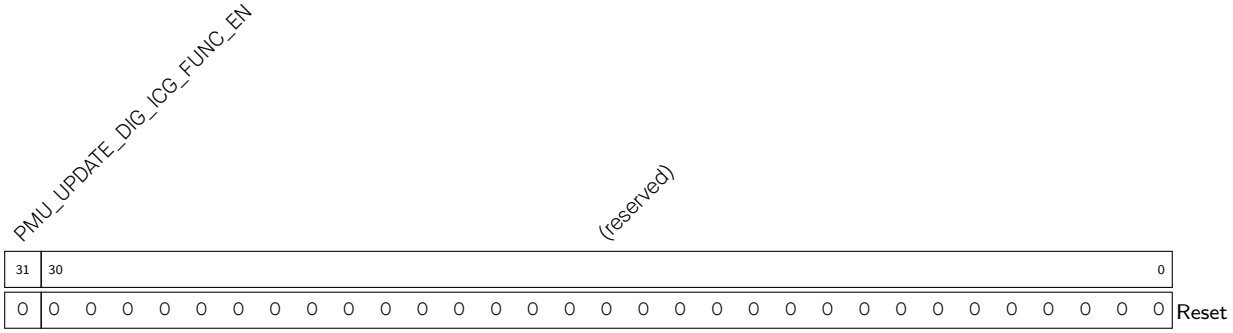
(WT)

PMU_TIE_HIGH_ICG_SLP_SEL Configures whether to enable PMU control of function clock.

0: No effect

1: Enable

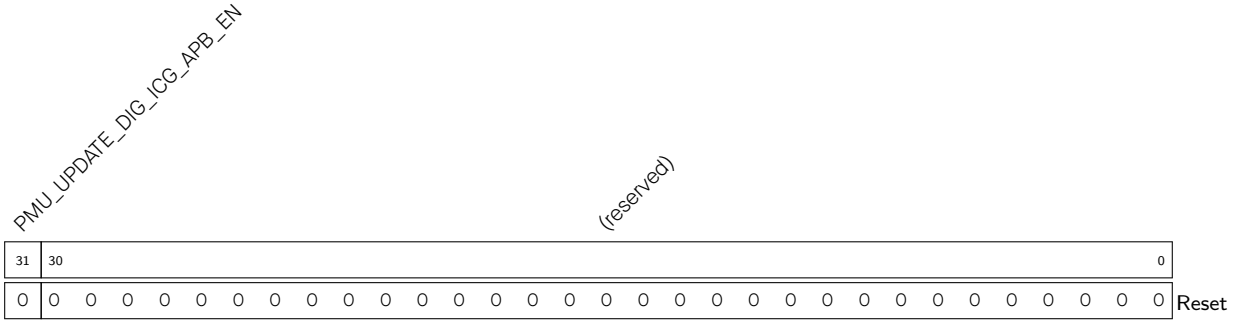
(WT)



PMU_UPDATE_DIG_SYS_CLK_SEL Immediately updates system clock.

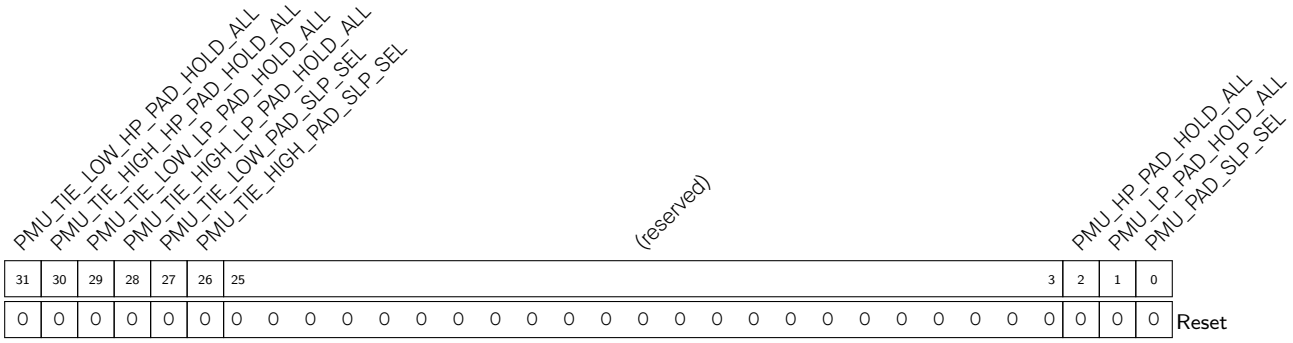
0: No effect

1: Updates the configurations of SYS_CLK_SEL in the current PMU state to the application side.



(WT)

Register 15.30. PMU_IMM_HP_FUNC_ICG_REG (0x00D4)



PMU_UPDATE_DIG_ICG_FUNC_EN Immediately updates function clock gating bitmap. (WT)

Register 15.31. PMU_IMM_HP_APB_ICG_REG (0x00D8)

PMU_UPDATE_DIG_ICG_APB_EN Immediately updates APB clock gating bitmap. (WT)

Register 15.32. PMU_IMM_PAD_HOLD_ALL_REG (0x00E4)

PMU_PAD_SLP_SEL Indicates whether the current GPIO function uses sleep configurations.

0: No

1: Yes

(RO)

PMU_LP_PAD_HOLD_ALL Indicates whether the LP PAD is in the HOLD status.

0: No

1: Yes

(RO)

PMU_HP_PAD_HOLD_ALL Represents whether the HP PAD is in the HOLD status.

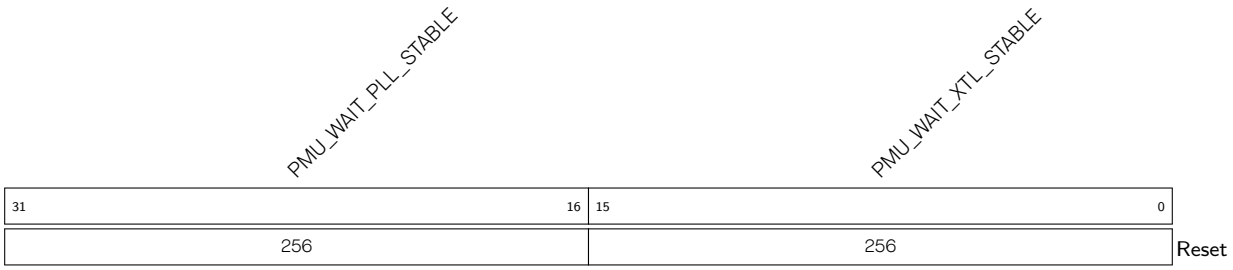
0: No

1: Yes

(RO)

PMU_TIE_HIGH_PAD_SLP_SEL Immediately configures GPIO function to use sleep configurations. (WT)

PMU_TIE_LOW_PAD_SLP_SEL Immediately releases GPIO function from using sleep configuration. (WT)

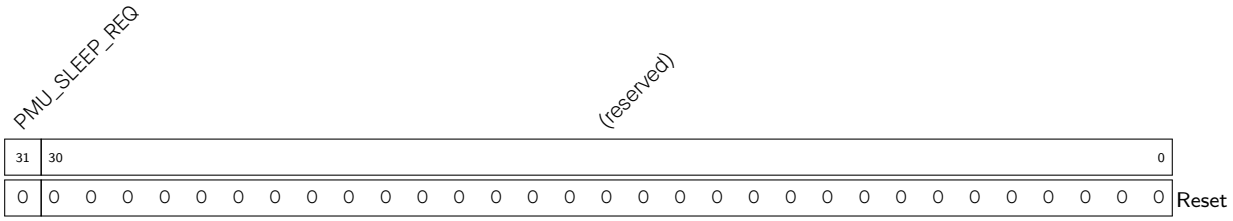


PMU_TIE_HIGH_LP_PAD_HOLD_ALL Immediately configure LP PAD to enter HOLD state. (WT)

PMU_TIE_LOW_LP_PAD_HOLD_ALL Immediately releases LP PAD from HOLD state. (WT)

PMU_TIE_HIGH_HP_PAD_HOLD_ALL Immediately configures HP PAD to enter HOLD state. (WT)

PMU_TIE_LOW_HP_PAD_HOLD_ALL Immediately releases HP PAD from HOLD state. (WT)

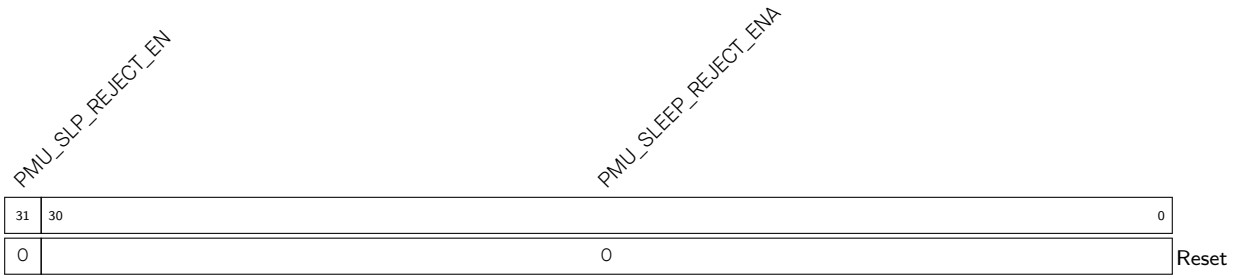


Register 15.33. PMU_POWER_CK_WAIT_CNTL_REG (0x011C)

PMU_WAIT_XTL_STABLE Configures the wait time for enabling XTAL global clock gating after the XTAL power supply is enabled. The unit is LP_DYN_FAST_CLK. (R/W)

PMU_WAIT_PLL_STABLE Configures the wait time for enabling PLL global clock gating after the PLL power supply is enabled. The unit is LP_DYN_FAST_CLK. (R/W)

Register 15.34. PMU_SLP_WAKEUP_CNTL0_REG (0x0120)



PMU_SLEEP_REQ Configures whether to switch the PMU state to HP_SLEEP or LP_SLEEP.

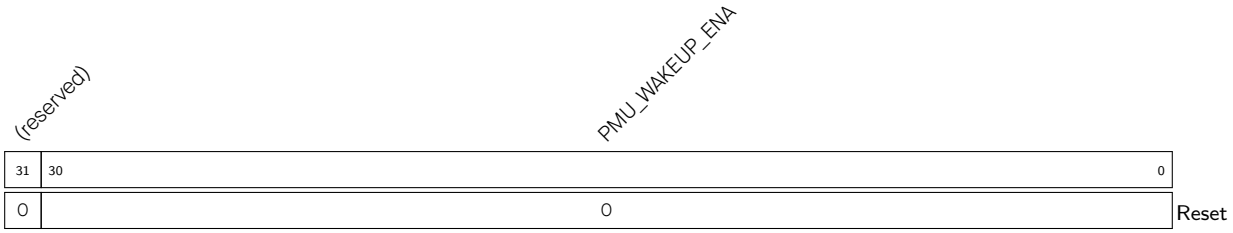
0: Do not switch

1: Switch to HP_SLEEP or LP_SLEEP, depending on the state of the LP CPU.

(WT)

Register 15.35. PMU_SLP_WAKEUP_CNTL1_REG (0x0124)

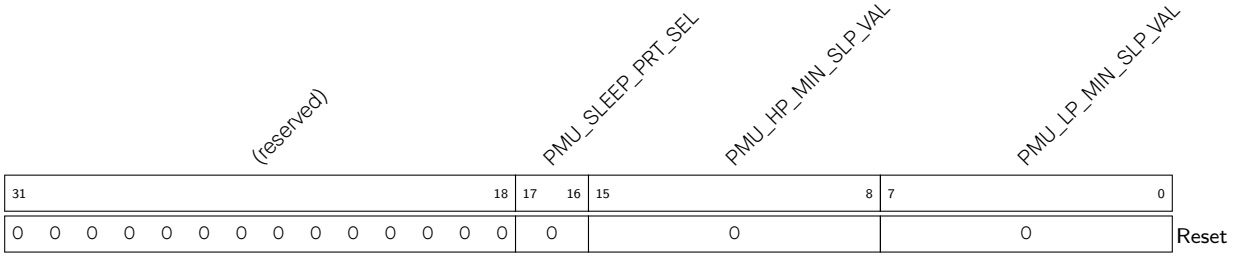
PMU_SLEEP_REJECT_ENA Configures the sleep rejection source. For the mapping between values and sources please refer to Table 15.4-1. (R/W)



PMU_SLP_REJECT_EN Configures whether to enable sleep rejection function.

0: Disable

1: Enable



(R/W)

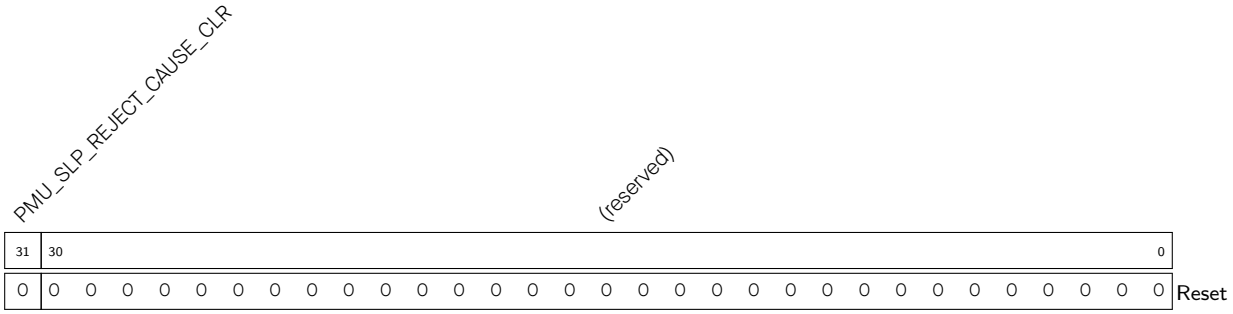
Register 15.36. PMU_SLP_WAKEUP_CNTL2_REG (0x0128)

PMU_WAKEUP_ENA Configures wake-up source. For the mapping between values and sources please refer to Table 15.4-1. (R/W)

Register 15.37. PMU_SLP_WAKEUP_CNTL3_REG (0x012C)

PMU_LP_MIN_SLP_VAL Configures the minimum sleep time to enter LP_SLEEP. The unit is LP_DYN_SLOW_CLK. (R/W)

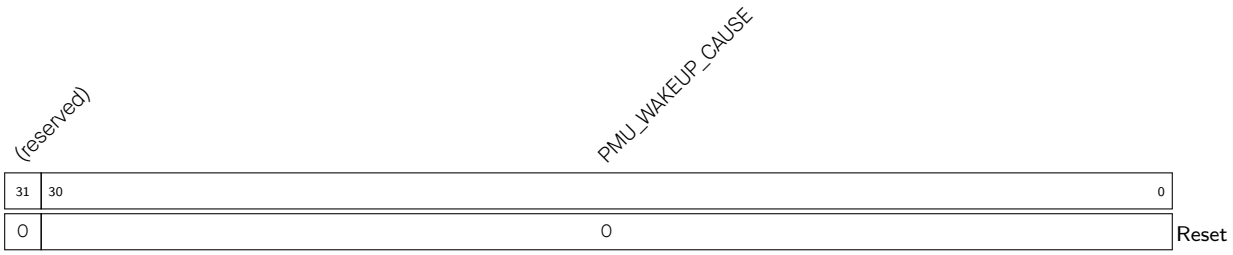
PMU_HP_MIN_SLP_VAL Configures the minimum sleep time to enter HP_SLEEP. The unit is LP_DYN_SLOW_CLK. (R/W)



PMU_SLEEP_PRT_SEL Configures the minimum sleep time mode.

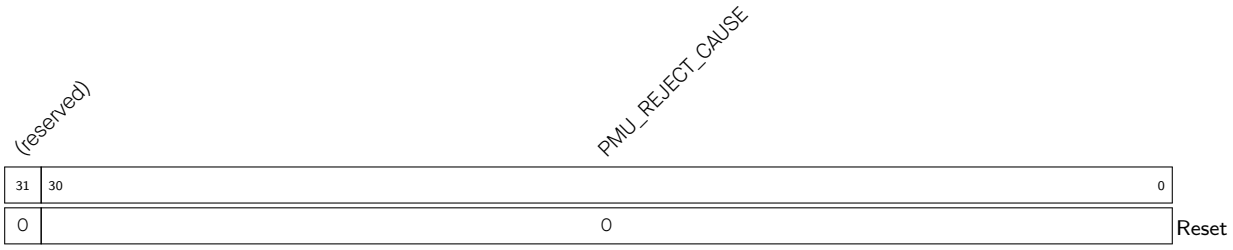
0, 1, 3: Reserved

2: Protects both LP_SLEEP and HP_SLEEP simultaneously



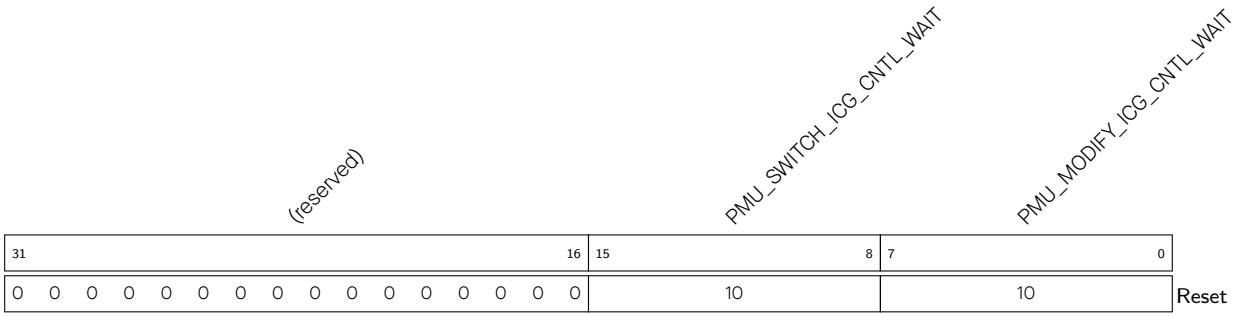
(R/W)

Register 15.38. PMU_SLP_WAKEUP_CNTL4_REG (0x0130)



PMU_SLP_REJECT_CAUSE_CLR Write 1 to clear PMU_REJECT_CAUSE. (WT)

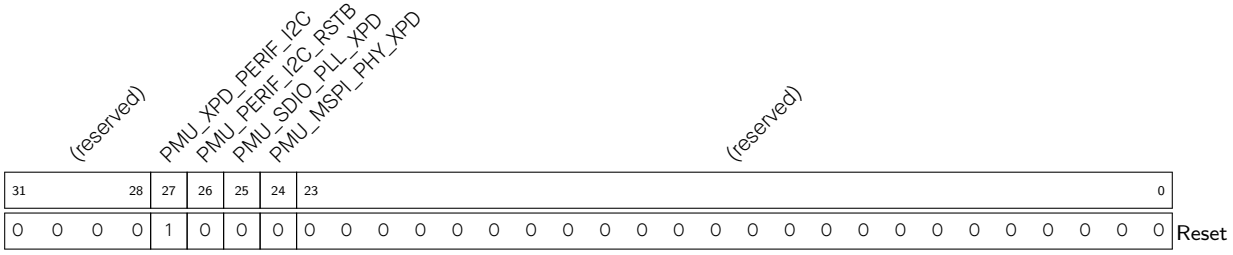
Register 15.39. PMU_SLP_WAKEUP_STATUS0_REG (0x0144)



PMU_WAKEUP_CAUSE Indicates the wake-up source. For the mapping between values and sources please refer to Table 15.4-1. (RO)

Register 15.40. PMU_SLP_WAKEUP_STATUS1_REG (0x0148)

PMU_REJECT_CAUSE Indicates the wake-up rejection source. For the mapping between values and sources please refer to Table 15.4-1. (RO)



Register 15.41. PMU_HP_CK_CNTL_REG (0x0154)

PMU_MODIFY_ICG_CNTL_WAIT Configures the wait time for modifying the functional module clock gating. The unit is LP_DYN_FAST_CLK. (R/W)

PMU_SWITCH_ICG_CNTL_WAIT Configures the wait time for switching the functional module clock gating. The unit is LP_DYN_FAST_CLK. (R/W)

Register 15.42. PMU_RF_PWC_REG (0x015C)

PMU_MSPI_PHY_XPD Configures whether to enable MSPI PHY.

0: Disable

1: Enable

(R/W)

PMU_SDIO_PLL_XPD Configures whether to enable SDIO PLL.

0: Disable

1: Enable

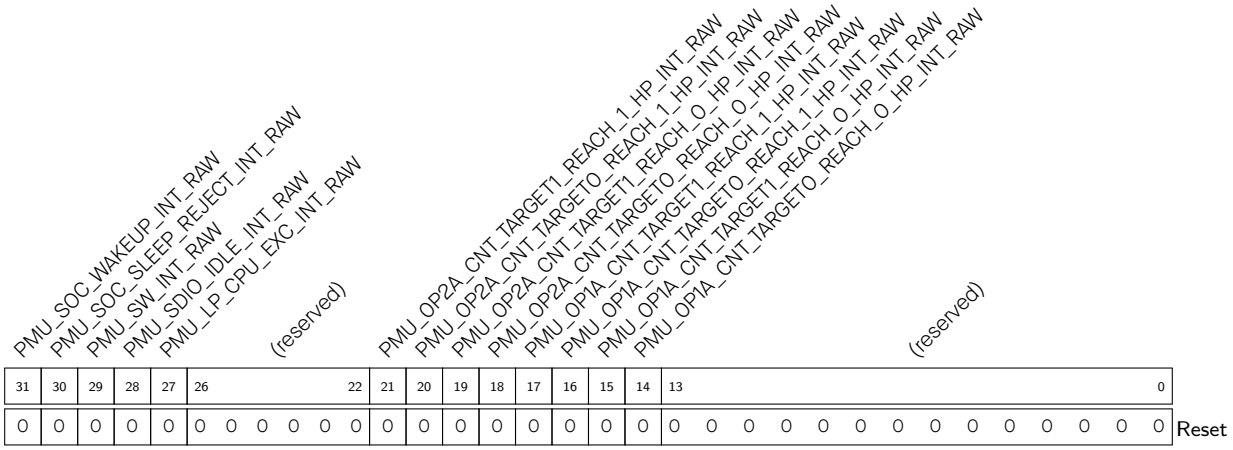
(R/W)

PMU_PERIF_I2C_RSTB Configures whether to enable reset for PERI I2C.

0: Reset

1: Release

(R/W)



PMU_XPD_PERIF_I2C Configures whether to enable the power for PERI ADC.

0: Disable

1: Enable

(R/W)

Register 15.43. PMU_INT_RAW_REG (0x0164)

PMU_OP1A_CNT_TARGET0_REACH_0_HP_INT_RAW The raw interrupt status of PMU_OP1A_CNT_TARGET0_REACH_0_INT. (R/WTC/SS)

PMU_OP1A_CNT_TARGET1_REACH_0_HP_INT_RAW The raw interrupt status of PMU_OP1A_CNT_TARGET1_REACH_0_INT. (R/WTC/SS)

PMU_OP1A_CNT_TARGET0_REACH_1_HP_INT_RAW The raw interrupt status of PMU_OP1A_CNT_TARGET0_REACH_1_INT. (R/WTC/SS)

PMU_OP1A_CNT_TARGET1_REACH_1_HP_INT_RAW The raw interrupt status of PMU_OP1A_CNT_TARGET1_REACH_1_INT. (R/WTC/SS)

PMU_OP2A_CNT_TARGET0_REACH_0_HP_INT_RAW The raw interrupt status of PMU_OP2A_CNT_TARGET0_REACH_0_INT. (R/WTC/SS)

Register 15.51. PMU_LP_CPU_PWR0_REG (0x0184)

PMU_LP_CPU_WAITI_RDY Indicates whether the LP CPU is in the waiti state.

0: Does not enter the state

1: Enters the state

(RO)

PMU_LP_CPU_STALL_RDY Indicates whether the LP CPU is in the stall state.

0: Does not enter the state

1: Enters the state

(RO)

PMU_LP_CPU_FORCE_STALL Configures the LP CPU to enter the stall state.

0: Does not enter the state

1: Enters the state

(R/W)

PMU_LP_CPU_SLP_WAITI_FLAG_EN Configures whether the LP CPU needs to enter the waiti state when entering sleep mode.

0: Does not enter the state

1: Enters the state

(R/W)

PMU_LP_CPU_SLP_STALL_FLAG_EN Configures whether the LP CPU needs to enter the stall state when entering sleep mode.

0: Does not enter the state

1: Enters the state

(R/W)

PMU_LP_CPU_SLP_STALL_WAIT Configures the time to wait for the stall to take effect after enabling stall state when the LP CPU enters sleep mode. The unit is LP_DYN_FAST_CLK. (R/W)

PMU_LP_CPU_SLP_STALL_EN Configures whether to pause the LP CPU in sleep mode.

0: Do not pause

1: Pause

(R/W)

Continued on the next page...

Register 15.51. PMU_LP_CPU_PWR0_REG (0x0184)

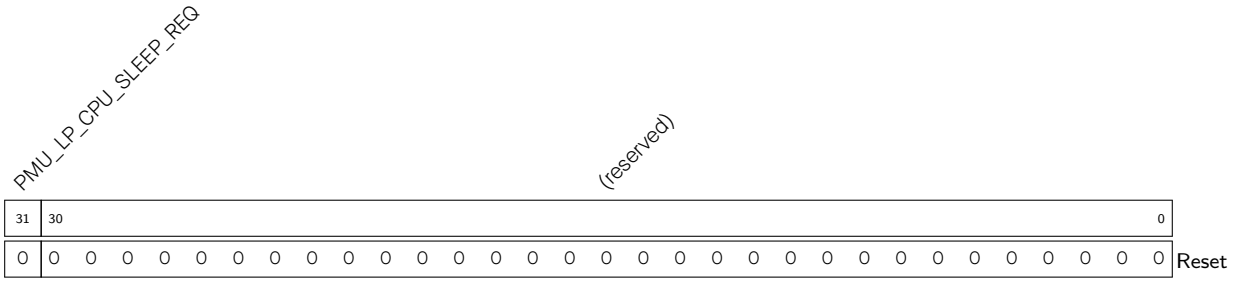
Continued from the previous page...

PMU_LP_CPU_SLP_RESET_EN Configures whether to reset the LP CPU in sleep mode.

0: Do not reset

1: Reset

(R/W)



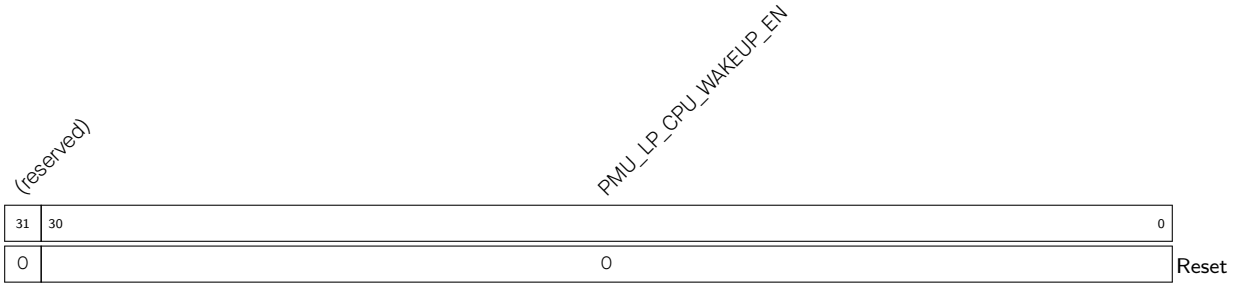
PMU_LP_CPU_SLP_BYPASS_INTR_EN Configures whether to enable interrupt signals for the LP CPU in sleep mode.

0: Disable interrupt signals

1: Enable interrupt signals

(R/W)

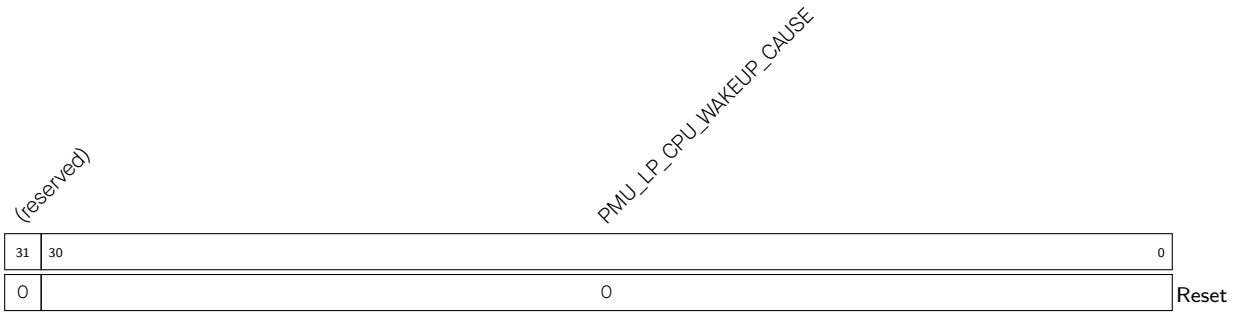
Register 15.52. PMU_LP_CPU_PWR1_REG (0x0188)



PMU_LP_CPU_SLEEP_REQ Configures whether the LP CPU enters sleep.

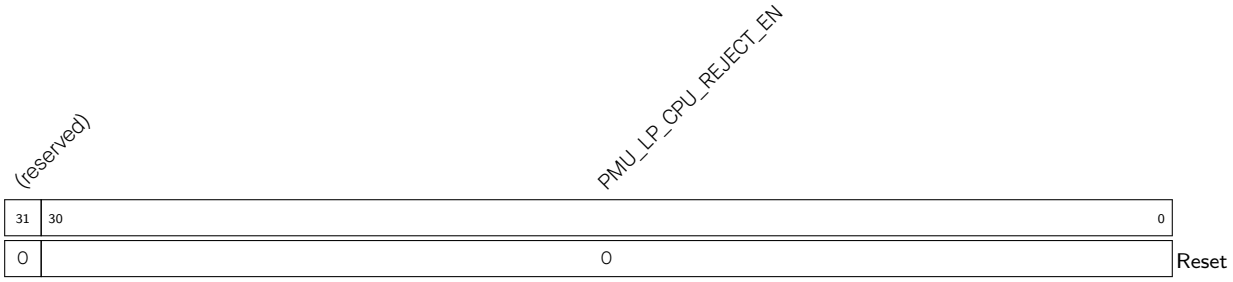
0: Does not enter sleep

1: Enters sleep



(WT)

Register 15.53. PMU_LP_CPU_PWR2_REG (0x018C)

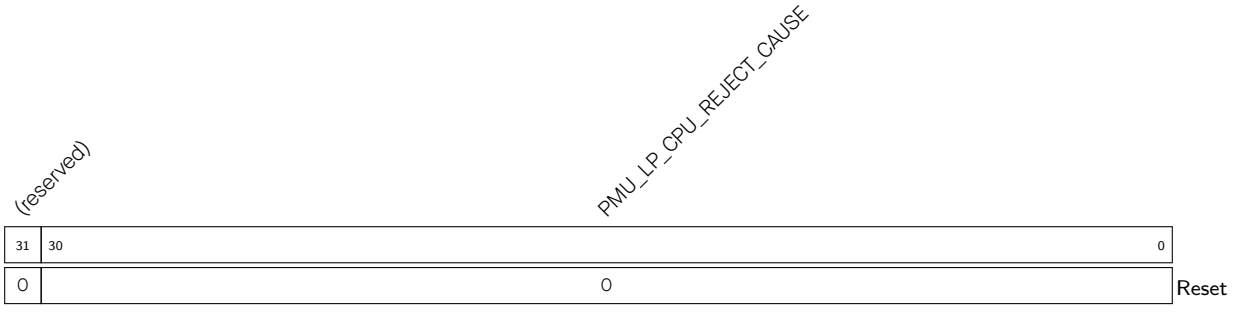


PMU_LP_CPU_WAKEUP_EN Configures the wake-up source for LP CPU. For details please refer to Table 15.4-1 *Wake-up Sources*. (R/W)

Register 15.54. PMU_LP_CPU_PWR3_REG (0x0190)

PMU_LP_CPU_WAKEUP_CAUSE Indicates the wake-up cause of LP CPU. (RO)

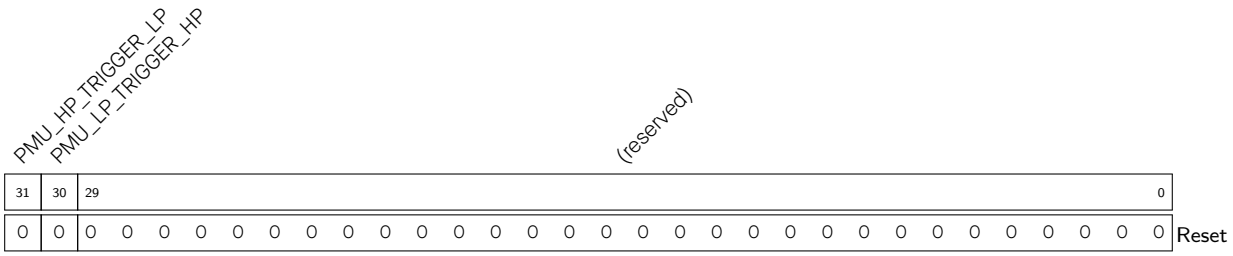
Register 15.55. PMU_LP_CPU_PWR4_REG (0x0194)



PMU_LP_CPU_REJECT_EN Configures whether to enable sleep rejection function for the LP CPU.

0: Disable

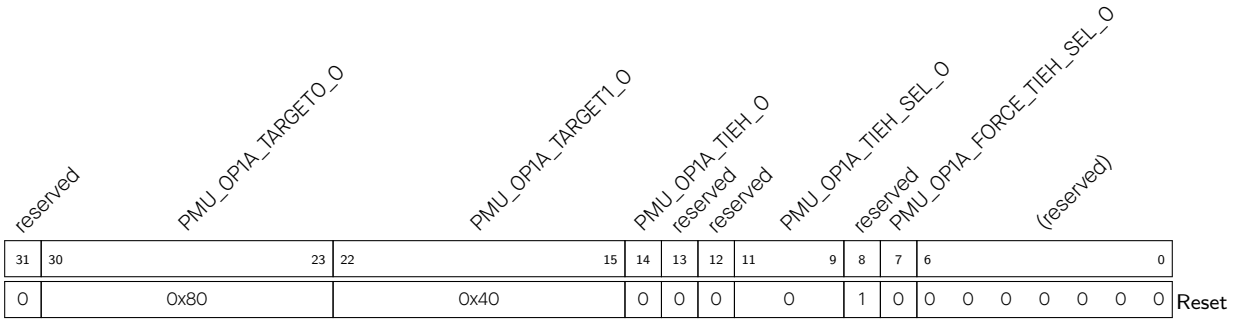
1: Enable



(R/W)

Register 15.56. PMU_LP_CPU_PWR5_REG (0x0198)

PMU_LP_CPU_REJECT_CAUSE Indicates the sleep rejection cause of LP CPU. (RO)



Register 15.57. PMU_HP_LP_CPU_COMM_REG (0x019C)

PMU_LP_TRIGGER_HP When the LP CPU sets this register to 1, the chip is woken up. (WT)

PMU_HP_TRIGGER_LP When the HP CPU sets this register to 1, the LP CPU is woken up. (WT)

Register 15.58. PMU_EXT_LDO_P0_0P1A_REG (0x01B8)

PMU_0P1A_FORCE_TIEH_SEL_0 Configures which of the following controls the mode selection for VO1 regulator.

1: Mode selection is controlled by PMU_0P1A_TIEH_SEL_0

0: Mode selection is controlled by eFuse

(R/W)

PMU_0P1A_TIEH_SEL_0 Configures mode for VO1.

0: Mode is controlled by PMU_0P1A_TIEH_0.

1: Mode is controlled by SDMMC_0

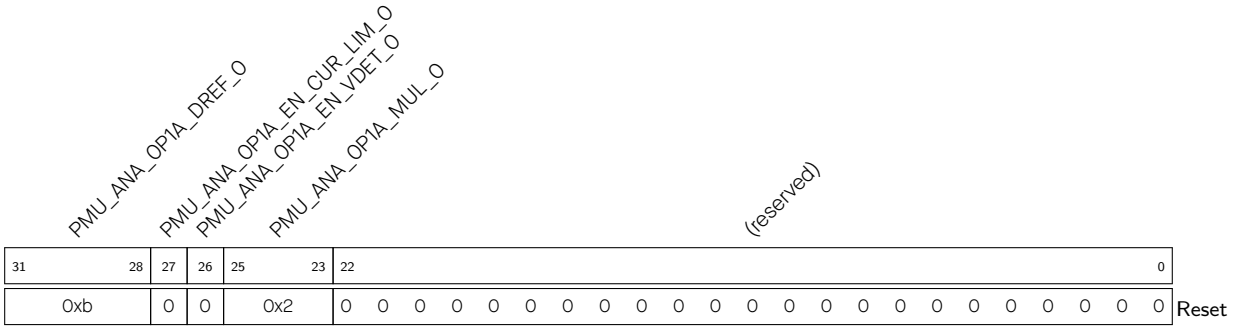
2: Bypass mode

3: Mode is controlled by SDMMC_1

(R/W)

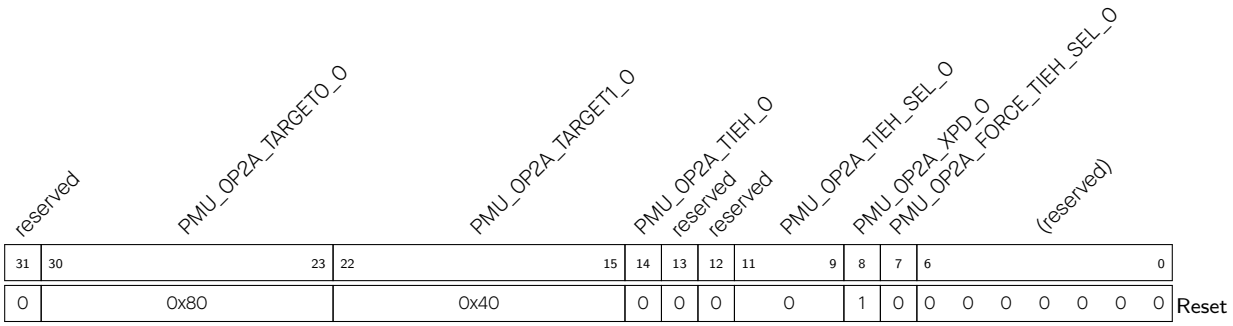
PMU_0P1A_TIEH_0 Configures mode for VO1.

0: LDO mode



1: Bypass mode

(R/W)



PMU_0P1A_TARGET1_0 Configures the timeout for stage 2 of the VO1 regulator wait counter, with the unit being a 16 division of LP_DYN_SLOW_CLK. (R/W)

PMU_0P1A_TARGET0_0 Configures the timeout for stage 1 of the VO1 regulator wait counter, with the unit being a 16 division of LP_DYN_SLOW_CLK. (R/W)

Register 15.59. PMU_EXT_LDO_P0_0P1A_ANA_REG (0x01BC)

PMU_ANA_0P1A_DREF_0
PMU_ANA_0P1A_EN_CUR_LIM_0
PMU_ANA_0P1A_EN_VDET_0

Register 15.60. PMU_EXT_LDO_P0_0P2A_REG (0x01C0)

PMU_0P2A_FORCE_TIEH_SEL_0 Configures which of the following controls the mode selection for VO3 regulator.

0: Mode selection is controlled by PMU_0P2A_TIEH_SEL_0

1: Mode selection is controlled by SDMMC_0

2: Bypass mode

3: Mode selection is controlled by SDMMC_1

(R/W)

PMU_0P2A_XPD_0 Configures whether software enables VO3 regulator.

0: Disable

1: Enable

(R/W)

PMU_0P2A_TIEH_SEL_0 Configures mode for VO3.

0: Mode is controlled by PMU_0P2A_TIEH_0.

1: Mode is controlled by SDMMC_0

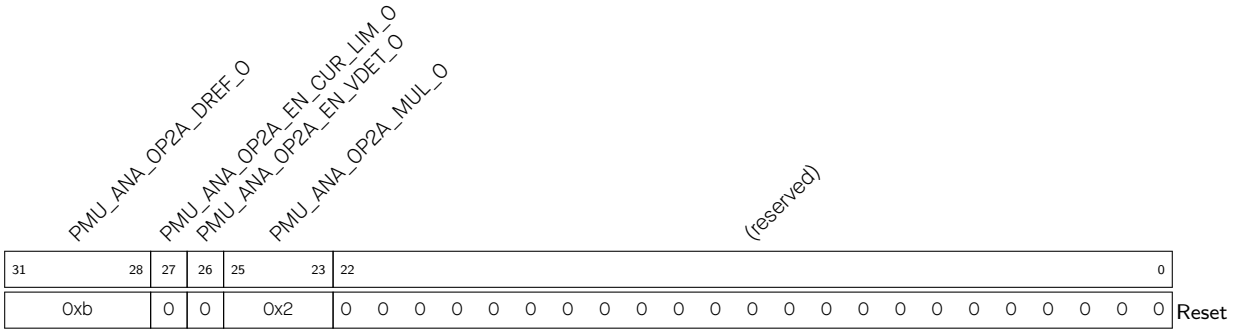
2: Bypass mode

3: Mode is controlled by SDMMC_1

(R/W)

PMU_0P2A_TIEH_0 Configures mode for VO3.

0: LDO mode



1: Bypass mode

(R/W)

PMU_0P2A_TARGET1_0 Configures the timeout for stage 2 of the VO3 regulator wait counter, with the unit being a 16 division of LP_DYN_SLOW_CLK. (R/W)

PMU_0P2A_TARGET0_0 Configures the timeout for stage 1 of the VO3 regulator wait counter, with the unit being a 16 division of LP_DYN_SLOW_CLK. (R/W)

Register 15.61. PMU_EXT_LDO_P0_0P2A_ANA_REG (0x01C4)

PMU_ANA_0P2A_MUL_0 Configures the MUL, where the output voltage of the regulator is MUL × Vref.

0-7: MUL ranges from 1 to 2.75, with a step of 0.25.

(R/W)

PMU_ANA_0P2A_EN_VDET_0 Configures whether to enable VO3 voltage detection.

0: Do not enable

1: Enable

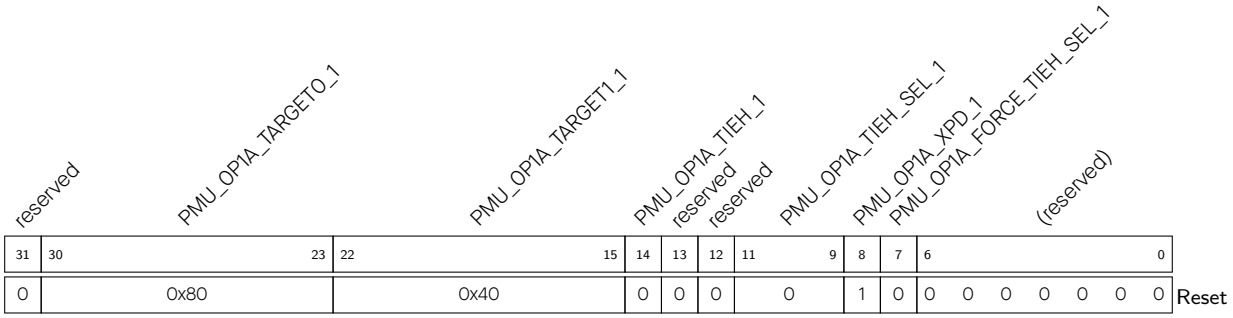
(R/W)

PMU_ANA_0P2A_EN_CUR_LIM_0 Configures whether to enable over current protection for VO3.

0: Do not enable

1: Enable

(R/W)



PMU_ANA_0P2A_DREF_0 Configures the LDO Vref, where the output voltage of the regulator is MUL × Vref.

0-8: Vref = 0.5 V - 0.9 V, with a step of 50 mV

9-15: Vref = 1.0 V - 1.6 V, with a step of 100 mV

(R/W)

Register 15.62. PMU_EXT_LDO_P1_0P1A_REG (0x01D0)

PMU_0P1A_FORCE_TIEH_SEL_1 Configures which of the following controls the mode selection for VO2 regulator.

0: Mode selection is controlled by PMU_0P1A_TIEH_SEL_1
